GENERATION.

GENERATION is that function of the animal economy by which the ſpecies is perpetuated. Inanimate matter and unorganized bodies are ſubject to no alterations, and would never change their condition, did not external forces deſtroy or modify them. On the contrary, organized bodies, very different from theſe inert maſſes, are active media of new combinations and changes; they undergo alterations, and are even deſtroyed by the exerciſe of their own powers, the entire ceſſation of which delivers up their ſpoils to the grand circle of changes, which organized matter is conſtantly undergoing. Although ſome of theſe bodies may laſt for a century, while the greater number live only for a few years, days, or even hours, this unequal duration, theſe moments or ages of exiſtence, are nothing with reſpect to nature, and the death which ſhe allots to man, to the plant or the inſect, is not the leſs neceſſary and certain. But, if individuals are ſacrificed and periſh, the ſpecies ſurvive and are immortal; by a conſtant and general law, animated bodies never die altogether, but are renewed and perpetuated by various modes of re-production. Some terminate their vital courſe while others are beginning it; and never, ſays Lucretius, does morning or night viſit the globe, without having funeral lamentations round a bier, and the plaintive cries of an infant in the cradle. There is a conſtant alternation of deaths and births, of loſſes and reparations; and the torch of life is rapidly tranſmitted in the ſeries of ſucceeding generations; "quaſi currentes vitai lampada tradunt." At a certain point of elevation in the ſcale of animal exiſtence, this object is accompliſhed by a double ſeries of organs, executing very different functions; and re-production is effected by a true proceſs of generation, under the influence of that phyſical feeling, the Venus, whoſe univerſal empire and irreſiſtible attractions are ſo beautifully delineated by the Roman poet.

"Æneadum genetrix, hominum divumque voluptas,
Alma Venus! cœli ſubter labentia ſigna
Quæ mare navigerum, quæ terras frugiferenteis
Concelebras; per Te quoniam genus omne animantum
Concipitur, viſitque exortum lumina ſolis:
Te, Dea, te fugiunt venti, te nubila cœli,
Adventumque tuum: tibi ſuaves dædala tellus
Submittit flores; tibi rident æquora ponti,
Placatumque nitet diffuſo lumine cœlum.
Nam, ſimul ac ſpecies patefacta eſt verna diei,
Et reſerata viget genitabilis aura Favonii;
Aëriæ primum volucres, te, Diva, tuumque
Significant initum, perculſæ corda tuâ vi.
Inde feræ pecudes perſaltant pabula læta,
Et rapidos tranant amnes; ita, capta lepore,
Illecebriſque tuis omnis natura animantum
Te ſequitur cupide, quo quamque inducere pergis.
Denique, per maria, ac montes, fluvioſque rapaces,
Frondiferaſque domos avium, campoſque virentes,
Omnibus incutiens blandum per pectora amorem,
Efficis, ut cupide generatim ſecla propagent.

Generation is the greateſt myſtery preſented to our view in the economy of living bodies; and its real nature is ſtill involved in the moſt complete obſcurity. Hitherto no obſervation authorizes us to admit the ſimultaneous formation of a living body in all its parts; that is to ſay, by the union of particles ſuddenly brought together. The compariſon of generation with cryſtallization is ſupported by no juſt analogy: cryſtals are made up of homogeneous particles, attracting each other indiſtinctly, and agglutinated by their

Strahan and Preſton,
New-ſtreet Square, London.

faces, which determine the order of arrangement; while living bodies are compoſed of numerous fibres or plates, heterogeneous in their compoſition, diverſified in their configurations, and deſtined to particular ſituations, ſo that they can only be in one place, and between other determined fibres or lamellæ. Moreover, living bodies, however ſmall they may be, poſſeſs all their parts from the firſt moment of their exiſtence; they grow, not by the addition of new layers, but by the ſometimes uniform, and ſometimes irregular developement of parts, all of which exiſted previouſly to any ſenſible growth. The only circumſtance belonging to all kinds of generation, and conſequently the only eſſential circumſtance in the proceſs is, that every living body, at the firſt periods of its ſenſible exiſtence, is attached to a larger body, of the ſame ſpecies with itſelf, that it makes a part of this larger body, and is nouriſhed by its juices for a certain length of time. Its ſubſequent ſeparation conſtitutes its *birth;* which may be produced ſimply from the life of the larger body, and the conſequent developement of the ſmaller, without the aid of any occaſional cauſe. Thus, in its eſſence, *generation*, as far as we can underſtand it, is only the appearance of a ſmall organized body upon or in ſome part of another and larger one, from which it will be ſeparated, at the expiration of a certain period, in order to aſſume an independent and iſolated exiſtence. All the acts or organs, which co-operate in the proceſs, in a certain claſſes of organized bodies, are only acceſſary to this primary function. When the function is thus reduced to its moſt ſimple ſtate, it conſtitutes the *gemmiparous*, or generation by ſhoots. In this way buds are formed on trees, and developed into branches, which will form future trees, by means of ſlips or cuttings. The polype (hydra) and the ſea anemone (actinia) multiply in this manner; ſome worms are propagated by a diviſion of their body, and muſt therefore be arranged in the ſame diviſion. This mode of generation requires no diſtinction of ſex, no copulation, nor any particular organ. Other modes of generation are accompliſhed in appropriate organs: the germs appear in a definite ſituation of the body, and the aſſiſtance of certain operations is required for their further developement. Theſe operations conſtitute *fecundation*, and ſuppoſe the exiſtence of ſexual parts; which may either be ſeparate or united in the ſame individual. The fecundated or fecundable ſex, in which the germ is found, is the female; and the fecundating ſex, the aſſiſtance of which is neceſſary for the complete developement of the germ, is the male. The office of the latter is that of furniſhing the fecundating or ſeminal fluid: but the manner in which that contributes to the developement of the germ, is not yet ſettled by phyſiologiſts. Some, forming their opinions from the human ſubject and the mammalia, where the germs are imperceptible before fecundation, ſuppoſe that theſe are created by the mixture of the male fluid, with that which they ſuppoſe to exiſt in the female; or that they pre-exiſt in the male ſemen, and that the female only furniſhes them with an abode. Others conſult the analogy of the other claſſes of animals, and of plants. In ſeveral inſtances, particularly in the frog, the germ may be clearly recognized in the ovum of the female before fecundation: its pre-exiſtence may be inferred, in other caſes, from the manner in which it is organically connected to the ovum, when it is firſt viſible. For it is agreed on all ſides, that the ovum exiſts in the female before fecundation, ſince virgin hens lay eggs, &c. From this analogy, theſe phyſiologiſts conclude, that the germ pre-exiſts in all females; and that the fecundating liquor is a ſtimulus which beſtows on it an independent life, by awakening it, in a manner, from the ſpecies of lethargy, in which it would have otherwiſe conſtantly remained.

The origin of the germs, and the mode of their exiſtence in the female; whether they are originally formed in all their parts in each individual by any vital proceſs, or are all pre-exiſtent, being incloſed in each other, or whether they are diſſeminated through the body, and require a concourſe of circumſtances to bring them into a ſituation favourable for their developement, are queſtions, which it is utterly impoſſible for us to decide in the preſent ſtate of our knowledge. Theſe points have for a long time been agitated by phyſiologiſts; but the diſcuſſion ſeems now to be abandoned by univerſal conſent.

The combination of the ſexes, and the mode of fecundation, are ſubject to great variety. In ſome inſtances, the two ſexes are united in the ſame individual, and fecundation is accompliſhed without any extraneous aid; ſuch are the hermaphrodite and monoïcous plants, the acephalous molluſca, and the echinodermatous animals. In others, each individual poſſeſſes both ſexes, but requires the aſſiſtance of another, which it fecundates, and by which it is fecundated. This is the caſe with the gaſteropodous molluſca, and with ſeveral worms. There are diſtinct individuals, male and female, in other claſſes; as, for inſtance, in the dioïcous plants, in all animals, which have a vertebral column, in the cephalopodous and ſome gaſteropodous molluſca, in ſome worms, in the cruſtacea, and in inſects; in ſhort, in the far largeſt portion of the animal kingdom.

Fecundation is accompliſhed in plants by means of a liquor contained in ſmall capſules, which reſemble a fine powder in appearance, lodge on the female organs, and, burſting, depoſit their contents. In animals, the liquor is always applied immediately upon or about the germs; and in many caſes it is not brought in contact with the ova, until they have been laid, as in the bony and oviparous fiſhes, and the cephalopodous molluſca: here the males and females have no commerce. Sometimes, as in the frog and toad, copulation is neceſſary in order to determine the diſcharge of the ova and ſemen, but fecundation is ſtill performed out of the body. Laſtly, in the great majority of inſtances, the ſeminal liquor, introduced by the male into the body of the female, fecundates the ova before they are laid. This is the caſe in the mammalia, birds, moſt reptiles, and ſome fiſhes, in the hermaphrodite gaſteropodous molluſca, in the cruſtacea and inſects. The union of the two ſexes, or the act by which this is accompliſhed, is called *copulation.* In all the laſt-mentioned orders ova may be diſcharged without previous copulation, as in the preceding ones. But they receive no further developement; nor can they be fecundated when thus voided. The effect of a ſingle copulation varies in its degree; it uſually fecundates one generation only, and produces one pregnancy; but ſometimes, as in poultry, ſeveral eggs are fecundated, and afterwards diſcharged ſucceſſively: ſtill, however, they only form one generation. In a very few inſtances, one act of copulation fecundates ſeveral generations, which can propagate their ſpecies without the aid of the male. In the plant-louſe (aphis) the ſpecies has been continued through eight generations from one copulation; and in ſome monoculi, through twelve or fifteen.

When the germ is detached from the ovary, its means of exiſtence may be more or leſs complete. In moſt animals it is accompanied by an organized maſs, to which it is connected by means of veſſels. The abſorption of this ſerves for its nutrition and developement, until the period of its independent exiſtence. It derives nothing therefore from the body of the mother, from which it is ſeparated by coverings, varying in number and ſolidity. The germ, together with its maſs of nouriſhment, and the ſurrounding membranes, conſtitutes an egg, or *ovum;* and the animals, which produce their young in this ſtate, are denominated *oviparous.* In moſt of theſe the germ contained in the egg is not developed, or hatched, until that part has quitted the body of the mother, or has been *laid;* whether it be neceſſary that it ſhould be afterwards fecundated, as in many fiſhes, or that it requires only the application of artificial heat for its incubation, as in birds; or that the natural heat of the climate is ſufficient, as in reptiles, inſects, &c. Theſe are ſtrictly *oviparous* animals.

The ovum, after being fecundated, and detached from the ovarium, remains in ſome animals within the body of the mother, until the contained germ be developed and hatched. Theſe are *falſe viviparous* animals, or *ovo-viviparous.* The viper and ſome fiſhes afford inſtances of this proceſs.

The mammalia alone are truly viviparous animals. Their germ poſſeſſes no proviſion of nouriſhment, but grows by what it derives from the juices of the mother. For this purpoſe it is attached to the internal ſurface of the uterus, and ſometimes by accident to other parts, by a kind of root, or infinite ramification of veſſels, called a *placenta.* It is not therefore completely ſeparated from the mother by its coverings: and it does not come into the world until it can enjoy an independent organic exiſtence. The mammalia cannot therefore be ſaid to poſſeſs an ovum, in the ſenſe which we have aſſigned to that term.

According to this ſketch of the ſubject, generation may be ſaid to conſiſt of four functions, differing in their importance, and in the number of animals, to which they belong, *viz:* 1ſt. The *production of the germ,* which is a conſtant circumſtance: 2dly. *Fecundation,* which belongs only to thoſe inſtances where there is a diſtinction of ſexes: 3dly. *Copulation,* which is confined to thoſe kinds of ſexual generation in which fecundation is accompliſhed within the body: laſtly, *Utero-geſtation,* which belongs excluſively to viviparous generation. The generative organs may be moſt naturally arranged according to this diſtribution of the partial functions, which they execute. The ſimple production of a germ, or gemmiparous generation, may be accompliſhed at any point of the body, and has, therefore, no peculiar organ. Sexual generation demands an organ for the production of germs, and another for that of the fecundating liquor. Modes of union are neceſſary when copulation takes place: and geſtation requires a receptacle adapted to the abode of the fœtus. Thus we have preparatory and preſerving organs; inſtruments of copulation; and organs of education. Thoſe of the two firſt claſſes are divided into male and female; the laſt belong to the latter ſex only. The preparatory and preſerving organs of the males ſecrete the ſemen, and the other fluids which are to be mingled with it, and retain theſe ſecretions. They conſiſt, in their moſt complicated form, 1ſt. Of the *teſticles,* which prepare the ſeminal fluid, and conduct it, either into a particular reſervoir, or into a canal, from which it is conveyed out of the body, or into a cloaca, from which it is in like manner ejected: 2dly. Of the *veſiculæ ſeminales,* ſuppoſed to be reſervoirs for the ſemen: 3dly. Of the *proſtate* glands; and, 4thly. Of *Cowper's glands,* which ſeparate a peculiar fluid, mixed with the ſemen at the time of coition. The teſticles are abſent in the laſt claſſes only of the animal kingdom, where generation is performed by a ſimple diviſion of the animal, or by ſhoots. They exiſt in all the claſſes of vertebral animal; and of the invertebral diviſion, in the molluſca, cruſtacea, inſects, and moſt vermes. Their number, ſtructure, &c. differ very much in theſe various claſſes. The veſiculæ, proſtates, and Cowper's glands, being leſs eſſential in their functions, are much leſs generally found, and are chiefly confined to the firſt claſſes of the animal kingdom. The preparatory female organs ſerve the purpoſe of developing and preſerving the germs. Their exiſtence is as general as that of the parts juſt mentioned; but they are much more ſimple in the firſt claſs of the animal kingdom. They conſiſt of two bodies ſimilar in form, ſize, and ſtructure, and named by modern phyſiologiſts *ovaria,* in order to expreſs more accurately, than by their old name of teſtes, the function to which they are deſtined. In fact, if their ſtructure, conſidered ſimply in man, and moſt of the mammalia, leave any doubt concerning their office, its nature is ſo evident in the other claſſes, that their function cannot fail to be recognized. In all the claſſes which ſucceed the mammalia, the ovary or ovaries ſerve evidently for the production and preſervation of the germs or ova, which are formed in theſe bodies previouſly to the approaches of the male. Analogy leads us to conclude that the ſame circumſtance holds good in the mammalia; and this concluſion is one of the moſt important reſults from the ſtudy of comparative anatomy and phyſiology.

The organs of copulation, in the male ſex, conſiſt of one or more projecting bodies, called penes, generally perforated by a canal, named the urethra, capable of being introduced into the female organs, in order to convey to them the fecundating liquor, or for the ſimple purpoſe of producing an irritation neceſſary for conception; or they are ſupernumerary members, enabling the male to graſp and hold the female. In the latter ſex, the copulating organs conſiſt of canals, particularly deſigned to receive the male penis, or give paſſage to the products of conception: or of cavities, which ſerve alſo for other purpoſes, but which, at the time of copulation, receive the penis, and tranſmit the fecundating liquor to the educating organs.

The educating organs receive the germ or ovum, after its detachment, from the ovarium, retain it for a greater or leſs length of time, contribute in a more or leſs direct manner to its growth, and convey it out of the body: or they furniſh nouriſhment to the young, when born, or afford it a temporary lodging. They are, therefore, divided into external and internal parts. The latter may be again diſtinguiſhed into two kinds. The firſt of theſe are ſimple canals, through which the germ or ovum is to paſs, either in order to be conveyed out of the body (as in the egg), or to be tranſmitted into the parts of the ſecond deſcription. The latter are very dilatable bags, to the parietes of which the germ is attached by means of veſſels conveying the materials of its nutrition, and preſerving it in this way until it has acquired a certain degree of growth. Organs of the firſt kind are formed in the four claſſes of vertebral animals; and are called *Fallopian tubes* in the mammalia, *oviducts* in the birds, reptiles, and fiſhes. Parts of the latter deſcription belong to the mammalia only, and are the *uterus.* The external educating organs are, in the mammalia, the mammary glands ſecreting the milk by which the young are nouriſhed; or receptacles, in which they are retained for a time, in a few genera. One kind of reptiles only poſſeſſes analogous pouches.

To fill up the outline which we have preſented to our readers in the preceding ſketch, would require a detailed deſcription of organs varying almoſt infinitely in form and ſtructure in the different claſſes of organized bodies. Theſe details will be found in the proper articles of the Cyclopædia, relating to vegetable and comparative anatomy: this general view has been thought neceſſary, as introductory and explanatory. The remainder of this article will be devoted to the anatomy and phyſiology of the generative organs in the human ſubject. The growth and developement of the ovum in the uterus have been conſidered under the article Embryo, and the anatomy of the mammary gland will be found under Breast.

The preceding account will ſhew what various methods are employed by nature for the perpetuation of the races of organized beings; this ſeems to have been a very leading object, and one accordingly, in which ſhe has developed all the fertility of her reſources. Scarcely can ſuch diverſified phenomena be reduced, by artificial claſſifications, to any common and conſtant laws: new facts ſpeedily modify or overturn the previous generalizations; and imagination can ſcarcely conceive any poſſible forms of propagation which obſervation does not ſoon realize. The generative functions ſhould be particularly attended to by thoſe who are employed in delineating the manners of animals. They will probably find that the propenſities and habits of each are intimately connected with the mode of propagation; and that the character of its wants, pleaſures, and labours, its ſociability and perfectibility, and the extent or importance of its relations either to other ſpecies or to the various external bodies or agents, particularly depend on the circumſtances or conditions to which its reproduction is ſubjected, and on the diſpoſition of the organs employed for this purpoſe. This is certainly very much the caſe with man, which is the object of our preſent inveſtigation.

Man belongs to one of thoſe claſſes of the more complicated and perfect animals, where propagation is effected by the concurrence of two beings, whoſe organization, poſſeſſing moſt circumſtances in common, is diſtinguiſhed by certain particular traits. He quits the womb of his mother with organs capable of reſiſting the impreſſions of the atmoſphere, and of aſſimilating food to his own ſubſtance: he can already live by his own independent powers. He is not deſtined to remain, like the oviparous animal, included in a foreign envelop, and to continue for an indeterminate length of time in a ſtate of inaction which hardly differs from non-exiſtence: he does not wait until creative warmth beſtows on him motion and life, amid the nutritive fluids prepared beforehand by nature, like thoſe in which the embryo of the ſerpent, the tortoiſe, or the bird ſwims for a long time as an inviſible point. The human fœtus has been ſupported in the uterus by fluids animalized in the veſſels of the mother: it ſubſiſts, immediately after birth, on milk, prepared in organs ſet apart for that office. The duration of geſtation, that of infancy, during which the aid of the parents is indiſpenſible, and the epoch of puberty, or the moment at which the generative faculty is manifeſted by ſenſible ſigns, differ greatly in the different ſpecies of animals; theſe circumſtances are not connected together by uniform or conſtant relations.

Man, like all the more perfect animals, is not born with the power of reproducing the ſpecies. The organs, which are at a future period to exerciſe this function, are now completely inactive, and the appetites which ſolicit their action do not exiſt. The time of puberty;—the epocha at which the frame and powers of the being receive their full developement, is alſo the period at which the generative organs, recovered from their lethargy, aſſume an active ſtate, and become capable of exerciſing their functions. The duration of infancy is longer, and the age of puberty is later in man than in any animals; although the term of geſtation is ſhorter than in ſome other ſpecies. Theſe circumſtances muſt have a very marked influence on the wants, the faculties, and the habits of the human race.

The characters of the generative functions partake of thoſe which belong to the animal and organic lives. Thus, on one ſide, all that precedes the union of the ſexes, all the impreſſions made on one by the charms which nature has beſtowed on the other, belong to the ſenſes; this very union is an act of the external life, to which animals are impelled by inſtinct, over which reaſon preſides to a certain degree in man. The influence of habit is alſo perceived here; but inſtead of blunting the enjoyment, it renders it rather more acute, and often gives riſe to factitious wants. On the other hand, the ſecretion of the fluid, by the emiſſion of which man contributes to the reproductive proceſs, the myſterious work of conception, the developement of the new being, &c. all belong to the organic life.

Sexual Diſtinctions.—Some ancient philoſophers have held on this ſubject opinions very injurious to the fair ſex, and indeed ſo manifeſtly whimſical and ridiculous, that a ſimple ſtatement of them will ſhew their abſurdity. Woman, in the opinion of Ariſtotle, is an imperfect man, an ill-formed and imbecile individual; while man is characterized by the attributes of ſtrength and power. Galen goes even further, and confounding the ſexes in thoſe very parts, where their diſtinguiſhing characters are the moſt unequivocally marked, admits no other differences between the male and female generative organs than ſuch as may be deduced from developement and ſituation. He does not regard even the addition of the uterus in the female as an objection to this opinion, but, bending nature to his hypotheſis, he repreſents this organ as being turned inſide outwards in man to envelope the glands in which the ſeminal fluid is elaborated. This ſtrange paradox has been adopted by numerous writers, and is hardly yet completely abandoned. Daubenton calls the clitoris a penis in miniature; Buffon turns the ovaries into teſticles, and endeavours to prove that the addition of the uterus alone conſtitutes any eſſential diſtinction between the male and female parts.

Some reſemblance in the unimportant points of form and arrangement gave riſe to theſe unfounded analogies: pride and ſexual prejudices, joined to the reſults of ſuperficial obſervation, ſeem to have ſo far miſled true philoſophers, whoſe ſtrange opinions we have juſt alluded to, as to make them diſcover, in one of the firſt productions of nature, a feeble ſketch, and a timid production. Woman has appeared to them as a degradation and imperfect copy of the conſtitution of man, while, in fact, ſhe is the moſt eſſential part of the ſpecies, as contributing by far the greateſt ſhare to the buſineſs of reproduction. A more accurate examination will deſtroy theſe ſuppoſed analogies, and prove that man and woman do not differ in the relations of more or leſs, but that the ſtructure and functions of their generative organs are different in their kind; that their whole conſtitution has in each its peculiar type, the diſtinctive traits of which offer to our view a long chain of phyſical and moral effects more or leſs immediately dependent on the functions of the organs concerned in the buſineſs of generation.

The characters of ſex do not therefore ſhew themſelves in any ſingle point; it is not merely a particular organic apparatus, nor thoſe external forms which delight us, that conſtitute woman: and if ſhe is principally characterized in ſome parts, where the ſexual phyſiognomy is the moſt decidedly expreſſed, if the ſuperficial traits, and the ſweetly rounded contours, which conſtitute her charms, form her moſt agreeable diſtinction, ſhe is woman in the eyes of the naturaliſt and phyſician, in all her modes of exiſtence, in her moral affections as well as in her phyſical ſyſtem, in her enjoyments and pains; in a word, all parts of her exiſtence bear the character of ſex, and preſent a ſeries of contraſts and oppoſitions with the correſponding points in man.

It is however only at the epocha of puberty, at that period of life called by Buffon " le printemps de la nature, la ſaiſon des plaiſirs," that the aſſemblage of all the ſexual traits is exhibited to our obſervation; and that man and woman, attracted to each other the more forcibly in proportion as they differ, become connected by various relations, which enlarge an exiſtence hitherto perſonal, ſolitary and iſolated. Woman may be diſtinguiſhed from man by general and particular differences: the latter are ſo decided as to be eaſily diſcernible at all times, while the former, which are our preſent object, are not always equally remarkable, and at one time cannot be diſtinctly traced. In the firſt years of life, the individuals of the two ſexes do not differ from each other at the firſt view; they have nearly the ſame general air, the ſame delicacy of organization, the ſame gait, and the ſame voice. Experiencing the ſame wants, exerciſing the ſame functions, and often partaking together of the ſame infantile ſports, they excite in the mind of the ſpectator who watches them with pleaſure, no ideas of diſtinguiſhing characters; they both appear to him only as awakening that tender emotion which we always feel at the contemplation of innocence joined to weakneſs. Indifferent and iſolated, each as yet lives only for himſelf; their exiſtence, purely individual and independent, exhibits hitherto none of the relations which conſtitute in the ſequel a ſource of mutual dependence. However, this equivocal ſtate does not laſt long: man ſpeedily aſſumes the features and character which mark his deſtination; his limbs loſe the ſoftneſs and the gentle forms which he partook with the female; the muſcles, the chief inſtruments of animal force, condenſe, by their reiterated contractions, which are conſequent on more violent and long continued exerciſe, the cellular ſubſtance, which filled their interſtices and gave a roundneſs to their form; hence they become more prominent, and give to the limbs more rough and decided outlines. It is no longer the ſame individual: the deeper tint of the countenance, the increaſed depth and ſtrength of the tone of voice announce an acceſs of vigour neceſſary for the purpoſes of his future character. The timidity of infancy has given way to an inſtinct which makes him deſpiſe danger; he fears nothing, becauſe the impetuous current of his blood makes him diſregard all obſtacles. His ſuperior ſtature, his determined gait, his new taſtes and ideas all conſpire to mark in him the image of ſtrength, and to give the characters of that ſex which is to protect the other.

Woman, in advancing towards the age of puberty, departs from her primitive conſtitution leſs ſenſibly than man. Delicate and tender, ſhe even retains ſomething of the temperament belonging to children. The texture of her organs does not loſe all its original ſoftneſs. The developement, produced by age in all the parts of her body, never beſtows on them the ſame degree of conſiſtence which they acquire in man: yet, in proportion as the traits of the female are fixed, her figure, form and proportions exhibit differences, ſome of which did not exiſt before, while others were ſcarcely ſenſible. Although ſhe ſets off from the ſame point as man, ſhe is developed in a manner peculiar to herſelf, and arrives ſooner at the term of her developement. Every where puberty arrives earlier in the female than in the male ſex. Has nature a greater taſk to perform in the latter than in the former? Does it coſt her greater efforts to bring man to perfection than woman? Or does the eaſe which characterizes female motions and actions exhibit itſelf already in the firſt developements of her phyſical conſtitution? Perhaps nature terminates her work the ſooner from the female organs being of leſs volume than the male, as her operations are conducted within a more limited ſphere. However we may explain it, man is ſtill ſubject to the laws which govern him in infancy, while woman experiences already a new mode of exiſtence, and finds herſelf, perhaps with aſtoniſhment, provided with new attributes and ſubject to a claſs of functions not obſerved in man, and hitherto unknown to herſelf. From this inſtant there is unfolded in her a new chain of phyſical and moral relations, on which depends that new and attractive intereſt with which ſhe inſpires man, and which has already become a ſource of new wants and affections.

In running through a more detailed ſketch of the differences obſervable in the two ſexes, we find them differing in the firſt place in ſtature, and in the ſize and proportions of parts. The height is leſs in the female, by about one-ſixth. The middle of the body in man is at the ſeparation of the lower limbs at the pubes: in woman it is higher, and hence the lower limbs are ſhorter, while the lumbar region is longer. This gives to the female ſex in general, and to the Americans and Negreſſes in particular, that elegant ſlenderneſs which diſtinguiſhes them. The arm or leg of a woman could be immediately diſtinguiſhed from thoſe of a man: the form of theſe parts is much more delicate, and leſs marked by decided prominences. The buſt is not ſo broad, but more rounded, and particularly diſtinguiſhed by the ſize and elegant formation of the breaſt, which is commonly but little developed in man, where its greater developement would be regarded as a deformity. The thighs are much larger, more rounded, and further apart; they approach each other below, ſo that the knees are ſlightly turned in. The latter circumſtance is ſeen in the Venus, and the whole formation of theſe parts is attended with advantages in geſtation and parturition, although the peculiarity in queſtion is not ſeen in theſe females which in common opinion are the beſt formed. The convexities deſcribed by the lower limbs at their upper part, and uniting them by ſuch happily rounded forms with the trunk, have a very obvious peculiarity of character in the ſofter ſex. They are more prominent, and approach in their contour more to the hemiſpherical form. All other parts of the lower limbs are diſtinguiſhed by their ſoftly rounded outlines. The foot is ſmaller, and the baſe of ſupport for the body is proportionally narrow. The leg gradually diminiſhes from above downwards, inſtead of ſwelling out abruptly at the calf. The outlines of the upper limbs are equally flowing and ſoft; thus the arm of woman is fatter and more rounded; the whole upper extremity correſponds in its comparative ſhortneſs and ſmallneſs to the general difference in ſtature; and is terminated by a ſmall hand, and ſhort, delicate and flexible fingers.

We may obſerve further that the head is ſmaller, the face ſhorter, and the neck longer in woman. The cheſt is not ſo long, but deeper; the abdomen more prominent and rounded; the ſhoulders are carried more backwards, and ſtand out leſs from the trunk. Hence the breadth of this part is much leſs conſiderable than in man, where the ſhoulders are more fully developed and more widely ſet off, and conſtitute, in their comparatively greater ſize, a very impreſſive feature of the ſuperior ſtrength, which is the attribute of the male ſex. In the female trunk, on the contrary, the broadeſt part is below: the pelvis, holding the organs of generation, being principally concerned in the functions of utero-geſtation and parturition, being, in ſhort, the ſeat of thoſe attributes which eſpecially diſtinguiſh the female, is much more capacious than in the male. Hence the ſuperior breadth of the female hips: hence the oppoſite characters of the trunk in the two ſexes, in reſpect to ſize. The trunk of the female is a pyramid, with the broadeſt part below; that of the male is juſt the reverſe. Camper has ſhewn, that if the body of a well-formed man be delineated on an elliptical area, the ſhoulders paſs out of the ellipſe, while the pelvis falls within it; on the contrary, that the hips exceed, and the ſhoulders fall within the line in woman. (Mémoire ſur le beau Phyſique). In thoſe ſpecimens of ancient art, which may be regarded as models of the moſt characteriſtic formation, the difference of breadth in theſe parts amounts to one-third: the ſhoulders being ſo much broader in the male, and the hips in the female. The greater breadth of the pelvis gives a broader baſe of ſupport to the female trunk; and, as it throws the thigh-bones further apart at their upper ends, produces the increaſed wideneſs of the hips. Hence in progreſſion the centre of gravity is more ſenſibly changed at each ſtep; and there is a perceptible rolling of the pelvis, which characterizes the female gait. The inconvenience of this arrangement counterbalances the advantages which the broader baſe of ſupport might otherwiſe have beſtowed on the female organization; and the latter is, in truth, an imaginary ſuperiority, ſince the feet, which are always ſmall in women, offer ultimately a narrow ſurface for the body to reſt on.

The various pieces of the ſkeleton, by their reſpective diſpoſition and junctions, determine the eſſential form of the body, its poſition and attitudes, and the extent and variety of its motions. The characters of the general form, which we have already conſidered, are therefore to be retraced in the bones; and in this point of view a parallel of the male and female organization leads to very important reſults. It is difficult to meet with a well-formed female ſkeleton, where the ſtructure can exhibit or recal the leading traits of the female form. After much trouble and obſervation, Soemmerring met with a ſpecimen of what he conſidered the beſt and moſt natural form in a young girl of Mentz, whoſe form had not been impaired by abſurd modes of dreſſing, and who had been ſucceſsfully delivered a ſhort time before her death. A beautiful plate of this ſkeleton, with its deſcription, is exhibited in his "Tabula ſceleti feminini, juncta deſcriptione," folio, 1797. The female ſkeleton, on the whole, is ſmaller in all its dimenſions, and more ſlender than the male. The individual bones have fewer inequalities, their prominences are leſs ſtrongly marked, the grooves or impreſſions more ſuperficial, all the cavities leſs deeply hollowed out: hence the ſurface ſeems more finely turned, and is diſtinguiſhed by its ſmoothneſs. They are often actually ſofter, and have on the whole a peculiarly feminine character, which cannot be eaſily conveyed in deſcription. The head, with the teeth, bears a greater ratio to the weight of the ſkeleton, on account of the individual bones being in general more ſlender: the proportions are 1 : 6 in the female, 1 : 8 or 1 : 10 in the male. The cranium is larger in proportion to the face. The thorax is ſhorter, more convex in front, and more diſtant from the pelvis, the ſpace between the laſt rib and the criſta ilii being greater. It is leſs prominent in front; ſo that while this part projects the furtheſt in the erect or ſupine poſition of the male, the ſymphyſis pubis does the ſame in the female. The loins are longer, and the angle between them and the ſacrum more acute. The diſpoſition of the pelvis is particularly characteriſtic, as being ſo immediately connected with the ſexual functions. It is larger in all its dimenſions. The ſacrum is turned more backwards, is broader, and more concave; the oſſa coccygis, more moveable and ſlender, project leſs into the cavity of the pelvis. The hip-bones (oſſa innominata) are broader, ſmoother, and expanded further in the lateral direction: hence their criſtæ and tuberoſities are more diſtant, hence the ſpace between the oſſa pubis is greater. The angle formed between the ramus and ſymphyſis pubis is larger: that between the two bones of the pubes is acute in man, while it is of 80 or 90 degrees in woman; and approaches more nearly to the form of an arch. That the ſexual functions are favoured by all theſe circumſtances is very evident; but the advocates of final cauſes point out more particularly the reaſon for the wider ſpace under the oſſa pubis: "Ad virum admittendum intercapedine majore crurum inferiorum oſſium pubis." (Albinus de ſceleto, p. 475.) The tuberoſities of the iſchia are more diſtant, larger and ſmoother. The clavicles are leſs curved, and the ſhoulder joints are leſs diſtant. The acetabula are further apart, and the thigh-bones more oblique in their poſition: the latter are alſo more curved forwards, and have longer internal condyles.

The muſcles of the female are more ſlender and delicate, they are, in fact, leſs denſe, ſofter and moiſter. Theſe organs are leſs prominent, and their ſwellings, partaking of the general ſoftneſs of the female conſtitution, have not that character of vigour which their rough prominences and ſtrongly marked interſtices impreſs on the frame of a muſcular man, in whom the exterior traits of ſex have not been deſtroyed by effeminate manners or ſedentary habits. The cellular and adipous tiſſue is more abundant in the female; and this, joined to the ſmaller prominence of the muſcular bellies, gives to the limbs that ſoft roundneſs and delicate contour which characterize female beauty, as expreſſed in the moſt celebrated productions of great artiſts.

The differences juſt deſcribed, the comparative weakneſs of the muſcles, the elegance and beauty of the external forms, belong to the very nature of woman. Education and habits may add to theſe characters; may increaſe the delicacy of organization; but their influence is not ſufficiently powerful to induce us to overlook the exiſtence of a radical innate difference in the phyſical ſtructure of the ſexes, occurring in all ages and amongſt every people. That ſuch differences of organization will produce correſponding varieties of function may be readily allowed: but our facts are not quite ſo indiſputable on this point. We could undoubtedly point out many peculiarities in the ſenſibility of women, taking the term in its moſt extenſive ſenſe, in their perceptions, their mental operations, and the reactions of the nervous ſyſtem on the reſt of the frame. We could trace many circumſtances to the influence of the generative organs, and particularly of the uterus. But the influence of education, habits and cuſtoms, is ſo extenſive, that it is difficult to diſtinguiſh between the reſults of theſe cauſes, and of the ſuppoſed original diſtinctions in organization. The reader may refer on this ſubject to the Hiſtoire naturelle de la Femme, by Moreau, tome 1, p. 112, &c.

We cannot draw any very ſtrong line of diſtinction between the ſexes in the vital and natural functions. We may apply, indeed, to this ſubject, the philoſophical remark of Buffon concerning animals; *viz.* that they differ from each other more ſtrikingly in proportion as we compare them together in ſuperficial points, which do not affect the nature of their exiſtence ſo much as its exterior development. Yet the characters of ſex are ſo deeply impreſſed, that we find traces of them even in theſe functions, when ſubmitted to a rigorous examination. The pulſe, ceteris paribus, is more frequent; the lungs are ſmaller, and the cheſt narrower. The appetite is leſs; the body grows more rapidly, and the periods of dentition, puberty, and adult ſtature are more early. See, for more detailed obſervation on this head, the work above quoted.

The voice is marked by very characteriſtic diſtinctions in the two ſexes. In man it is ſtrong, deep, leſs ſoft and flexible. In the female it is ſharper, and the organs are more flexible, ſo that articulation can be performed more rapidly. It has alſo a peculiar quality or tone, which, in many inſtances, conſtitutes an inexpreſſibly attractive charm. "Of all acute voices," ſays Rouſſeau, "it muſt be allowed, in ſpite of the prejudices entertained by the Italians in favour of the caſtrati, that none are equal to thoſe of women, either in the extent or beauty of the tone." The anatomiſt, perhaps, will attempt to explain theſe circumſtances by obſerving, that the glottis is not enlarged at the age of puberty in females, as it is in males; that the larynx is conſiderably ſmaller; that the tongue, the muſcles, and the organs of ſpeech being leſs rigid, like all the other parts of the female, young girls ought to ſpeak ſooner than boys, &c. Among the ſeveral diſtinctions belonging to this head, we muſt notice the greater prominence of the thyroid cartilage in the male.

The texture of the ſkin is more denſe and compact in men, whiter and more expanded in women. In brunettes, particularly, it has a ſoftneſs and poliſh, which convey the moſt voluptuous impreſſions to the organs of touch. "Perſons," ſays Winckelmann, "who prefer ſuch females, are captivated through the medium of feeling, rather than of viſion." The ſkin in woman poſſeſſes alſo a tranſparency, which allows the colour of the blood to be diſcerned in the ſuperficial veins, and produces the beautiful azure tint, which contraſts ſo charmingly with the clear whiteneſs of other parts. The cutaneous ſecretion has been conſidered to differ in the two ſexes. "La tranſpiration parait beaucoup moins abondante chez les femmes ; elle a ſurtout, dans certaines parties, une odeur, qu'il ſerait difficile d'exprimer, mais qu'un odorat exercé parvient aiſément à diſtinguer chez les femmes qui jouiſſent avec plénitude de tous les attributs de leur ſexe, et qui ſont femmes juſque dans leur atmoſphere." Moreau, t. 1. p. 171.

The ſkin of man is always, comparatively, more deeply tinted ; it is thicker, rougher, and covered with more numerous hairs. In our account of this organ, too, we have to mention a very characteriſtic attribute of the male ſex, the beard.

This production, which adorns the figure of the male, in the human ſpecies, is more or leſs abundant in different ſubjects. It does not begin to appear until the age of puberty, and is not completely developed until after ſome years. Its great thickneſs depends, perhaps, on the habit of cutting it. In old age a ſimilar production appears in ſome women ; here, however, it is diſperſed irregularly, and has not the thickneſs which it poſſeſſes in man ; nor does it ever acquire the ſame length. Yet rare examples have been known of women with long beards. A caſe of this kind is mentioned in the Anatomie Deſcriptive of Bichat, tom. 5. p. 165, as having been ſeen at the hoſpital of the Ecole de Médecine. The woman was forty years of age ; her breaſts were well-formed, and ſhe had had a child. Her beard was as ſtrong as that of a man, and numerous hairs covered the lobuli of the ears.

The characters of ſex in thoſe organs which are immediately employed in the generative functions, will be exhibited in the courſe of this article. We have only to obſerve further, that the circumference of the anus, which is covered with hair in the male, is ſmooth in the female ſubject.

The reader may refer, on ſexual diſtinctions, to Rouſſel, Syſteme phyſique et moral de la Femme ; to the works of Moreau and Cabanis ; to the French Encyclopedie, Yverdun edition, art. *Femme* and *Viril* ; to Ackermann, De diſcrimine ſexuum præter genitalia, Mogunto 1788, 8vo. ; to A. F. Nolte, Diſſ. ſiſtens momenta quædam circa ſexus differentiam. Getting. 8vo. The differences in the general habit and appearance of the body, the ſoftneſs, delicacy, and inferior ſtature of the female, as contraſted with the ſtrong ſinewy frame of the male, may be ſeen in the two figures, ſuppoſed to have been drawn by Titian, contained in Veſalius, De Corp. hum. Anat. Baſil. 1542 : alſo in the 1ſt, 2d, and 3d plates of Bidloo's work ; and in the Cours complete d'Anatomie gravé par M. A. E. Gautier, et expliqué par M. Jadelot ; Nanc. 1773, folio. The unrivalled artiſts of Greece could not fail to perceive the ſame diſtinctions, which they have expreſſed moſt admirably in ſome of the fineſt monuments of their art, as in the Venus, the Apollo, and Hercules.

The differences which we have enumerated are not very diſtinctly perceivable, until the two ſexes have reached the epocha of their reſpective perfect development. They are concealed, in the early periods of infancy, under external forms which are nearly the ſame in both ſexes. It is true, indeed, that we can diſtinguiſh a male from a female embryo (ſee EMBRYO) ; but the leading ſexual diſtinctions are by no means fully developed until the age we have mentioned. The muſcles have not yet produced any remarkable change in the direction of the bones ; the glandular and fleſhy parts hardly differ either in form or volume ; and the ſkeletons can ſcarcely be diſtinguiſhed by the breadth of the hips and pelvis. The like confuſion prevails in the moral diſpoſition of the two ſexes : boys are not diſtinguiſhable in this reſpect from girls. The appetites, ideas, and paſſions of both are the ſame. We cannot at preſent, nor perhaps ſhall we ever be able to determine, by what particular action the organs of generation influence the other parts of the body, direct their operations, and modify the character and order of the phenomena relating to them. The fact, however, is evident ; and the influence is inconteſtable. For, when the natural developement or actions of the generative organs is impeded, the ſecondary characters, by which the ſexes are diſtinguiſhed, do not take place.

To illuſtrate this ſubject, let us obſerve, that the ſeveral differences of animals may be divided into primary and ſecondary ; the former include the differences in the parts of generation themſelves, which are originally formed differences, and belong equally to both ſexes ; the latter are all the other variations depending on theſe, not taking place until the parts of the firſt claſs are coming into uſe, and being principally, though not entirely, in the male. One of the moſt remarkable ſecondary characters in animals, generally ſpeaking, is the ſuperior ſtrength of make in the male ; and this ſtrength is generally directed particularly to the organs employed in fighting. Hence it is eſpecially noticeable in the animals whoſe females are of a peaceable nature ; *e. g.* the legs of the cock and neck of the bull. But in carnivorous animals, where ſtrength is required by both ſexes to kill the prey, the differences in the form of the male and female are not ſo ſtriking, yet the ſexes are ſtill diſtinguiſhed by ſome differences in their external covering, as the male lion by his mane, and the cock and hen of many birds by the plumage. The general ſtrength of make, the hairy covering, and the voice diſtinguiſh the male from the female of the human ſpecies. Now in all animals, which are not of any diſtinct ſex, no ſuch alteration takes place in the form at the time of puberty. Thus, the free martin, which poſſeſſes a mixture of the generative organs of both ſexes, does not exhibit in form a reſemblance of either the cow or bull. It is very much like the ox or ſpayed heifer, being conſiderably larger than either the bull or the cow, and having horns very ſimilar to thoſe of the ox. The voice is ſimilar to that of the ox, and more like that of the cow than of the bull. The fleſh, like that of the ox or ſpayed heifer, is generally much finer in the fibre, than that of either the bull or cow ; it is ſuppoſed to exceed that of the ox and heifer in delicacy of flavour, and bears a higher price at market. (See "Account of the Free Martin" in Mr. Hunter's obſervations on the animal economy, p. 55.) A ſimilar effect is produced, when the ſexual parts are removed after birth ; the caſtrated male and the ſpayed female have both the ſame common properties, and are very much like the free martin ; the artificial removal of the generative organs preventing the occurrence of thoſe changes, which would naturally have occurred at the time of puberty. Thus, by depriving either ſex of the true parts of generation, they ſeem to approach each other in appearances, and acquire a reſemblance to the hermaphrodite. Reſpecting the changes, which occur at puberty, Mr. Hunter ſays, "It is evidently the male, which at this time in ſuch reſpects recedes from the female; every female being at the age of maturity more like the young of the ſame ſpecies than the male is obſerved to be: and if the male is deprived of his teſtes when young, he retains more of the original youthful form, and therefore more reſembles the female. From hence it might be ſuppoſed, that the female character contains more truly the ſpecific properties of the animal than the male; but the character of every animal is that which is marked by the properties common to both ſexes, which are found in a natural hermaphrodite, as in a ſnail, or in animals of neither ſex, as the caſtrated male or ſpayed female. But, where the ſexes are ſeparate, and the animals have two characters; the one cannot more than the other be called the true; as the real diſtinguiſhing marks of each particular ſpecies, as has been mentioned above, are thoſe common to both ſexes; and which are likewiſe in the unnatural hermaphrodite. That theſe properties give the diſtinct character of ſuch animals is evident, for the caſtrated male and ſpayed female have both the ſame common properties; and when I treated of the free martin, which is a monſtrous hermaphrodite, I obſerved that it was more like the ox than the cow or bull; ſo that the marks characteriſtic of the ſpecies, which are found in the animal of a double ſex, are imitated by depriving the individual of certain ſexual parts, in conſequence of which it retains only the true properties of the ſpecies." (See "Account of an extraordinary Pheaſant," in Mr. Hunter's obſervations on the animal economy, p. 75.)

The influence of the generative organs in the developement of the body at puberty, and in the modifications which conſtitute the ſexual character, is clearly evinced in the ſtag, whoſe amours are conducted in ſo ſplendid a ſtyle, and evince ſo remarkable an exuberance of vitality. When he is deprived, at an early age, of the ſexual attributes, none of the vigour of the rutting ſeaſon is diſplayed; the muſcular fleſh is ſofter, and the horns are either arreſted in their growth entirely, or are imperfectly formed. Ruſſel caſtrated a very young ſtag, and no horns appeared; he operated on an older one, and the horn was partially developed. When he removed one teſtis at a more advanced age, the oppoſite horn was the moſt completely formed; the removal of both glands from two adult ſtags did not prevent the appearance of the horns; but they were ſhorter, and neither the inveſting membrane, nor the horn itſelf, were afterwards ſeparated. (On the Economy of Nature in glandular Diſeaſes.)

Facts very analogous to theſe may be obſerved in the human ſubject. An imperfect original formation of the ſexual organs, or the removal of ſome of them modifies the whole character of the individual, changes the phyſical conſtitution in a very remarkable manner, and influences in a no leſs ſtriking degree the moral habits and diſpoſitions. Obſervers in all ages have remarked, that mutilated or imperfect animals poſſeſs an aſſemblage of peculiar characters, all of which have not a very direct relation to the functions of the generative organs. Not only are the ſexual deſires entirely loſt in theſe degraded individuals, but the whole of their organization is affected in a very ſingular way. The cellular texture becomes more abundant and lax, and is more loaded with fat; the muſcles are weaker; the voice more acute; and the developement of the beard is impeded. The change in the moral diſpoſitions is not leſs worthy of attention. It was the opinion of the ancients, that mutilation degrades man, and brings animals to perfection; the truth is, that it equally degrades both, ſince it alters their nature. But, by weakening an animal, it renders him more docile, and better ſuited to the purpoſes of man; by deſtroying the tie, which connects him the moſt powerfully to his ſpecies, it aſſiſts in developing thoſe habits of obedience and attention, and thoſe feelings of gratitude and attachment which make him ſo ſerviceable to us. A ſimilar effect is produced in man; mutilation ſeparates him in a manner from his ſpecies; and the fatal event, which deprives him of the moſt agreeable relations eſtabliſhed by nature, between beings of the ſame kind, almoſt extinguiſhes in his breaſt the peculiar feelings of humanity.

In thoſe young perſons, to whom nature has denied either wholly or in part, the diſtinguiſhing powers of the male ſex, puberty does not produce its ordinary effects. And moreover, at this time the bony and muſcular organs are conſtantly aſſuming more and more of the external forms, and general character belonging to the female. Theſe equivocal individuals have an acute voice, weak muſcles, a ſoftneſs and laxity in the general organization. The pelvis, too, has that greater proportional breadth which characterizes this part in women. This circumſtance, as well as the conſequent breadth, and great roundneſs of the hips, may be particularly noticed in the caſtrati. The phyſical condition is generally accompanied in theſe individuals with a perfectly correſponding moral ſtate. All theſe points are fully ſubſtantiated in the following account of a marine ſoldier, aged 23, by Mr. Home, (Obſervations on Hermaphrodites, Philoſ. Tranſact. 1799.) "He had no beard; his breaſts were fully as large as thoſe of a woman at that age; he was inclined to be corpulent; his ſkin uncommonly ſoft for a man; his hands fat and ſhort; his thighs and legs very much like thoſe of a woman; the quantity of fat on the os pubis reſembled the mons veneris; the penis was unuſually ſmall, as well as ſhort, and not liable to erections; the teſticles not larger in ſize than we commonly find them in the fœtal ſtate; and he had never felt any paſſion for women. He was weak in his intellects, and his bodily ſtrength." Mr. Home mentions, in the ſame place, two other ſtill more ſtriking examples. A woman had three children, of which the firſt and third were ſuppoſed to be hermaphrodites; the ſecond was a perfect female. The eldeſt, when Mr. H. ſaw him, was thirteen years of age, "of a moſt uncommon bulk, which appeared to be almoſt wholly compoſed of fat; his body, round the waiſt, was equal to that of a fat man, and his thighs and legs in proportion; he was four feet high; his breaſts as large as thoſe of a fat woman; the mons veneris loaded with fat; no penis; a preputium $\frac{1}{6}$th of an inch long; and under it the meatus urinarius, but no vagina. There was an imperfect ſcrotum, with a ſmooth ſurface, without a raphe in the middle, but in its place an indented line; it contained two teſticles of the ſize they are met with in the fœtus. He was very dull and heavy, almoſt an idiot, but could walk and talk. The younger one was ſix years old, uncommonly fat, and large for his age; more an idiot than the other, not having ſenſe enough to learn to walk, though his limbs were not defective. The external parts of generation differed in nothing from thoſe juſt deſcribed, except in the prepuce being an inch long."

An intereſting caſe is mentioned in the Mémoires de la Société médicale d'Emulation, t. 3, p. 293, which tends to confirm the preceding obſervations. A young man, aged 23, has no teſtes in the ſcrotum, which is only indicated by a ſlight corrugation of the integuments; a very ſmall penis, which never changes its ſize, and two folds of ſkin, extending from the latter organ to the anus, and very much reſembling the female labia. His ſtature is below the middle ſize. The ſkin is ſoft, ſmooth, and entirely free from hair;

the place of the beard ſupplied by a ſlight down. The voice habitually hoarſe. The muſcles not well marked, and the pelvis and cheſt reſembling thoſe of the female. The intellectual faculties are very dull, and the ſexual appetite entirely wanting.

The period, and the manner of mutilation, have conſiderable influence on the effects of the proceſs. The complete removal of all the external organs is a much more deciſive method of annihilating the propenſities connected with them, than any partial amputation, or compreſſion, or ligature of the ſpermatic cords. The operation is alſo more effectual, when performed in early infancy, than after the period of puberty. Venereal deſires have been known to ſubſiſt in conſiderable force, and with the uſual external ſigns, after the removal of the teſtes in the adult. The moral effects of this mutilation have been ſtrongly depicted by Cabanis. "Eunuchs are the vileſt claſs of the human ſpecies: cowardly and knaviſh becauſe they are weak; envious and malignant, becauſe they are unfortunate. Their underſtanding ſhews the abſence of thoſe impreſſions, which give to the brain ſo much activity, which infuſe into it an extraordinary proportion of vital energy, which cheriſh all the expanſive and generous feelings of the ſoul, elevate and direct all the thoughts. Narſes is almoſt the only very impoſing exception to this rule; he is almoſt the only eunuch whoſe name appears with glory in the page of hiſtory. Solomon, one of the lieutenants of Beliſarius, is another rare example; he exhibited great courage and talents in the war with the Vandals in Africa. How immoral then, how cruel and fatal to ſociety, is the practice of thus degrading and corrupting at pleaſure the human ſpecies!"

A curious caſe in the Philoſophical Tranſactions for 1805, pt. 2, in which the ovaria were deficient, ſhews that ſuch a deficiency occaſions the female to approach in ſome points to the male formation. The ſubject of this narrative died at the age of twenty-nine. "Having ceaſed to grow at ten years of age, ſhe was in ſtature not more than four feet ſix inches high. Her breadth acroſs the ſhoulders was as much as fourteen inches, but her pelvis (contrary to what is uſually obſerved in the proportions of the female ſkeleton) meaſured only nine inches from the oſſa ilia acroſs the ſacrum. Her breaſts and nipples never enlarged more than in the male ſubject; ſhe never menſtruated: there was no appearance of hair on the pubes, nor were there any indications of puberty, either in mind or body, even at twenty-nine years of age." The removal of the ovaries has been moſt rarely practiſed in the human ſubject: probably the only caſe in which it has ever been done is that recorded by Mr. Pott, where theſe bodies were contained in inguinal herniæ. A healthy young woman, aged twenty-three, large breaſted, ſtout, and menſtruating regularly, had a painful tumour in each groin, near the abdominal muſcles. The ovaria were removed from theſe tumours by a ſurgical operation. "She has enjoyed good health ever ſince, but is become thinner and more apparently muſcular; her breaſts, which were large, are gone; nor has ſhe ever menſtruated ſince the operation, which is now ſome years." (Pott's Works, vol. iii. p. 329.) The changes which took place in the latter caſe ſeem analogous to what has been obſerved in ſome birds. After they have done laying, hen pheaſants have been obſerved to acquire the plumage of the cock in ſome inſtances. This has been noticed in wild individuals; but Mr. Hunter had three opportunities of aſcertaining the fact by his own examination. He further mentions a pea-hen, which had produced chickens eight times, and which, after moulting at eleven years old, diſplayed the feathers peculiar to the other ſex. The tail of the cock appeared at the ſame time. This was repeated for three years, and the ſpurs of the cock appeared alſo in the third year. The animal never bred after this change of plumage. The ſame fact has been noticed in the duck, ſee Home on Hermaphrodites, in the Philoſ. Tranſact. 1799. "We may conclude," ſays Mr. Hunter, "that this change is merely the effect of age, and obtains to a certain degree in every claſs of animals. We find ſomething ſimilar taking place even in the human ſpecies; for that increaſe of hair obſervable on the faces of many women in advanced life, is an approach towards the beard, which is one of the moſt diſtinguiſhing ſecondary properties of man. Thus we ſee the ſexes, which, at an early period, had little to diſtinguiſh them from each other, acquiring, about the time of puberty, ſecondary properties, which clearly characterize the male and female; the male at this time receding from the female, and aſſuming the ſecondary properties of his ſex. The female, at a much later time of life, when the powers of propagation ceaſe, loſes many of her peculiar properties; and may be ſaid, except from the mere ſtructure of parts, to be of no ſex; even receding from the original character of the animal, and approaching in appearance towards the male, or perhaps more properly towards the hermaphrodite." Obſervations on the Animal Economy, p. 80.

Nothing can be more abſurd than to ſeek for any mechanical explanation of theſe accidental phenomena, or even of the more regular phenomena, of which they interrupt the courſe, at the ſame time that they elucidate the laws. They cannot ſurely be derived from the ſtructure of the organs to which they belong, nor from the known nature of the liquors ſecreted in thoſe organs. But the conſideration of ſome phyſiological circumſtances, which are very ſimple in themſelves, may enable us to eſcape from this dark abode of occult cauſes, to which the theories of the ancients were confined, and which have been little changed, except in name, by the moderns. The latter indeed, by ſubſtituting, for the opinions of the ancients, other more dogmatical explanations, have given riſe to more important and dangerous errors: they have inured men's minds to the pernicious habit of attempting to determine the nature of cauſes, where we can only obſerve effects; and in determining theſe cauſes they have often perſonified mere abſtractions. In the firſt place, it is a certain fact, however it may be explained, that the muſcular fibres are weaker, and the cellular tiſſue more abundant, in women than in men. Secondly, we cannot doubt that this difference is produced by the preſence and influence of the uterus and ovaria; it takes place infallibly when theſe organs are originally well formed, and are developed in the natural order. This weakneſs of the muſcles imparts an inſtinctive diſtaſte for violent exerciſes; it inclines the individual to amuſements, and, when the age admits of it, to ſedentary occupations. The greater ſeparation of the hips renders progreſſion leſs eaſy in the female, on account of the more extenſive change of the centre of gravity. The mode of life in the female is thus indicated à priori by a circumſtance in their organization, which might be regarded as trifling, and which can hardly be diſtinctly obſerved at an early age. Again, the habitual ſenſe of weakneſs inſpires leſs confidence. Not poſſeſſing the means of acting on ſurrounding objects by direct force, woman ſeeks for more indirect methods; in proportion as ſhe finds herſelf leſs calculated to exiſt alone, does ſhe attempt to attract the attention of others, and to fortify her own exiſtence by that of thoſe ſurrounding beings, whom ſhe judges moſt able to protect her. Theſe obſervations would be almoſt ſufficient to explain the diſpoſitions, taſtes, and general habits of women. They will naturally prefer thoſe employments which require delicate addreſs rather than muſcular force:

they will employ themſelves on little objects: and their minds will conſequently acquire acuteneſs and penetration rather than extent and depth. Thus, as they lead a ſedentary life, to which the nature of their employments confines them as ſtrongly as the immediate propenſities depending on their organization, we ſee in a manner a new phyſical and moral ſyſtem developed in them. They perceive their own weakneſs; hence the neceſſity of pleaſing: from the latter circumſtance ariſes the continual obſervation of all that is paſſing around them, alſo their diſſimulation, their artifices, their manners, their graces, in a word their coquetry, which, in the preſent ſyſtem of ſociety, muſt be regarded as the aſſemblage or reſult of their good and bad qualities.

For reaſons exactly contrary to thoſe which have been juſt explained, boys acquire the oppoſite original and characteriſtic propenſities: hence they naturally contract oppoſite manners and habits. Full of the feeling of their growing ſtrength, and of the wiſh to exerciſe it, repoſe is diſagreeable and irkſome to them: they want lively motion, and they indulge in it with impetuoſity. Thus, without entering into further details, we ſee that the bent of their ideas and the character of their paſſions are formed directly by their original diſpoſitions, and the kind of amuſements or occupations which theſe determine them to prefer. Now, the paſſions and ideas of the grown man are only thoſe of the child developed and completed by the maturity of the organs, and the perſonal experience of the individual. See Cabanis, Rapports du phyſique et moral de l'Homme, memoire cinquieme.

But nothing hitherto explains to us how modifications of ſo general a nature can depend on the conditions of certain peculiar organs. We muſt then aſcend a little higher, and inquire whether the remarkable influence exerted by the organs of generation can be at all elucidated by their ſtructure, their functions, or their phyſiological relations to the other branches of the ſyſtem. We ſee, in the firſt place, that parts ſupplied by nerves which come from different trunks, or are formed by different nerves united together, are either more ſenſible or more irritable, and almoſt always both at once. Nature ſeems to have placed the ganglia and plexuſes in the neighbourhood of the viſcera, where the nervous influence muſt be the moſt conſiderable. The epigaſtric and hypochondriac regions abound with them; conſequently their ſenſibility is very acute, their ſympathies very extenſive, and the correſponding portions of the inteſtinal canal enjoy a degree of irritability hardly equalled by that of the heart. Now the nerves of the generative organs in both ſexes, without being apparently very important by their ſize or number, come from various ſources, are connected with thoſe of all the abdominal viſcera, and by them, or rather by the great ſympathetic, which ſerves as a general medium of connection, with the moſt eſſential diviſions of the nervous ſyſtem.

Secondly, obſervation ſhews us that the nervous ſyſtem (of which the original organization and mode of acting determine the general ſenſibility of all the organs taken together, and the particular ſenſibility of each conſidered ſeparately) may in its turn be powerfully modified by the character of thoſe functions, which perform the moſt important part in the animal economy; that is to ſay, in other words, by the habitual impreſſions conveyed to it from ſome of its moſt ſenſible extremities. The loſs of one ſenſe does not produce merely an increaſe of energy or attention in thoſe which remain, and which ſeem to redouble their efforts in order to ſupply its place; but it changes the manner in which the nervous ſyſtem feels and re-acts, and hence ariſe new habits evidently connected with the unuſual impreſſions which theſe ſenſes then begin to receive. The practice of medicine proves to us, by daily examples, that the affections of various organs have the moſt marked influence on the taſtes, ideas, and paſſions. The moral diſpoſitions are by no means the ſame in diſeaſes of the cheſt, as in thoſe of the ſpleen or liver. A greater or leſs propenſity towards a particular train of ideas or feelings (as for inſtance towards thoſe connected with religious belief) is experienced in particular ſtates of languor than in others; and the greateſt aptitude to thoſe avocations, which demand either conſiderable ſtrength and activity in the imagination, or long continued and profound meditation, is often experienced in a ſtate of diſeaſe cauſed by the deranged functions of ſome of the abdominal viſcera. Thus, then, nothing is more conformable to the laws of the animal economy, than that organs, endowed with a ſingular degree of ſenſibility, ſhould exerciſe a very extenſive influence on the machine in general; and we perceive immediately that the preſent is one of the moſt remarkable phenomena referrible to theſe laws.

In the work laſt quoted, Cabanis endeavours to explain this ſubject further, by obſerving that thoſe organs, which ſeem to be the principal ſeats (foyers) of the peculiar ſenſibility of the generative apparatus, *viz.* the ovaries and teſticles, are of a glandular ſtructure, that the various parts of the glandular ſyſtem affect each other very powerfully; and that the condition of this ſyſtem altogether has a moſt important influence on the ſtate of the brain, augmenting or diminiſhing its energy. The latter circumſtance will apply with ſo much the greater force to a caſe, where the glands are diſtinguiſhed by their great ſenſibility.

Again, it has been alleged that the ſeminal fluid formed in the teſticles, when abſorbed and conveyed into the circulation, affects the general maſs of blood. At all events the commencement of this ſecretion is marked by important changes in the voice, the muſcular motions, and the phyſiognomy, by the appearance of the beard, &c. And we have ſeen, that in animals, the development of particular parts is materially modified by the preſence and action of the teſtes. That an analogous fluid forms in the ovaries, and either furniſhes the materials of the embryo, or contributes to their formation, and that its abſorption produces analogous effects in the female, to thoſe which we obſerve in the male, is in truth a mere hypotheſis. But the influence of the ovaries in the changes at the time of puberty, whether produced in this way or not, is inconteſtible. Laſtly, in explaining the different influence of theſe parts in the two ſexes, we muſt aſſume peculiar diſpoſitions in the original formations of the nervous ſyſtem, as well as in the cellular organ, the muſcles, and bones. Theſe muſt depend on thoſe unknown circumſtances which influence the formation, life, and development of the embryo; their explanation muſt be referred to that of the differences of ſex, they muſt be regarded as ſimple facts, and be admitted as ſuch, without attempting to trace them any higher.

Hermaphrodiſm.—Having compared together the two ſexes, and mentioned the moſt remarkable circumſtances which diſtinguiſh the organization of each, we have to examine further whether nature has in any inſtances united the attributes of the male and female in the ſame individuals, ſo as to form a true hermaphrodite. The reſolution of this queſtion, which is not to be conſidered as ſatisfying idle curioſity, is equally intereſting to the naturaliſt and the philoſopher, and may influence the deciſions of judicial tribunals on the important queſtions of impotence and ſterility. The Grecian artiſts have endeavoured to combine the beauties and properties of the two ſexes in the ſame ſubject, and have exerted the magic powers of their chiſſel on figures of hermaphrodites.

maphrodites. Among theſe ideal productions, we may mention two beautiful ſtatues in a recumbent poſition in the Florentine gallery. A ſmall hermaphrodite ſtatue is ſeen in the villa Albani, a very fine one in the villa Borgheſe, and there is another in an obſcene attitude, pointing out that it partakes of the two ſexes. All theſe are males in the external appearance of their generative organs, females in the form of the breaſt, in the features, in the elegance of the figure, and the ſoftneſs of the contours. (Winckelmann, Hiſtoire de l'Art, 4to. tome 1. p. 364.) Theſe monuments furniſh no proof on the ſubject; they are to be regarded as creations of art, derived from the imagination of the ſculptor, and not as the repreſentatives of any real exiſtence. Winckelmann himſelf, who, in other reſpects, believes in hermaphrodiſm, claſſes the chef-d'œuvres we have juſt alluded to among the ideal productions. They exhibit an attempt to form a more perfect being, by uniting together the peculiar excellencies of the male and female, without attending very particularly to the genital organs. The word hermaphrodite then, as applied to theſe works of art, includes the notion of a very high degree of beauty and elegance, in which all that is moſt admirable in either ſex is combined in one individual; and the works, in which ſuch are repreſented, may be regarded as the inventions of the greateſt maſters. (See Caylus's Recueil d'Antiquités, tome 3.) The fabulous account of the transformation of Hermaphroditus and the nymph Salmacis into a moſt lovely being, combining the attraction and the powers of both ſexes, may be regarded as an expreſſion of the common opinions on the ſubject.

The vaſt multitude of obſervations and hiſtories of hermaphrodites, recorded in various medical works, renders it neceſſary for us to claſs them under certain heads. 1ſt. The true hermaphrodite? There is much reaſon to believe, that no inſtance of an hermaphrodite, in the ſtrict ſenſe of the word, has ever occurred in the more perfect quadrupeds, or in the human ſpecies. For, when we conſider the bones of the pelvis, to which the organs of generation are connected, it is difficult to conceive in what way the complete parts of the male and female could be placed, diſtinct from each other; and no inſtance of its having happened is to be found, in any record, which can be depended on. To conſtitute an hermaphrodite, in the ſenſe we are now conſidering, it would be neceſſary that the male organs of copulation and impregnation, ſuch as the teſtes and their ducts, the veſiculæ ſeminales, proſtate, urethra, and penis, ſhould exiſt in the ſame individual with the organs employed for the purpoſes of conception, of receiving, nouriſhing, and expelling the fœtus, ſuch as a well-formed vagina, uterus, ovaries, and Fallopian tubes. The difficulty, and even impoſſibility of ſuch an union, has been already recognized by Haller and Pietſch. Medical authors have indeed related caſes of women, who, after having many children, had impregnated other females; (ſee Mollerus, Tractat. de Hermaphrodit. cap. 2.: Blancard, Collect. Medico-Phyſ. cent. 3, obſ. 80.) but ſuch narratives are too obviouſly fabulous to require ſerious refutation.

The neareſt approach to ſuch an occurrence, as we have juſt alluded to, conſiſts in a partial mixture of the female and male organs. This has been obſerved, not very rarely, in ſome animals. Mr. Hunter has given ſeveral inſtances of it in neat cattle; and it has alſo been ſeen in the dog, the aſs, and the goat. The individuals, in whom ſuch appearances have been noticed, are ſo far from having had the properties of both ſexes, that they were obviouſly incapable of executing any ſexual function at all. Even in this reſtricted ſenſe, we believe that no caſe has occurred in the human ſpecies, and that all the ſuppoſed hermaphrodites among men have been individuals with imperfect or monſtrous formations of ſome parts. The caſe mentioned by Petit, in the Memoirs of the Academy of Sciences for 1720, as exhibiting a mixture of organs, was clearly a male: and that related by Maret in the Memoires de Dijon, t. 2, p. 157, belongs to the ſame claſs. The following caſe, diſſected by Giraud of the Hotel Dieu, ſhews us how careful we ſhould be in drawing concluſions from external appearances, and will convince us that no accounts of hermaphrodites can be received, except on the faith of diſſection performed by experienced anatomiſts. The individual was eſſentially a male, and offered ſome appearances of the other ſex, not from the addition of any organs, but from an unuſual diſtribution of ſome parts of the male apparatus. He was received in ſociety as a woman, and was connected by a voluntary aſſociation with a man, who had for a long time performed the duties of a huſband towards him. This ſingular character died in the Hotel Dieu. He exhibited, externally, an aſſemblage of the male and female properties. The buſt has a completely maſculine appearance; the chin was covered with firm hairs, very analogous to a beard; the neck was thick, the cheſt broad, the boſom ſlightly ſwoln, and the nipples exactly like thoſe of a man. The lower half of the body preſented a contraſt to theſe characters. The ſoft and delicate contours of the lower limbs, the rounded hips, the broad pelvis, and the greater ſeparation of the thighs, approximated decidedly to the female form. An imperforate penis, two teſticles, and an appearance of vulva, were the external generative organs. The teſtes were well formed, the veſiculæ ſeminales imperfect, and the urethra opened at the cul-de-ſac, which repreſented the vagina. Thus, inſtead of a double ſex, the individual was an ill-formed male, entirely incapable of any ſexual function. See Journal de Médecine par Sédillot, tome 2, p. 319.

The laſt inſtance of mixed organs, which we ſhall quote, is mentioned by Dr. Baillie, to whom it was communicated by Dr. Storer of Nottingham. "The perſon bears a woman's name, and wears the apparel of a woman. She has a remarkably maſculine look, with plain features, but no beard. She had never menſtruated; and on this account ſhe was deſired by the lady, with whom ſhe lived as ſervant, to become an out-patient at the Nottingham hoſpital. At this time ſhe was twenty-four years of age, and had not been ſenſible of any bad health, but only came to the hoſpital, in order to comply with the wiſhes of her miſtreſs. Various medicines were tried without effect, which led to the ſuſpicion of the hymen being imperforated, and the menſtrual blood having accumulated behind it. She was therefore examined by Mr. Wright, one of the ſurgeons to the hoſpital, and by Dr. Storer. The vagina was found to terminate in a cul-de-ſac, two inches from the external ſurface of the labia. The head of the clitoris, and the external orifice of the meatus urinæ, appeared as in the natural ſtructure of a female, but there were no nymphæ. The labia were more pendulous than uſual, and contained each of them a body reſembling a teſticle of a moderate ſize, with its cord. The mammæ reſembled thoſe of a woman. The perſon had no deſire or partiality whatever for either ſex." (Morbid Anatomy of ſome of the moſt important Parts of the human Body, 2d ed. p. 410.) This narrative leaves very little doubt that the individual was a male, with the generative organs ſo imperfect as not to have exerted their uſual influence on the frame in general: there is no evidence of any female organ being preſent here.

We repeat then, that there is not only no inſtance recorded, of perfect male and female organs ſo united in the human ſpecies, as to conſtitute an individual capable of exerciſing the generative functions of both ſexes—of impregnating or being impregnated—but alſo, that there is no clearly deſcribed inſtance of the ſmalleſt mixture of organs in any human perſon, aſcertained by actual diſſection, and teſtified by perſons of competent anatomical ſkill. All the ſuppoſed inſtances of hermaphrodites muſt then be referred to one of the following claſſes; in which unuſual ſituations of certain organs, vicious conformations, various monſtroſities, imperfectly developed male organs, or a greater prominence than uſual of ſome female parts, occaſion a deviation from the accuſtomed type, ſuppoſed to conſtitute hermaphrodiſm, very capable, when aſſiſted by lies and fraud, of impoſing on thoſe who know nothing of natural appearances, and often miſtaken by thoſe who ought to have known better. Hence have ariſen the numerous ſtatements, contained even in the writings of anatomiſts and phyſicians, and tending to prove the exiſtence of the prodigy, of which no well authenticated fact has hitherto determined the reality. A ſound ſpirit of criticiſm, founded on a more accurate knowledge of natural appearances, reduces to their juſt ſtandard thoſe ſingular deviations from the ordinary type, from which ignorance, credulity, and a love of the marvellous, have drawn ſuch extravagant and ridiculous conſequences.

2d Claſs.—Male individuals, with unuſual formations of the urinary and generative organs; (androgynus.) Where the ordinary type is conſiderably changed, an appearance is ſometimes produced, very capable of deceiving ſuperficial obſervers: there is a kind of ſketch, or imperfect attempt, at a double apparatus of organs. But the male ſex generally predominates very clearly in theſe caſes, and the ambiguity depends commonly on the teſtes being contained in ſeparate parallel folds of the ſkin; the penis being imperforate; and the urethra opening in the perineum, on the ſurface of a blind pouch, having a red and tender appearance, and eaſily miſtaken for the vagina. In ſuch an individual the penis, being imperforate, and probably ſmaller than uſual, is conſidered as a large clitoris; the folds of ſkin holding the teſtes very much reſemble the female labia, and the red ſlit, behind which the urethra ends, is tolerably analogous to the vagina. The imperforation of the penis, and the opening of the ejaculatory ducts near the perineum, at which their contents eſcape, deprives theſe individuals of the power of procreation; and the ſterility of their marriages, if they enter into that ſtate, in ſpite of their imperfect formation, ariſes entirely from this cauſe. The teſtes and veſiculæ ſeminales appear to be perfect in theſe caſes. The individuals experience the ordinary ſexual deſires, and the ſeminal fluids are expelled at the unnatural opening in the perineum. A ſimilar deformity occurs not unfrequently in the goat and ſheep; Ariſtotle having obſerved it in the former. The reader will find examples in Haller's Commentarius de Hermaphroditis, where a vaſt number of inſtances is quoted; in Wriſberg's Commentatio de Singulari genitalium Deformitate in puero Hermaphroditium Mentiente; § 7, note *b*: in Moreau Hiſtoire Naturelle de la Femme, tom. 1. p. 224: in Mertrud, Diſſertation ſur la fameuſe Hermaphrodite, qui paroit aux yeux du publique, Paris 1749, folio: Agoty, Obſervations ſur l'Hiſtoire Naturelle, la phyſique, &c. avec des planches imprimées en couleur, Paris 4to. 1752

An inſtance, ſimilar to the kind juſt deſcribed, is related and drawn by Wriſberg in the memoir above quoted: but there was this difference, that the rectum, as well as the urethra, opened in the unnatural ſituation in the perineum; this male child had been chriſtened by a female name.

Other leſs eſſential deviations from the accuſtomed organization have given riſe to the opinion that the individuals were hermaphrodites. A fiſſure, of various depths, has exiſted in the perineum; covered with a ſecretion from numerous ſebaceous glands; when all the other organs were perfect in every reſpect. Wriſberg knew an inſtance of this kind at Gottingen: the individual was always deemed an hermaphrodite, but he had the natural deſires and powers of a male. The abſence of the teſtes from the ſcrotum has given riſe to the ſame opinions. A confinement of the penis to the ſcrotum, by a particular formation of the integuments, has occaſioned perſons to be reputed hermaphrodites. In theſe the urine is in the direction downwards, and the confinement of the organ will not allow of its performing the ſexual functions. The parts may be ſet free by a ſurgical operation.

The laſt deſcription of males, ſuppoſed to be hermaphrodites, are thoſe in whom the urinary bladder is deficient, together with the lower and anterior portion of the abdominal muſcles and integuments, and the ſymphyſis pubis, a red and ſenſible maſs of an irregular and fungous-like ſurface, with the ureters opening on it, is placed at the lower part of the abdomen. Conſiderable alterations take place in the generative organs, in conſequence of this deformity. The urethra is deficient, and the penis conſequently imperforate. The ſeminal ducts open near the fungous maſs above-mentioned, or on the open ſurface of the urethra, or even terminate in blind extremities. As the tuberoſities of the iſchia are at an unuſual diſtance from each other, the crura penis are concealed within the body for a greater length, and the pendulous part of the organ is extremely ſhort, ſeldom exceeding two inches in length, even in the adult. The urethra appears as if it had been ſlit open, forming a band or groove, inſtead of a perfect canal, and rendering the glans penis bifid. The ſituation of the urethra is alſo very remarkable; for, inſtead of running, as it naturally does, in the lower angle formed by the junction of the corpora cavernoſa, it has commonly paſſed along the upper angle, giving the penis and glands the appearance of being inverted. That the part now deſcribed is really the urethra, is evident from its vaſcular ſurface, with lacunæ opening upon it, from the preſence of the caput gallinaginis, and of the openings of the ſeminal ducts. In conſequence of the glands being bifid at its upper ſurface, the prepuce is attached only to the lower half, and is connected by a frænum, as uſual. The teſticles, in ſome inſtances, are contained in the ſcrotum, in others in folds of integument reſembling the labia of the female; and in ſome do not deſcend. The ſcrotum is rarely pendulous, being increaſed in breadth in conſequence of the ſeparation of the oſſa pubis. The ſexual appetite, in ſome of theſe individuals, has been weak, in others ſtrong, in others altogether wanting. It is evident that they are not capable of procreating the ſpecies, in conſequence of the ſhortneſs and imperforation of the penis, and the ſeminal ducts opening externally. See Dr. Duncan, jun. on this ſubject, in the Edinburgh Medical and Surgical Journal, vol. 1. pp. 43 and 132: where he has collected together a vaſt number of caſes.

3d Claſs.—Female individuals; (androgynæ). An unuſually large ſize of the clitoris, is one of thoſe cauſes which have led to miſtakes concerning the ſex. This is not a common occurrence in theſe countries, but is ſaid to be much more frequent in warm climates; inſomuch that a ſurgical operation for removing the part is deſcribed by the Arabians. Theſe individuals are perfect females in all other circumſtances of their organization, and the menſtrual diſcharge ſufficiently characterizes them. In many of the recorded inſtances of this deſcription, there is probably exaggeration, as any enlargement of the clitoris can hardly make it ſufficiently

ciently like a penis to give riſe to miſtakes. A gipſey applied to Columbus for the removal of a clitoris which incommoded her. The famous hermaphrodite negreſs of Angola, exhibited in London, was in the ſame caſe with the gipſey mentioned by Columbus. Parſons has collected many facts of this kind. Mr. Home relates an inſtance in a negreſs. "She was of the Mandingo nation, 24 years of age; her breaſts were very flat; ſhe had a rough voice, and maſculine countenance. The clitoris was two inches long, and in thickneſs reſembled a common-ſized thumb; when viewed at ſome diſtance, the end appeared round, and of a red colour; but, on a cloſer examination, was found to be more pointed than that of a penis, not flat below, and having neither prepuce nor perforation; when handled it became half erected, and was then fully three inches long, and much larger than before: when ſhe voided her urine, ſhe was obliged to lift it up, as it completely covered the orifice of the urethra. The other parts of the female organs were found to be in a natural ſtate." A gentleman, who had practiſed midwifery among the negro women, ſtated that an enlarged condition of the clitoris was common amongſt them. Parſons and ſome others, in conſequence of the ſtructure juſt deſcribed, have aſcribed all hermaphrodites to the female ſex. Whether this unuſual ſize of the organ can be produced, "per ſceleratum abuſum clitoridis" is very doubtful. In order to avoid all miſtake concerning ſex in newly born children, it muſt be remembered that the clitoris is proportionally very large at that age.

A prolapſus of the uterus is another circumſtance which has occaſioned females to be deemed hermaphrodites, and even to be publicly exhibited as ſuch. A perſon of this kind came to Paris in 1693, dreſſed as a man, and wearing a ſword. She pretended to have the organs of both ſexes, and to be able to employ both, and exhibited her perſon to the curious for a ſmall gratification. Beſides the numbers who took up the common opinion of her being an hermaphrodite, and who could not be ſuppoſed ſufficiently well-informed to judge of ſuch a ſubject, ſeveral phyſicians and ſurgeons fell in with the vulgar ſentiment, and gave certificates which prove inconteſtibly, that a great reputation may be acquired in the profeſſion, without any real talents, or any large ſtock of ſolid information. Saviard, after inſpecting the parts cloſely, found that the caſe was a prolapſus uteri, which he reduced. When the female had recovered, ſhe preſented a requeſt to the king for permiſſion to take again the female dreſs, in ſpite of the magiſtrates of Toulouſe, who had ordered her to clothe herſelf as a man. See Saviard, Recueil d'Obſervations, obſ. 15.

An inſtance of the ſame kind is related by Mr. Home. "A French woman had a prolapſus uteri at an early age, which increaſed as ſhe grew up; the cervix uteri was uncommonly narrow, and at the time I ſaw her, when ſhe was about 25 years old, projected ſeveral inches beyond the external opening of the vagina; the ſurface of the internal parts, from conſtant expoſure, had loſt its natural appearance, and reſembled the ſkin of the penis: the orifice of the os tincæ was miſtaken for the orifice of the urethra. This woman was ſhewn as a curioſity, and in the courſe of a few weeks made 400*l.* I was induced by curioſity to viſit her, and on the firſt inſpection diſcovered the deception; which, though very complete to a common obſerver, muſt have been readily detected by any perſon intimately acquainted with anatomy. To render herſelf ſtill more an object of curioſity, ſhe pretended to have the powers of a male." Philoſ. Tranſact. 1799.

We have already mentioned ſome inſtances where the generative organs, although belonging clearly to one ſex, had been imperfectly developed, and conſequently had not produced their uſual effect in modifying the form of the body, and impreſſing it with the ſexual character. There are other caſes, in which men or women, having their organs apparently of the accuſtomed magnitude, partake reſpectively of the characters of the other ſex, probably from the cauſe juſt alluded to, of the ſexual parts not exerting their full influence on the frame. Such individuals may be accounted neuters; and ſeem, in the human ſubject, to reſemble the free martin in neat cattle, where there is a true mixture of organs, but they are ſo imperfect that organization is not influenced by them, and the form of the individual differs both from that of the bull and cow. The perſons thus circumſtanced are often deemed by the vulgar hermaphrodites.

All the caſes of ſuppoſed hermaphrodites may be referred to one or the other of the heads now deſcribed: they will be found to be either males, with ſome unuſual organization or poſition of the urinary or generative apparatus; or females, with a long clitoris, or prolapſed uterus; or individuals, in whom the generative organs have not produced their uſual effect in influencing the development of the body. Thus, it is evident, that inſtead of combining the powers of the two ſexes, they are, for the moſt part, incapable of exerting any ſexual function. Yet ignorance and ſuperſtition have marked out theſe individuals, already ſufficiently unfortunate from their defective organization, as the objects of perſecution, and have ſubjected them to the operation of the moſt abſurd and cruel laws. The ancients, regarding them as an impure and ominous kind of monſters, diſpatched them by the moſt barbarous deaths. It appears from Diodorus that they had been burned by the Athenians and Romans. By the edicts of Conſtantine and other princes, they were beheaded, drowned, or baniſhed to deſert iſlands. Livy informs us that a newly born child, of which the ſex could not be aſcertained, was thrown into the ſea. (L. 31.) Further information on this ſubject may be derived from Gaſpar Bauhin, De Hermaphroditorum monſtroſorumque partuum natura, ex Theologorum, Jureconſultorum, Philoſophorum, et Rabbinorum ſententia; libri duo, Francof. 1629, 8vo. Theſe abſurd notions and practices have at preſent diſappeared; but the ſubject is important on many accounts, as theſe unuſual deviations render the ſex of an individual often doubtful, and impoſe even on profeſſional perſons. The deciſion may be important in deciding the employment in life of an individual, the deſcent of property, the fitneſs for religious functions, particularly for the male or female religion in the Romiſh church, and the judicial deciſions concerning impotence or ſterility. We therefore add a few obſervations on the grounds of diſtinction in ſuch circumſtances. The greateſt difficulty is experienced with reſpect to newly born children; for many things aſſiſt our determinations in the adult. The beard, the hair ſurrounding the anus, the deſires excited by the preſence of women, the teſtes and their cords, and the comparatively greater breadth of the ſhoulders than of the pelvis and hips, ſhew us that the individual is a man. The ſmoothneſs and ſoftneſs of the body in general, the increaſe of the beard, and of the hair from the anus, the menſtrual diſcharge, the want of teſtes, and the ſuperior breadth of the hips, prove the individual to be a woman.

A male, with a fiſſure in the perineum and an imperforate penis, may be aſcertained by the ſize of the penis, by the different organization of the preputium from that which covers the clitoris; the abſence of nymphæ and hymen, and probably the preſence of teſtes. The different relation of the fiſſure in the perineum to the penis, from that of the meatus urinarius to the clitoris in the female, will aſſiſt the deciſion, as alſo the want of power to paſs an inſtrument towards the ſituation of the uterus.

The ſmaller ſize of the clitoris, and its different ſhape; the connection of its preputium to the nymphæ, and the preſence of the latter parts; the ſeparate opening of the vagina and meatus urinarius, and the preſence of the hymen; the abſence of teſticles, all prove the individual to be a woman.

An adheſion of the labia to each other at their convexities may cauſe a difficulty in deciding: but here the abſence of the penis and teſticles, the diſcharge of the urine at the upper end of the labia, and the line of union between thoſe folds, ſhew us the nature of the caſe.

Much information on the ſubject of hermaphrodites may be gained from the following works. Parſons' Mechanical and Critical Enquiry into the nature of Hermaphrodites: London, 8vo. 1741. Ambroſe Paré's Works, book 24. Pietſch, Gedanken von den Zwittern, in the Old Hamburg Magazine, vol. iv. p. 538, et ſeq. Arnaud, in Mémoires de Chirurgie. Haller, num dentur Hermaphroditi, commentarius, in the Commentarii ſoc. reg. ſcient. Gottingen, tom. i.; or in his Opera Minora, vol. ii. Hunter on the Free Martin, in his Obſ. on the Animal Economy. Home, Diſſection of an Hermaphrodite Dog, with Obſervations on Hermaphrodites in general, Philoſ. Tranſact. 1799. Moreau Hiſtoire Naturelle de la Femme, tom. 1. p. 211, et ſeq. Wriſberg, Commentatio de ſingulari genitalium deformitate in puero, hermaphroditium mentiente, in his Commentat. vol i. p. 504, et ſeq.

Male Organs of Generation.—In the human ſubject theſe conſiſt of the teſticles, veſiculæ ſeminales, proſtate, Cowper's glands, urethra, and penis; making up a ſecretory apparatus, which is double, conſiſting of a right and left organ, in the two former parts, and ſingle in the latter. The peculiarities of the apparatus conſiſt in the ſmall quantity of fluid which it furniſhes, in the long periods for which this fluid is retained in its reſervoirs; in the particular condition of the organ deſtined for its emiſſion, eſſentially neceſſary to that act; and in the phyſical feeling which accompanies the act.

The Teſticles.—Theſe organs, placed externally to the cavity of the abdomen, and leſs protected againſt external injury than moſt other important viſcera, are ſuſpended, each of them by a conſiderable vaſcular bundle, called the *ſpermatic cord*, and contained in a kind of bag or cavity formed of ſeveral membranous layers. A middle ſeptum divides the interior of the bag, and ſeparates from each other the right and left teſtis, with their coverings, which are double with the exception of the outer one. The latter, formed by the integuments, and called the ſcrotum or purſe (in French les bourſes) conſtitutes a ſingle bag, which envelopes all the others. The ſcrotum is attached to the upper and front part of the pelvis, unconnected in every other ſituation, contiguous laterally to the inſide of the thighs, in front to the penis, and ſeparated behind from the anus by an interval of two or three inches, called the *perineum*. A ſmall fold of the ſkin under the penis, a ſlight groove below, and a prominent line behind, continued into the raphe of the perineum, mark out ſucceſſively, on the external ſurface, the ſymmetrical diviſion of the organ. Yet the right ſide of the ſcrotum is almoſt conſtantly more elevated than the left, in conſequence of the correſponding ſpermatic cord being ſhorter, and the teſtis nearer to the ring. The ſcrotum is ſoft to the feel, and elongated, ſo that the teſtes appear looſe and hang low, in warm weather, in old perſons, after coition, and under the action of any cauſes which have a debilitating influence on the frame in general. It is rough and harder on the ſurface, and ſhorter in cold weather, in young ſubjects, at the time of erection, and in a ſtrong, vigorous ſtate of the body: conſequently, at ſuch times, it is applied more exactly to the teſtes, and, drawing theſe organs gently upwards, ſhortens the cords. The ſudden action of cold, and even of fear, will produce the latter ſtate of the organ. The wrinkles which it exhibits at ſuch times are effaced by extending it.

The coverings of the teſtes ſucceed each other in the following order: 1ſt. The cutaneous inveſtment, or ſcrotum; 2dly. The cellular layer; 3dly. Membrane of a fibrous appearance, common to the teſtis and cord; 4thly. The ſerous membrane. The reaſon why the dartos is not enumerated among theſe coverings will appear preſently.

The ſcrotum is continuous with the integuments of the inſide of the thighs, the perineum, and penis. It is diſtinguiſhed by a browniſh hue from the reſt of the integuments, but follows in general the tints of the latter, being always darker in colour. A few ſhort hairs are ſcattered over its ſurface, and their bulbs, obliquely implanted, form ſenſible prominences from the thinneſs of the ſkin, which are not effaced by extenſion of the organ. In its general organization the ſcrotum reſembles the ſkin; but it is very thin, ſo that the veins of the ſubjacent cellular tiſſue are viſible through it. The vital properties of the ſcrotum are the ſame with thoſe of the ſkin in general; but the contraction produced by cold is more manifeſt in the former than in the latter. The phenomenon ſeems to be the ſame in both inſtances. It conſtitutes the cutis anſerina of the ſurface in general. This corrugation of the part has given riſe to the opinion that a muſcular expanſion is found under the ſkin in this ſituation; and hence have ariſen the deſcriptions of the dartos. We can, however, clearly diſtinguiſh that the contraction is in the integuments, and not in any more deeply-ſeated part; they feel denſe and firm at this time, inſtead of being ſoft and looſe, as in their ordinary ſtate.

The teſtis and cord are ſurrounded in their ſituation by a copious and looſe layer of cellular ſubſtance, placed immediately under the ſkin, and conſtituting, where it divides the two teſtes from each other, the ſeptum ſcroti. This is rather more denſe immediately under the cutaneous integument, and looſer at the ſurface of the teſtis. Several blood-veſſels ramify through it, particularly veins; and hence ariſes an appearance which may have authorized the opinion concerning a muſcular covering on a ſuperficial examination: but accurate inſpection can diſcover no muſcular fibres. Many nervous filaments are alſo ſeen in this ſubſtance, and enable us to explain the acute ſenſibility obſerved on the removal of the teſtis in ſurgical operations, a little fat is ſeen near the ring and the urethra; but it is completely abſent from all other ſituations. Here, as in the penis, the eye-lids and ſome other parts, the abundant depoſition of fat would interfere with the functions of the organ; and its abſence in theſe ſituations ſeems to indicate the deſign and foreſight employed in the conſtruction of the body as fully as the particular conſtruction of any parts can do. However the ſize of the body in general may be increaſed in corpulent perſons, the ſcrotum, penis, &c. always retain the ſame dimenſions. The abſence of fat renders theſe parts more eſpecially ſubject to the watery depoſitions of anaſarca: ſuch effuſions often manifeſt themſelves firſt in the ſcrotum, and that organ is generally very much increaſed in bulk when the anaſarca is conſiderable. The impulſion of air through an opening in the ſcrotum demonſtrates very well the nature and extent of this cellular layer; by diſtenſion of this kind it reſembles cotton in appearance. Maceration in water may be employed for the ſame purpoſe; as the fluid penetrates very minutely into the cellular interſtices. It is continuous with the ſimilar covering of the penis, and with the cellular ſubſtance of the perineum and groins; ſo that air paſſes from it into theſe ſituations.

The cord and teſtis are cloſely enveloped by a condenſed cellular covering, which deſcends from the neighbourhood of the abdominal ring, and includes the organs juſt mentioned, together with the membranous coverings of the latter; it conſtitutes the elythroid or erythroid coat of ſome writers. The cremaſter muſcle is ſtrongly connected with this, and contributes to the formation of the cellular ſheath. This part has been deſcribed as the tunica vaginalis of the ſpermatic cord, but it is entirely overlooked by many writers. Its thickneſs differs conſiderably in different ſubjects. It is connected to the cellular ſubſtance of the ſcrotum externally; and adheres, by cellular connections, to the ſpermatic veſſels, and to the tunica vaginalis teſtis, on the inſide. If air be impelled through a ſmall opening, it is ſeparated from theſe parts, and may be divided ſo as to ſhew that it is a diſtinct membrane. It then appears ſemi-tranſparent and thin, and ſeems to conſiſt of fibres variouſly interwoven. Its thickneſs is much increaſed in ſcrotal ruptures, to which it gives a complete external covering. Camper has delineated it very well in his poſthumous plates edited by Soemmerring, and he deſcribes it in the following paragraph; "Cremaſteres igitur muſculi ſunt, ab obliquo interno et tranſverſo abdominis orti, per involucrum membranaceum ſub cute ſcroti diſperſi, quocum velamentum efformant, funiculum ſpermaticum et teſtem undequaque cingens, quodque in hernioſis craſſius tenaxque fit, et ex multis ſibi invicem impoſitis lamellis conſtare videtur, cum chirurgia hernias attingimus. Velamentum illud facile a ſacco herniæ digiti ſeparatur; formius autem adheret vaſis ſpermatices." Icones herniarum, p. 13.

The ſerous membrane of the teſtis is called the *tunica vaginalis*, and the name ſhould be confined entirely to it, as moſt of the anatomical deſcriptions apply to this part only. Like all other ſerous membranes, this forms an entire and unperforated bag. Its arrangement is ſimple. It forms a pouch-covering, and appearing to include the teſtis and epididymis, as the heart is included in the pericardium. When an opening is made into it, and air impelled, it is elevated into a bag on the front and ſides of the teſtis. At the poſterior edge of the organ it is reflected over its ſurface, covering the epididymis, a ſmall portion of the ſpermatic veſſels, and the whole teſtis; and giving to theſe parts a ſmooth external coat. The tunica vaginalis therefore may be ſaid to conſiſt of two parts; *viz.* an exterior portion, forming the bag, which includes the teſtis; and an internal, reflected over the ſurface of the organ. The two are continuous at the back edge, and at the upper and lower ends of the teſtis. The bag-like portion of the membrane is covered by the fibrous inveſtment already deſcribed: the reflected part adheres very cloſely to the epididymis and teſticle. The tunica vaginalis is very thin, and every where cellular on its external ſurface; internally it is ſmooth, poliſhed, and moiſtened by a ſerous ſecretion, which, in an increaſed quantity, conſtitutes hydrocele. There is hardly any ſenſible fluid in the ordinary ſtate of the parts. Sometimes there are partial adheſions between the oppoſed ſurfaces of the two portions of the membrane; and ſometimes a general adheſion, by which the cavity is entirely deſtroyed, is produced by the operation for the radical cure of hydrocele.

In man and quadrupeds the teſticle conſiſts of two parts; *viz.* the proper teſtis, and the epididymis, which adheres to it behind. Ordinarily the ſcrotum contains two of theſe glands, a right and a left one: but this number is not invariable. We ſhall explain hereafter how it may happen that the ſcrotum ſhould contain no teſtis, or only one; and, if authors could be credited, we might cite examples, in which there have been three, four, or even five. We believe that the number never exceeds two, that the ſtatements now alluded to have ariſen from the ſwellings incidental to theſe parts, being miſtaken for teſtes, and that there is no obſervation deſerving of credit by which this aſſertion can be contradicted. The ordinary ſize of the gland in the adult is an anatomical fact known to each individual; but there are ſome varieties in this reſpect. Long continued chaſtity probably cauſes a ſhrinking of the organ; and a ſimilar diminution, to a much greater degree, may be occaſionally obſerved in old ſubjects, when the function of the part has ceaſed, without any diſeaſe. On the contrary, when venereal enjoyment has been habitually indulged, temporary abſtinence will cauſe a ſwelling of the organ, with ſome pain; and this may be relieved by a ſpontaneous diſcharge of the ſecretion. Again, there are differences of volume from original formation. The right and left glands are not always of the ſame ſize, nor is the right particularly obſerved to exceed the left, as ſome have aſſerted. The figure of the part is pretty exactly oval, with the two ends placed perpendicularly, and the ſurface flattened in the direction of the ſmall diameter. The extremities, which are diſtinguiſhed by the epithets ſuperior and inferior, are not in the ſame perpendicular line; the former is inclined forwards and outwards; the latter backwards and inwards. The two ends are ſometimes almoſt anterior and poſterior. The flat ſides, which are external and internal, are turned, the former towards the thigh of the ſame ſide, and the latter towards the correſponding ſurface of the oppoſite gland. The edges of the teſtes, which are anterior and poſterior, are placed obliquely, ſo as to ſlant from above backwards and downwards. The anterior edge is ſometimes deſcribed as the interior, and the poſterior as ſuperior. The epididymis is a thin and elongated organ, placed along the back edge of the teſtis, to which it adheres by means of the tunica vaginalis and blood-veſſels, ſmaller in the middle and enlarged at its upper and lower ends, and reflected at the latter, to form the vas deferens. Its upper extremity is called the caput epididymidis or globus major (tête de l'epididyme); and this adheres very firmly to the upper end of the teſtis, being placed rather above, as well as behind it. From this point the organ deſcends in a thin and flattened form, diſtinctly ſeen as a ſeparate part in the ſide of the teſtis, which is turned towards the thigh, but not on the oppoſite ſurface. It ſwells again at the lower end into the globus minor (queue de l'epididyme) and then turns up to form the vas deferens. The ſpermatic cord is attached along the poſterior edge of the gland, and the greater or leſs obliquity of the teſtis depends on the mode of its connection. A cord, compoſed of the ſame parts, ſuſpends each teſtis in its place, but it is rather longer on the left ſide; a circumſtance which has been noticed by painters and ſtatuaries. The pathologiſt aſcribes to this circumſtance the more frequent occurrence of varico-cele on the left ſide of the body. The diſtance of both organs from the ring is variable, and depends on the ſtate of the ſcrotum, and the cremaſter muſcle. Theſe two parts generally contract together. The conſiſtence of the gland is ſoft to the feel. As it is covered almoſt entirely by the ſerous membrane already deſcribed, it acquires from this circumſtance a ſmooth and poliſhed ſurface; its whiteneſs ariſes from the tunica albuginea.

Structure of the Teſticle.—The glandular part of the organ, in which the ſeminal ſecretion is immediately effected, is a light-brown pulpy maſs, conſiderably ſofter than the parenchyma of the other glandular organs, contained in a ſtrong fibrous membrane, which determines the exterior configuration of the part, and the conſiſtence which it preſents on examination. This membrane is named the tunica albuginea. It is ſeen through the reflection of the tunica vaginalis, which envelopes the teſticle, and adheres to it very cloſely. Yet, notwithſtanding the ſtrength of this adheſion, the ſerous layer may be partially ſeparated by diſſecting from the epididymis forwards. But, over the general ſurface the union is too intimate to admit of ſeparation; and conſequently the ſerous layer and the true albuginea are deſcribed ordinarily as compoſing one membrane under the latter name. It is from analogy, rather than the direct teſtimony of anatomical obſervation, that we deſcribe them as diſtinct parts. Along the poſterior edge of the teſtis, the albuginea is perforated by numerous openings for the paſſage of the ſeminal and blood-veſſels. From the inner ſurface of this membrane are detached numerous delicate proceſſes penetrating the ſubſtance of the teſtis, and forming partial ſepta, by which the glandular maſs is ſlightly ſubdivided into ſmaller portions. Some of theſe productions ſeem to conſiſt of blood-veſſels. The ſtructure of this part claſſes it amongſt the fibrous membranes: it is denſe, very firm, of a peculiar white colour, and poſſeſſing ſome blood-veſſels. Its external ſurface is every where covered by the reflected tunica vaginalis, except at the back of the teſtis, and its inner ſurface is in contact with the glandular ſubſtance of the organ. The great cloſeneſs and firmneſs of its texture explain to us the peculiarly hard feel of the inflamed teſtis, as the membrane yields with difficulty to the diſtention produced by the ſwelling of the contained vaſcular parts. It is manifeſtly thicker where the ſeminal tubes penetrate it; and in this ſituation we obſerve the corpus Highmori, concerning which we have further obſervations to make below. The albuginea poſſeſſes extenſibility, and the correſponding contractility: the ſwellings of the teſticle, from various cauſes, ſhew the former, and its ſubſequent return to the natural ſize, as well as the ſhrinking of the part from age demonſtrate the latter. It is very ſubject to converſion into cartilage. Little excreſcences are ſometimes obſerved on the ſurfaces of the gland, about the ſize of a pin's head.

The tunica albuginea is filled with a ſoft pulpy matter, of a light browniſh-yellow hue, and divided into ſmall portions or lobuli. Imperfect cellular ſepta, along which the ſmall arteries and veins run, divide theſe portions; but the partitions are not merely vaſcular. They are attached, as we have already obſerved, to the internal ſurface of the albuginea. Behind, they unite together in a white cellular hue, running along the back edge of the teſticle, from above downwards. Such are the appearances exhibited in the recent organ, without any diſſection or preparation. Its ſubſtance is very ſoft, ſo that when dried it loſes more than eight-tenths of its weight. A more accurate examination, particularly with the aſſiſtance of maceration and putrefaction, diſcover that all this pulpy maſs is made up of convoluted ſerpentine threads poſſeſſing ſome firmneſs and connected together by a very ſoft cellular ſubſtance. Theſe, which are called the tubuli or ductus ſeminiferi teſtis, ſeem about the ſize of an ordinary ſewing thread, and can eaſily be drawn out with a needle, after maceration, to the length of an inch and even more. Theſe threads are tubular, cylindrical thick in their coats with ſmall calibre, plentifully ſupplied with minute vaſcular ramifications, from which however injected liquors do not paſs into the ducts. They do not ramify, but paſs in a tolerably ſtraight direction to the cellular line at the back of the teſtis. That they are tubular is proved by the poſſibility of injecting them with quickſilver from the vas deferens: this indeed often fails, but in ſome caſes the tubuli are filled in this way through the whole teſtis. The diameter of one of theſe ducts, according to Monro, is 1-200dth of an inch; or 1-120th when injected with quickſilver. By the calculations of the ſame anatomiſt, the teſtis ſhould appear to conſiſt of 62,500 tubes, ſuppoſing each to be one inch in length: and conſequently, if they were joined into one tube, it would be 5208 feet and 4 inches in length. The convolutions and turns of the ducts are ſo numerous, that they do not continue their courſe, in the ſame ſtraight line, for more than 1-40th of an inch.

The white and firm cellular line at the back of the teſtis, juſt at the adheſion of the epididymis, is called the corpus Highmori. Many anatomiſts have deſcribed it as tubular, and have aſſigned to it the office of conveying the ſemen to the epididymis. Such a part obviouſly exiſts in the teſtis, and is ſtill more manifeſt in animals, as in the boar, than in the human ſubject. Haller, who has given the moſt accurate account of this ſubject, ſays, "After I had accurately filled the vas deferens with quickſilver, I obſerved in the corpus Highmori numerous veſſels, larger than the tube of the epididymis, running according to the length of the gland, ſerpentine, eaſily torn, and communicating with each other." Elem. Phyſiol. v. 7. p. 445. In theſe the tubuli ſeminiferi teſtis terminate; and they conſtitute the rete vaſculoſum of the organ. The ducts contained in each part of the tubuli ſeminiferi end in one ſtraight tube, which terminates in the rete teſtis. A certain number of tubes, called the vaſa efferentia, convey the ſemen from the rete vaſculoſum to the commencement of the epididymis. Obſcure notices of theſe veſſels may be found in various writers, and De Graaf in particular has deſcribed them. But the labours of Haller have thrown the greateſt light on the ſubject. "When, after various unſucceſsful attempts, the continued labour of an hour or more had enabled me to fill completely the vas deferens, I obſerved the head of the epididymis to be made up of vaſcular cones, amounting in number to twenty or thirty, and connected together by cellular ſubſtance before any diſſection had been uſed. Each of theſe cones is made up of a ſingle ſmall veſſel, larger however than the tube of the epididymis, convoluted into innumerable folds. The baſis of the cone is turned towards the epididymis; its apex is a veſſel proceeding downwards to the teſtis, perforating the albuginea, and communicating with the rete teſtis." Ibid. p. 447.

The epididymis, of which we have already deſcribed the poſition and figure, is diſtinguiſhed by its greyiſh colour from the ſhining whiteneſs of the teſtis. Being placed at the point where the cord is attached to the teſticle, it is ſurrounded by blood-veſſels, of which ſeveral are diſtributed to itſelf: its ſurface is partially covered by the reflection of the tunica vaginalis, which adheres to it cloſely, except at the angle of reflection, where the connection is looſer. Its ſtructure is much more eaſily unravelled than that of the teſtis, for, when filled with quickſilver from the vas deferens, it is proved to conſiſt of a ſingle tube, almoſt infinitely convoluted upon itſelf, excepting only a ſmall part of the caput, which is made up of the vaſcular cones. The latter uniting together form one very ſmall tube, which by its ſerpentine courſe and turns, connected to each other by cellular ſubſtance, containing the ramifications of blood-veſſels, forms the body of the epididymis. As it deſcends along the back of the teſtis, it increaſes in diameter, and at the ſame time is proportionally leſs convoluted. In a conſiderably enlarged ſtate, it is reflected from the lower end of the teſtis, ſtill a little convoluted at firſt, but ſoon forming a ſtraight tube, called the vas deferens. By carefully deſtroying the cellular ſubſtance, which connects together the convolutions of this tube, we can demonſtrate the facts now mentioned concerning the ſtructure of this organ. In ſuch a proceſs the tube can be drawn out to a ſurpriſing length, to five ells, according to De Graaf, to 400 times the length of the epididymis in its natural ſtate, according to Heuermann. Monro has taken great pains in meaſuring and calculating the dimenſions of this part: he finds the diameter of the tube, on an average, to be 1-80th of an inch, its length 31 feet, and the number of its turns, as it does not go in a ſtraight direction at any part, for more than 1-30th of an inch, 11,100. (De ſemine et teſtibus in variis animalibus, p. 31 and 32). As a further proof, that the organ is made up of a ſingle tube, we may obſerve, that if we cut it acroſs while we continue to inject quickſilver from the vas deferens, the fluid eſcapes from one orifice only, and when that is tied, no more runs out.

Thus, the ſemen, firſt formed in the ſmall ſerpentine veſſels *(tubuli teſtis)* which make up the pulpy maſs of the teſtis, is depoſited from theſe in the ſtraight ſeminiferous tubes, which convey it into the rete vaſculoſum, placed at the back of the teſtis, and connected to the albuginea, where it forms the corpus Highmori. Hence it paſſes through the vaſa efferentia, or excretoria teſtis, about twelve in number, which perforate the albuginea, at the upper end of the teſtis, and then form, in a convoluted ſtate, the ſerpentine vaſcular cones, which make up the caput epididymidis. Theſe unite into a ſingle ſmall tube, which, by its numerous turns, firſt forms the epididymis, and then ends in the vas deferens. Haller, Programma de vaſis ſeminalibus, Gotting. 1745; and in Oper. minor t. 2. p. 5.

From the origin of the convoluted tubuli ſeminiferi, to the termination of the epididymis in the vas deferens, the ſemen goes through a ſeries of veſſels, which are folded 16,860 times, and, if extended in a ſtraight line, would exceed 42 feet in length. Monro, lib. cit.

The ſmallneſs of theſe tubes prevents us from aſcertaining their texture, or the nature of their ſides. The tubuli teſtis poſſeſs conſiderable firmneſs, as we may aſcertain by extending them until they break, and by obſerving the column of quickſilver which they ſupport, when we inject them. The tube of the epididymis poſſeſſes firm and ſtrong ſides, in compariſon to its cavity.

A ſmall tube, either ſtraight, or ſlightly convoluted, is ſometimes obſerved to ariſe from the epididymis, and after paſſing to various diſtances on the cord, to terminate in a cul-de-ſac. Its ſize is equal to that of the tube of the epididymis itſelf. This circumſtance was firſt noticed by Haller, who called the veſſel *vaſculum aberrans.* (Progr. de vas. ſeminal.) He did not undertake to determine its termination or nature, obſerving that it proceeded along the cord, "incerto fine: an lymphaticum?" The exiſtence of the vaſculum aberrans has been confirmed by Monro, who injected it in four out of ſixteen teſticles; and he adopts the opinion ſuggeſted by Haller, of its being a lymphatic. Mr. Cruikſhank takes a different view of the matter. "It is," ſays he, "a luſus naturæ, and either forms a cul-de-ſac, or, after many convolutions, returns back again upon itſelf, and terminates where it began. It ſometimes mounts four inches upon the cord, and then terminates in a cœcum, or blind end. Sometimes it is not a quarter of an inch in length. I have ſeen it convolute, like the epididymis itſelf; from which it could not be diſtinguiſhed, till, by maceration and diſſection, the cellular membrane had been removed. It may be compared with the diverticulum ilii, ſo frequently met with in the human inteſtines." Anatomy of the abſorbing Veſſels, p. 141.

Veſſels of the Teſticle: Spermatic cord.—Under the inferior extremity of the kidney, and about the middle of the pſoas magnus muſcle, we obſerve a faſciculus of blood-veſſels, lymphatics, and nerves, placed behind the peritoneum, and connected to that membrane by a cellular ſubſtance: this is the commencement of the ſpermatic cord. It deſcends over the pſoas muſcle, paſſing at the ſame time rather outwards, croſſes the ureter, continues its courſe over the iliacus internus, and arrives at the upper opening of the abdominal ring. Here it is increaſed by the acceſſion of the vas deferens, from the ſide of the bladder. It now penetrates the upper aperture of the ring, going under the inferior edge of the obliquus internus, and tranſverſus abdominis: then it turns downwards and forwards in the canal placed between the two openings of the ring, covered in front by the aponeuroſis of the obliquus externus, and lying behind on the faſcia tranſverſalis. In this part of its courſe, it is further increaſed by the acceſſion of the cremaſter muſcle. The cord finally emerges through the opening in the tendon of the obliquus externus, and then turns ſuddenly downwards; lying not ſo much on the bone between the two columns of the ring, as on the outer column itſelf, ſo as to cover its inſertion into the pubes. Juſt at the point, where the cord enters the abdominal canal, it lies on the root of the epigaſtric artery. As it is placed behind the peritoneum, in the whole of its deſcent from the loins to the abdominal ring, that membrane is not perforated at the point where the cord leaves the abdomen. Nor is there any ſheath continued from the peritoneum, along the cord, to the tunica vaginalis; although ſuch a ſtructure has been aſcribed to the human ſubject from the obſervation of animals, in which it is really found. In bubonocele, indeed, a membranous cavity, produced by a continuation of the peritoneum, lies over the cord; but this is diſeaſe: and in a particular period of fœtal exiſtence, there is a canal leading from the abdomen to the tunica vaginalis, but this is ordinarily cloſed before birth. Neither is there any foundation for the deſcription of two layers of the peritoneum, of which the ureter is ſaid to accompany the cord. Eſcaping through the opening in the tendon of the obliquus externus abdominis, the cord deſcends in a ſtraight courſe to the teſtis, covered externally by the fibrous ſheaths already deſcribed, and growing rather larger as it approaches the organ. Copious ſoft cellular ſubſtance, with very little fat, connects together the component parts of the cord.

The ſpermatic are the chief arteries for ſupplying the teſtes and their coverings. Theſe veſſels are the longeſt in their courſe, compared to their diameter, of any in the body; they were known to the ancient phyſicians, and called by them the *ſeminal* veſſels. They would probably have eſcaped the diligence of the diſſector, had not the importance of the part, which they ſupply, been more attended to, than the ſize of the tube. They ariſe, moſt commonly, from the front of the aorta, between the origins of the renal and inferior meſenteric veſſels; either near together, or at a ſmall diſtance from each other. This is the caſe in twenty-two out of thirty-five inſtances. They may ariſe from the aorta higher or lower than the point which has been mentioned. The artery of the right ſide ſometimes comes from the right renal; but the left ariſes much more commonly from the renal artery, inſomuch, that this has been deſcribed as the accuſtomed origin. Often a ſmaller branch from the renal joins the trunk of the ſpermatic. It deſcends at an acute or half-right angle, and goes in front of the vena cava, on the right ſide of the body; but has been ſeen behind that vein. Its courſe is rather tortuous: joining the vein on the pſoas muſcle, it deſcends along the cord, and arrives at the teſtis in two branches. It gives off ſmall twigs to the renal capſule, fat of the kidney, ureter, lumbar glands, and the cord itſelf. The area of the veſſel, inſtead of being diminiſhed by all theſe branches, is rather increaſed. Several ramifications are diſpatched, below the ring, to the cremaſter, tunica vaginalis, and cellular ſubſtance of the ſcrotum. Ultimately it is diſtributed in numerous branches to the epididymis and teſticle; theſe partly perforate the back of the albuginea, and are employed in ſupplying the pulpy ſubſtance of the organ. Some of the ramifications communicate with branches of the epigaſtric artery. Smaller arteries come to the ſpermatic cord, or teſticle, from the epigaſtric, or from the circumflexa abdominis. The ſcrotum, and its cellular ſubſtance, receive twigs from the arteries of the thigh. "Hence," ſays Haller, "tying the ſpermatic arteries does not deſtroy the teſtis, on account of the ſupply derived from the external veſſels; but as theſe are very ſmall, the venereal powers of the organ are loſt." Element. Phyſiolog. v. 7. p. 430.

It has been aſſerted by many anatomiſts, and ſome of conſiderable celebrity, that the ſpermatic arteries and veins communicated together: and Euſtachius has drawn large communicating channels. That injection will ſometimes paſs from one order of theſe veſſels into the other, when dexterouſly impelled, is very true, and it holds equally good of other parts; but there is no more than the ordinary kind of communication here.

The ſpermatic veins, like the arteries, are two in number: the right uſually terminating in the front of the vena cava, the left in the renal vein, either alone, or in conjunction with the capſular, or a lumbar, or the hemiazyga. The left ſpermatic may end in the vena cava; or the right in the renal vein. Sometimes the vein ends by two, three, or four branches in the cava and renal vein. The ſize of the veſſel is very conſiderable when compared to that of the artery: its diameter being nearly a line and a half. When the veſſel has reached the pſoas muſcle, it divides into branches, which unite again, and give origin to other ramifications, which alſo anaſtomoſe together, and ſo on: thus a large plexus of veins is formed, conſtituting the *corpus pampiniforme*, forming the chief bulk of the cord, and increaſing in ſize as it approaches the teſtis. Branches correſponding to theſe arteries, which ariſe from the ſpermatic, join the vein. Valves are found in the ſpermatic veins, but none at their terminations: the tendency to the formation of varices in theſe veſſels, ſhews the neceſſity for the exiſtence of valves. The veins of the ſcrotum, derived from the epigaſtric, communicate with the ſpermatic, and with thoſe of the penis.

The abſorbents of the teſticles are numerous and large, but have not been long known. Nuck had demonſtrated them by inflating the ſpermatic veins; and Monro rejected them when he had thrown quickſilver into the vas deferens. He obſerved four or five valvular veſſels ariſing from the rete teſtis, and aſcending the cord. Haller candidly admits that he did not know much of them; "In homine aliquoties vidi majuſcula, non tamen valde numeroſa, in funiculo ſeminali cum venis aſcendentia, valvuloſa, ut tamen neque originem, neque finem ſatis accurate viderem." (Elem. Phyſiol. v. 7. p. 436.) Mr. Cruikſhank has given us the moſt perfect account of theſe veſſels. "The abſorbents of the tunica vaginalis," ſays he, "are eaſily diſcovered, lying between the reflection of that coat and the tunica albuginea. Though they are thus ſituated, I know that they belong equally to the body of the teſticle; they are in great numbers, and I have ſometimes covered the albuginea with abſorbents injected with quickſilver; perhaps there is not any part of the body where the abſorbents are larger or more numerous, in proportion to the part, than they are here. They ſoon leave the albuginea, and get upon the cord, where they are joined by others, to be deſcribed preſently; but the tunica vaginalis has alſo other abſorbents, upon the anterior and lateral parts, which have not the leaſt connection with the body of the teſticle, nor with the albuginea, and which alſo ſoon blend with the former, on the beginning of the cord. The abſorbents, which ariſe out of the rete teſtis, are exceedingly large, and appear to have no connection with its coats. A very beautiful preparation of theſe veſſels I made at Windmill-ſtreet, at leaſt ten years ago: I injected the vas deferens with quickſilver, and had in view not only the filling of the epididymis, but the tubuli teſtis themſelves. I had forced the mercury along the epididymis, and was delighted to ſee it get into the body of the teſticle; the mercury continued to deſcend very quickly through the glaſs injecting tube, but I ſoon found that it was not running into the tubuli teſtis, but into ſome veſſels, which mounted along the cord: theſe I ſoon perceived were abſorbents. I have alſo injected them from every part of the epididymis, from its ſuperior extremity, from the middle, and from the lower end. The abſorbents, having reached the cord, form from ſix to twelve trunks or more; ſome of theſe are ſometimes larger than a crow-quill: they do not appear to anaſtomoſe with one another as they paſs along the cord; at firſt they run ſtraight upwards, in the direction of the ring of the external oblique muſcle; after which they are bent upon themſelves, and paſs a little way in the direction of the ſpine of the ilium; after which they are bent as it were a ſecond time upon themſelves, and run over the anterior ſurface of the pſoas muſcle, and terminate at laſt in the lumbar glands. The reaſon of their termination, ſo diſtant from their origin, will eaſily occur to thoſe who reflect that the original ſituation of the teſticle was at this place, and that it was natural for it, like the other viſcera, to receive its blood-veſſels and nerves from the neareſt trunks, and to return its abſorbents to the neareſt glands." Anatomy of the abſorbing Veſſels, p. 140.

The nerves, like the blood-veſſels of this organ, ariſe from the trunks contained in the abdomen, and have conſequently a long paſſage to their ultimate deſtination. They are rather numerous than large. They are produced from the renal plexus chiefly, with additions from the meſenteric and hypogaſtric plexuſes, and from the trunk of the great ſympathetic. They are cloſely connected to the veſſels in the cord, but can hardly be traced to the teſtis. The ſcrotum and cremaſter are ſupplied by the lumbar nerves. Although the teſtis does not appear to poſſeſs acute ſenſibility, compreſſion of the organ cauſes a peculiar, dull, and intolerable ſenſation, of the moſt diſtreſſing kind.

Beſides the parts juſt enumerated, the cord contains the vas deferens, which will be preſently noticed; and the cremaſter muſcle, which is deſcribed under the article Cremaster.

A ſoft and looſe cellular ſubſtance unites together the parts which have been juſt mentioned; it reſembles that of the ſcrotum in not containing fat generally; but in corpulent perſons ſmall depoſitions of adipous matter may be obſerved in it. It does not communicate with that of the ſcrotum, as the fibrous covering of the cord is interpoſed between them; and it is much leſs ſubject than the latter to anaſarcous affections. Indeed its quantity is proportionally leſs abundant. Yet in rare caſes it has been the ſeat of aqueous infiltration, conſtituting a very uncommon kind of hydrocele of the cord: the latter complaint ſhews itſelf more frequently ly in the form of a ſingle cyſt with ſmooth ſides, contained in the cellular ſubſtance of the part.

The *vas*, or *ductus deferens*, is the tube which conveys the ſemen from the epididymis to the urethra. Its figure is for the moſt part cylindrical, and it conſiſts of a very ſmall tube, which will only admit a large briſtle, with very thick ſides. Although its calibre is ſo ſmall, the diameter of the part on a ſection equals a line. The ſubſtance of its ſides is very firm, and cuts like cartilage; hence we can diſtinguiſh it by the feel from the other component parts of the cord, by ſliding them between the finger and thumb in the living ſubject. The internal ſurface of the tube is ſmooth. Nothing of a muſcular ſtructure can be diſcerned in its compoſition.

It ariſes from the poſterior and inferior part of the epididymis, aſcends behind and a little on the inſide of that organ, and then continues its courſe along the ſpermatic cord behind the veſſels to the ring. Compreſſion of this part occaſions the ſame kind of pain as is experienced when the teſtes are injured; and the very acute ſuffering obſerved on tying the cord in caſtration, has been explained by the circumſtance of this tube being included in the ligature. Perhaps this explanation may be doubted, as the nerves of the teſtes are alſo among the compreſſed parts; however, the vas deferens is eaſily omitted, as its hard feel enables us to ſeparate the veſſels which lie in front, and are connected to it by a looſe cellular ſubſtance. It paſſes through the abdominal canal, holding the ſame relative ſituation to the ſpermatic veſſels. It ſeparates from them behind the opening, and then bends downwards and backwards along the ſurface of the pſoas muſcle, and of the iliac veſſels, to enter the pelvis. Here it becomes attached to the poſterior and lateral part of the bladder, and deſcends obliquely from without inwards, juſt in the ſituation where the peritoneum is reflected to the bladder from the ſide of the pelvis, connected by cellular ſubſtance on one ſide to the bladder, and on the other to the peritoneum, and ſituated in front of the rectum. In this courſe it decuſſates the umbilical artery, behind which it paſſes: it alſo croſſes the ureter, being placed between the lower extremity of that canal and the bladder. At the lower and back part of the latter organ it turns forwards and inwards, ſo as to approach towards the canal of the oppoſite ſide, ſtill connected to the ſurface of the bladder: in this direction it continues along the under ſurface of the organ, within the veſicula ſeminalis, and connected below by cellular ſubſtance to the rectum. In the neighbourhood of the proſtate, the two vaſa deferentia are placed cloſe together, and each unites juſt at the ſurface of the gland, with the anterior extremity of the veſicula ſeminalis. The canal, reſulting from this junction, ſometimes called the ejaculatory duct, penetrates the ſubſtance of the proſtate, from below and behind, upwards and forwards, and opens in the urethra at the ſide of the veru montanum.

The commencement of the vas deferens is a little convoluted, and rather larger in its calibre: at the upper part of the teſtis it becomes ſtraight in its courſe, and its area is diminiſhed. Under the bladder it is conſiderably enlarged again, where it lies along the inner edge of the veſicula ſeminalis. It has here ſometimes a ſlightly ſerpentine courſe, and poſſeſſes a flattened form. Its cavity is proportionably augmented, and, inſtead of a cylindrical tube, preſents a reticulated texture, like that of the veſiculæ ſeminales. Its ſurface is irregular and tuberculated in conſequence of this cellular ſtructure. After receiving the tube of the veſicula ſeminalis, it is again diminiſhed remarkably in ſize, and forms a ſmall cylindrical canal.

The vas deferens receives arterial and venous ramifications from the trunks, in the neighbourhood of which it paſſes. Nothing is known of its nerves.

It is by no means common in animals for the vas deferens to join the veſicula ſeminalis in the manner already deſcribed. In all caſes where there are teſticles, that duct conveys the ſecreted fluid into the urethra, there being no veſiculæ in ſome, while in others they terminate by ſeparate openings. The communication between the two parts in man is a very free one; and, although the canal formed by their junction proceeds in a ſtraight direction to its termination in the urethra, yet quickſilver, or any other injected fluid, or air thrown into the vas deferens, paſſes into, and diſtends the correſponding veſicula before it gets into the urethra. The compreſſion of the common canal by the firm ſubſtance of the proſtate, the ſmall ſize of the tube and of its opening, and a particular turn made by it, have been aſſigned to explain this fact. If the injection is puſhed further, it will go into the urethra. Fluids thrown into the veſicula alſo diſtend the vas deferens, but are more readily admitted into the urethra, as the capacity of that veſſel is not conſiderable.

The *veſiculæ ſeminales* are two ſoft bodies, reſembling, when undiſturbed by diſſection, membranous tubes with blind extremities, convoluted, and therefore marked with riſings and grooves on their ſurface. They are ſituated under the inferior flattened ſurface of the bladder, and upon the upper ſurface of the rectum, being connected to both theſe organs by looſe cellular adheſions. They are pyriform, with the apex placed forwards, and the baſis backwards, and convergent from behind forwards. Their anterior extremities, joined, as we have already mentioned, to the vaſa deferentia, lie on the upper and back part of the proſtate, and would be in contact with each other, were they not ſeparated by the tubes juſt alluded to. From this point they grow gradually broader, and are divergent, terminating behind in rounded ends, which are the moſt diſtant from each other. The ſuperior ſurface, in contact with the bladder, is rather flattened: the inferior, lying upon the rectum, is ſlightly convex. The vas deferens runs in contact with the inner margin, and the outward edge is turned towards the ſide of the bladder. The poſterior broad and rounded ends are partly in contact with the peritoneum, and lie at the ſides of the pouch, formed where that membrane is reflected from the bladder to the rectum. Numerous arterial and venous ramifications, particularly the latter, and a conſiderable quantity of cellular ſubſtance, ſurround theſe organs in all directions, and connect them to the neighbouring parts. In ſome individuals the pyriform ſhape is not well marked; but the anterior and lower end is always ſmall. The flattened appearance of its ſurfaces is altered by injection: the whole organ then appears thicker, and the tubercular riſings of the ſurface are more diſtinct.

A very different appearance is produced when theſe bodies are unravelled by the anatomiſt. Each veſicula is then found to conſiſt of a ſingle tortuous tube, about the ſize of a writing quill, with a blind extremity, and ſeveral lateral appendices, which alſo end in cul-de-ſacs. Sometimes the latter are very few; perhaps one or even none. In other inſtances they may amount in number to ten, or more. Haller has ſeen ſeventeen larger, beſides ſmaller ones. Some of theſe are ſimple blind appendices; others, particularly near the anterior end of the organ, again branch out. Sometimes the whole veſicula is bifid almoſt from its very origin; the varieties, indeed, are ſo numerous, that two veſiculæ will hardly be found exactly reſembling each other; but theſe variations are not important. (See Monro de Teſtibus, tab. 3.) This tube, with its appendices, is ſo convoluted upon itſelf, the turnings being cloſely connected together by cellular ſubſtance, containing numerous vaſcular ramifications, that the organ, when undiſſected, is four or five times ſhorter than the unravelled tube; and a ſection of it in this ſtate makes it appear to be compoſed of numerous cells, communicating together. This ſtructure accounts to us alſo for the knotted appearance of the organ on its ſurface.

The ſtructure of the veſicula is analogous to that of the vas deferens: its ſides are not ſo thick, but they are ſtill denſe and ſtrong. The external coat is of a cloſe texture, and whitiſh colour, covered with cellular ſubſtance externally. Nothing of a muſcular nature can be diſcerned here, although the functions of the organ oblige us to admit that it poſſeſſes a contractile power. We cannot otherwiſe account for the expulſion of the contents of the veſicula. The action of the levatores ani, which has been aſſigned as the efficient cauſe of this expulſion, is certainly inadequate to account for it; as their ordinary daily exertion is attended with no ſuch effect, when the venereal orgaſm is not preſent, and theſe parts are not exerted in their ſpecific manner. We may obſerve, moreover, that the perineal muſcles contract at the moment of ejaculation; now the contents of the veſiculæ muſt be conveyed into the urethra in the previous moments. The internal ſurface of the veſiculæ is formed by a mucous lining, connected cloſely to the preceding tunic. Its colour is whitiſh, and its thickneſs not conſiderable. It is continuous with the lining of the urethra. Its ſurface is very minutely reticulated, and marked with extremely ſmall diviſions, not to mention the larger ſepta formed by the turnings and folds of the tube and its appendices. It has, moreover, a downy or villous appearance: a ſimilar ſtructure characterizes that enlarged portion of the vas deferens which lies along the edge of the veſicula. The ſtructure of theſe parts, as well as the junction of the vas deferens and veſicula at an acute angle, has very conſiderable analogy to the gall-bladder and ductus hepaticus. Both have the ſame reticulated internal ſurface; the union of the two tubes, and the ſuppoſed courſe of the contained fluids, are conſidered to be ſimilar.

Some anatomiſts have deſcribed glands as being contained in the ſubſtance of the coats of the veſiculæ, and ſecreting the mucous fluid poured into theſe organs: but the moſt careful inveſtigation does not lead us to detect any thing glandular, and the ſecretion is probably performed by the ſurface of the parts.

We proceed to deſcribe more exactly the canal by which the veſicula and vas deferens communicate with the urethra. The tube of the former aſſuming a ſmooth appearance on its internal ſurface, and rather diminiſhed in ſize, converging towards its fellow, joins the correſponding vas deferens at a very acute angle: it is ſtill conſiderably larger than the latter canal. When the parts are diſſected, and the connecting cellular membrane removed, as in the hepatic and cyſtic ducts, the junction appears to be effected at a half right angle. The canal formed by this union, and belonging equally to the veſicula and vas deferens, proceeds more directly in the courſe of the latter, lies in cloſe contact with its fellow, paſſes between the proſtate and neck of the bladder, and thus arrives at the under ſurface of that part of the urethra, which runs through the gland. A ſmall elongated eminence is found in this portion of the urinary canal, compoſed of its internal coat, broader behind, where it aſſumes an oval figure. Towards the front it is continued into a long prominence, which is ſimply a fold of the urethral lining, and diſappears in the bulb, ending in one of the long ſtriæ, of which ſeveral are ſeen in the urethra, and ſometimes bifid, or even radiated at its extremity. It is called caput gallinaginis, or veru montanum. The elevations of the lining of the bladder, continued from the ureters, terminate in this eminence. Its oval portion is hollow, and preſents a long ſlit leading into a cul-de-ſac, which can be inflated, but which has no communication with the ſeminal paſſages. On each ſide of the eminence there is a ſmall oblong opening, the termination of the ejaculatory duct, but much narrower than the calibre of that tube, which is ſuddenly reflected from within outwards, at nearly a right angle, and pours its contents, by this ſmall opening, into the urethra. There is no valvular ſtructure at theſe orifices. The ſlit and cul-de-ſac already mentioned have given riſe to an opinion, that the two ejaculatory ducts terminated by a common orifice, which is altogether erroneous.

The proſtate is a firm glandular body, placed behind the ſymphyſis pubis, in front of the neck of the bladder, and ſurrounding the commencement of the urethra. In moſt animals there are two ſeparate glands in this ſituation, and the expreſſion *proſtates* has been erroneouſly transferred to the human ſubject. The ſize and figure of this part have been not unaptly compared to thoſe of a large cheſnut. Its broader end is turned towards the bladder, and is divided by a ſlight fiſſure into two lateral lobes, the narrower part is ſituated forwards. It is conſiderably thicker from ſide to ſide, than in the vertical direction. The ſuperior ſurface correſponds to the arch of the pubis, but is rather behind that part: it is covered by a ſtrong fibrous expanſion, deſcending from the arch, and named the inferior ligament of the bladder. Below, the gland is connected by cloſe cellular adheſions to the upper ſurface of the rectum, and the contact of theſe two parts is more extenſive in proportion to the ſize of the gut, which, when much diſtended, riſes ſlightly on each ſide of the proſtate, ſo as to be endangered in the lateral operation of lithotomy. The convex prominent ſides are covered by the anterior fibres of the levator ani. The baſis, or broad poſterior part, which is gently concave, embraces the neck of the bladder, and the ſmall anterior ends of the veſiculæ ſeminales and vaſa deferentia. The cellular ſubſtance, which connects it here to the bladder, is very denſe and firm, and the muſcular fibres of the organ are partly interwoven with it. This part preſents the groove already mentioned as dividing the organ into two lateral lobes. In front, the narrower portion of the proſtate is loſt indefinitely on the membranous part of the urethra, to which it adheres moſt firmly. The bulk of the urethra, the fat and muſcles of the perineum, cover the part ſo deeply on its anterior aſpect, that it can by no means be felt from the ſurface: on the upper part of the rectum, however, the gland may be diſtinctly recognized by the finger introduced into the gut, as nothing but the inteſtine covers it in this ſituation: and it projects ſenſibly into the tube when enlarged.

The urethra, immediately at its origin from the bladder, paſſes through the proſtate from behind forwards, and the membrane is almoſt conſolidated with the ſides of the opening in the gland. This paſſage does not take place at the centre, but nearer to the ſuperior ſurface, ſo that a ſmall portion only of the gland is above the urethra, and the chief bulk of it below and at the ſides. At the inferior part of the opening, by which the urethra commences, a ſmall portion of the gland projects ſlightly towards the bladder; and this part is perforated by the ſeminal ducts. It has been particularly deſcribed by Mr. Home as forming a third lobe of the proſtate. See the deſcription of a ſmall lobe of the human proſtate gland in the Philoſ. Tranſact. 1806, pt. 1.

The external ſurface of the proſtate is covered by a more or leſs diſtinct cellular inveſtment, which is the moſt complete below, and ſurrounded by numerous vaſcular ramifications, particularly of the venous kind. For an account of ſome muſcular fibres connected to it, ſee COMPRESSOR.

Its ſtructure is rather obſcure; for it does not conſtitute a ſimple gland with one excretory cavity, nor is it ſeparable into ſmaller conſtituent portions. It is denſe and very firm to the feel, apparently homogeneous when cut into, of a light brown colour, and on the whole conſiderably reſembling a ſcirrhous maſs. Small cavities are ſcattered through it, and excretory ducts, from 7 or 8, to 12 or 15 in number, continued from theſe, open into the commencement of the urethra, on each ſide of the caput gallinaginis. From theſe openings, a white and thickiſh fluid may be expreſſed in conſiderable abundance: it differs eſſentially in its colour from that contained in the veſiculæ ſeminales.

Cowper's glands, are two ſmall glandular maſſes, ſo named from the anatomiſt who particularly deſcribed them, and publiſhed figures of them; ſee his Deſcriptio glandularum, quarundam nuper detectarum, &c. 1702. They have alſo been called the inferior, or ſmaller proſtates, or glandulæ acceſſoriæ; they are of a roundiſh or oval figure, rather flattened, about the ſize of a pea, placed on each ſide of the lower end of the bulb of the urethra, and covered by the accelerator muſcle. They may be eaſily demonſtrated by cutting through the middle of that muſcle, and reflecting it towards each ſide: they are of a reddiſh-grey colour, and compoſed of many little portions, united together by cellular ſubſtance. Each of them has a ſeparate excretory duct, about half an inch in length, running obliquely forwards, and opening into the urethra by an aperture, which will admit a hog's briſtle. They ſecrete a mucous fluid, of a reddiſh colour, which aſſiſts in lubricating the lining of the urethra. According to Morgagni, they are ſometimes wanting. Haller has always found them, when he ſought for them carefully. Cowper deſcribes a third gland as being placed under the pubes in the curve of the urethra; but this has not in general been admitted.

The Penis.—After this deſcription of the organs, which ſecrete and preſerve the ſeminal fluid, or form other liquors which are added to the produce of the teſticles, we proceed to ſhew how this is conveyed to the place of its deſtination in the female. The urethra is a common paſſage for the ſemen and urine, commencing at the bladder, continued along the penis to its extremity, at which it opens, and facilitating, by its connection with this organ, the tranſmiſſion of the fecundating liquor to the germs prepared in the generative parts of the female. The penis is a very leading character in the ſtructure of the male, and is the ſeat of enjoyment in the act of copulation. Its form is elongated, and nearly cylindrical; it is placed at the middle and lower part of the abdomen, in front of the ſymphyſis pubis, and at the bifurcation of the lower limbs. When not erected it is ſoft and pendent, hanging in front of the ſcrotum. Its length and ſize are not conſtant, even in this condition, in the ſame individual: for there are numerous degrees between the conſiderable diminution of bulk produced by the operation of cold, and the ſwelling, which precedes erection, in any of which the organ may be found according to circumſtances; yet there is a middle ſtate, in which it is commonly found, which is not the ſame in all individuals. In the erected ſtate it is lengthened, enlarged, changed in its direction, and rendered, by the ſwelling of the urethra, ſomewhat triangular: a ſlight curvature may be obſerved in it at this time, adapted to the direction of the vagina. The increaſe in the length and ſize of the penis is always the ſame in the ſame individual: and it is more conſiderable in proportion as the dimenſions of the organ in its ſtate of repoſe are greater; but this is not conſtant. We may notice a ſuperior and inferior ſurface, two ſides, an anterior and a poſterior extremity.

The upper ſurface, named the dorſum, or back of the penis, is inclined forwards; it is turned towards the abdomen, and becomes poſterior in the erected ſtate. A large vein runs along its middle, and ſometimes there are two trunks. The inferior ſurface, turned backwards, is placed againſt the front of the ſcrotum; it forms a prominent line from the courſe of the urethra, and the integuments in this ſituation have a longitudinal rough mark, called the raphé, continuous with a ſimilar part in the ſcrotum. On each ſide of this middle prominence there is a ſuperficial depreſſion, where the urethra is in contact with the corpora cavernoſa. The two ſides of the penis are rounded. The poſterior extremity, called alſo the root of the penis, is divided into three portions, which will be preſently deſcribed, *viz.* the urethra in the middle, and the two corpora cavernoſa, one on each ſide. The anterior extremity preſents the glans and prepuce.

The penis is made up of various parts, each of which ſerves ſome particular purpoſe in the functions of the organ, conſidered as an inſtrument of reproduction. 1ſt. The corpora cavernoſa, making up its chief bulk, ſoft and looſe in the ſtate of repoſe, are ſo organized as to become very ſuddenly increaſed in ſize and hardneſs, in conſequence of the operation of certain ſtimuli. By theſe the penis is rendered capable of introduction into the female vagina. 2dly. The urethra, by which the fecundating liquor is conveyed, is a membranous canal, ſurrounded by a vaſcular ſubſtance, called corpus ſpongioſum, which is ſuſceptible of the ſame change in erection as the corpora cavernoſa. 3dly. The glans is a ſmall organ, conſiſting of a continuation of the corpus ſpongioſum, covered by a highly organized and acutely ſenſible ſkin, the excitation of which, in the act of coition, determines the diſcharge of the ſeminal fluid through the urethra. The penis poſſeſſes an external cutaneous covering, which is ſimply contiguous to the glans, but united to the corpora cavernoſa and urethra by cellular ſubſtance.

The *corpora cavernoſa*, or *crura penis*, are two nearly cylindrical bodies, of a very firm texture, united laterally in the greateſt part of their length, but ſeparated from each other behind, like the branches of the letter Y, and terminating by ſlender, conical, and pointed extremities. Theſe, fixed behind to the rami of the iſchia and pubes, advance forwards and inwards, approximating to each other. In front of the ſymphyſis pubis they come in contact, or rather, are confounded together in one ſingle body, the ſize of which is uniform throughout, except in front, where it terminates by a blunt extremity. The ſeparate origin of the two lateral portions has led anatomiſts in general to ſpeak of the *corpora cavernoſa* in the plural number; but their conſolidation into one body has induced Sabatier, and ſome other modern authors, to admit only a ſingle *corpus cavernoſum*, bifurcated behind for a double inſertion into the pelvis. The ſingle body, formed by the union of the two crura, to which the bulk and firmneſs of the penis are almoſt entirely owing, is flattened above and below, and preſents two ſurfaces, a ſuperior and an inferior, on each of which there is a longitudinal groove, correſponding to the ſeptum, which is within the corpus cavernoſum. That of the upper ſurface is the ſmalleſt, and lodges the great veins of the penis; the inferior, broader and deeper, receives the urethra, to which it is united by a cloſe cellular ſubſtance. The ſides of the body are rounded and covered by the ſkin, its anterior extremity forms a blunt point, received into a concavity, at the baſe of the glans. The two parts are united by a very denſe cellular ſubſtance, and ſome blood-veſſels paſs between them, but there is no other kind of communication; and air or injection, thrown into the cellular ſubſtance of the corpus cavernoſum, do not find their way into the glans. The latter, therefore, is not an expanſion or continuation of the former, as ſome old anatomiſts ſuppoſed. The poſterior extremity is bifurcated, and its two prolongations form the two crura penis already mentioned. Theſe begin in a pointed form a little above the tuberoſities of the iſchia, from the inner ſurface of the bone, to which they are attached as far as the ſymphyſis. Below and within they are covered by the erectores and accelerator muſcles, above and without they adhere ſtrongly to the bone. They leave between them a triangular ſpace, filled by fat, and by the urethra, which occupies its middle. Three parts are to be conſidered in the corpus cavernoſum, *viz.* an external membrane, a peculiar ſpongy ſubſtance, and a longitudinal ſeptum, occupying its middle. The outer membrane is of a fibrous nature, very thick and firm, whitiſh in its colour, and beſtowing on the body its peculiar figure. Its external ſurface is covered with a denſe cellular tiſſue: on the inſide it adheres cloſely to the ſpongy ſubſtance. Thinner on the crura, in the groove lodging the urethra, and at the anterior extremity, it preſents in theſe ſituations a livid tint, produced by the contained blood, while it is thicker every where elſe, whitiſh, and opake. In the former ſituations there are ſome perforations for the admiſſion of blood-veſſels. It is continuous and ſtrongly interwoven with the perioſteum of the os innominatum, at the origin of the crura. It partakes entirely of the characters belonging to fibrous organs; and is made up of fibres variouſly interlaced, and forming ſeveral ſtrata. It is found to be very hard and reſiſting, when expoſed to the action of a cutting inſtrument. It experiences a paſſive dilatation from the influx of blood in erection, and returns to its former ſtate, when this extenſion goes off. It does not ſeem to poſſeſs any vital properties.

The ſpongy matter of the corpus cavernoſum is a cellular ſubſtance, compoſed of very fine and numerous plates and fibres detached from the internal ſurface of the fibrous membrane, and decuſſating each other in every direction. Its cells are all communicated together, and are more or leſs filled with blood, which can be removed by forcible ſqueezing, or repeated waſhings. Various fibrous threads croſs the cellular ſubſtance in different ſituations, and are attached to the ſurface of the fibrous membrane. They are ſaid to prevent exceſſive diſtention of the corpora cavernoſa. An artery and a vein paſs through the centre of the cellular ſubſtance on each ſide, from behind forwards. Their minute ramifications muſt, undoubtedly, communicate with the cells of the organ, ſince injection will paſs from the arteries into theſe cells; and injected fluids or air, after filling the corpus cavernoſum, gain admiſſion into the veins. The blood contained in the corpus cavernoſum has always a dark livid appearance in the dead body; but it is red during life, as may be ſeen in amputation of the penis, or in living animals. Its quantity varies very conſiderably, according to the condition of the penis; when it is increaſed, the whole corpus cavernoſum is diſtended; from the bony origin to the glans, it is elongated and hardened, and erection is produced.

The ſeptum of the penis divides it longitudinally into two portions, which moſt anatomiſts conſider as diſtinct tubes, under the name of corpora cavernoſa. In order to ſee it well, the fibrous membrane ſhould be cut through on each ſide of the penis, and all the ſpongy ſubſtance removed; the ſeptum will then be found continuous, by its two edges, with the fibrous membrane, and compoſed of ſtrong whitiſh fibres, not forming an entire plane, but leaving intervals between them, at which the two ſides of the corpus cavernoſum communicate freely. From this ſtructure the name of ſeptum pectiniforme has been derived. The intervals between the fibres are larger towards the inferior than the ſuperior edge of the ſeptum. At the part where the two crura meet together, the ſeptum is complete, it degenerates into ſeparate faſciculi towards the oppoſite end of the organ, and the intervals between theſe are more conſiderable, as we approach nearer to the front extremity.

The dimenſions of the penis are determined in great meaſure by the corpus cavernoſum; and to this body the organ owes that firmneſs in the erected ſtate, which enables it to fulfil its office in the buſineſs of generation.

Each of the crura penis gives attachment at its origin to a tolerably ſtrong muſcle, named the *erector* penis, probably, becauſe when a power, capable of producing the effect indicated by that name, was ſought for by anatomiſts, this muſcle ſeemed to be their only reſource. At preſent the name appears very ill adapted, ſince the muſcles in queſtion obviouſly draw the penis downwards and backwards, inſtead of upwards and againſt the pubes. Thoſe who explain the erection of the penis, by the compreſſion of its vein, ſhould find out a power capable of elevating the organ againſt the bone, and of carrying it forwards. It has a tendinous origin, below the attachment of the crus penis, from the inner ſurface of the tuberoſity, and ramus of the iſchium. It paſſes forwards, upwards, and a little inwards, and is firmly implanted in the fibrous membrane of the crus penis. It will draw the corpus cavernoſum downwards, ſo as to bring it more nearly into a direction, ſuitable to the cavity of the vagina: it has a ſlight power of ſhortening the crus penis, and thereby expreſſing the blood into the anterior part of the organ, ſo as to increaſe its turgeſcence. Its origin and courſe render it completely incapable of compreſſing the large vein of the penis.

The *urethra*, which, in the female, belongs only to the urinary paſſages, conſtitutes moreover in man an eſſential part of the generative apparatus. Its length is very conſiderable, and its organization very complicated, in conſequence of the latter office. It has connections with almoſt all the parts belonging to this apparatus; the ejaculatory and proſtatic ducts open into it; it is cloſely connected to the corpus cavernoſum, and terminated by the glans. In the male ſubject it forms a canal extended from the neck of the bladder to the end of the penis, and giving paſſage to the urine and ſemen. Its length, which varies in different individuals, and in ſubjects of different ages, is about nine or ten inches in the adult. At its origin it penetrates the proſtate, paſſing forwards and downwards; it goes under the ſymphyſis pubis, and then aſcends in front of that part, between the two crura penis, in order to reach the inferior ſurface of the corpus cavernoſum, and become attached to the channel which we have already deſcribed. Being thus united to the corpus cavernoſum, it runs along the whole length of that body, and follows its direction. Laſtly, it traverſes the glans penis, and opens at its extremity, by a vertical ſlit with ſlightly rounded edges of a bright red colour. Hence the canal forms in its courſe curvatures reſembling thoſe of the letter S; but this is only when the penis is relaxed; for, in the erected ſtate, the curvature in front of the pubes, of which the concavity is turned downwards, is entirely effaced, and that only remains, which is below the pubes, and of which the concavity faces upwards.

The canal is divided into three portions, diſtinguiſhed from each other by their organization. The firſt, of about an inch in length, which paſſes through the proſtate, has received no name; the ſecond, of about equal extent, continued from the proſtate to the bulb, is called the membranous portion; the latter correſponds above to the inferior ſurface of the ſymphyſis pubis, but is about half or three quarters of an inch below the bone. Below it is connected by cellular ſubſtance to the ſurface of the rectum, and at the ſides, the front edges of the levatores ani are in contact with it. This part of the canal has been called the membranous portion, from a notion that the membrane of the urethra was covered here by no external inveſtment, but in fact it is cloſely ſurrounded by a thick ſtratum of muſcular fibres. The moſt interior of theſe are circular, and lie cloſe upon the membrane of the urethra. Mr. Wilſon has lately deſcribed ſome fibres, ariſing by a double tendon from the arch of the pubes, deſcending on each ſide of the urethra, and united under the canal. (See the Medico-chirurgical Tranſactions, vol. i.) Theſe fibres are connected in front with the accelerator urinæ, and behind with the levatores ani. They will compreſs the canal when they contract, and, by cloſing it at the time of emiſſion, will prevent the ſeminal fluid from being driven backwards by the action of the accelerator. The third portion of the urethra, including all the reſt of the canal, is called the ſpongy part. It begins by an oblong rounded portion, named the bulb of the urethra. This is ſituated below the union of the crura penis, between which it makes a remarkable prominence. Below, and on the ſides, it is covered by the accelerator urinæ (ſee ACCELERATOR), and by Cowper's glands. Together with the two preceding parts of the canal, the bulb forms the firſt curvature of the urethra, and its ſides are ſtrongly connected to the arch of the pubis by means of a fibrous expanſion, termed the triangular ligament of the urethra. The latter part poſſeſſes the figure, which its name indicates; the baſe of the triangle is turned downwards, the apex upwards, correſponding to the junction of the oſſa pubis, and the ſides are attached to the rami of the pubes. It is perforated by the paſſage of the urethra, which it holds firmly in its relative ſituation to the bone. In the reſt of its extent, the ſpongy portion of the urethra correſponds above to the channel in the under ſurface of the corpus cavernoſum. Below, it is covered near the bulb by the accelerator, then by the cellular ſubſtance of the ſcrotum, and afterwards by the integuments of the penis.

The diameter of the canal is by no means uniform in its whole length. It is large in the middle of the proſtate, and ſmaller where it enters and leaves the gland. The canal is here rather flattened laterally. In the membranous portion it is perfectly cylindrical, but ſmall in its ſize; and the narroweſt portion of the whole canal is juſt where the bulb and membranous part join. In the bulb it is again conſiderably enlarged, and after contracting ſlightly, preſerves a cylindrical figure and uniform ſize to the baſe of the glans. There it again dilates, and forms what ſome anatomiſts have called the foſſa navicularis; its anterior opening is ſomewhat narrower. Mr. Home took the trouble of aſcertaining the dimenſions of the canal by filling it with wax, and meaſuring the caſt thus formed. The length was nine inches; from the external orifice to the bulb, ſeven. The membranous portion was $1\frac{1}{2}$ inch, and the proſtatic part of the canal half an inch. The diameter of the caſt, at $\frac{3}{4}$ of an inch from the external orifice, was 9-20ths of an inch in a ſubject of 80 years, and 7-20ths in one of 30 years; at $4\frac{1}{2}$ inches from the external orifice 7-20ths; at the bulb of the urethra 12-20ths; in the membranous part, immediately adjoining the bulb, 7-20ths; in the middle of the proſtate 11-20ths; at the neck of the bladder 9-20ths. Home on Strictures, vol. i. p. 24, and 25.

The ſituation of the eminence, on which the ejaculatory ducts open, called the veru montanum, in the proſtatic part of the urethra, and its figure, have been already noticed; as well as the openings of the proſtatic ducts in the ſame part of the canal. In the reſt of its extent, the internal ſurface of the canal poſſeſſes a reddiſh colour In the membranous and ſpongy portions, longitudinal folds are obſervable, diſappearing on extenſion. Theſe are not ſeen in the proſtate, nor at the glans, becauſe the firm texture of the parts which adhere ſo very cloſely to the mucous membrane, keeps it conſtantly ſmooth. Hence the diameter of theſe parts is nearly uniform at all times. The ſides of the canal exhibit openings of numerous ſmall oblique ducts, frequently named after Morgagni. Theſe are only ſeen in that part of the urethra which is in front of the bulb, and are ſometimes called lacunæ; their number and ſize vary in different ſubjects. They run from behind forwards, and terminate by ſimple oblique orifices. They are always very numerous about the foſſa navicularis, from which ſome have explained the circumſtance of this part being particularly affected in gonorrhœa. They conſiſt of ſhort canals, formed in the membranous ſides of the urethra, lined by a continuation of the internal membrane of this canal, and about large enough to admit a large hog's briſtle. They are of various lengths, but commonly about a quarter of an inch. Sometimes ſeveral ſmaller join into one larger duct. If carefully examined, their whole number will not be found leſs than 60 or 70. No glandular apparatus can be diſcerned connected with them. In theſe tubes the mucous fluid is ſecreted, by which the ſurface of the urethra is ſmeared, and defended from the action of the urine. Where theſe lacunæ do not exiſt, as in the bulb, membranous portion and proſtate, a protecting fluid is furniſhed from other ſources, as Cowper's glands and the proſtate. The fluid of the lacunæ ſeems to be a clear viſcid ſecretion, ſimilar in appearance and tenacity to the white of egg. In this form it can be expreſſed from the openings on the ſurface of the urethra. Under various circumſtances of diſeaſe it is increaſed in quantity, and variouſly altered from its natural properties, as in gonorrhœa and gleet, and in ſtricture. In ſome of theſe inſtances, it is a clear, tranſparent, viſcid fluid, being the natural ſecretion in a more abundant form.

The ſides of the urethra are differently organized in different parts; it is lined indeed throughout by a mucous membrane, but this is covered externally by very different ſtructures. Where the canal is paſſing through the proſtate, the ſides are formed merely by the mucous membrane, cloſely united to the gland by a denſe cellular texture. The firm ſubſtance of the proſtate, ſo intimately connected with the canal, gives to it a ſtrength and thickneſs in this part. The membranous portion is differently circumſtanced; this is the thinneſt, and leaſt firmly ſupported diviſion of the canal, and, as it is placed in the bend of the urethra, is particularly liable to injury in the employment of the catheter. Even here the membrane is covered by a denſe cellular texture, continued from the proſtate, and by the muſcular fibres already deſcribed. In the ſpongy portion of the urethra, the ſides of the canal are covered by a ſubſtance of peculiar organization, analogous in its effects to that which fills the corpora cavernoſa penis. This is called corpus ſpongioſum urethræ, or corpus cavernoſum. It begins in front of the membranous part of the canal, by a large protuberance already mentioned, as the bulb of the urethra. It forms an oblong rather elongated production, hanging between the crura penis and below the canal of the urethra, ſometimes bearing a ſlight appearance of diviſion into two lateral parts by a middle line, and terminating behind by a rounded end. The bulb correſponds only to the inferior ſurface of the urethra; but a thinner layer of the corpus ſpongioſum, continued from the bulb, covers the urethra on all ſides in front of that body to the end of the canal. Here it is again increaſed in quantity, and reflected over the anterior extremity of the corpus cavernoſum penis, to form the glans. The ſpongy ſubſtance ſurrounds the urethra uniformly on all ſides. It is cloſely connected to the corpus cavernoſum above by cellular ſubſtance, and by veſſels which are ſeen when the urethra is detached from its channel; below and on the ſides it is covered by a cellular ſheath, common to it with the corpus cavernoſum penis. The external ſurface of the corpus ſpongioſum conſiſts of a thin but compact fibrous layer; and the interval between this and the mucous membrane ſeems to be filled by a very fine cellular net-work, the cells of which contain venous blood. The tenuity of the external layer occaſions the part to poſſeſs a livid colour, as the tint of the blood is diſcernible. This net-work is covered in the glans by a highly organized ſpecies of ſkin, through which the colour of the venous blood is not diſcernible. The corpus ſpongioſum does not conſiſt, according to the common opinion, of a cellular texture; but it is made up of very ſmall and repeatedly convoluted veins, as may be aſcertained diſtinctly enough by inſpecting attentively the ſurface of it, when ſucceſsfully injected: this ſtructure is more evident in ſome animals, as particularly in the dog. The bulk of the corpus ſpongioſum depends on the quantity of blood which it contains; and this part admits of the ſame diſtinction, as the ſpongy ſubſtance of the corpora cavernoſa penis, and for the ſame purpoſes. Air, impelled into any part, finds its way readily over the whole extent of the ſubſtance, and the ſame circumſtance may be obſerved of injection. It may be readily injected from the large vein at the back of the penis; but the valves ſometimes prevent the ſucceſs of this attempt.

The canal of the urethra is lined by a mucous membrane, continuous with the lining of the bladder at one extremity, and with the cutaneous covering of the glans at the other, and ſending prolongations into the mucous ſinuſes of Morgagni, the ducts of Cowper's glands, the ejaculatory ducts, and thoſe of the proſtate. Its ſurface is perfectly ſmooth, excepting the longitudinal wrinkles, which are effaced by extenſion. The colour is a bright red at the external orifice, and in the foſſa navicularis: in other parts it appears pale, when the blood has been expreſſed from the corpus ſpongioſum. But the injection of coloured fluids proves that it receives every where an abundant ſupply of blood-veſſels. Its ſubſtance is very thin, and the opinion of its being covered by a continuation of the epidermis does not ſeem to be at all well-founded, as there is a well marked line of ſeparation at the glans, and no cuticle can be ſhewn in the canal. The external ſurface is rough and cellular for its connection to ſurrounding parts. No appearance of muſcular ſtructure can be diſcerned in any part of the membrane. The introduction of an inſtrument ſhews this membrane to poſſeſs acute ſenſibility; and the repetition of the practice evinces the force of habit in blunting ſuch feelings. The firſt time of paſſing a bougie or ſound is ſometimes attended with fainting, and almoſt always with ſharp pain, but after a few times, no unpleaſant ſenſation is excited. The paſſage of the urine is attended ordinarily with no ſenſation; but this becomes moſt acutely painful when the membrane is inflamed. It has been much diſputed whether or no this canal poſſeſs a contractile power in its own lining. The phenomena are ſtrongly in favour of the affirmative, although no muſcular fibres have been demonſtrated. The temporary obſtruction to the flow of urine, under circumſtances of diſeaſe, and the ſudden ceſſation of this inconvenience, can hardly be [illegible]ile force to the membrane. [illegible] from the canal is [illegible] ſame kind. That the urethra is extenſible, and that it returns again to its original ſize, is proved by the paſſage of inſtruments. Haller ſtates that chemical ſtimulants will cauſe it to contract.

The *glans* is the body ſurmounting the anterior and upper part of the corpus cavernoſum penis, and forming the front extremity of the organ, of which it augments the length in a trivial degree. It has the form of a cone, ſlightly flattened from before backwards, with its baſe very obliquely truncated. Its apex preſents the aperture of the urethra already deſcribed. Below this, is placed the frenum connecting it to the prepuce; and on each ſide of this fold it ſwells into a ſmall convex protuberance (colliculi glandis). This part is called by Haller "ſenſus acerrimi ſedes." The glans cannot be ſaid to extend below the urethra, as that part belongs to the corpus ſpongioſum. Since the baſis is ſo obliquely truncated, the depth of the organ is very inconſiderable at the two convexities already named; but it is much more conſiderable above, where it is produced over the corpus cavernoſum, and terminated by a thick riſing edge of a ſemi-lunar outline, with the convexity turned backwards, called the corona glandis. This margin, ſufficiently thick and prominent to elevate the integuments, and cauſe a perceptible riſing externally, forms the front boundary of a cul-de-ſac, or gutter, cauſed by the reflection of the inner membrane of the prepuce over the glans. Below, the corona glandis is interrupted by a ſmall groove, which extends to the orifice of the urethra, and gives attachment to the fold which forms the frenum. In ſome ſubjects this groove is hardly perceptible. The colliculi glandis are continuous below with the corpus ſpongioſum; the baſis of the glans is hollowed out, and the anterior extremity of the corpus cavernoſum penis is received into the concavity. In conſequence of this ſtructure, although the glans appears to be an inch or more in length, it makes very little addition to the length of the penis.

The ſubſtance of the organ conſiſts of a ſpongy matter ſimilar to and continuous from that of the urethra. Air or injected fluids paſs readily from one into the other. This matter is made up, as in the urethra, of convoluted veins, and it admits of the ſame changes of laxity and erection from the ſame cauſes. Sometimes there is an appearance as if the corpus ſpongioſum urethræ and the glans were ſeparated from each other by a ſeptum. The ſubſtance of the glans is always more denſe, and contains leſs blood than that of the urethra. The ſurface of the organ is covered by a very vaſcular and delicate production of the integuments, continuous towards the apex of the glans with the mucous lining of the urethra, and at its baſis with the inner layer of the prepuce. This covering is very thin, and ſmooth and ſoft to the touch. Its external ſurface is compoſed of a delicate epidermis; this is ſucceeded by a layer of the true ſkin, of a very ſoft and delicate ſtructure, covered with numerous ſmall villous proceſſes, which are moſt diſtinctly ſeen about the corona glandis. The moſt favourable method of obſerving theſe villi is to plunge the part in boiling water, which ſeparates the cuticular covering; they are then viſible in vaſt numbers over the whole ſurface, giving it an irregularity in its appearance. This circumſtance in the ſtructure of the glans was firſt demonſtrated by Albinus (Annot. Academ. lib. iii.), and is admitted by Ruyſch and Winſlow, although ſome anatomiſts have queſtioned it, probably becauſe the demonſtration is rather difficult. That the nerves of the organ are continued into theſe papillæ, as they are in the tongue, and that the exquiſite ſenſibility of the glans ariſes from this organization, is rather matter of probable conjecture, than the reſult of direct proof. The blood-veſſels of this cutaneous production are numerous, ſo that a general redneſs is produced by minute injections. The oppoſed ſurfaces of the glans and prepuce are ſmeared over with a white, friable, and unctuous ſubſtance, of a very peculiar odour, moiſtening the parts and preventing the effects which might otherwiſe follow their mutual attrition. In animals there are manifeſt glands to ſecrete this ſubſtance, and an apparatus of glandular ſtructure deſtined to the ſame office has been deſcribed in man. This kind of ſebaceous matter is formed in other ſituations of the body by peculiar glandular organs, as in the eye-lids by the Meibomian glands; and the notion that it is depoſited by the urine, which is contrary to all obſervation, and to every thing we know of the properties of that fluid, would be immediately overturned by the fact, that a ſimilar depoſition occurs under the preputium clitoridis of the female, where the urine could not form it. Although in many ſubjects no glands can be ſeen, they are occaſionally obvious enough, and are now univerſally admitted, under the name of glandulæ odoriferæ. Morgagni, in his Adverſaria, has given a very particular deſcription of them, and Haller confirms his ſtatements. They are hardiſh, white, and very ſmall bodies, particularly obſervable about the corona glandis, and in the channel behind that part, where the prepuce is reflected. Morgagni alſo mentions them near the frenum in the prepuce. "I have ſeen," ſays Haller, "five rows of them in the corona, but their number diminiſhed towards the frenum, ſo that no more than two rows could be ſeen." They can be obſerved moſt advantageouſly when the cuticle has been removed. That the orifices of theſe bodies can be ſeen, and their ſebaceous contents ſqueezed out, is not ſo clearly aſcertained; but both theſe facts are aſſerted by competent witneſſes. They may be rendered more evident when enlarged in diſeaſe; and might be miſtaken for venereal pimples, if their ſymmetrical arrangement did not throw light on the appearance. That the matter ſecreted by theſe glands accumulates under the fore-ſkin, in the form of a white, ſoft, and greaſy ſubſtance, where the neceſſary attentions to perſonal cleanlineſs are neglected, and that in hot weather, it may become acrid and irritating, ſo as to produce excoriation and even ulceration, are well known facts. The inhabitants of warm climates are chiefly expoſed to theſe inconveniences, and the moſt important advantage of circumciſion conſiſts in its obviating ſuch accumulations. Hence we know that Chriſtians, living under the burning ſun of Senegambia, ſubmit to this operation, and that uncircumciſed Europeans, living in the Eaſt, very frequently experience the ill effects ariſing from the ſource juſt alluded to. For this reaſon Guido de Cauliaco, a celebrated ſurgeon of his time, about the middle of the fourteenth century, obſerved that circumciſion was uſeful to many others beſides Jews and Saracens: "propterea quod non congregantur ſordities in radio balani et calefacerent ipſum." Chirurgiæ, tr. vi. doctr. ii. p. iii. iii.

The glans penis poſſeſſes a very exquiſite ſenſibility, particularly in perſons where it is habitually covered by the prepuce; this feeling is only obſerved on certain occaſions, and is the ſource of that phyſical ſenſation experienced at the expulſion of the ſeminal fluid. It ſwells and becomes firm in the act of erection, as well as the reſt of the penis.

The cutaneous covering of the penis is continuous, at one end, with that of the ſcrotum and pubes, and at the other with the prepuce. It is thin, furniſhed with numerous ſebaceous glands, particularly at the under ſurface, and marked in that ſituation by a rough line, called the raphé, running along the middle of the organ, and continued with a ſimilar one on the ſcrotum. It is darker coloured than the integuments in general, and has a few hairs towards the root of the organ. The cellular texture connecting the ſkin to the penis is very looſe, and contains no fat except cloſe to the pubes; hence the ſkin adapts itſelf with the greateſt facility to the varying bulk of the organ, falling into wrinkles in the collapſed ſtate, and extended more ſmoothly in the erected condition. It is continuous with the cellular ſubſtance of the ſcrotum, groins, and pubes, and air paſſes readily between them. Towards the ſurface of the corpus cavernoſum it becomes more denſe, and aſſumes the form of a regular membranous covering; it is more and more looſe towards the ſurface, and has, when inflated, a cottony appearance. The ſuſpenſory ligament of the penis is placed at the root of the organ, which it unites to the ſymphyſis pubis. It conſiſts of a denſe, cellular, elongated, and flattened band, proceeding from the front of the ſymphyſis pubis, running along the cellular tiſſue of the organ, and expanded under the ſkin. Its limits and figure are not very determined, and the knife of the diſſector often influences its ſize and appearance.

The prepuce or fore-ſkin is a looſe fold of the cutaneous covering of the penis, continued over the glans, without adhering to it, and affording a more or leſs complete covering to the extremity of the penis. Its length varies in different individuals; ſometimes it is produced conſiderably in front of the glans, and its opening is then generally ſmall. Its external ſurface offers the ſame ſtructure and appearance as the integuments covering the body of the penis, and is ſmooth or wrinkled, according to the ſtate of the organ. The inner ſurface, much ſofter to the touch, is in contact with the glans, to which it has a membranous attachment below, termed the frenum. The latter is continuous, on one ſide, with the internal membrane of the prepuce, and fixed, on the other, to the ſmall longitudinal groove which we have deſcribed in the under part of the glans; and it ends in this ſituation by a prominent line fixed to the very opening of the urethra. The frenum limits the extent to which the retraction of the prepuce can be carried; but allows the organ either to be brought ſufficiently forwards to cover the whole glans, or to be carried backwards far enough to expoſe its whole ſurface. In the latter ſtate the frenum is on the ſtretch, and, if the prepuce be moved forcibly in this direction, it may even be torn, as in coition: this accident is particularly likely to occur, if the ſhortneſs of the fold allows only a partial expoſure of the glans. Such a diſpoſition of parts rendering the act of copulation painful, might require a ſection of the frenum. The baſis of the prepuce is attached, on the inſide, to the baſe of the glans, behind which it is reflected ſo as to line the ſmall channel already deſcribed in this ſituation. Its apex forms a large round opening, of a ſufficient magnitude, in general, to allow the part to be drawn entirely back behind the glans; and, even where it is more contracted, much larger than the orifice of the urethra. In ſome caſes its opening is ſo ſmall as not to allow the retraction of the organ, and even to obſtruct the flow of urine; this conſtitutes phymoſis: in others, it can be withdrawn, but the tightneſs is ſo great that it may not be poſſible to reſtore it; that is termed paraphymoſis. It has been aſſerted of ſome races in the Eaſt that the prepuce is unuſually long, and that this ſtructure particularly favours the accumulation of the matter ſecreted by the glandulæ odoriferæ; ſo that circumciſion has been more eſpecially neceſſary on that account.

The integuments of the penis, having arrived at the baſe of the glans, are continued forwards to its apex, as far as the opening of the prepuce. There they acquire a different organization, are folded back in a contrary direction, and terminate by a firm attachment round the baſis of the glans. The two layers, of which the exterior does not differ from the ſkin of the penis, except in being thinner, are connected by a ſtratum of very looſe cellular ſubſtance, perfectly free from fat. The laxity of this cellular matter is ſo conſiderable, that, when the prepuce is withdrawn as far as poſſible, the two component layers are no longer in contact, but ſeparated completely. The ſurfaces, by which they before adhered, are now applied to the corpora cavernoſa, and the integuments of the penis are withdrawn towards the pubes. The prepuce ſeems deſigned to protect the glans, and defend it from the effects of contact, and rubbing againſt external objects. Yet it is not eſſential to the functions of the organ, that it ſhould poſſeſs ſuch a covering, as the deſtruction of it by circumciſion or diſeaſe proves. The covering of the glans becomes afterwards thicker and harder, but the peculiar ſenſibility, excited in the performance of the generative functions, does not ſeem to be diminiſhed.

The arteries of the male generative organs are chiefly furniſhed by the trunk of the pudendal; but the proſtate and veſiculæ ſeminales receive branches alſo from the veſical arteries. The integuments of the external parts have branches from the perineal artery, and from the veſſels of the thigh. The veins of the penis unite, for the moſt part, into a large trunk at the middle of the upper ſurface of the organ, which paſſes under the ſymphyſis pubis, and opens into a large plexus ſurrounding the proſtate and neck of the bladder. Theſe end partly in the hypogaſtric veins, and partly in the inferior meſenteric. Beſides theſe there are ſuperficial veins in the prepuce and penis, terminating in the ſaphena and femoral vein. The lymphatics of the penis are divided into ſuperficial and deepſeated. The former ariſe from the prepuce and integuments, and go to the ſuperficial inguinal glands. The latter, ariſing from the urethra and corpus cavernoſum, enter the pelvis in company with the branches of the pudendal artery, and join the hypogaſtric plexus. The nerves of the penis are of conſiderable ſize, and are derived principally from the 2d, 3d, and 4th ſacral pairs.

Developement of the Male generative Organs.—As the function of generation does not commence until a conſiderable period after birth, the developement of its organs in the human ſubject follows a law derived from this circumſtance. They undergo no remarkable change from birth till the age of puberty, at which time the proceſs of nutrition is carried on in them with great activity. But they may be obſerved at an early period in the fœtus, where, without having any remarkable predominance over other parts, they are conſiderably advanced, as if nature, in ſketching out the organization, had wiſhed to mark decidedly the diſtinguiſhing ſexual traits.

In the fœtal ſtate, we ſhall deſcribe merely the condition of the teſtis and ſpermatic cord, as theſe are the only parts differing eſſentially at that time from the ſtate in which they are found in the newly born child. The reſt of the generative apparatus undergoes no remarkable changes, until the time of birth, and we ſhall therefore not notice them until that time.

There is no part in the body which undergoes ſo remarkable a change in its ſituation as the teſticle; and, if it be interrupted in this proceſs, a particular diſeaſe is very commonly occaſioned. This organ, which, at its firſt formation, lies in the abdominal cavity at the inferior margin of the kidney, ſurrounded by the inteſtines, paſſes in the advanced periods of utero-geſtation into the ſcrotum, and, as the canal through which it deſcended is ſhut up, never regains its original ſituation. At the time of birth, or very ſoon after, man and moſt other mammalia have both teſticles in the ſcrotum. This remarkable change was firſt noticed and deſcribed about the middle of the laſt century, when many celebrated anatomiſts turned their attention to it, inſomuch that it is difficult to determine with whom the credit of being the firſt deſcriber reſts. The peculiar kind of rupture, called hernia congenita, which takes place when the deſcent of the teſtis is not accompliſhed in the regular manner, was the circumſtance which principally led to the diſcovery, and more minute inveſtigation of the facts. When ſurgeons began to reaſon on the cauſes and ſeats of ruptures, and the ſtructure of the hernial ſac, they naturally turned their attention towards theſe parts, and ſoon diſcovered that kind of the complaint in which the parts occupy the canal formed by the deſcent of the teſtis, and to which the name of congenital was given, becauſe the ſtate of parts favouring its occurrence commonly exiſts at the time of birth. The examination of the origin and peculiarities of this affection, led to a complete elucidation of the whole affair, in a ſeries of excellent publications.

Reneaulme de la Garaune, a French ſurgeon, who wrote a treatiſe on ruptures in 1726, has the firſt hint on the ſubject; he ſpeaks of the inteſtines and omentum eſcaping through the ſame canal at which the teſtis has paſſed out. Among the numerous claims, which the great Swiſs phyſiologiſt poſſeſſes, to the gratitude and reſpect of all medical men, is that of having given the firſt clear account of this matter. Indeed, there is hardly any part of the ſubject which has not been diſcuſſed and explained in the writings of this great man; and, as the obſervation of La Garaune is a ſingle and indirect hint, we muſt aſſign the honour of the diſcovery entirely to Haller. (See Commerc. litterar. Norimberg. 1735, p. 197; 1737, p. 3. Programma, herniarum obſervationes aliquot. Goetting, 1739. Opuſcula pathologica, Lauſanne, 1755.) Soon after theſe publications, the ſubject was taken up in England by the Hunters. Dr. W. H. according to his brother's ſtatement, had found both teſtes lying in the abdomen in a ſtill-born child of ſeven or eight months, ſome years before the publication of Haller's "Opuſcula Pathologica," and could not explain the matter to his ſatisfaction. Mr. J. Hunter publiſhed a very full and accurate account of the original ſituation, and of its change in the teſtis. (See Medical Commentaries, p. 1. Lond. 1762, cap. ix.) About the ſame time the obſervations of Mr. Pott were made public. The vaſt practical opportunities enjoyed by this gentleman enabled him to explain all the pathological circumſtances connected with the deſcent of the teſtis; his knowledge of the anatomy was probably derived from the ſources already pointed out. (See account of a peculiar kind of rupture frequently attendant upon new born children, and ſometimes met with in adults, London, 1765. Treatiſe on the Hydrocele, ſect. 3. p. 12. Chirurgical obſervations and caſes relative to ruptures, ſect. 2.) Camper, who united ſo ſucceſsfully anatomical and ſurgical purſuits, inveſtigated this matter with conſiderable attention, and gave the reſults of his labours to the public in the Haarlem Tranſactions, v. 6. and 7. The works of Neubaur and Lobſtein muſt not be omitted in this enumeration; that of the former is entitled, "De tunicis vaginalibus teſtis et funiculi ſpermatici." Gieſſæ, 1767. The diſſertation of the latter, "De hernia congenita, inqua inteſtinum in contactu teſtis eſt," Argentorat 1771, contains a very excellent and complete account of the whole matter, both in an anatomical

cal and ſurgical point of view. In addition to theſe we have to notice, as containing good deſcriptions and uſeful information, the following more modern works. Girard's Appendix adjecta tabulis poſthumis Santorini. Palletta nova gubernaculi teſtis Hunteriani et tunicæ vaginalis anatomica deſcriptio. Mediolani, 1777. Brugnone de teſtium in fœtu poſitu, &c. Wriſberg obſervationes anatomicæ de teſticulorum ex abdomine in ſcrotum deſcenſu, &c. in the Gottingen commentaries for 1778. Vicq d'Azyr recherches ſur la ſtructure et la poſition des teſticules, &c. in the Memoires de l'Acad. des Sciences, année 1780. Martin commentarius de herniæ congenitæ ortu, &c. in the Nova Acta Reg. Soc. Scient. Upſal. v. 3. Sandifort icones herniæ congenitæ, Lugd. Bat. 1781, 4to.

Until the approach of birth, the teſtes of the fœtus are lodged within the cavity of the abdomen, and may therefore be reckoned among the abdominal viſcera. They are ſituated immediately below the kidneys, on the fore-part of the pſoæ muſcles, and by the ſide of the rectum, where this inteſtine is paſſing down into the cavity of the pelvis; for in the fœtus, the rectum, which is much larger in proportion to the capacity of the pelvis, than in the full-grown ſubject, lies before the lumbar vertebræ, as well as before the ſacrum. Indeed the caſe is nearly the ſame with regard to all the contents of the pelvis; that is, their ſituation is much higher in the fœtus than in the adult; the ſigmoid flexure of the colon, part of the rectum, the greateſt part of the bladder, the fundus uteri, the Fallopian tubes, &c. being placed in the fœtus above the hollow of the pelvis, in the common or great abdominal cavity. At this time the figure of the gland is much the ſame as in the adult, and its poſition is the ſame as when it is in the ſcrotum, that is, one end is placed upwards, the other downwards; one flat ſide is to the right, the other to the left; and one edge is turned backwards, the other forwards. But as the teſtis is leſs firmly connected to the ſurrounding parts, while it is in the loins, its poſition may vary a little. The moſt natural ſeems to be when the anterior edge is turned directly forwards; but the leaſt touch will throw that either to the right ſide, or to the left, and then the flat ſide will be turned forwards. It is attached to the pſoas muſcle all along its poſterior edge, except juſt at its upper extremity. This attachment is formed by the peritoneum, which covers the teſtis and gives it a ſmooth ſurface, in the ſame manner as it envelopes the other looſe abdominal viſcera. The epididymis lies along the outer and poſterior edge of the organ, in the ſame relative poſition, which it occupies at a more advanced age. This part is larger in proportion, and adheres behind to the pſoas. When the fœtus is very young, the adheſion of the teſtis and epididymis to the pſoas is very narrow, the part is conſequently more looſe and prominent. As its age advancees, the adheſion becomes broader and tighter. The blood-veſſels, like thoſe of moſt parts of the body, commonly ariſe from the neareſt large trunks; *viz.* from the aorta and cava, or from the emulgents. The nerves too come from the neareſt ſource; that is, from the abdominal plexuſes of the intercoſtal. In reſpect, therefore, to its ſupply of nerves and of veſſels, this organ may be reckoned an abdominal viſcus; and this circumſtance of its peculiar ſituation before birth accounts for its being ſupplied afterwards from ſo remote a ſource.

The vas deferens, inſtead of running upwards from the lower end of the teſtis, as it does at a more advanced period of life, goes downwards and inwards in its whole courſe; it continues, indeed, in the direction of the epididymis. It turns inwards from the lower end of that organ, behind the upper extremity of the gubernaculum, which we ſhall deſcribe preſently; then it goes over the iliac veſſels, and the inſide of the pſoas muſcle, ſomewhat higher than in the adult, and paſſes afterwards, in the direction already deſcribed, along the bladder. The cremaſter muſcle turns upwards, inſtead of deſcending over the pubes, and ſeems to be loſt on the peritoneum near to the teſtis.

No ſpermatic cord exiſts at the time of life we are now conſidering. The arteries and veins of the teſtis go behind the peritoneum, connected to it by looſe cellular ſubſtances, and enter the ſubſtance of the organ at its poſterior edge, where the peritoneum is reflected over it, juſt as the veſſels of the inteſtines paſs between the laminæ of the meſentery or meſocolon. The vas deferens alſo goes behind the peritoneum from the teſtis to the bladder.

While it remains in the abdomen, the teſtis is connected in a very particular manner with the parietes of the cavity, and with the ſcrotum, at the place where the ſpermatic veſſels paſs out. This connection is by means of a ſubſtance, which runs down from the lower end of the teſtis to the ſcrotum, and which Mr. Hunter named the ligament, or gubernaculum teſtis, becauſe it connects the organ with the ſcrotum, and, as he conceived, directs its courſe in its deſcent. It has been deſcribed alſo under the names of ligamentum ſuſpenſorium, baſis, and cylindrus. It is of a pyramidal form; its largeſt part is placed upwards, and fixed to the lower end of the teſtis and epididymis, while the lower and ſlender extremity is loſt in the cellular membrane of the ſcrotum. The upper part of the gubernaculum is within the abdomen, before the pſoas, and reaches from the teſtis to the abdominal muſcles. It runs into the ſcrotum through the ſame opening that is afterwards occupied by the ſpermatic veſſels, and is there loſt. That portion of it which is within the abdomen is covered by the peritoneum, except at its poſterior part, which is contiguous to the pſoas, and connected with it by the reflected membrane and cellular ſubſtance. Its colour is white, and it may be diſtinguiſhed by this circumſtance from the teſtis, which is of a reddiſh-grey. The texture is ſoft, and has a fibrous vaſcular appearance. "It is covered," ſays Mr. Hunter, "by the fibres of the cremaſter muſcle, which is placed immediately behind the peritoneum: this is not eaſily aſcertained in the human ſubject, but is very evident in other animals, more eſpecially in thoſe whoſe teſticles remain in the cavity of the abdomen after the animal is full grown." He obſerves again, "that in the human fœtus, while the teſtis is retained in the cavity of the abdomen, the cremaſter is ſo ſlender, that I cannot trace it to my own ſatisfaction, either turning up towards the teſtis, or turning down towards the ſcrotum." The peritoneum, which covers the teſtis and its gubernaculum, is firmly united to the ſurfaces of thoſe two bodies; but all around, that is, on the kidney, the pſoas, the iliacus internus, and the lower part of the abdominal muſcles, that membrane adheres very looſely. Where it is continued, or reflected from the abdominal muſcles to the ligament of the teſtis, it paſſes firſt downwards a little way, as if paſſing out of the abdomen, and then upwards, ſo as to cover more of the ligament than what is within the cavity of the abdomen. At this place the peritoneum is very looſe, thin in its ſubſtance, and of a tender gelatinous texture; but all around the paſſage of the ligament it is conſiderably tighter, thicker, and more firm. When the abdominal muſcles are pulled up, ſo as to tighten or ſtretch the peritoneum, this membrane remains looſe at the paſſage of the ligament, while it is braced or tight all around; and in that caſe, the tight part forms a kind of border, or edge, around the looſe doubled portion, where the teſtis is afterwards to paſs. If the parts are drawn towards the abdomen, there is no appearance of an aperture, or paſſage, down towards the ſcrotum: but when the latter and the ligament are drawn downwards, then there is an aperture from the cavity of the abdomen all round the fore-part of the ligament, apparently ready to receive the teſtis. This aperture becomes larger when the teſtis deſcends lower, as if the pyramidal ligament was firſt drawn down, in order not only to direct, but to make room for the teſtis, which muſt follow it. The aperture is ſometimes ſo large that the teſtis can be puſhed into it, as far as the tendon of the external oblique muſcle.

From this original ſituation in the abdomen, the teſtis moves downwards, at a certain period, to its deſtined ſtation in the ſcrotum. Its lower extremity comes into contact with the lower part of the abdominal parietes. At this time, the upper part of the ligament, which hitherto was in the abdomen, has ſunk downwards, and lies in the paſſage from the abdomen to the ſcrotum, which is afterwards to receive the teſtis. As the latter paſſes out, it inverts the gubernaculum, going down behind it: what was the anterior ſurface of that organ now becomes poſterior, and compoſes the lower and anterior portion of the tunica vaginalis. Mr. Hunter ſtates, that the place where the ligament is moſt confined, and where the teſtis meets with moſt obſtruction in its deſcent, is the ring in the tendon of the external oblique muſcle; and, conſequently, that where the teſtes are not in the ſcrotum, they are more frequently lodged immediately within the tendon of that muſcle, than included in the cavity of the abdomen. The teſtis commonly remains for ſome time by the ſide of the penis, and deſcends only by degrees to the bottom of the ſcrotum. When it has entirely deſcended, the ligament is no longer viſible.

While the teſtis is deſcending, and even when it has paſſed into the ſcrotum, it is ſtill covered by the peritoneum, and is connected by its poſterior edge exactly in the ſame manner as when it was within the abdomen. The ſpermatic veſſels run in the ſame way behind the membrane, the teſtis is fixed backwards to the parts againſt which it reſts, and is unconnected and looſe forwards, as it was when in the abdomen. In its deſcent the teſtis brings the peritoneum with it; but the elongation of that membrane, though it reſembles, in ſome circumſtances, a common hernial ſac, in others is very different. If a perſon can repreſent to himſelf a hernial ſac reaching to the bottom of the ſcrotum, and covered by the cremaſter; if he can imagine, further, that the poſterior half of the bag covers, and is united with the teſtis, epididymis, ſpermatic veſſels, and vas deferens, while its anterior half lies looſe before all thoſe parts, he will have a perfect idea of the ſtate of the peritoneum and of the teſtis when it firſt deſcends into the ſcrotum. This gland, therefore, does not fall looſe, like the parts protruded in a rupture, into the elongation of the peritoneum; but it ſlides down from the loins, carrying the peritoneum with it, and both continue to adhere, by cellular membrane, to the parts behind them, as they did in the loins. The ductility of the peritoneum, and the looſeneſs of its connection to the parts ſurrounding the teſtis, are circumſtances which favour its elongation and deſcent into the ſcrotum with the teſtis.

It is plain, from this deſcription, that the cavity of the bag, or elongation of the peritoneum, which contains the teſtis in the ſcrotum, muſt at firſt communicate with the general cavity of the abdomen, by an aperture at the abdominal ring. That aperture has exactly the appearance of a common hernial ſac: the ſpermatic veſſels and vas deferens lie immediately behind it, and a probe paſſes readily through it from the general cavity of the abdomen down to the bottom of the ſcrotum. And if this proceſs of the peritoneum be laid open through its whole length on the fore-part, it will be plainly ſeen to be a continuation of the peritoneum; the teſtis and epididymis will be ſeen at the lower part of it; and the ſpermatic veſſels and vas deferens may be obſerved, covered by the poſterior part of the bag, in their whole courſe from the groin to the teſtis.

Before the teſtis has quitted the abdomen, the ſcrotum is ſmall and corrugated, and contains nothing but cellular ſubſtance. This is looſe, and yielding near the ring, but more denſe and cloſe below. Some have deſcribed a pouch of peritoneum paſſing through the ring, and therefore contained in the ſcrotum, previouſly to the deſcent of the teſtis: but this is not generally correct. There is no ſuch pouch while the gland remains near the kidney. The parts about the ring are ſurrounded by ſuch a looſe and cellular texture, that, by drawing the gubernaculum downwards, the peritoneum is carried with it ſo as to repreſent a ſmall cul-de-ſac. The teſtis, too, after it has paſſed the ring, may be drawn up again into the abdominal cavity, in conſequence of this laxity of the ſurrounding ſubſtance.

In the human body then, when the teſtis has recently come down, it is contained in a membranous bag, formed of an elongation of the peritoneum, and communicating with the abdomen by means of a narrow proceſs, aſcending in front of the ſpermatic cord. The parts remain in this condition throughout life in the quadruped, but in man the communication between the membranous covering of the teſtis and the abdomen is ſoon cut off. The upper end of the canal is cloſed firſt, and the aperture is obliterated ſo ſpeedily, that there is ſeldom any communication in a child born at its full time. The proceſs of contraction is continued downwards, along the cord, to the upper end of the teſtis, at which it ſtops. Thus the tunica vaginalis teſtis, which was in the firſt inſtance a production of peritoneum, becomes entirely ſeparated from that membrane; the peritoneal covering of the gland is the reflected tunica vaginalis.

"This contraction and obliteration of the paſſage ſeems," ſays Mr. Hunter, "to be a peculiar operation of nature, depending upon ſteady and uniform principles, and not the conſequence of inflammation, or of any thing that is accidental: and, therefore, if it is not accompliſhed at the proper time, the difficulty of bringing about an union of the part is much greater: as in children who have had the ſac kept open by a turn of the inteſtine falling down into the ſcrotum immediately after the teſtis." "The cloſing of the mouth, and of the neck of the ſac, is peculiar to the human ſpecies; and we muſt ſuppoſe the final cauſe to be the prevention of ruptures, to which men are ſo much more liable than beaſts, from their erect ſtate of body." We feel ſome heſitation in admitting this reaſoning as to the cauſe of obliteration: at all events, if we ſhould acknowledge it, the frequent occurrence of ruptures muſt prove that nature accompliſhes her end very imperfectly. "What!" ſays the ſame phyſiologiſt, "is the immediate cauſe of the deſcent of the teſtis from the loins to the ſcrotum? It is evident that it cannot be the compreſſed force of reſpiration, becauſe commonly the teſtis is in the ſcrotum before the child has breathed; that is, the effect has been produced before the ſuppoſed cauſe has exiſted. Is the teſtis pulled down by the cremaſter muſcle? I can hardly ſuppoſe that it is. Becauſe, if that was the caſe, I ſee no reaſon why it ſhould not take place in the hedge-hog, as well as in other quadrupeds; and if the muſculus teſtis had this power, it could not bring it lower than the ring of the muſcle."

The proceſs, which we have now deſcribed, is liable to ſome variations. In ſome individuals, the neck of the peritoneal elongation is not obliterated, ſo that the tunica vaginalis communicates permanently with the abdomen, as in quadrupeds. Hence, we ſometimes ſee hydroceles particularly in children, where the fluid can be made to paſs into the belly by preſſure. If a rupture occurs in ſuch individuals, it is contained, together with the teſtis, in the tunica vaginalis. Sometimes the teſtes do not deſcend before birth; when they paſs down after this time, a part of the inteſtine or omentum is liable to deſcend with them, and is of courſe contained in the tunica vaginalis. One or both may be retained in the abdomen beyond the uſual period. When the natural proceſs has not begun, or has been interrupted before birth, it becomes afterwards very uncertain when the deſcent will be completed. It takes place moſt frequently between the years of two and ten, while the perſon is young and growing, being ſeldom delayed beyond the age of puberty. However, one or both of theſe glands may be retained in the abdomen through life. In this caſe, Mr. Hunter conceives that there is ſome imperfection in their formation. "I am inclined," ſays he, "to ſuſpect that the fault originates in the teſticles themſelves." And again, "when both teſticles remain through life in the belly, I believe that they are exceedingly imperfect, and incapable of performing the natural functions of thoſe organs; and this imperfection prevents the diſpoſition for their deſcent taking place." The writer of this article has ſeen two caſes, where one teſtis had remained in the abdomen, and where the circumſtances aſcertained by anatomical examination corroborated the opinion of Mr. Hunter. In one, the body of the gland was not more than half its uſual ſize: the epididymis, which was very imperfect, ran for about an inch behind the ſac of a hernia, which had occurred in this individual, and did not join the body of the teſtis. The other caſe preſented exactly the ſame appearances. A third inſtance has come to his knowledge, in which both of the teſtes remained in the abdomen, but were formed apparently perfect in their ſtructure. In this caſe, it was underſtood, that the ordinary functions of the glands had been executed in a healthy manner during the perſon's life.

The times, at which the changes in poſition already deſcribed take place, are moſt accurately noted by Wriſberg in the memoir above quoted. He gives a tabular arrangement of his obſervations on this ſubject, deduced from very numerous examinations, of which the following account contains the chief particulars. "At the age of one month and three weeks, the teſtes were cloſe to the kidneys, with the ſmalleſt poſſible interval; the ſcrotum looſe and œdematous. At two months, the teſtes, exceedingly ſmall, touched the kidneys; the gubernaculum very long, and the ſcrotum wrinkled and rather hard. Two months and one week, teſticles very near the kidneys; ſpermatic veſſels diſcernible through the peritoneum, like very fine threads; gubernaculum diſtinct. Three months, teſtes about the ſize of hemp-ſeeds, placed rather further from the kidneys, and at the edge of the pelvis. Three months one week and a half, the ſcrotum extremely ſmall, and indeed ſcarcely diſcernible, ſo that the penis hung from a ſlight prominence of the ſkin. The ſmall inteſtines coiled together in the upper part of the abdomen, far from the teſtes. The latter had deſcended farther on the ſide of the pelvis; the gubernaculum very ſhort. Three months and three weeks, the ſcrotum ſmall and contracted: the teſtes more than three lines below the kidneys. Four months, the ſcrotum very ſmall: the teſtes deeply placed, with their inferior ends touching the rings. A diſtinct canal of peritoneum on the left ſide, leading from the cavity of the abdomen into the ſcrotum, although the gubernaculum was not yet inverted. Four months and one week, the teſtes very high, nearly touching the kidneys: the gubernacula long; no canal paſſing through the ring, which was perfectly cloſed. Four months and two weeks, the teſtes near the ring, with a canal of peritoneum on each ſide, paſſing to the bottom of the ſcrotum. Five months and two weeks, both teſtes in the rings; ſo that they could not be ſeen until preſſed towards the abdomen, when they appeared readily. Eight months, ſcrotum well formed, with its ſurface wrinkled, but empty. The teſtes had paſſed the ring, but remained in the neighbourhood of the groin: the right could be eaſily puſhed back into the abdomen through the proceſs of peritoneum, which was ſtill open; but the left could not, as the communication was already cloſed. Nine months, teſtes in the bottom of the ſcrotum; the canal of communication perfectly cloſed on the left ſide; it was ſhut on the right by a ſoft cellular ſubſtance eaſily yielding to the probe. Nine months, both canals perfectly cloſed."

From the foregoing facts, the following concluſions may be drawn: 1ſt. Before the beginning of the ſixth month the teſtis has not paſſed the ring on either ſide; but generally remains near the kidney: ſo that this ſituation may be depended on as a proof of the immaturity of a fœtus. 2dly. Between the beginning of the ſixth, and end of the ſeventh month, they are generally found about the ring; being in ſome inſtances above it, in ſome within the canal, and in others juſt below. 3dly. The ſcrotum in the firſt months, up to the ſixth, is ſmall in proportion to the body, ſometimes looſe, ſometimes harder, but always empty, and containing cellular ſubſtance inſtead of the cavity, in which the teſtis is to be afterwards lodged. A broad and ſtrong faſciculus of fibres (the gubernaculum) is contained in the midſt of its cellular ſubſtance. 4thly. When the teſtes have firſt deſcended into the ſcrotum, the canal of peritoneum ſtill opens to the abdomen, ſo that they can be eaſily drawn back into the belly, and ſink down again. This is generally practicable, in fœtuſes, between the 7th and 9th months.

The ordinary law of nature on this ſubject is, that the human ſubject, born at the expiration of the full term of utero-geſtation, has both teſticles in the ſcrotum. Haller's contrary ſtatement, "ut rariſſime fetus in lucem edatur, cum teſticulis ſcroto incluſis," (Element. Phyſiol. vol. 7. p. 413.) has been completely diſproved by the teſtimony of ſubſequent obſervers. Whether the canal of communication be generally cloſed before birth, is a point on which authors are not unanimous. According to Wriſberg, with whom Vicq d'Azyr agrees, this is commonly the caſe. But the repreſentation of Camper is ſomewhat different: this anatomiſt and Lobſtein obſerve, that the obliteration takes place earlier on the left than on the right ſide. Of 53 newly born children examined by Camper, 23 had the canal open on both ſides, 11 on the right ſide only, and ſix on the left only. In ſix it was cloſed on both ſides. In four both teſtes were contained in the abdomen; and in three only the right.

In the excellent memoir of Wriſberg, already referred to, there is a table of 103 births obſerved by himſelf, in which the poſition of the teſtes was carefully aſcertained. The proportion of premature to mature and perfect births was as 9 to 94, or in round numbers 1 to 10. All the children, whoſe weight did not exceed 5lbs. came into the world at the beginning of the ninth month, or in the eighth, or even in the ſeventh month. Three of theſe had both teſtes in the ſcrotum; three in the groins, and three in the abdomen of the children born towards the end of the ninth month, 69 had both teſtes in the ſcrotum, 17 one or both in the groin, eight one in the abdomen, and three, whoſe weights were 5¾, 6¾, and 7lbs. both in the abdomen. In the 12 out of theſe 103 caſes, where one or both teſtes remained in the abdomen, they were obſerved to deſcend on the days mentioned below, viz. : in one inſtance it paſſed down on the day of birth; the deſcent took place in three ſubjects on the ſecond day, in an equal number on the third, in two on the fifth, and in one on the twenty-firſt. In the remaining individuals, they had not appeared on the fourth and fifth weeks from the time of birth ; and as the children then left the hoſpital, the time of deſcent was not known. In three inſtances, the deſcent was obſerved to be accompanied with crying and convulſive motions of the limbs. Both teſtes had paſſed into the ſcrotum of one child, born at the end of ſeven months, and weighing only 3½lbs. ; which muſt be deemed a rare occurrence. They have been ſeen in the ring in a fœtus of four months. Bichat, Anat. Deſcr. t. 5. p. 234.

The colour of the organ, while in the abdomen, is greyiſh, and its form elongated. The epididymis is conſiderably larger in proportion than in the adult, and its head lies conſiderably above the teſtis : it is more looſely connected to the body of the gland. The conſiſtence of the teſtes at this time is ſoft and pulpy.

The penis, at the time of birth, although ſmall, is well formed, and poſſeſſes an elongated prepuce, which completely covers the glans. The integuments of the penis, as well as thoſe of the ſcrotum, are not diſtinguiſhed in colour from thoſe of the body in general. The rugæ of the ſcrotum are not yet well marked. There is a ſmall quantity of fat in the ſcrotum, and the fibrous covering, common to the cord and teſtis, cannot yet be diſtinguiſhed. The veſiculæ ſeminales, in conſequence of the poſition of the bladder, peculiar to this age, are nearly vertical in their direction, very ſmall and collapſed, and not exhibiting the tubercles on their ſurface ſeen in the adult. Internally they contain a mucous fluid.

The corpus cavernoſum penis is very ſhort and ſmall, and remarkable for the ſmall proportion of its ſpongy ſubſtance, and the trifling quantity of blood which it contains. The latter circumſtance is ſtill more ſtriking after a few years, in conſequence of the increaſed thickneſs of the fibrous membrane : hence, as erection depends principally on the ſwelling of the ſpongy part of the corpus cavernoſum, the penis of children, when erected in conſequence of ſome ſympathetic excitation, is hardly increaſed in ſize, and very little in length. The urethra, in the firſt years of life, is long ; and its direction from the bladder to below the ſymphyſis pubis is more oblique than in the adult. Theſe two circumſtances, in the conformation of the urinary canal, ariſe from the bladder being ſituated higher in the abdomen, and from the ſuperior aperture of the pelvis being more ſlanting. The prepuce is elongated, ſo as to give the penis a pointed termination. Its opening, always very narrow, may be ſo ſmall as to prevent the diſcharge of the urine, or to render it impracticable to denude the glans. The latter circumſtance conſtitutes congenital phimoſis. The frenum is narrow and reaches to the opening of the urethra.

No great changes are obſerved in the organs of generation from the time of birth until puberty. Buſied with the general organization of man, and particularly attentive to the bringing to perfection the agents by which he communicates with ſurrounding objects, to the putting in action the ſprings of his intellectual powers, nature ſeems, if we may uſe the expreſſion, to forget the inſtruments of reproduction, which continue for a time ſtationary. If, during this long period, theſe organs undergo no important revolution, they partake ſlightly in the general growth. Each of them, conſidered ſingly, without increaſing in any very marked degree, becomes more perfect in its organization, of which the principal traits may be more eaſily obſerved ſome years after birth. But theſe changes, which take place very gradually, are trifling when compared with thoſe which happen at puberty.

Changes in the male Organs at the Time of Puberty.—In the two or three years immediately preceding this period, the pubes is covered by a ſlight down, which appears generally before the beard. We may remark alſo, that its appearance is more conſtant, and its growth more rapid. In fact, the hair on the generative organs, although it is not completely developed for ſome years, has gained nearly its full length and thickneſs, while the beard is ſtill thin and ſhort. At the ſame time that the hairs appear, the ſkin of the ſcrotum and penis loſes its whiteneſs, and becomes more or leſs brown in conformity with the tint which it poſſeſſes in other parts of the body. The ſcrotum, hitherto contracted, becomes longer ; the teſticle is removed to a greater diſtance from the ring, and the ſpermatic cord proportionally elongated. The penis becomes larger and longer ; the frequent erections occaſion the prepuce to appear ſhorter, and the glans to be a little uncovered. The various layers compoſing the ſcrotum are complete at this time. The teſtis is proportionally larger than the veſiculæ ſeminales and penis, as the exerciſe of the generative functions commences here. The veſiculæ ſeminales are ſtill very ſmall, even in a ſubject of 14 or 15 years. The canal of the urethra, as well as the other parts of the penis, is conſiderably increaſed, as may be ſeen by obſerving the ſtream of urine.

In old men the ſcrotum is generally ſoft and pendent, and external impreſſions are no longer able to bring it into the ſtate of corrugation. The cellular ſubſtance which it contains is frequently the ſeat of watery effuſion. The fibrous covering of the teſtes and cord is denſe, thick, and eaſily demonſtrable. The teſticle is ſmall, ſoft, and waſted ; but without any remarkable change in its organization : the volume of the epididymis, on the contrary, is equal to what it poſſeſſed in the adult. The ſpermatic cord is rather ſmaller, unleſs the veins ſhould be in a dilated ſtate. The veſiculæ ſeminales are collapſed, and the proſtate becomes hard : the penis is conſtantly placid.

Phyſiology of the male Organs of Generation.—We ſhall deſcribe, in the firſt place, the fecundating fluid, as it appears when expelled from the body in the act of copulation ; and ſhall then diſtinguiſh the various parts of this compound liquor. We ſhall exhibit the facts which have been aſcertained concerning this intereſting ſubject, juſt as we treat any other part of phyſiology : we muſt either uſe ſuch language as ſhall be intelligible, or paſs over in entire ſilence every thing which relates to the production and development of the new beings, and the continuation of the ſpecies.

The fluid expelled from the urethra of a healthy man, under the influence of the venereal act, is white, inclining perhaps ſlightly to a blueiſh caſt. But it is not homogeneous, as it contains thicker and more opaque mixed with a more thin and ſemipellucid matter. The latter is more abundant in proportion as the ſubject is weaker, and the act more frequently repeated. From this difference in the appearance of its component parts it has been ſometimes compared to coagulated milk. It is of a viſcous or glutinous nature, and therefore readily entangles air : hence it becomes frothy if rubbed in a mortar. When firſt diſcharged, its conſiſtence is about equal to that of a thick cream ; but as it cools, the opaque mucilaginous part becomes tranſparent, and acquires greater conſiſtency. In about twenty minutes after its emiſſion the whole becomes liquid : at this time, too, it is tranſparent, having depoſited a ſediment of a whitiſh matter, reſembling a maſs of ſlender rags. The liqueſaction is not owing to the abſorption of moiſture from the air, for it loſes inſtead of acquiring weight during its expoſure to the atmoſphere ;

nor is it owing to the action of the air, for it takes place equally in cloſe veſſels. It has been obſerved that the thick flaky portion is thrown out firſt; while the thinner part comes after. It is heavier than any animal fluid, and ſinks immediately in water: but a part ſwims, conſiſting of white ſhining filaments, forming a cobweb-like texture, and compoſing ſmall floating maſſes. That which ſinks in the mucous or pulpy portion, which is the greater part of the whole; but of this little membranous-like flakes are ſometimes ſuſpended by air bubbles. Theſe ſink to the bottom and diſappear on the ſecond day, but the water remains turbid, and contains flocculi and white ſhining threads. Its odorous properties are very ſenſible; not irritating but mawkiſh and unpleaſant, like the farina of the Spaniſh cheſnut. In animals it is ſaid to be of a more penetrating nature; ſo that when abſorbed it infects the whole body, and renders the fleſh unfit for eating, unleſs the teſtes are cut out immediately after the animal's death. (See Buffon, t. 5. p. 121. of the boar.) The taſte is at firſt inſipid; yet there is ſomewhat of pungency in it, which after ſome little time ſtimulates and excites a degree of warmth in the mouth.

It converts paper ſtained with the bloſſoms of mallows or violets to a green colour, and conſequently contains an alkali. It diſſolves readily in water, after its ſpontaneous liquefaction: alcohol or oxymuriatic acid precipitates white flakes from this ſolution. Acids readily diſſolve the ſemen, and alkalies do not decompoſe this ſolution. Lime diſengages no ammonia from freſh ſemen; but after that fluid has remained for ſome time in a moiſt and warm atmoſphere, lime ſeparates a great quantity from it. Conſequently ammonia is formed during the expoſure of ſemen to the air. When oxymuriatic acid is poured into ſemen, a number of white flakes precipitate, and the acid loſes its peculiar odour. Theſe flakes are inſoluble in water, and even in acids. If the quantity of acid be ſufficient, the ſemen acquires a yellow colour. Thus it appears that ſemen contains a mucilaginous ſubſtance analogous to that of the tears, which coagulates by abſorbing oxygen. Vauquelin obtained ſix parts of this mucilage from 100 parts of oxygen. When expoſed to the air at the temperature of 60°, a pellicle forms gradually, and in three or four days ſmall tranſparent cryſtals of phoſphate of lime are formed. Afterwards ſmall round maſſes of the ſame ſubſtance are obſerved in the pellicle. If the air is moiſt, cryſtals of carbonate of ſoda may be formed. The evaporation does not go on to complete exſiccation, unleſs in a temperature of 77° with dry air. When all the moiſture is evaporated, the ſemen has loſt 0.9 of its weight; the reſiduum is ſemi-tranſparent like horn, and brittle. When kept in moiſt air, at the temperature of 77°, it acquires a yellow colour, acid taſte, and putrid odour. Expoſed to heat, it becomes brown, and exhales a yellow fume, having the odour of burnt horn. When the heat is raiſed the matter ſwells, becomes black, and gives out a ſtrong odour of ammonia. When the odour of ammonia diſappears, if the matter be lixiviated with water, an alkaline ſolution may be obtained, which, by evaporation, yields cryſtals of carbonate of ſoda. If the reſiduum be incinerated, there will remain only a quantity of white aſhes, conſiſting of phoſphate of lime. Thus it appears that ſemen is compoſed of the following ingredients:

90	water,
6	mucilage,
3	phoſphate of lime,
1	ſoda.
100	

The ſeminal fluid, in its recent ſtate, contains an immenſe number of animalcula, called ſometimes vermiculi ſpermatici. They have a rounded head, with a gradually tapering tail, not ſtraight, but alternately bent to either ſide. They are 1000 times ſmaller than a hair, and 10,000 times more ſlender than one of the tubuli teſtis: ſo that, according to Leeuwenhoeck, 216,000 of them would go in a ſphere, equal in diameter to the breadth of a hair. Their length has been eſtimated at $\frac{3}{1,162,361}$dth of an inch. They are found in all quadrupeds, in reptiles, birds, fiſhes, inſects, and even in teſtaceous animals. Some variations in figure are obſerved in different animals: but their ſize is nearly uniform in all. They are no larger in a whale than in a ſmall fiſh. They are ſaid not to exiſt in children, nor to be obſervable after frequent coition, nor in old ſubjects; but only in healthy and prolific ſemen, ſo that their preſence may perhaps be deemed a criterion of the maturity and perfectneſs of that fluid. The ſeminal vermiculi were firſt obſerved by a German youth, Lewis Hamme. He ſhewed living animals in the human ſemen to Leeuwenhoeck in the year 1677. This indefatigable obſerver immediately employed himſelf on the ſubject, and in the ſame year ſent an account of the phenomenon, with drawings of the vermiculi in the dog and rabbit, to the Royal Society at London. (See Phil. Tranſ. n. 143.) The communication was received with great applauſe, the facts were ſhewn to king Charles II. and admitted by all. At the ſame time they were examined and deſcribed in France, and, as far as the mere demonſtration goes, they were univerſally admitted in the literary world. Nicolas Hartſoeker claimed the diſcovery, but not till the year 1678. (Eſſais de Dioptrique, p. 227.)

It has been alleged that theſe animalcula are not peculiar to the ſemen, but that they are found in various other animal fluids. Accurate inveſtigation has not ſubſtantiated this objection; but, on the contrary, ſhews that they are peculiar to the ſeminal fluid. Others have denied that they poſſeſſed tails; and Buffon, in particular, repreſents the facts very differently from Leeuwenhoeck. (Hiſtoire Nat. Gener. & Partic. t. 2. p. 176 & ſeq.); his repreſentations being ſupported by thoſe of Turberville Needham. (Nouvelles Obſervations Microſcopiques, p. 213.) M. De Buffon obſerved the fluid from the ſeminal veſſels of a dead human body yet warm. It was full of filaments moving about, and branching into many parts. The filaments ſwelling burſt, and many ovular corpuſcula eſcaped, which ſtill remained attached to the filament, as by a thread: then they oſcillated like a pendulum, and during thoſe oſcillations the thread extended. The corpuſcula, at length detached from the filaments, traverſed the moſt fluid part of the ſemen, along with their filaments, the extreme length of which impeded their motions, and they ſeemed to him to endeavour to free themſelves from it. Having diluted the ſemen with rain water, the microſcopic view was better defined. It clearly appeared that each ovular corpuſcle had a double motion of oſcillation, and of progreſſion. In two or three hours the ſeminal matter acquired greater fluidity, the filaments diſappeared; the number of corpuſcula increaſed; the threads contracted; the oſcillations relaxed; and the progreſſive motion increaſed. In five or ſix hours the ovular corpuſcula, having loſt the threads, reſembled animals more than ever; not only becauſe their quickneſs in ſwimming was greater, but becauſe they directed their courſe to every quarter. In twelve hours the activity of the corpuſcula was great; and ſome revolved upon their axis; others changed the ovular to the globular figure under the obſerver's eye; ſome divided aſunder, ſo that one formed two.

At the end of one day the number diminiſhed ; and, upon the third, none were to be ſeen. In other ſemen, which ſeemed to be entirely filamentous, the ovular corpuſcula did not proceed from the filaments ; but theſe, dividing in two, were metamorphoſed into corpuſcula. They were embarraſſed by a thread. The longer it was, the more it impeded their motion ; but it gradually contracted, and was at laſt completely deſtroyed. The figure of theſe ovular corpuſcula reſembled that of thoſe of infuſions. They ſwam with a progreſſive motion, though, at firſt, the thread occaſioned a ſimple oſcillation. He obſerved ſimilar phenomena in the ſeminal fluid of other animals. Sometimes the corpuſcula altered their figure ; ſometimes they divided into two. Buffon conceives that they cannot properly be deemed animals, and he forms of them a particular claſs, under the term of *organic molecules*, which are particles diſſeminated through all matter, original, incorruptible, animated, and always active. Nor does he heſitate to confide the formation of the animated univerſe to thoſe molecules. Subſequent reſearches have not confirmed theſe opinions of the French naturaliſt. That the ſeminal vermiculi have tails is proved by numerous accurate obſervers, and is particularly ſupported by the teſtimony of Haller. (Elem. Phyſiol. t. 7. p. 521.) It ſeems queſtionable whether Buffon ever ſaw the real ſpermatic vermiculi ; for the latter live at moſt only for a few hours after the diſcharge of the fluid, while thoſe obſerved by him remained for ſome days. And his remarks on the whole ſeem much more applicable to the microſcopic animalcula obſerved in vegetable infuſions, as well as in all liquors expoſed to the air. This point ſeems clearly proved by the labours of Spallanzani, who made a vaſt number of obſervations on the ſubject, and ſet the whole hiſtory of the ſpermatic animalcula in ſo clear a light, that no doubt can remain on the ſubject. The general reſult of his reſearches tends completely to confirm the original remarks of Leeuwenhoeck. (See his Tracts on the Nature of Animals and Vegetables, Edinb. 8vo. 1799.) He obſerves that his experiments on freſh human ſemen preſented him with totally different reſults from thoſe deſcribed by Buffon, but as he could not regard Buffon's ſtatements as purely chimerical, he thought the contradiction might be reconciled by ſhewing that the French naturaliſt had deſcribed animals of a different kind. " I had remarked," ſays he, " that there is no part of an animal which, when infuſed, does not give exiſtence to a particular kind of animalcula. They are produced indifferently, by the muſcles, brain, nerves, membranes, tendons, veins, and arteries. The ſame holds good of the blood, ſerum, milk, chyle, ſaliva, &c. mixed with water, or even by themſelves. I had not yet made experiments upon the human ſemen for this purpoſe ; but it was moſt probable, that the putrefaction of this liquid would give exiſtence to particular beings. May not M. de Buffon have confounded theſe with the ſeminal vermiculi, and aſcribed to the latter the properties and phenomena exhibited by the former ? I determined to aſcertain this fact by obſerving what happened ſucceſſively to the ſemen, when long preſerved in a watch-glaſs. I made my firſt experiments on the human ſeminal fluid. The vermiculi died in three hours and a half, and were precipitated to the bottom of the glaſs. Upon the ſixth day, the ſeminal fluid began to exhale a fœtid and diſagreeable odour ; but I could perceive no animated being : only, upon taking ſome drops from the bottom of the glaſs, I obſerved the dead bodies of the vermiculi apparently very entire. The ſeventh and eighth days I ſaw no change, but the fœtor increaſed. On the ninth I diſcovered very minute animalcula, their ſize nearly equalling that of ſpermatic vermiculi ; but they had no tail, and greatly reſembled moſt minute ſpherules. Like animalcula of infuſions, they ſometimes ſtopped at little fragments of corrupted ſemen : ſometimes their courſe was very rapid, retrograde, riſing and ſinking in the fluid : in a word, they poſſeſſed every property of infuſion animalcula. They were ſeen in every ſtratum of the ſemen ; and thoſe at the bottom put in motion the dead bodies of the ſeminal vermiculi, which were ſtill entire, and remained ſo ſome days longer." Two or three ſucceſſive generations of theſe animals were obſerved, as in the caſe of other animalcula. When the ſemen was expoſed to a greater degree of heat, they appeared at a more early period, even as ſoon as twenty-three hours from the removal of the fluid from the dead body. In one inſtance they were obſerved to propagate by a ſpontaneous tranſverſe diviſion of the body. " Theſe facts ſufficiently ſatisfied me that Buffon had erroneouſly aſcribed to the ſpermatic vermiculi properties belonging only to the animalcula of infuſions. Let us, in a few words, collect the circumſtances. According to this author, after a certain time, the vermiculi were deprived of their tails. He ſhould have ſaid that the animalcula of infuſion came in the place of the vermiculi, which were already dead, and precipitated to the bottom of the liquid. He was arreſted by their firſt appearance : and took them for ſeminal vermiculi deprived of their tail, which in truth they often very much reſemble. When diſengaged from the tail, Mr. Buffon adds, they acquire greater activity. This was a neceſſary conſequence of the firſt miſtake. When the infuſion animalcula had taken place of the vermiculi, their increaſed agility could not be unobſerved, ſince the animalcula move with much greater quickneſs than the vermiculi. This erroneous ſuppoſition being admitted, Mr. Buffon had to relate, as he has done, the remainder of the phenomenon. He had to ſpeak of the imaginary changes of the vermiculi, of their diviſion, and their diminution, with the more confidence, as his opinions had to be confirmed by a repetition of his experiments, if not upon all, at leaſt upon many ſpecies of infuſion animalcula in the ſemen." p. 135--142. The following account of the ſpermatic vermiculi is taken from the work of Spallanzani already quoted, which contains the moſt complete account of the ſubject.

When the ſemen begins to diſſolve, if it be examined with a magnifier of ſmall power, the irregular parts ſeem to be in an indiſtinct ſlow agitation, produced by globular corpuſcula, of which each poſſeſſes a ſort of filament, or ſhort appendage, about ſix times the length of the body. They have two motions ; one oſcillatory, from right to left, and *vice verſâ*, in which the appendage is curved from one ſide to the other : the other is progreſſive, the vermiculus tranſporting itſelf by oſcillation. They ſtrike againſt every obſtacle, and when in conſiderable numbers, make a thouſand contortions to eſcape, at laſt taking that way where they feel the leaſt reſiſtance. Thus they are in continual motion. In twenty-three minutes the motions of oſcillation and progreſſion had diminiſhed ; and in an hour and a half it had leſſened ſo much, that a very ſmall number of corpuſcula poſſeſſed any power of motion. In general, the progreſſive motion ceaſes before the oſcillatory ; ſo that, at laſt, the corpuſcle merely bends from right to left, and reciprocally. They continue fixed to the ſame ſpot, until the oſcillatory motion inſenſibly dies away. After all motion is gone, the corpuſcula remain entire in the fluid, and then they are better ſeen than even when the liquid is diluted with water. Each corpuſcle is not properly globular, but elliptic, and the appendage is not only longer than it appears, but the breadth is not equal throughout like a thread, but increaſes as it approaches the body. Water or other fluids rendered them immediately motions. They may be ſometimes obſerved, in the clots of the ſemen, before they have diſſolved, attached by their appendages to the filamentous matter: they ſtruggle to diſengage themſelves, and then ſwim about in the fluid. The motion continues much longer when the temperature of the atmoſphere is increaſed: at 36° all motion had ceaſed in three quarters of an hour: at 49° in two hours; at 59° in three hours and a half: and at 81° they lived for ſeven or eight hours. The corpuſcula were ſeen in the fluid obtained from the epididymis and teſticles of various living and recently dead animals. That they are not formed, according to the ſentiment of Buffon, from the filamentous part of the ſemen, is proved by this; that they are moſt abundant in the fluid part, and even do not exiſt at all in the clots, where they are examined in a very recent ſtate, and freed as much as poſſible from the thinner part of the ſeminal fluid; while the latter, at the ſame time, abounds with them. Nor are they generated, as Needham aſſerted, by expoſure to air. For Spallanzani ſaw them in the uſual numbers, when the time employed in taking the fluid matter from the ſeminal veſſels ſtill warm, to preſent it to the microſcope, did not exceed a ſecond; and they were obſerved in the ſame numbers in ſeminal fluid carried without delay from the epididymis of a living ram to the microſcope.

Great care and attention are neceſſary in obſerving the appendages of theſe vermiculi, and hence they eſcaped the notice of Buffon. It is wonderfully ſlender, and at the ſame time tranſparent, ſo that too ſtrong a light confounds it with the ſeminal fluid: the ſlider ſhould be fine and thin, and the drop of fluid very thin: and a microſcope of a ſingle lens is preferable to the compound one.

They live longer in cloſe veſſels, than when the ſemen is expoſed to the air; and they alſo live longer in vacuo. The difference of time at which they die in theſe different ſituations amounts even to one, two, or three hours. "Theſe facts prove that the air is noxious to the vermiculi, and the following prove that it is the cauſe of their being in continual agitation. With the blow-pipe I formed capillary tubes, one end of which I immerſed in recent ſemen; it aſcended the cavity, filling the tube to a certain height. Breaking the tubes near the part to which it aſcended, I preſented this extremity to the blow-pipe, and immediately ſealed it hermetically. I did the ſame to the other end, by which means the ſeminal fluid was deprived of all communication with the external air. I drew out the tubes, ſo that the thinneſs of the tubes permitted me to ſee the vermiculi within. The peculiarities preſented by the vermiculi in the tubes were very different from thoſe of the reſt. All, or at leaſt moſt of them, had a ſingular mode of moving. Some had that ſort of activity obſerved in thoſe, which experience the influence of the open air. Others had a continued irregular motion; they changed from quickneſs to inactivity, and reciprocally. Others ſtopped entirely, and, after reſting ſome minutes, reſumed their former velocity; beſides, they were not obſerved to run againſt the ſolid portions of the ſemen, but to avoid them by turning aſide or retreating. Theſe peculiarities always ſucceeded better, and with more uniformity, when the tubes were kept warm. I have before ſaid that the longeſt period of life, of the human ſpermatic vermiculi, was ſeven or eight hours, when expoſed to the open air, but this period is greatly prolonged when they are included in tubes. In ſummer I have ſucceeded in preſerving them two days or more; and in ſpring and autumn they have lived almoſt three." P. 158.

Cold, near to that of freezing, renders the vermiculi motionleſs; but they are recovered by the application of heat. A temperature of 131° kills them; but the animalcula produced in the ſemen by putrefaction are deſtroyed by a temperature of 108°.

To this account of the ſeminal vermiculi we ſubjoin the following reflections on them by Bonnet, obſerving only that we are in a ſtate of the moſt profound ignorance of all the points alluded to in his queſtions.

"The vermiculi are, of all the animalcula of liquids, thoſe which have moſt excited my curioſity; the element in which they live, the place of their abode, their figure, motion, ſecret properties, all, in a word, ſhould intereſt us in ſo ſingular a kind of minute animated beings. How are they found there, how are they propagated, how are they developed, how are they fed, and what is their motion? What becomes of them when the liquid they inhabit is returned by the veſſels, and mixed with the blood? Why do they appear only at the age of puberty; where did they exiſt before this period? Do they ſerve no purpoſe but to people that fluid, where they are ſo largely ſcattered? How far are we from being able to anſwer any of theſe queſtions!" Spallanzani's Tracts, p. 179. The reader may alſo conſult, on this ſubject, W. F. von Gleichen über die Saumen-unk infuſions-thierchen, Norimb. 1778, 4to.

The opinions of Leeuwenhoeck concerning theſe vermiculi; *viz.* that they are of different ſexes, that they copulate, become impregnated and produce young; and that they are the rudiments of the future beings, to be conveyed by copulation into the body of the mother, and there developed; are deſtitute of all proof, and completely chimerical.

We have no accurate accounts of the ſenſible properties, nor any chemical hiſtory of the fluid ſeparated in the teſtis. When obſerved in the vas deferens or epididymis of man, after death, it poſſeſſes a light-brown or yellowiſh colour, and approaches in fluidity to water. It may be ſeen in animals, on cutting into the teſtis or epididymis, much thicker, viſcous, and of a grey colour. At leaſt it has this appearance in a dog. The whole gland, in a healthy animal, is turgid with this fluid. The contents of the veſiculæ ſeminales differ in their appearance from the ſecretion of the teſticles. It is a browniſh or yellowiſh fluid of light colour, ſemitranſparent, and often containing flakes or coagula, ſo as to vary in conſiſtence in different parts of the bag. Expoſure to the air produces no change in its conſiſtence, as it does in the ſemen. Sometimes the contents of theſe bags are a clear mucous fluid. Mr. Hunter took the trouble of obſerving them, in two healthy perſons killed ſuddenly, immediately after death. "In one the fluid in the veſiculæ was of a lighter colour than is uſually found in men who have been dead a conſiderable time; but it was not by any means like the ſemen either in colour or ſmell." In the other "the contents of the veſiculæ were of a lightiſh whey colour, having nothing of the ſmell of ſemen; and in ſo fluid a ſtate, as to run out on cutting into them." (Obſ. on the animal Economy, p. 28.) Thus it appears that the fluid of theſe bags differs both from that contained in the teſtis, and from the ſemen emitted in coition; conſequently, that they are not merely reſervoirs for the matters ſeparated in the teſticle, but that they add to the ſecretion of that gland ſome conſiderable bulk of fluid, ſeparated by their own veſſels. The peculiar organization of their internal ſurface would have led us a priori to expect this, as it exhibits an arrangement of parts found only where ſome ſecretion is performed. The ſame argument will lead us to aſſign a ſimilar function to the enlarged portion of the vas deferens lying by the ſide of the veſicula ſeminalis. The exact nature of the fluid ſeparated in the veſiculæ is not known; nor have we any chemical analyſis of it. In many inſtances it looks like a ſimple mucus; and there can be very little doubt, that in all caſes the contents of theſe bags conſiſt chiefly of their own ſecretions.

The opinion, that the veſiculæ perform a particular ſecretion, was held by Haller: "I have," ſays he, "no experiments of my own to prove that any thing is ſeparated in theſe organs, and mixed with the fluid formed in the teſtes. I ſuſpect, however, that a ſecretion takes place here as in the gall-bladder." (Elem. Phyſiol. 7. p. 540.) Galen conceived that the ſemen was generated in theſe parts; and Riolau, Ruyſch, and Swammerdam, were of opinion that they added ſomething to the ſeminal fluid. The point has been moſt clearly proved by Mr. Hunter in a paper contained in his Obſervations on the animal Economy, and entitled "Obſervations on the Glands ſituated between the Rectum and Bladder, and called Veſiculæ ſeminales." His chief argument is derived from the examination of the organs in perſons who have loſt one of the teſtes by accident, or in conſequence of diſeaſe. It is well known that this loſs does not affect the generative powers, and that ſuch individuals retain their ſexual appetites and the faculty of procreation. We may conſequently preſume that they have afterwards had connection with women, and conſequently had the action of emiſſion, which muſt have emptied the veſicula of the caſtrated ſide, if it had contained ſemen; and, as the removal of the teſtis muſt have cut off all ſource of ſupply from that quarter, it ſhould be found empty after death, on the ſuppoſition of its contents being ordinarily derived from the teſtis. Such caſes alſo afford an opportunity of making comparative obſervations between the veſicula of the perfect and that of the imperfect ſide.

"A man," ſays Mr. H., "who was under my care in St. George's hoſpital for a venereal complaint, died there, and was diſcovered to have loſt his right teſticle. From the cicatrix being hardly obſervable, it muſt have been removed ſome conſiderable time before his death; and the complaint, for which he was received into the hoſpital, is a convincing proof that he had connection with woman after that period. I inſpected the body in the preſence of Mr. Hodges, the houſe ſurgeon, and ſeveral of the pupils of the hoſpital. Upon diſſecting out, and examining the contents of the pelvis, with the penis and ſcrotum, I found that the vas deferens of the right ſide was ſmaller and firmer in its texture than the other, eſpecially at that end next to the abdominal ring, near to the part that had been cut through in the operation. The cellular membrane ſurrounding the duct on the right ſide was not ſo looſe as on the left; neither were the veſſels which ramified on the right veſicula ſo full of blood. But upon opening the veſiculæ, both appeared to be filled with a kind of mucus ſimilar to that which is found in other dead bodies; and the veſicula on the right ſide was rather larger than that on the left. Whatever, therefore, may be the real uſe of theſe veſiculæ, we have a proof from this diſſection, that in the human ſubject they do not contain the ſemen.

"In a man who died in St. George's hoſpital with a very large bubonocele, the teſticle of that ſide was diſcovered to have almoſt loſt its natural texture from the preſſure of the hernial ſac; and upon examining the teſticle with attention, there was no appearance of vas deferens till we came near the bladder, where it was almoſt as large as uſual. The veſicula of that ſide was found to be as full as the other, and to contain the ſame kind of mucus.

"I extirpated the left teſticle of a Frenchman on account of its being diſeaſed. He was a married man, and died about a year afterwards, having been extremely ill for ſeveral months before his death. On examining the body, the veſiculæ were both found nearly full; more eſpecially that of the left ſide, which I ſuppoſe might be accidental. But upon examining the vas deferens of the left ſide, where it lies along the ſide of this bag, and where it has a ſimilar ſtructure with the veſiculæ, I found it filled with the ſame kind of mucus; and this, I believe, is always the caſe, whether the teſticle has been removed or not.

"A young man, a coachman, who had a diſeaſe in his left teſticle, had it removed, at St. George's hoſpital, by Mr. Walker, in Auguſt 1785; and in February 1786 he returned again to the hoſpital, on account of uncommon pains all over him, and for which he requeſted to be put into the warm bath. But as he was going from the ward to the bath, he dropped down, and died almoſt immediately. The body was inſpected, with a view to diſcover the cauſe of his death, and upon an examination of the veſiculæ, the bag of the left ſide was as full as that on the right, and the contents in both were exactly ſimilar.

"In diſſecting a male ſubject, in the year 1755, for a ſide view of the contents of the pelvis, I found a bag on the left ſide, lying contiguous to the peritoneum, juſt on the ſide of the pelvis, where the internal iliac veſſels divide above the angle of reflection of the peritoneum at the union of the bladder and rectum. The left vas deferens was ſeen paſſing on to the bag; and, what is very ſingular, that of the right or oppoſite ſide croſſed the bladder near its union with the rectum to join it. I traced the left vas deferens down to the teſticle; but on following the right through the ring of the external oblique muſcle, I diſcovered that it terminated at once, about an inch from its paſſage out of the abdomen, in a blunt point, which was impervious. On examining the ſpermatic cord from this point to the teſticle, I could diſcover no vas deferens, but by beginning at the teſticle, and tracing the epididymis from its origin about half way along, where it lies upon the body of the teſticle, I found that it at firſt became ſtraight, and ſoon after ſeemed to terminate in a point. The canal at this part was ſo large as to allow of being filled with quickſilver, which however did not paſs far, ſo that a portion of the epididymis was wanting; and the vas deferens for nearly the whole length of the ſpermatic cord of the right ſide. On the left ſide the vas deferens begun where the epididymis commonly terminates; and there was a deficiency of nearly an inch of the extremity of the epididymis. I then diſſected the bag above-mentioned, which proved to be the two veſiculæ; for by blowing air from one vas deferens I could only inflate half of it; and from the other vas deferens, the other half. They contained the mucus commonly found in theſe bags; but upon the moſt accurate examination I could diſcover no duct leading from them to the proſtate gland, nor any remains of one. In this ſubject it was evident that there was no communication between the vas deferens and epididymis; nor between theſe bags and the urethra. The caput gallinaginis had the common appearance, but there were no orifices to be ſeen. The teſticles were very ſound; and the ducts from them to the epididymis were very manifeſt, and full of ſemen." P. 30—32.

Mr. Hunter obſerves further, in ſupport of his opinion, that theſe bags are as full of mucus in bodies much emaciated, where the perſon has died from a lingering diſeaſe, as in ſtrong robuſt bodies where death has happened from violence or acute diſeaſes; and they are nearly as full in the old as in the young; which moſt probably would not be the caſe if they contained ſemen." Ibid. p. 33.

The ſecretion of the proſtate is the laſt ingredient in the ſeminal fluid; and it contributes very largely to the bulk of what is expelled in copulation. Its opaque whiteneſs and viſcidity completely obſcure the properties of the fluid ſecreted in the teſtis, and beſtow on the ſeminal liquor its moſt obvious characters. The opinion which ſuppoſes that the ſemen is formed, or that part of it is produced in the proſtate, is not therefore ſo very far from the truth. A thick, white, and opaque liquor may be expreſſed in conſiderable abundance from the proſtatic ducts on each ſide of the caput gallinaginis after death. Phyſiologiſts aſcribe to the proſtatic fluid the office of increaſing the bulk of the ſemen, and of thereby augmenting its impetus, ſo that it may arrive with greater force at the place of its deſtination.

It has been conjectured that a nervous fluid is mixed with the ſemen, and hence the weakneſs of the male after copulation has been explained. We may be excuſed from diſcuſſing this opinion until we know what nervous fluid is. The convulſive exertion of the whole frame, which occurs in the venereal organs, will ſufficiently account for the ſenſe of fatigue that follows it.

It appears from what we have ſaid, that the fluid expelled in copulation is furniſhed in a ſmall proportion only by the teſtes; that a peculiar ſecretion of the veſiculæ ſeminales is added to this, and that the chief bulk is made up of the proſtatic liquor. An important queſtion ariſes here, which of theſe is the eſſential and immediate agent in impregnation? The general practice in the Eaſt, continued from ages of the moſt remote antiquity, of entruſting their females to the care of eunuchs, and the common operation of gelding, as performed on various domeſtic animals, lead us to aſſign this prerogative to the fluid ſecreted in the teſtis. In emaſculating animals, or men, the teſtes are cut or torn out, or they are compreſſed ſo as to deſtroy their organization, or the cord is ſo ſqueezed or bruiſed as to annihilate the functions of the part. Yet, under the circumſtances juſt enumerated, we read of numerous examples where venereal deſires have been experienced, where erection, copulation, and emiſſion have taken place, and even where children have been begotten. Theſe examples, however, are too repugnant to the general effect of caſtration, as obſervable in man and animals, to allow of our admitting them. Ordinarily we obſerve not only that no deſires are felt, but alſo that the loſs of the organs, in which the natural and leading ſtimulus reſides, occaſions the other parts concerned in the buſineſs of generation to be much diminiſhed in ſize, and altered in appearance. Where emaſculation has been performed merely by compreſſing the cord or teſtis, the organization of the part may not have been deſtroyed ſufficiently to interrupt its functions, and ſuch an animal might be ſtill capable of fecundating; but no well authenticated inſtance can be produced of impregnation being effected where the teſtes had been cut out in any male animal. Yet it cannot be doubted that eunuchs may have erections, ſince the ſeat of the phyſical feeling is in the glands, and the whole apparatus concerned in erection remains entire after the loſs of the teſtes. A man, after the latter occurrence, like one who has loſt his powers through age, may at times be ſtimulated by the recollection of paſt joys. Hence, in the Eaſt they value thoſe eunuchs moſt highly, in whom the penis as well as the teſtes has been removed; no cauſe for the ſlighteſt jealouſy can then remain. The proſtatic liquor, or that of the veſiculæ ſeminales, might be diſcharged in the eunuch. If an animal has impregnated another after caſtration, there may have been ſome ſemen remaining in the veſiculæ ſeminales.

Beſides the facts now enumerated, we may obſerve that all animals which copulate have teſtes; but that ſeveral have either no proſtate or no veſiculæ.

The ſecreted ſemen is either expelled from the body, fulfilling the purpoſes of its formation; or it is retained in its receptacles, and taken up by the abſorbents. The ſeminal veſſels are always full of their peculiar fluids, which are only diſcharged at conſiderable intervals, and often only at periods of ſome months or years. As the teſtis and veſiculæ ſeminales poſſeſs numerous abſorbents, we cannot doubt that the contained fluids are conveyed by theſe veſſels into the general circulation. It has been a general opinion that this abſorption produces many of the changes which are well-known to take place at puberty; and which obviouſly depend, as we have already ſhewn, on the teſtes. We refer to a former part of the article on this ſubject. The males of animals, when the rutting ſeaſon approaches, have their whole bodies penetrated by a ſingular fetor, ſo that they are unfit for food. The fleſh at this time putrifies more rapidly than at other ſeaſons in the ſtag. That abſorbed ſemen is the cauſe of this fetor, is rendered probable by the fact, that the removal of the teſtes deſtroys it; and by its abſence from caſtrated animals of the ſame ſpecies. The ſame cauſe has been aſſigned for the phenomena conſequent on conception in the female; but this ſeems very doubtful. This abſorbed ſemen has been ſuppoſed by phyſiologiſts to act as a ſtimulus on the heart, and the organs of motion, to increaſe the muſcular ſtrength, and to contribute thereby to health of body and ſtrength of mind. Hence, too, they have explained the ſoftneſs and inſipidity of the fleſh obſerved in ſome animals after the copulating ſeaſon; as, for inſtance, in the boar. The fleſh of the ſalmon is remarkably changed in colour and flavour at this time. Caſtration produces debilitating effects both on the body and mind of man and animals; the ferocious and powerful bull is changed into the mild and patient ox. The influence of the ſame proceſs in mankind has been already noticed; and we have ſufficiently proved that the remarkable developement of the frame at the time of puberty ariſes entirely from the influence of the teſticles. And it is no leſs true that the reſt of the ſexual organs are particularly affected by the preſence and activity of the teſtes. In this country we have little or no opportunities of obſerving in eunuchs the effect of the mutilation on the other organs of generation; but we can ſee the conſequences in animals. In Mr. Hunter's opinion, the penis, urethra, and all parts connected with them, are ſo ſubſervient to the teſticles, that he conceives that few of them would have exiſted if there had been no teſticles in the original conſtruction of the body; theſe parts would then have been ſo formed as to aſſiſt merely in the expulſion of the urine. To illuſtrate this opinion, let us obſerve what is the difference between theſe parts in the perfect male, and in a male that has been deprived of the teſticles when very young, at an age when they have had no ſuch influence on the animal economy as to affect the growth of the other parts. In the perfect male the penis is large; the corpora cavernoſa being capable of dilatation. The corpus ſpongioſum is very vaſcular; and that part of the canal which is called the bulb is conſiderably enlarged, forming a cavity; the muſculi acceleratores urinæ, as they are called, are ſtrong and healthy. In many animals which have long peniſes, they are continued forwards to the end of it, and in others they are not extended ſo far, but are very large. On the contrary, in the caſtrated animal, the penis is ſmall and not capable of much dilatation; the corpus ſpongioſum is leſs vaſcular; the cavity at the bulb is a little larger than the canal of the urethra; and the muſcles are white, ſmall, and have a ligamentous appearance. The ſame obſervations are true, if applied to the erectores penis. The penis of the perfect male is of ſufficient length, when erected, to reach to the further end of the vagina of the female. In the caſtrated animal it is much ſhorter; and erections having thus become unneceſſary, the parts which ſhould project often adhere to the inſide of the prepuce. The proſtate, Cowper's glands, and the glands along the urethra, of which the lacunæ are the excretory ducts, in the perfect male, are large and pulpy, ſecreting a conſiderable quantity of a ſlimy mucus, which is ſalt to the taſte, is moſt probably for the purpoſe of lubricating thoſe parts, and is only thrown out when the animal is in vigour for copulation; while in the caſtrated animal they are ſmall, flabby, tough, and ligamentous, and have little ſecretion." Animal Economy, p. 39.

It muſt be acknowledged that we have no very direct proof that any actual abſorption of ſemen takes place from the teſticles or veſiculæ, and ſome phyſiologiſts deny it altogether. "I very much doubt," ſays Blumenbach, "whether real ſemen be ever abſorbed from its veſicular reſervoirs in a healthy man;—ſtill more of what has been occaſionally aſſerted, that it is immediately conveyed into the neighbouring veins: and moſt of all, that ſuch abſorption (ſuppoſing [illegible]tence to be granted) ſhould be conſidered as a proviſion againſt premature venereal ſtimuli. On the contrary, if we compare the phenomena obſerved in animals, the impetuous irreſiſtible nature of their deſires at particular ſeaſons of the year, with the conſtitution of ſuch as are caſtrated, we ſhall rather deem ſuch abſorption the cauſe of that ungovernable and almoſt furious appetite. I conceive that a very different means (peculiar, as far as I know, to the human ſubject) has been adopted to anſwer the purpoſe juſt alluded to; *viz.* nocturnal emiſſions, which I refer to the natural excretions of man, inaſmuch as their more rare or frequent occurrence, according to varieties of temperament and conſtitution, ſerves to liberate him from the troubleſome and inconvenient conſequences of an abundant ſeminal ſecretion. It may be readily granted that barbarous nations, of a phlegmatic temperament, and practiſing irregular ſexual intercourſe, do not require ſuch an excretion: yet, I think it muſt be deemed a very natural and ſuitable relief in a young unmarried man, of a ſanguine temperament, plethoric habit, lively and warm imagination, particularly if he indulges in a luxurious mode of life and enjoys perfect health. See Chr. Rud. Jaeniſch de pollutione nocturna. Götting. 1795, 4to. Inſtitut. Phyſiol. ſect. 36.

The length of courſe, and the ſmall diameter of the ſpermatic artery, together with the impoſſibility of forcing any injected fluid from its branches into the ſecretory tubes of the teſticle, have led phyſiologiſts to conclude that the ſecretion of the ſeminal fluid is performed very ſlowly. But various circumſtances are capable of accelerating this proceſs. "Princeps eſt amor;" ſays Haller, Elem. Phyſiol. 7. 551. "Nemo forte fuerit, quin in juventute ſua feminam concupiverit; quin ſi caſta fuit, in ejus familiaritate ignes conceperit occultos: quin ſenſerit cum dolore et incommodo ſibi teſtes intumeſcere, et vaſa ſeminalia; dolore certe tanto, ut vix tangere poſſet eam regionem, vix incedere. Manifeſto in hoc malo accelerata eſt ſecretio ſeminis, ejuſque liquoris major penus teſtem diſtendit. Id mali genus ex reddita tranquillitate animi, et abſentia amotæ feminæ ſedatur; et celerius etiam ſanatur fruitione cupitæ puellæ, et ſi neutrum remedium acceſſerit in difficiles tumores abire poterit. Quare in univerſum, ut plurimum ad movendam venerem irritamenta faciant deſideratæ feminæ, aut imagines aſpectu lubricæ, aut alia quæcunque, quæ per legem aſſociationis idearum voluptatis memoriam renovant; ita abſentia ejuſmodi ſtimuli, et cogitationes perpetuo ad alia averſæ, ipſaque religio, ita minuunt ſeminis generationem, ut multo minori copia gignatur, neque moleſtum ſit, et demum vaſa ſeminis pene coaleſcant, et genitalium moles ipſa diminuatur." A healthy and ſtrong ſtate of the animal, nutritious and perhaps rather generous food, and a certain warmth of the weather, promote the ſeminal ſecretion. All theſe circumſtances diſpoſe the organs for action, when the natural feelings are duly excited; and the oppoſite cauſes, as infirm health, fatigue, inſufficient or bad food, and conſiderable cold, prevent the feelings or diſpoſitions neceſſary for the action of the generative organs from taking place. The reproductive function is ſo much influenced by the ſeaſon in animals, that it is only carried on at a particular time of the year; and the leading organs (the teſticles) are reduced in many inſtances to a very ſmall ſize in the winter. But in man, and in ſuch domeſticated animals as are not in a ſtate of nature, no ſuch change takes place in the teſticles; they are conſequently always in good condition, and in that ſtate to which other animals that are left to themſelves, can only attain in the warmer ſeaſon.

That the ſemen, ſecreted in the ſerpentine tubuli of the teſtis, is conveyed from them into the epididymis, and thence into the vas deferens, is ſufficiently obvious from the anatomical ſtructure. De Graaf proved it ſtill further, by tying the vas deferens of a dog before copulation: all the ſecreting tubes were diſtended to the utmoſt, and the teſtis conſiderably ſwollen.

We cannot doubt that the ſecretory veſſels of the teſtis propel their contents by ſome contractile power; although the preciſe manner in which this is effected eſcapes our obſervation. Does the elevation of the teſtis to the ring, by the action of the cremaſter, conſtantly obſerved to accompany emiſſion, promote the progreſs of the ſecreted fluid? The immenſe length and numerous turns of the ſeminal tubes muſt render the paſſage of this fluid from its firſt ſecretion very ſlow: hence, when the ſupply contained in the veſiculæ is entirely exhauſted, an intermiſſion of ſome time is neceſſary for the reproduction of a ſufficient ſupply; hence too, in the dog, where there are no veſiculæ, the act of copulation is unuſually prolonged.

It has been generally conſidered that the fluid produced in the teſtes is depoſited and retained in the veſiculæ ſeminales, as in reſervoirs, until occaſion occurs for its diſcharge. Mr. Hunter has endeavoured to ſhew that theſe bags are not to be regarded in the light of receptacles for the ſemen, but as deſtined to perform a peculiar ſecretion. The common opinion reſts on the facts of the very free communication between the vaſa deferentia and veſiculæ, on the courſe which injected fluids take in the dead body, and the extreme minuteneſs, numerous convolutions, and great length of the ſeminal tubes, which ſeem very unfavourable to the production of ſemen in the ſudden way, and at the very ſhort notice at which it muſt be formed, if we do not ſuppoſe it to come from the veſiculæ. We have already detailed the proofs by which it appears that theſe organs perform a ſecretion; but none of thoſe facts ſhew that the contents of the veſiculæ may not conſiſt, in part, of matter formed in the teſtis. We know that the gall-bladder produces a copious ſecretion of its own; but that it alſo receives bile from the hepatic duct through the ductus cyſticus. Mr. H. endeavours to adduce a deciſive argument from comparative anatomy: he ſtates that in many animals, the parts correſponding to the human veſiculæ ſeminales have no communication with the vaſa deferentia, and moreover, that their ſtructure, in ſeveral inſtances, ſeems little calculated to make them reſervoirs. Where the obvious ſtructure is ſo different, we are by no means warranted in concluding that the functions are exactly ſimilar. To argue that the ſemen does not paſs into the veſiculæ of man, where the vaſa deferentia are ſo intimately connected to thoſe bags, becauſe the analogous parts are not connected in other animals, is not more reaſonable, than it would be to affirm aſfirm that the fluid of the vaſa deferentia paſſes into the veſiculæ in animals, where the two are not connected, becauſe the ſtructure leads us to infer that it does ſo in man.

Mr. Hunter continues, “ we may likewiſe infer, from what has been ſaid, that the ſemen is not retained in reſervoirs after it is ſecreted, and kept there till it is uſed; but that it is ſecreted at the time, in conſequence of certain affections of the mind ſtimulating the teſticles to this action: for we find, that if laſcivious ideas are excited in the mind, and the paroxyſm is afterwards prevented from coming on, the teſticles become painful and ſwelled from the quantity of ſemen ſecreted, and the increaſed action of the veſſels; which pain and ſwelling are removed immediately upon the paroxyſm being brought on and the ſemen evacuated; but if that does not take place, the action of the veſſels is ſtill kept up, and the pain in the teſticles will generally continue till the paroxyſm and the evacuation of the ſemen are brought on, which renders the act complete; without which a ſtop cannot be put to the action of the veſſels that produce the ſecretion, nor the parts be allowed to fall back to their natural ſtate. There is at this time no ſenſation felt in the ſituation of the veſiculæ ſeminales. The pain in the teſticles, in conſequence of their being filled with ſemen; and the action being incomplete, is ſometimes ſo conſiderable as to make it neceſſary to produce an evacuation of the ſemen to relieve the patient.” Animal Economy, p. 33.

We certainly admit with Mr. H. that the veſiculæ ſeminales of the human ſubject perform a particular ſecretion; but we do not conceive him to have ſucceeded in proving that they are not alſo reſervoirs for the ſemen.

The opinion, which denies the veſiculæ ſeminales to be reſervoirs for the ſemen, is defended alſo by J. A. Chaptal, in the Journal de Phyſique, February 9, 1787, p. 101. Soemmerring has refuted it in the third vol. of Blumenbach's Mediciniſche Bibliothek, p. 87.

The tranſmiſſion of the ſemen, from its ducts or veſiculæ, into the urethra, takes place under the influence of a particular ſtate of mind; and its expulſion from the body is effected, in all animals which have a penis, by means of what is called the erection of that organ. In the human ſubject, this is an increaſe of volume produced by the diſtention of the three corpora cavernoſa. Among the exciting cauſes of this proceſs, we may enumerate, in the firſt place, the preſence of a ſufficient ſupply of ſeminal fluid: when this is preſent, any additional ſtimulus eaſily produces the effect. Hence, we obſerve, that the venereal powers of animals are the greateſt, when their teſtes are of the largeſt ſize; hence, too, we may perhaps explain the erection ſometimes obſerved after a full meal. A ſecond and more powerful excitement is derived from mental cauſes. “ Altera cauſa,” ſays Haller, “ in ſano homine eſt imaginatio, ſive cupido veneris, quæ ex quacunque cauſa orta, lectione, viſa pictura, memoria voluptatis priſtinæ, confabulatione, tactu, et aliis cauſis, in ſano homine continuo in erectionem erumpit. Eadem nocturnam illam et ſolitariam venerem ſola abſolvit, qua ſe natura nimii ſeminis onere liberat variis, pro varia ſeminis abundantia, et ſenſu acriori aut obtuſiori, intervallis. Nam pueris facillima, ſenibus ea venus rarior eſt, aut nulla. Soli homini data eſt, forte quod homo potiſſimum memoria et imaginatione valeat. Imaginationem ſolam, non erectionem, ſed plenam venerem, etiam in vigilantibus perfeciſſe adſunt teſtimonia. Neque poteſt abſque imaginatione excitata unquam hoc opus perfici; ut turpi, neque hactenus adamata in femina venus vix exerceri poſſit. Inde illæ impotentiæ ex verecundia, ex imaginaria debilitate, quo faſcinum revoco, aut ex odio, quæ quidem ſpecies cum relativa poteſtate conjuncta eſt. Hinc manifeſta iniquitas ejus legis, quæ ex congreſſu de virilitate mariti judicabat, quem in exoſa uxore, poſt ſummam injuriam paſſam, in conſpectu tot hominum, ferreum oporteret eſſe, ut iis cum impedimentis venerea jura perficiat. Quare in Gallia anno, 1677, die 18. menſis Januarii, ridicula lex abolita fuit, cum Marchio de Langey, a judice poſt congreſſum pro impotente damnatus, diſſoluto matrimonio, cum alia uxore multos filios generaſſet.” (Element. Phyſiol. 7. 557.) The peculiar odour exhaled from the female organs, particularly at certain ſeaſons, is a very powerful incentive of venereal feelings in the animal kingdom. Haller conſiders that this cauſe acts in the human race alſo. “ Propius partes genitales ipſas adficit, et excretionem extorquet, auget et perficit, frictio glandis, et potiſſimum colliculorum, qui ſunt ſub ortis urethræ, quocunque fere modo ea frictio adminiſtretur. Sed ea cum voluptate peculiari, ſumma, pene nimia, conjungitur, agitque iterum manifeſto in nervos, ut vel ex acuto ſenſu glandis conjicere licet.” Elem. Phyſ. ibid.

Erection of the penis takes place from various cauſes, not enumerated under the foregoing heads; and then it has no concern with the expulſion of the ſeminal fluid. When a perſon wakes in the morning, with the bladder tolerably full of urine, the organ is commonly erect; but it ſubſides when the water is evacuated. Striking the nates with a rod is well known to produce erection; and has ſometimes been reſorted to to rouſe dormant paſſions. Calculus, ſtrangury, and hemorrhoids are ſometimes attended with this ſymptom; which has been occaſionally obſerved alſo in other affections. It is often particularly troubleſome in gonorrhœa; and has been obſerved many times after death, particularly in thoſe who have been hanged. (See Morgagni de Sed. et Cauſ. Ep. xix.) Mechanical obſtruction to the return of blood from the part will produce erection, and even ſuch a ſwelling as ends in gangrene, if the obſtacle be conſiderable and long continued. Ligatures, thoughtleſsly placed on the penis by children, and the ſtricture produced by the retracted glands in paraphymoſis, come under this deſcription. In the ſame way dangerous ſwelling has been produced by drawing a ring over the penis. The effect of intercepting the return of blood is clearly ſhewn, in an experiment made by Mr. Hunter on the dog. “ In April 1760, in the preſence of Mr. Blount, I laid bare the penis of a dog, almoſt through its whole length; traced the two veins that came from the glans (which in this animal makes the largeſt part of the penis), and ſeparated them from the arteries by diſſection, that I might be able to compreſs them at pleaſure, without affecting the arteries. I then compreſſed the two veins, and found that the glans and large bulb became full and extended; but when I irritated the veins, in order to ſee if there was any power of contraction in them, which might occaſionally ſtop the return of the blood, no ſuch appearance could be obſerved.” Animal Economy, p. 40, note *a*.

That erection is produced by blood being ſent into the penis faſter than it can be returned, and that the encreaſed ſize of the organ is entirely produced by this ſanguineous diſtention, are points clearly aſcertained. The obſtacle to its return is ſo complete, that no mechanical preſſure applied to the body of the penis can force the blood on into the veins. The exact mode, in which this object is accompliſhed, has not, we believe, been as yet aſcertained. There certainly is no power capable of directly compreſſing the veins: and the erector penis in particular, by drawing the organ away from the ſymphyſis pubis, would rather free them from preſſure. The accelerator urinæ, by ſqueezing the blood forwards from the bulb, may make the front of the corpus ſpongioſum and glans rather more firm when they are erect, but can produce no effect on the penis in general.

Neither is the phenomenon at all like thoſe produced by muſcular contraction: it is a quiet and gradual increaſe, and it often laſts for hours. Muſcular action is ſudden, and not of ſuch long duration. There are other examples of analogous effects, which are totally inexplicable by muſcular action. The nipple, when left to itſelf, like the penis, is ſoft and flaccid, ſhort, and retracted: when excited by gentle friction, it riſes into a cylindrical form, ſwells, grows red and warm: yet there is nothing like a muſcle in the part. The red fleſhy organs about the head and neck of ſome gallinaceous birds undergo a ſimilar proceſs.

It appears, therefore, that the change termed erection, may take place in animal ſtructures, without the aſſiſtance of any muſcular power; and it is by no means certain, that any muſcle is concerned in the particular caſe now under conſideration. All that we can aſcertain on the ſubject is, that the blood is ſent into the corpora cavernoſa in much greater quantities than it can return. If a mechanical obſtacle does not produce that rigid ſtate of the organ, which is created by the immediate action of deſire, we conclude, that a more ſudden and complete congeſtion is produced by the latter than by the former cauſe. We cannot explain how the proportion of blood, which arrives, is thus altered in relation to that which returns, any more than we underſtand the analogous phenomenon in inflammation. It does not ſeem poſſible to aſcertain the mechaniſm of the proceſs by actual obſervation. The circumſtances already mentioned render it probable that the nerves are materially concerned.

Erection varies conſiderably in its degree. The organ at firſt ſwells, but continues ſoft; it then grows conſiderably longer, thicker, more firm and warm; and the glands become redder. The corpora cavernoſa penis are firſt diſtended, and the glands ſubſequently. In the ſtate of greateſt rigidity, it is proved, by ridiculous experiments, that conſiderable weights can be ſupported by the organ. The mere act of erection is not attended with thoſe remarkable effects on the frame which accompany emiſſion; it may be repeated or continued for any length of time without any injurious operation on the animal economy: hence, it is much more frequent than the latter act. Under the influence of certain feelings of the moſt acute kind, excited in the act of copulation, the ſeminal fluid is expelled from the ejaculatory ducts into the urethra. The pleaſurable ſenſation is raiſed to its higheſt pitch, and is attended with a convulſive agitation of the whole frame, before this effect follows. "Maxima certe eſt in venere convulſio, et late patens tremor, ut femina, cui clitoris titillatur, neque ſe ſuſtinere poſſit, neque genua coercere, ne tremant, et in aliis res in plenam epilepſiam erumpit: nihil audit neque ſentit animal in venerea tentigine. Sunt, qui animo in venere linquuntur, etiam feminæ; ſunt non rari, qui in grato nimis opere perierint. Eſt autem omnino major maris voluptas, etiam in pleriſque animalibus; nam mares, [illegible]r pauca exempla, feminas ſequuntur, et nonnunquam pene invitas vi [illegible]nt: eſt in viris glans, ſenſus venerei præcipua ſedes, multo quam clitoris major, et certe in ve[illegible]ilior. Et ſi aliquis ſenſus eſt in oſtio uteri interiori, quando ſemen eo pervenit, manifeſto tamen mas in egerendo ſemine majoribus, quam femina in toto venere, furiis agitatur. Quæ omnia ſapientiſſimis conſiliis ita facta ſunt, ut virum robore armatum, amoris dulcedo feminæ redderet æquiorem. Demum et cordis vires vehementer incitantur, et pulſus acceleratur, et cor palpitat, et reſpiratio laborat, et eadem, quæ in nixu, phænomena oriuntur." Element. Phyſiol. 7. 567.

After this tumultuous agitation of the whole frame, and when the ſwelling of the penis and glands has reached its greateſt extent, the ſeminal fluid is thrown into the urethra. The anus is cloſed by its ſphincter, and it is ſaid that the levatores ani, by their mechanical preſſure, ſqueeze out the contents of the proſtate and veſiculæ into the urethra. Probably the coats of the veſiculæ and vaſa deferentia poſſeſs ſome contractile power, by which their evacuation is aſſiſted. The contents of the proſtate and veſiculæ are collected in the bulb of the urethra, which is enlarged ſo as to form a kind of reſervoir for them; and are expelled with ſome force, by ſucceſſive ſpaſmodic contractions of the accelerator urinæ. As ſoon as this is finiſhed, the temporary agitation ſubſides, the blood returns from the cells of the penis, and that organ regains its original magnitude. A degree of languor follows, proportioned to the previous excitation; the palpitation of the heart goes off, the hurried reſpiration is quieted, and the ſtrength ſlowly returns. The ſubſequent weakneſs is greater, in proportion as the act has been more frequently repeated, and at ſhorter intervals. In many animals, where the ſexual appetites are only exerted at a particular ſeaſon, and where the powers are exhibited and exerciſed on a much grander ſcale than in man, the debilitating influence is very ſtrongly marked. The venereal powers of the human ſubject certainly appear very limited, when compared to thoſe of moſt animals: with a due regard to health, he cannot much exceed the limits aſſigned by Haller. "Homini adeo modicæ ſunt vires, ut non multo plus, quam bis in ſeptem diebus coire poſſit, et ſi forte acri amore percitus, poſt longam caſtitatem, femina concupita potitus, aliquoties poſſit ſemen emittere. Sed ea neque multum repeti poſſunt, neque durare." An attention to the dictates of nature will certainly enjoin temperance in theſe enjoyments. The performance of a function, ſo neceſſary to the continuance of the ſpecies, has been enſured by the phyſical pleaſure aſſociated with it: but the effects of too frequent repetition produce thoſe ſerious conſequences which the univerſal and violent influence of the act on our bodies would naturally lead us to expect. Severe nervous affections, impaired mental faculties, and premature death, are the ſure concomitants of exceſſive venereal enjoyments. Whether the convulſive agitation of the body, or the emiſſion, be the moſt injurious under theſe circumſtances, cannot, perhaps, be decidedly aſcertained. "Omnia iſta majora et celeriora, et minus medicæ manui obtemperatura, eveniunt ab illa deteſtabili juvenum circe, a qua amor abeſt, et in qua ſemen, multo quam in naturæ opere difficilius, elicitur. Ab ea enim corruptela impotentia inſanabilis ſupervenit, et ſeminis fluxus involuntarius perpetuus, obſtipa rigiditas, tabes intra triennium funeſta, amiſſa judicii vis, et omne fere malorum genus, quod votis velis avertere." Elem. Phyſiol. 7. 573.

Theſe circumſtances render it very plain that polygamy is not ſuited to the organization and powers of man; and afford a much ſtronger argument againſt the practice, than the alleged ſuperior numbers of females in Eaſtern countries would be in favour of it, even if the fact were well proved; which we by no means admit. We may collect alſo, from the foregoing account, that the ſexual functions ought not to be exerciſed, until the growth and ſtrength are complete; and that all attempts at exciting the venereal appetites, before the natural period of their developement, muſt be prejudicial. On this ſubject we ſhould bear in mind the obſervation of Tacitus concerning the ancient Germans; "Sera juvenum Venus, eoque inexhauſta pubertas."

Man is capable of exerciſing the generative functions through a certain portion only of his life. We have explained that the organs are in a ſtate of very imperfect developement during the early periods of his exiſtence. Boys have erections, but they are not produced by thoſe ſtimuli which act at a more advanced age. In the middle of Europe, a ſecrea ſecretion of ſeminal fluid generally takes place about the twelfth or fourteenth year, inſomuch that it is commonly diſcharged from the effect of dreams. Soon after this time there is a complete capacity of performing the ſexual functions; and there is a well-known inſtance of a prince who begot twins in his 16th year. The approach of puberty is regulated conſiderably by the climate, and alſo by manners; in warm countries it comes on earlier than we have mentioned, and later in colder regions. In the higher ranks of ſociety, where the feelings are prematurely and artificially excited, and encouraged by a copious and generous diet, and looſe morality, the generative functions may be called into exerciſe more early, than under the oppoſite circumſtances. As the individual approaches to the 50th year, the venereal ſuſceptibility is conſiderably diminiſhed. Semen is ſtill ſecreted, but hardly ever emitted during ſleep, even after the longeſt abſtinence. The venereal act is more ſlowly performed, but is equally efficacious in producing impregnation. From this time the powers are gradually diminiſhed; but a man of 60 may ſtill become a father, although ſome legiſlators have choſen to determine otherwiſe. A longer continued and more powerful irritation is required to produce erection and emiſſion at this age. In rare examples men have been known to retain their powers of propagation even to the age of 100 years; and it is very well authenticated that Thomas Parre married at 120, and performed the duties of a huſband until the age of 140. Theſe latter examples muſt, however, be regarded as deviations from the ordinary courſe; and we have equally remarkable inſtances of the generative functions being performed at an unuſually early age. Perhaps the moſt remarkable caſe of this kind is a boy now living in London, of whom an account is given in the Medico-Chirurgical Tranſactions, vol. i. p. 276, & ſeq. At the time of birth this child had much long hair on the head, and the ſutures of the cranium were perfectly cloſed. At the end of the firſt year thoſe changes took place which uſually happen at puberty. The penis and teſtes increaſed in ſize, hairs appeared on the pubes, and the tone of the voice was evidently altered. From this time his body grew very rapidly, and the expreſſion of his features, as well as the general organization, had a completely manly character. The prominence of the thyroid cartilage, and the voice, reſembled thoſe of a youth of 16. "The pubes and ſcrotum are covered with black curling hair. The penis and teſtes are as large as I have ſeen in ſome adults. The latter are firm and perfect in their formation, and the cord may be diſtinctly felt. The uſual brown appearance of the integuments of theſe parts is here to be obſerved." There has been a ſecretion of ſemen from the end of the ſecond year. This account was drawn up when he was three years old. In his "Anecdotes de Médecine," Borden mentions three boys who had ſtrong venereal deſires between 10 and 11 years of age: the generative organs were unuſually large in theſe individuals. and were fully capable of exerciſing their ordinary functions at this time. "Ils ne penſaient qu'au plaiſir phyſique de l'amour; ils ne ſemblaient avoir autre ſenſation que celle de cette paſſion; ils ſe fondaient, pour ainſi dire, en ſperme; ils tiraient leur caractere individuel de l'organiſme ſeminal."

The moſt ſuitable and natural ſtate after the age of puberty, is that of marriage. If the deſigns of nature are not fulfilled; if, by refuſing to ſatisfy the imperious calls of love, we prevent the exceſs of vital energy, which ſoon animates the generative organs, from being carried off in its natural channel, the accumulated irritability of theſe organs will frequently diſturb the whole frame by its re-action. The phyſical feeling of love, the impulſe of reproduction, has generally a remarkable character of violence and energy in animals. The phenomena of the rutting ſeaſon ſhew the effects of this powerful appetite in a much ſtronger point of view than they are ſeen in the human ſubject; as the influence of the paſſion is here heightened by its being reduced within a ſhort period of time. Great fierceneſs, impetuous motions, and often even convulſions, are the effects of the new want in many animals. Parrots, canary-birds, and bull-finches, experience attacks apparently of an epileptic kind, when ſeparated from their females. The phyſical appetite is rarely accompanied with ſuch phenomena in man. With many individuals, the obſervance of the laws of chaſtity hardly requires an effort. However, if the influence of the generative organs ſhould predominate ſo far as to conſtitute a well-characterized erotic temperament; if an ardent imagination and a forced ſtate of celibacy ſhould ſtrengthen this temperament, its influence on the conſtitution may be exceſſive, and cauſe various kinds of general diſorder. Under the influence of ſuch circumſtances, a ſoldier ſeized and attempted to violate a girl in public at Montpelier. Neither the publicity of the ſituation, nor the cries of his victim, nor the exclamations and blows of the ſurrounding perſons, could prevail with him to relinquiſh his attempt, for which he was hanged. (Borden, Anecdotes de Médecine.) The unnatural abſtinence obſerved from miſtaken notions of religion, has produced very remarkable effects in ſome caſes. An eccleſiaſtic mentioned by Buffon, in whom the feelings were very ſtrong, fearing he ſhould be tempted to break his vow, cut away the organs. The ſame author relates the ſufferings of another individual during a kind of erotic delirium, which laſted for ſix months, and ſeems to have amounted nearly to mental derangement.

Female Organs of Generation.—Woman contributes more largely than man to the buſineſs of reproduction; and the apparatus deſtined to this function includes the generative organs, properly ſo called, and the breaſts. Theſe iſolated parts are appropriated to the execution of a common object, to which each contributes in its own way, and their developement is regulated by a common law. They are called into activity at the ſame epocha, and their reſpective functions ceaſe, or at leaſt their capacity of fulfilling them ceaſes at the ſame time. The cloſe ſympathy which connects them has been remarked at all times. The breaſts, however, are manifeſtly dependent on the generative organs; while the former exerciſe but a very ſlight influence on the latter. As the male organs are calculated by their formation to convey the prolific fluid, ſo the female are conſtructed with a view to its reception; and the two differ completely from each other. Yet there is a conſiderable reſemblance in ſome parts of the apparatus in both ſexes. Thus the clitoris, which is concealed under the pubis in the ſuperior commiſſure of the labia, reſembles the penis in many points; differing from it by having no connection with the urethra, and conſequently being imperforate, alſo in being very ſmall in well-formed individuals. The moſt convenient arrangement of the ſubject, for anatomical deſcription, is that in which the organs are divided into the external and internal. The latter include the eſſential agents of the generative proceſs in the female; *viz.* the vagina, with the uterus and its appendages. The former conſiſt of a longitudinal ſlit, placed between the thighs, containing the termination of the urethra and vagina, and certain prominent parts compoſed chiefly of folds of the integuments.

The external organs, which can be ſeen without the aid of diſſection, are the mons veneris, the vulva or pudendum, the labia, frenulum, foſſa navicularis, clitoris, nymphæ, meatus urinarius, and opening of the vagina.

A broad prominence, placed in front of the pubes, and between the groins, is called the mons veneris. At the time of puberty, this part becomes more convex, and is covered with hairs, of which the number, length, and colour, vary in different individuals. Theſe very ſeldom advance along the middle line of the abdomen, towards the navel, as in man. Their eminence is formed ſimply by the accumulation of an adipous cellular ſubſtance at this particular point, and it conſequently varies in ſize, according to the *embonpoint* of the individual. A longitunal fiſſure, or ſlit-like cavity, extends from the mons veneris, between the thighs, to within an inch of the anus; this is called the vulva, or pudendum, (which names ſometimes include, in a more large application, the external organs,) or ſinus pudoris. This excavation is larger in women who have had children, than in virgins. The ſpace left between the poſterior end of the vulva and the anus, which may be about one inch in length, is the perineum, in which the raphé can hardly be traced. The labia, or alæ majores, are two elongated cutaneous eminences, filled with adipous ſubſtance, deſcending from the mons veneris towards the anus, and forming the lateral boundaries of the cavity juſt mentioned. They have been named, from a compariſon with the lips of the mouth; but the fiſſure between them is vertical, inſtead of being tranſverſe, as in the other inſtance. Their length, which is nearly the ſame in all inſtances, and may be ſomewhere between two and three inches, determines the extent of the vulva. Their ſize and prominence vary according to the general embonpoint of the individual. Theſe folds are thicker above than below; their external ſurface, which correſponds to the upper and inner ſide of the thighs, is covered with hairs ſimilar to thoſe of the mons veneris, and poſſeſſes ſome ſebaceous glands. The internal ſurface, formed by a mucous membrane, is ſmooth, ſoft to the touch, is contiguous to that of the oppoſite ſide, and to the nymphæ. In virgins the colour of this ſurface is red; it acquires afterwards a pale and rather livid caſt. The upper edge of the labia is adherent, and continues externally with the integuments, on the inſide with the covering of the nymphæ: the inferior margin is unconnected, convex, rounded, and covered with hairs, and exhibits the continuity of the integuments with the mucous membrane. The anterior, or ſuperior extremity, is confounded with the mons veneris: the poſterior, growing gradually ſmaller, ends in a point, and is united with that of the oppoſite ſide behind the foſſa navicularis. From this union a ſharp prominent ridge reſults, called the commiſſure of the labia, or frenulum, and in French la fourchette. The following parts enter into the compoſition of the labia; 1ſt, a continuation of the ſkin forming their external ſurface and inferior or convex edge, provided with ſebaceous glands, in the ſecretion of which the diſtinguiſhing odour of theſe parts reſides: 2dly, a mucous membrane covering their internal ſurface, continuous on one ſide with the integuments, and on the other with the mucous covering belonging to the whole vulva: 3dly, an adipous tiſſue filling the interval between theſe layers, and giving to the parts their various degrees of thickneſs and prominence. The latter texture reſembles on the whole that of the mons veneris, with which it is continuous, but it preſents, in addition, ſome membranous laminæ deſcending from the iſchium and pubes to the looſe edge of the labium. It does not contain ſo much fat as the mons veneris, and hence, like the ſcrotum of the male, it is a part in which anaſarcous depoſitions are frequently obſerved.

The labia cover all the other external organs of generation, which, by this means, are conſtantly moiſtened with a mucous fluid, preventing the effects of friction, and preſerving the acute ſenſibility of the parts. In the ordinary attitudes of the body, theſe organs are in a ſtate of mutual contact, and therefore completely conceal the parts which we are proceeding to deſcribe: they are ſeparate only when the thighs are thrown widely apart; they receive an extraordinary developement during parturition, and thereby increaſe the capacity of the vulva. When the labia are ſeparated, the following parts may be obſerved in ſucceſſion from above downwards: 1. The clitoris, which appears as a ſmall tubercle, more or leſs prominent, ſeparated from the upper commiſſure of the labia by a ſmall ſmooth ſurface: 2. The nymphæ, alæ minores, or petites levres, ariſing from the inferior lateral parts of the clitoris, deſcending and diverging as they deſcend, and loſt on the ſides of the opening of the vagina: 3. A triangular ſurface ſlightly concave, bounded above by the clitoris, below by the meatus urinarius, on the ſides by the nymphæ, and ſometimes called veſtibulum: 4. The meatus urinarius, ſituated about one inch below the clitoris: 5. The orifice of the vagina, with the hymen, or carunculæ myrtiformes, placed immediately under the meatus: 6. The foſſa navicularis, a ſmall tranſverſe depreſſion, ſeparating the entrance of the vagina from the frenulum: 7. The frenulum, or poſterior commiſſure of the labia; behind which is the perineum. The clitoris occupies the upper part of the vulva, and forms a reddiſh ſlightly elevated tubercle, which ordinarily does not exceed the level of the labia. Its figure is obtuſely conical, ſomething like that of the end of the penis; this is called the glans clitoridis, and is covered by a looſe fold of the mucous membrane lining the vulva, and named preputium clitoridis. Beſides, the difference of its ſize, the want of a perforation at the extremity, ſufficiently diſtinguiſhes it from the penis. A ſmall part only of the organ appears on external examination; the larger portion, which is concealed, and can be brought into view only by diſſection, lies over the vagina, and under the arch of the pubes, and bears a great analogy to the penis, as it conſiſts of two crura or corpora cavernoſa, with erector muſcles. Theſe ariſe from the inner and even poſterior ſurface of the rami of the oſſa innominata; aſcend, approaching to each other, and unite into a ſmall cylindrical body, terminating in an obtuſe extremity, called the glans. Theſe crura are made up of a firm fibrous membrane, confuſed with the perioſteum, forming a tube filled with a cellular or ſpongy ſubſtance, into which blood is effuſed from the arteries, to be again taken up by the veins, as in the penis. There is a complete ſeptum between the two crura, ſo that they are diſtinct throughout. The ſpongy ſubſtance of the crura is more denſe than in the penis, and conſequently admits of leſs diſtention; hence the ſize of the organ is not greatly increaſed in the erect ſtate.

The *erector clitoridis* muſcle is analogous in every reſpect to the erector penis of the male; its origin, termination, and probably uſe, are ſimilar, but the ſize is ſmaller in proportion to that of the crus. It ariſes from the inner ſurface of the iſchium, aſcends and paſſes forwards, and is implanted in a tendinous form, in the inferior and poſterior extremity of the crus clitoridis.

The ſubſtance of the glans is not different from that of the body of the clitoris, as there is no urethra in this organ, and conſequently no peculiar corpus cavernoſum. It is rounded above and ſlightly bifid below. The looſe and folded prepuce covers it above and at the ſides, but not below, being attached to the two ſides of the ſlit, by which the part is marked in this ſituation. A white, friable, ſebaceous, and concreting ſubſtance, ſimilar to that formed by the glandulæ odoriferæ of the penis, is depoſited under the preputium clitoridis.

This ſecretion, being liable to accumulate, and becoming irritating in warm countries, as is the caſe with the analogous ſubſtance in the male, has given riſe to a ſimilar operation of circumciſion in girls in ſeveral parts of Africa and Aſia. Niebuhr enjoyed the very rare opportunity of ſeeing the pudenda of an Arabian girl, eighteen years of age, who had been circumciſed; he drew the parts from the life, and brought the repreſentation home with him. See his Beſchreibung von Arabien, p. 77. et ſeq.

The clitoris correſponds above to the arch of the pubes, to which it is fixed by a kind of ſuſpenſory ligament; below to the urethra, to which it is united by a looſe cellular tiſſue.

It reſembles the penis in its acute ſenſibility: "ſenſus mire vehemens eſt, ut tota crura ab ejus particulæ ſollicitatione contremiſcant, feminæque totæ extra ſeponantur, nihilque poſſint proco negare. Quæ extra venerem, in caſta femina parva fuerat, ſed etiam modo arrigit et intumeſcit, ut prepoſteræ veneri inſervire poſſit, multoque uſu ejus turpitudinis denique moles ejus augetur, ut omnia membra ſolent, quibus multum utimur. Quæ cauſa videtur fuiſſe, cur orientales populi, accurati caſtitatis muliebris cuſtodes, hanc particulam in nuper natis puellis amputaverint, aut certe ferro decurtaverint." Element. Phyſiol. lib. 28. § 20. We have made ſome obſervations, concerning the occaſional increaſe in ſize of this part, in the remarks on hermaphrodites.

The nymphæ are two membranous folds, connected above to the preputium clitoridis, and deſcending about as far as the middle of the aperture of the vagina. They are thin and flattened, broadeſt in the middle, and narrower at the two extremities. Their external ſurface correſponds to the inſide of the labia, while the internal, approximating above to that of the oppoſite ſide, correſponds below to the meatus urinarius and orifice of the vagina. Their adherent edge is tolerably thick; while the looſe margin is thin and convex: the latter is ſometimes wrinkled or notched, ſo as to have occaſioned a compariſon of the part to a cock's comb. The ſuperior extremity ariſes from the preputium or glans clitoridis: the inferior ends at the ſide of the vagina. They are ſmooth and of a red colour in young women, and acquire a darker hue in older ſubjects, and particularly ſuch as have had children. They are formed of duplicatures of the membrane lining the vulva, filled internally with a cellular ſubſtance, free from fat: and they contain ſebaceous glands, the excretory ducts of which form very obvious pores: they differ very much in ſize. Ordinarily, they are completely covered by the labia, when approximated. Sometimes they form ſcarcely perceptible prominences, while at others they are very large, and hang down between the labia, ſo as to form an inconvenient obſtruction to the ſexual functions; in this caſe their ſurface is irregular, being grooved and tuberculated. Such formations are more frequent in the inhabitants of warm climates, where it is not unuſual to cut off ſome part of them; and the operation is even occaſionally practiſed in European countries. Frequently one is larger than the other. They poſſeſs conſiderable ſenſibility. The chief uſe aſſigned to them is that of aſſiſting, by their developement, the enlargement of the vulva during parturition: the diſtention of the parts by the paſſage of the child deſtroying the fold. The name of nymphæ was given to them from a ſuppoſition that they regulate the jet of urine; but as women evacuate this fluid with the thighs apart, and as the direction of the ſtream ſeems to depend ſo entirely on that of the urethra, we cannot adopt this ſuppoſition. And we are further confirmed in rejecting the opinion by the exiſtence of theſe folds in many animals where they can have nothing to do with the ſtream of urine.

We have nothing further to ſay concerning the veſtibulum, except that the ſurface is ſmooth, and that it is terminated below by the opening of the urethra, which is about three quarters of an inch, or an inch from the clitoris. The deſcription of this canal, and its termination, will be found, together with that of the female bladder, under the article Kidney.

Immediately under the orifice of the urethra is the entrance of the vagina, called ſometimes the os externum uteri; the diameter and appearance of which vary very conſiderably in different individuals. In virgins this opening is very narrow; it is broader after the ſexual act has been performed, and moſt ample in women who have had many children. The narrowneſs in the firſt caſe ariſes from the preſence of a duplicature of the mucous membrane, called the hymen, which contracts the opening ſo conſiderably, that marriage cannot be conſummated without its being ruptured; hence, after this laceration, the entrance of the canal is more free. As the parts are vaſcular and ſenſible, more or leſs bleeding and pain generally attend this dilatation of the aperture; and theſe circumſtances are expected in ſome countries as the neceſſary proofs of virginity in the bride. However, they do not always attend the firſt coition; and it ſhould ſeem, by the following quotation, that the exiſtence of the hymen hangs by a very ſlender thread; "L'hymen, pendant le premier âge, eſt très mince, ſe rompt facilement et ſe detruit, lorſqu'on eſſuie avec trop peu de ménagement les parties éxtérieures de la génération, ſoit lorſque l'enfant lui-même, avec ou ſans intention, contracte des habitudes Leſbiennes, prépare et diſpoſe ainſi aux plaiſirs ſolitaires, des organes qui ſont á peine ébouchés." Moreau Hiſt. de la Femme, tom. 1. p. 53.

The hymen is a duplicature of the ſame membrane which lines the entrance of the vagina, and has the ſame texture and properties. It is ſoft, red, vaſcular, and ſenſible. The poſterior ſurface is reticulated, as the columns of the vagina terminate on it. Its ſize and figure vary very conſiderably. Generally it has the ſhape of a creſcent, with the concavity turned upwards or forwards. The convex edge is attached, the concave looſe; the former is fixed to the inferior part and ſides of the vagina, the latter is turned towards the urethra. The orifice of the vagina, in the virgin, is the ſpace bounded in front or above by the meatus urinarius, below or behind, and at the ſides, by the looſe concave edge of the hymen. The dimenſions of this opening muſt depend therefore on the breadth of the hymen, which differs much in different individuals: ordinarily, it will admit the little finger without any ſtretching. This creſcented or falciform figure of the hymen is ſeen only when the labia are drawn apart, and the ſides of the vagina gently ſtretched; for in the ordinary attitudes, the membrane is thrown into longitudinal folds, the ſides of the vagina coming into contact with each other, ſo that the entrance of the canal is completely ſhut. However, the ſpace left between the urethra and the edge of the membrane will always allow the eſcape of the menſtrual diſcharge. The lower part of the hymen is the broadeſt, and the horns of the creſcent, where they advance along the ſides of the aperture, grow gradually narrower, until they are completely loſt.

Sometimes the hymen is continued under the orifice of the urethra, ſo as to form a complete membranous circle, perforated in the middle, inſtead of a creſcent. Indeed Haller, and many other very accurate anatomiſts, have found the fold, when the parts were carefully examined in water, generally continued under the urethra; but very narrow at that part. In more rare caſes the hymen is an imperforate circular membrane, attached to the edge of the orifice of the vagina in every part, ſo as to cloſe the canal completely. Such females have been termed *atrotæ*, by a word derived from the Greek, and ſignifying imperforate. As there is no aperture in ſuch caſes for the diſcharge of the menſtrual fluid, it accumulates in the uterus and vagina, and muſt be evacuated by a ſurgical operation, conſiſting of a puncture of the hymen. For the various appearances which this part exhibits in different individuals, the reader may conſult J. G. F. Tolbeng, de varietate hymenum, Hal. 1791, 4to.

It has generally been aſſerted, that the hymen does not exiſt in quadrupeds; but the ſtatement of Cuvier, in his Leçons d'Anat. comparée, tom. 5, leçon 29, ſect. ii. art. 2, renders this point very doubtful. The general opinion of its non-exiſtence in the other mammalia beſides man, and the circumſtance of its being found in women only, at a particular period of life, and even then not univerſally, have led many anatomiſts to deny its exiſtence in the human ſubject. But the fact is ſo clearly proved by the concurrent teſtimonies of all modern anatomiſts, who have enjoyed conſiderable opportunities of diſſection, that we wonder to find Buffon ſtill conteſting the point; any of his anatomical friends might ſurely have convinced him by ocular proof. Though we are fully convinced, by repeated obſervation, that Buffon's opinion is incorrect in point of fact, we cannot help admiring the eloquence with which he inveighs againſt the diſgraceful opinions and practices which have prevailed on this ſubject. "Les hommes," ſays he, "jaloux des primautés en tout genre, ont toujours fait grand cas de tout ce qu'ils ont cru pouvoir poſſeder excluſivement et les premiers: c'eſt cette eſpèce de ſolie, qui a fait un être réel de la virginité des filles. La virginité, qui eſt un être moral, une vertu qui ne conſiſte que dans la pureté du cœur, eſt devenue un objet phyſique dont tous les hommes ſe ſont occupés; ils ont établi ſur cela des opinions, des uſages, des cérémonies, des ſuperſtitions, et même des jugemens et des peines; les abus les plus illicites, les coutumes les plus déſhonnêtes ont été autoriſées; on a ſoumis à l'examen de matrones ignorantes, et expoſé aux yeux de médecins prévenus, les parties les plus ſecrètes de la nature, ſans ſonger qu'une pareille indécence eſt un attentat contre la virginité; que c'eſt la violer que de chercher à la reconnoître; que toute ſituation honteuſe, tout état indécent, dont une fille eſt obligée de rougir intérieurement, eſt une vraie déſloration. Je néſpère pas réuſſir à détruire les préjugés ridicules qu'on s'eſt formés ſur ce ſujet; les choſes, qui font plaiſir à croire, ſeront toujours crues, quelque vaines et quelque déraiſonnables qu'elles puiſſent être; cependant, comme dans une hiſtoire on rapporte non ſeulement la ſuite des evènemens, et les circonſtances des faits, mais auſſi l'origine des opinions et des erreurs dominantes, j'ai cru que dans l'hiſtoire de l'homme je ne pourrois me diſpenſer de parler de l'idole favorite à laquelle il ſacriſie, d'examiner quelles peuvent être les raiſons de ſon culte, et de rechercher ſi la virginité eſt un être réel, ou ſi ce n'eſt qu'une divinité fabuleuſe."

It is not ſo eaſy to explain the uſe or purpoſes of this membrane, as to eſtabliſh the fact of its exiſtence. The partiſans of final cauſes have been much puzzled in attempting to diſplay the wiſdom or goodneſs of the Creator, as evinced in this part of our anatomy, and have as yet aſſigned no rational explanation of it. We ſubjoin from Haller a ſtatement of the commonly received notions, which, however, appear to ourſelves entirely unſatisfactory. "Vix tamen dubites, cum ſolo in homine ſit repertus, etiam ad morales fines ei eſſe conceſſum ſignum pudicitiæ, quo et vitium illatum cognoſcatur, et pura virgo decus ſuum poſſit tueri, et ipſe maritus de caſtitate ſponſæ facile convincatur, eo facilius, quod præterea in illibata virgine vagina anguſta ſit. Etſi enim poſſit fieri, ut laxus, ut parvus ſit hymen, atque prima venus aliquando abſque ſanguine abſolvatur, neque hymen rumpatur; etſi artificii porro in parum pudica femina ſanguis poſſit elici; etſi teneræ virgines aliquando etiam in altero coitu ſanguinem reddant, et menſes fluentes vaginam laxant; tamen in univerſem debet prima venus cruenta eſſe, eoque ſigno pudor virgineus adſeri, cum vix poſſit plena venus obtineri, quin ſuperior margo partis majoris hymenis laceratur. Quare et moſaicæ leges, et multorum populorum conſuetudo, hoc ſignum ſervatæ caſtitatis et requirunt et oſtentant, et de exemplis in virginibus etiam pene trigenariis certus ſum, quæ inſignem in prima venere ſanguinis jacturam ſunt paſſæ." Elem. Phyſiol. lib. 28, ſ[illegible] 2, [illegible]

After the hymen has been torn, the entrance of the vagina preſents ſome fleſhy prominent tubercles, called carunculæ myrtiformes, and varying in number and ſize. Theſe are generally conſidered to be the remains of the lacerated membrane; "et corruptæ adeo pudicitiæ indicia." The carunculæ are generally largeſt at the ſides of the vagina, where the hymen is narroweſt; ſo that all theſe prominences cannot well be referred to the origin juſt mentioned. Some are found behind the hymen, and exiſt previouſly to the laceration of that membrane: theſe are the prominent, obtuſe, and callous apices of the columns of the vagina. Laſtly, there are projections at the termination of the mucous ducts, which may be enumerated among theſe carunculæ: and warts are ſometimes formed in this ſituation. Whatever their origin may be, we find from two to five or ſix rounded and firm, or thin and looſe prominences, of a red or livid colour, about the entrance of the vagina.

The frenulum, or fourchette, is a cutaneous fold of a creſcent ſhape, with the concavity upwards, placed behind and below the entrance of the vagina, viſible in the virgin ſtate, when the ſides of the vulva are drawn apart, but not well marked when the parts are collapſed. It lies between the two labia, not quite at the lower extremities, and is extended almoſt to the nymphæ, protecting in ſome degree the entrance of the vagina. It is near to the hymen, which it reſembles in ſome reſpects. The act of copulation does not injure it, but repeated parturitions entirely efface it. A very manifeſt tranſverſe cavity, named the foſſa navicularis, is intercepted between the frenulum, the hymen, and the labia; and this cavity is loſt of courſe when the frenulum diſappears, ſo that it may not be recognizable in married w[illegible]

A mucous membrane, by which the genital and urinary organs are united in the female, is continued over all the parts contained in the vulva, and even forms many of them. It ariſes on the looſe convex edges of the labia, and at their commiſſures; covers the internal ſurface of theſe folds, the ſpace below their anterior commiſſure, and the foſſa navicularis, then forms the nymphæ and preputium clitoridis, covers the veſtibulum, is continuous with the lining of the urethra, and with that of the vagina, after forming the hymen or carunculæ myrtiformes. It is connected to the ſubjacent parts by a copious and looſe cellular texture, in which, generally ſpeaking, there is very little fat. Its colour is of a tolerably bright red in young women; but it aſſumes darker ſhades in more advanced ages, particularly when the ſexual functions have been much exerciſed. The texture of the integuments changes gradually into this mucous ſurface, ſo that there is no abrupt line of diſtinction, and an epidermis can be diſtinctly demonſtrated at its origin. The colour proves that it is copiouſly ſupplied with blood. The membrane is ſoft on its ſurface, and plentifully bedewed with a mucous fluid, poured out from ſmall tubes, which commence by open orifices, and run into the ſubſtance of the membrane, where they terminate by cul-de-ſacs. Theſe, which are called lacunæ, are ſimilar to what we have deſcribed in the male urethra, and they have been very minutely inveſtigated by Haller. He deſcribes ſome ſmall ones, to the number of ſeven or eight, between the clitoris and urethra; and others conſiderably larger, on each ſide of the urethra, admitting a fine probe for the length of ſome lines. There are alſo two or three large lacunæ on each ſide of the vagina, admitting briſtles for half an inch or more. Nothing of a glandular ſtructure can be detected about theſe parts; the lacunæ ſeem to produce the mucus here as in the male urethra. Theſe parts, together with other lacunæ ſituated in the urethra, are the ſources of the fluid by which the female organs are lubricated: the circumſtances, under which it is effuſed, are thus mentioned by Haller; "mucus, quam feminæ in venerem ardentes profundunt, aut in coitu, aut a turpi frictione, aut demum, nam reperiuntur mulieres ejus naturæ, ad conſpectum formoſi amatique juvenis." Elem. phyſiol. lib. 28. p. 88.

This membrane enjoys a high degree of ſenſibility, and appears in part to be the ſeat of that peculiar modification of ſenſation experienced in coition. Its extraordinary dilatation in parturition, and the recovery of its former ſize, ſhew that it poſſeſſes extenſibility and contractility.

Sometimes the labia are united at their convex edges, and the urine eſcapes by a ſmall opening towards their upper end. The line of ſeparation can be eaſily recognized in ſuch a caſe, and a very ſlight inciſion is ſufficient to bring the parts to their ordinary ſtate. The nymphæ may be ſimilarly circumſtanced.

We have mentioned already, that the women of hot countries generally have large nymphæ; it would not be right to paſs unnoticed the peculiarity of formation aſcribed to the Hottentot women. Travellers have related that the ſexual organs are covered, in theſe females, by a natural kind of apron, *i. e.* by an extenſion of the ſkin from the pubes. Ten Rhyne, who had opportunities of perſonal obſervation, explains the fact by an unuſually large ſize of the nymphæ (de promontorio bonæ ſpei, p. 33.); but this does not agree with the ſtatement of Le Vaillant, who ſeems to have taken conſiderable pains to aſcertain the truth. He repreſents it as an enlargement of the labia, produced by artificial means, from a whimſical notion of beauty. "Theſe organs," ſays he, "may be extended to the length of nine inches, according to the age of the individual, or the perſeverance with which ſhe endeavours to bring to perfection this very ſingular perſonal decoration. I ſaw a young girl, fifteen years old, in whom they were already four inches long. They are brought to that ſize by rubbing and drawing them, which is the beginning of the proceſs; the affair is completed by ſuſpending weights from the parts. I have ſaid that it is a peculiar taſte, a ſtrange kind of whim; in the horde, where I was, there were only four women, and the young girl, whom I have juſt mentioned, in this ridiculous ſtate." The account given by Meſſrs. Peron and Leſueur, in a memoir addreſſed to the national inſtitute, ſeems to differ ſomewhat from the ſtatement of Le Vaillant, but this perhaps ariſes only from the mode of deſcription. They ſay that the part is an appendage of the labia, $8\frac{1}{2}$ centimetres in length in an adult, adhering above, where it is narroweſt, to the ſuperior commiſſure of the labia, in front of the clitoris, and divided into two lobes, which, approximated to each other, cover the vulva. It conſiſts of a ſoft, wrinkled, and very extenſile ſkin, entirely free from hair, rather redder than the reſt of the integuments, and ſuſceptible of corrugation, like the ſcrotum of man." (Cuvier, tom. 5. p. 125.) Steller mentions ſome peculiarity, ſimilar to that of the Hottentots, in the Kamtſchatkan women. See his Beſchreibung von Kamtkhatkan, p. 300.

The internal Organs of Generation.—The *vagina*, or canalis uteri, is a membranous canal, extending with a very ſlight obliquity from below upwards, and from before backwards, from the vulva to the neck of the uterus. Its anterior poſition is nearly tranſverſe; the poſterior aſcends towards the uterus. It lies in the middle of the inferior aperture of the pelvis, between the urethra and bladder, which are in front of it, and the rectum which is behind. The ordinary length of the canal is from five to ſix inches, and the breadth one inch; but as it is very extenſile, theſe dimenſions are ſubject to change. It is narrower, but at the ſame time longer in the virgin, than in married women; during parturition its ſize is equal to that of the child's head; it is very capacious after delivery, ſo as to be three inches in diameter; but it ſoon regains its previous ſize, never however returning to the narrowneſs of the virgin ſtate. Its form is nearly cylindrical, but ſomewhat flattened towards its anterior extremity. It is ſlightly bent towards the pubes; its two extremities are obliquely truncated, ſo that the anterior ſurface is ſhorter than the poſterior. We ſhall deſcribe in it an external and an internal ſurface, and two extremities.

The external ſurface may be divided into an anterior, a poſterior, and two lateral regions. The anterior, ſloping upwards and ſlightly concave, correſponds to the bladder and urethra, being connected to the former by a looſe cellular texture, and very intimately united with the latter by a denſe and firm ſubſtance. The poſterior region, ſloping from above and behind downwards and forwards, is gently convex, and correſponds to the rectum; its ſuperior half, being covered by the peritoneum, is ſimply contiguous to the inteſtine; while the inferior part, poſſeſſing no ſuch covering, is connected to the inteſtine by cellular ſubſtance. This connecting medium is much looſer above than below; and in the latter ſituation it is difficult to ſeparate the two organs without cutting one or the other. The lateral regions are narrower than the parts juſt deſcribed, and ſurrounded by much cellular ſubſtance. They correſpond to the ureters, to the plexus formed by the blood-veſſels of the uterus and vagina, and below to the levatores ani. The internal ſurface of the organ preſents a vaſt number of folds and prominences, which make it irregular throughout. Theſe callous rugoſities exhibit a moſt elegant arrangement in the fœtus and in the virgin; they are confuſed and partially obliterated by parturition, but are very ſoon reſtored, and may often be very diſtinctly obſerved even in old women. In ſome ſubjects, however, the whole vagina is nearly ſmooth. The half of the canal next to the uterus contains the feweſt and leaſt remarkable irregularities; the folds here are ſoft, moſtly tranſverſe, but ſometimes partly oblique. Theſe prominences are jagged laminæ, ending in a thin edge, turned towards the opening of the vagina, differing in ſize and variouſly interwoven with each other. On the anterior half of the canal are raiſed two prominent *columns*; an anterior and a poſterior one. Theſe are beſet with hard and nearly cartilaginous warty prominences, cloſely arranged, of a roundiſh figure, and circumſcribed by grooves. The anterior column is the largeſt, and correſponds to the orifice of the urethra. Frequently this is bifid towards the front, and its two portions, joined by tranſverſe rugæ, end in the hymen. The front end of this column ſometimes projects like a papilla at the orifice of the vagina. The poſterior ſmaller column is exactly oppoſite to the anterior, and correſponds to the rectum; ſometimes it is hardly diſtinguiſhable. This ends alſo in the hymen, and in ſome inſtances projects anteriorly like the anterior column, but leſs conſiderably. From each of theſe columns, hard, cartilaginous, tranſverſe or oblique folds are extended; they project downwards, have a jagged edge, and are mixed with verrucæ and other leſs prominent laminæ in various directions. Between the two columns is a reticulated ſurface, formed from the tranſverſe productions. The uſe of this ſtructure does not ſeem very obvious. It may poſſibly facilitate the dilatation of the organ. "Voluptatem et ateritum augere crederes, niſi in uteri cervice ſimiles valvulæ redirent. Arctant tamen eminendo vaginam; et inferior columna parti glandis frenulo vicinæ occurrit. Senſilem vaginam etiam facere credas, quæ ob has valvulas et ipſa magis confricetur. Inſenſilem tamen fuiſſe lego." Haller, Elem. Phyſiol. lib. 28.

All the generative apparatus abounds with mucus, and this moiſture is obviouſly convenient in many of the functions of the part. In the fœtus it appears as a whitiſh milky kind of fluid; and it is a true mucus in the adult. The fluor albus and gonorrhœa ſeem to be merely a diſeaſed ſtate of this ſecretion. Round livid ſpots are frequently obſerved on the ſmooth part of the vagina, near the uterus; their cauſe and nature are unknown. Numerous pores are obſervable among the folds and rugæ of the vagina. Euſtachius noticed ſinuſes in the membrane; *i. e.* tolerably large ſlits, ſometimes ramified, and containing mucus. No glands can be diſcovered in the organ.

The ſuperior extremity of the vagina is united to the inferior part of the neck of the uterus. It embraces the latter organ obliquely, ſo that the anterior ſurface of the vagina is nearer to the os uteri, and the poſterior is more remote from it; and the vacuity between the vagina and the neck of the uterus extends higher behind than before. The inferior extremity occupies the lower and poſterior portion of the vulva, in front of the anus, and ends there by the orifice which we have already deſcribed. The ſides of the vagina poſſeſs conſiderable thickneſs and ſtrength. The upper half of its poſterior ſurface is covered by peritoneum. The chief ſubſtance of the canal is a thick, cloſe, and firm texture of a greyiſh colour, poſſeſſing large veſſels, and having fibres in various directions, ſo as to give it ſomewhat of a muſcular appearance. It appears to be continuous above with the ſubſtance of the uterus. Below it is ſurrounded by a kind of corpus cavernoſum, of about an inch in breadth, and two lines in thickneſs, compoſed apparently of veins, and called the plexus retiformis. A determination takes place to this part at the time of copulation, and it experiences a kind of ſwelling analogous to erection. On the whole, the membrane of the vagina is not ſo thick, as the diſtention which it experiences in parturition might lead us to expect. Excepting where it is covered by the peritoneum, and by the plexus retiformis, the ſurface is ſurrounded by a copious cellular ſubſtance, containing many vaſcular ramifications.

The vital properties of the ſides of the vagina are not well underſtood. Some aſcribe to it a contractile power, exerciſed, as it is ſaid, in coition, and felt by the hand when introduced in the proceſſes of midwifery. The phenomena of parturition ſhew that it poſſeſſes in a high degree the powers of extenſion and ſubſequent contraction.

The internal ſurface of the canal is lined by a mucous membrane, to which the peculiar tiſſue of the vagina already mentioned adheres very cloſely. It is continuous with the membrane of the vulva; and, after lining the vagina, is extended over that portion of the cervix uteri, which projects into the canal, and communicates, at the os tincæ, with the lining of the uterus. This mucous lining forms all the inequalities already deſcribed; it is thicker near the vulva, and grows manifeſtly thinner towards the uterus. At the entrance of the canal it has a red colour, which changes farther into a grey or whitiſh caſt, diverſified near the cervix uteri by the livid ſpots already mentioned, which give it a marbled appearance. The almoſt cartilaginous hardneſs of the membrane in ſome parts is peculiar to the vagina, as well as the permanent folds in its ſtructure; in other mucous membranes the inequalities are occaſioned by ſome external cauſe, and diſappear by extenſion. Some anatomiſts aſcribe an epidermis to the vagina; but this point is doubtful. The organs, by which its mucous fluid is ſecreted, have been already mentioned.

The place of the accelerator urinæ of the male ſubject is occupied in the female by the *ſphincter vaginæ*, which covers the plexus retiformis. It deſcends on each ſide from the body of the clitoris, behind the erector; ſurrounds the anterior extremity of the vagina, immediately behind the labium, where it poſſeſſes conſiderable breadth, and terminates below, on each ſide, in the lateral fibres of the ſphincter ani. It muſt have the power of contracting the front orifice of the vagina.

The arteries of the vagina come from the internal iliac; its veins join the venous plexus, which ſurrounds the canal. The lymphatics are not well known; the nerves come from the ſacral trunks.

The *uterus* is the organ in which the fœtus and its coverings are contained until the time of parturition. It is almoſt always ſingle; in ſome rare caſes there have been two uteri. There is ſome variety in theſe inſtances; either there may be two uteri and two vaginæ; or a ſingle vagina divided by a ſeptum in its whole length, or only in its upper half; or one of the uteri may open into the rectum, and the other into the vagina. In ſome caſes the uterus is divided internally by a longitudinal ſeptum, either confined to the neck, or prolonged to the orifice of the vagina. Sometimes the uterus is altogether deficient. A vaſt number of references to authors who have related examples of all the above-mentioned unuſual formations may be ſeen in Voigtel's Pathologiſche Anatomie, b. iii. p. 452—456.

This organ is ſituated in the pelvis, behind the urinary bladder, before the rectum, below the convolutions of the ilium, and above the vagina. Its ſituation is oblique, the fundus being placed upwards and rather backwards, the neck downwards, and ſlightly inclined forwards. Two broad folds of peritoneum, named the ligamenta lata uteri, fix it to the ſide of the pelvis. Other ligaments aſſiſt in maintaining this viſcus in its ſituation; *viz.* the round, the anterior, and the poſterior ligaments.

The broad ligaments extend from the ſides of the uterus to the ſides of the containing cavity. Together with the uterus they form a complete tranſverſe partition, dividing the pelvis into an anterior and a poſterior cavity, of which the former and ſmalleſt contains the urinary bladder, the latter and largeſt, the rectum. Theſe ligaments are flattened from before backwards and quadrilateral. Their two ſurfaces are ſmooth, and unattached; the anterior being turned directly forwards, towards the bladder, the poſterior directly backwards, towards the rectum. The upper edge is divided into two prominent lines; of which the anterior and higheſt contains the Fallopian tube, the poſterior, the ovary and its ligament. The three other margins are adherent; the inferior, to the lower part of the pelvis; the external, to the ſide of the cavity; and the internal to the lateral margin of the uterus. Theſe ligaments are formed by two layers of peritoneum, between which are placed the veſſels and nerves of the uterus, the ovaria and their ligaments, the Fallopian tubes, and ſome cellular ſubſtance. They fix the uterus in its ſituation, and give it a covering, in proportion as it increaſes in ſize during pregnancy; they conſequently become much narrower at the time; in the latter months, indeed, they are almoſt entirely effaced, ſo that the tubes and ovaries, which they contained before the enlargement of the uterus, are now applied immediately to the lateral and inferior parts of the uterus, in conſequence of the manner in which this organ has ſeparated the two layers of peritoneum.

The anterior ligaments are two ſmall folds formed by the peritoneum, as it is reflected from the back of the bladder to the front of the uterus. They are viſible only when the two viſcera are ſeparated from each other, and they appear under the form of creſcents, with the concavities directed upwards. The poſterior ligaments are two other folds of the ſame membrane, where it is continued from the back of the uterus to the rectum. They reſemble the former in every reſpect. The round ligaments are two whitiſh cords, extended from the upper angles of the uterus, in front and rather below the Fallopian tubes, to the groins. They paſs firſt outwards and rather upwards, in the broad ligaments, on the front ſurface of which they form a remarkable prominence, they then paſs on the inner ſurface of the iliac veſſels, behind the peritoneum, to the upper opening of the abdominal ring. They traverſe that canal in a direction obliquely downwards and inwards, juſt as the ſpermatic cord does in the male ſubject, and eſcape at the lower orifice. They then ſeparate into ſeveral threads, which are loſt in the cellular ſubſtance of the mons veneris and labia. Theſe ligaments are ſlightly flattened in their whole extent, and broader at their two extremities, than in the middle. They are arched, ſo as to deſcribe altogether a ſemicircle.

The round ligaments are compoſed of longitudinal fibres, conſiſting apparently only of a denſe cellular tiſſue, very ſlightly ſuſceptible of extenſion, of blood-veſſels and lymphatics, and nerves. As they are ſwelled in pregnancy, and in ſome affections of the uterus, this circumſtance has been employed to explain the pains in the groins experienced by females on ſuch occaſions. They contribute to fix the uterus in its poſition, and to limit its motions.

The ligaments, which we have juſt particularized, are ſo diſpoſed, as to allow to the uterus, in its natural ſtate, a certain degree of mobility. Hence its ſituation may be ſlightly changed in all the conſiderable motions of the abdominal viſcera in general; coming to the ground on the feet with much force, a violent exertion in raiſing a conſiderable weight, a deep, forcible, and long continued inſpiration, all tend to force the uterus downwards into the vagina, and thereby to produce the affection termed prolapſus or deſcent of the uterus. Diſtention of the bladder, or of the rectum, occaſions changes in the poſition of the uterus. But age and pregnancy produce the moſt ſignal effects in the poſition of this organ.

In an adult and unimpregnated female, its length is about 2½ inches, its thickneſs one inch, its breadth at the fundus 1½ or 2 inches, and at the cervix about 10 lines. Although it returns after parturition to its original ſize, it never becomes again ſo ſmall as it was in the virgin. Its figure on the whole is triangular, with the baſe upwards, and the apex downwards, and flattened from before backwards. It is divided into two parts, a ſuperior and broader, named the body; an inferior and narrower, called the neck. The body of the uterus is nearly oval externally, with the greateſt diameter tranſverſe. We obſerve in it an anterior and a poſterior ſurface, a ſuperior, an inferior, and two lateral ſides. The anterior ſurface, ſlightly convex, ſlopes gently downwards and forwards, and correſponds to the bladder. The poſterior, more convex, is inclined in the ſame direction, and is contiguous to the rectum. The ſuperior edge, which is named the fundus, and which extends from one Fallopian tube to the other, is gently convex, and ſupports the convolutions of the ſmall inteſtine. At the ends of this upper edge angles are formed between the fundus and the lateral ſides of the viſcus. To theſe angles of the uterus the round ligaments, the Fallopian tubes, and the ligaments of the ovaries are attached. The inferior edge, much ſhorter than the ſuperior, is continuous with the neck of the organ; and indeed the line of ſeparation is imaginary. The lateral ſides are very ſhort, ſlightly convex, and converging: they give attachment to the broad ligaments, and are concealed by them.

The neck of the uterus reſembles a cylinder, ſlightly flattened from before backwards, and continued downwards from the body. Its long axis is perpendicular to the tranſverſe diameter of the body. We deſcribe in it an anterior and poſterior ſurface, two lateral margins, and a ſuperior and inferior extremity. The two ſurfaces are convex and ſmooth; the former correſponds to the bladder, and the latter to the rectum. To the ſides, which are ſtraight, the broad ligaments are attached. The ſuperior extremity is continuous with the body of the organ; the inferior is obliquely embraced by the vagina, in which it projects, more conſiderably on the interior than on the poſterior part. This extremity is perforated by an oval opening, with its long diameter placed tranſverſely, named the os uteri, os internum, or os tincæ. The latter name has been given to it from a compariſon to the mouth of the tench; the end of the uterus is obtuſe, and as the aperture is tranſverſe, there is ſome reſemblance to two thick lips. In a newly born child, the length of the opening is two lines; in a girl of twenty years, three lines; in women, who have had children, five to eight lines. The orifice is always naturally gaping, but it is more or leſs ſo, in proportion as women have had many children, or none. Inſtead of being exactly in the middle it is rather behind; ſo that the anterior lip of the orifice is the thickeſt. That portion of the cervix uteri, which projects into the vagina, and forms the os tincæ, is about four or five lines long in front, and rather more behind: it meaſures about eight or nine lines tranſverſely, and ſix or eight from before backwards, being ſlightly flattened in that direction. This part of the uterus is ſometimes much longer and thicker, without any diſplacement of the organ, or ſwelling of its neck. In women who have had many children, the neck of the uterus is generally thicker, and more rounded. Its orifice is almoſt always very gaping, and the lips more or leſs irregular, preſenting generally one or more grooves or chops, ſeparated by a kind of tubercles. The os uteri may however be as regular in its figure in women who have had children, as in others: and, on the contrary, it may preſent in the latter thoſe irregularities which are more uſual in the former. Hence the inferences drawn from the ſtate of this part, in inſtances where infanticide is ſuſpected, or where parturition is ſuppoſed to have been concealed, are very liable to uncertainty.

The cavity of the uterus is proportionate to the bulk of the organ when it is empty; the parietes are contiguous, and leave between them no farther vacuity than ſuffices to hold a little mucous fluid. In this hollow the menſtrual diſcharge flows, and the produce of conception is received. It is divided into two parts, one belonging to the body, the other to the neck of the organ. Of theſe, the former is the largeſt: its figure is nearly triangular, eſpecially when the uterus has experienced no alteration in its bulk. We have to notice in it an anterior and a poſterior ſurface, three edges and three angles. The two ſurfaces are ſmooth and contiguous to each other. On each of them a ſlightly prominent longitudinal line may be obſerved, dividing them into equal right and left parts. Of the three margins one is ſuperior, and two lateral: they are ſlightly concave, particularly in women, who have had many children. The ſuperior, which makes the baſis of the triangle, and is continued from one Fallopian tube to the other, is uſually the ſhorteſt: ſometimes, however, it is the longeſt. Of the three angles, two are ſuperior, and one inferior. The former may be conſidered as two ſlender appendages of the cavity, terminating at the Fallopian tubes. The inferior angle preſents an opening of about four lines in extent, communicating with the cavity of the cervix. The cavity of the body of the uterus is lined by a mucous membrane, on which the veſſels that furniſh the menſtrual blood terminate.

The cavity of the cervix uteri is a kind of canal, flattened from before backwards, and more capacious at the middle than at the two extremities; ſo that it has the figure of two cones, joined by their baſes. Such is the figure which it conſtantly exhibits in women who have never borne children; but, from the time of conception, that extremity of the canal, which opens into the vagina, is dilated; and after parturition has once taken place, it is always found much wider than before. It then repreſents a cone, with the baſis towards the vagina, and the apex towards the uterus. The cavity of the cervix uteri has an anterior and poſterior ſurface, and a ſuperior and inferior orifice. A great number of hard, and as it were callous rugoſities, differently diſpoſed in different ſubjects, may be obſerved on each of the ſurfaces. In order to ſee their arrangement to advantage, the uterus of a newly-born child, or of one not very old, ſhould be ſelected. They will then be obſerved in an arboreſcent form (*arbor Morgagni*) on each ſurface. A hard ridge extends along the middle of each ſurface, and ends above in a flattened point, which is often continued with the line dividing the correſponding ſurface of the body of the uterus. The inferior end is prolonged to the os tincæ. From this kind of trunk laminæ are extended laterally on each ſide; the ſuperior ones forming nearly half right angles, and the inferior more open angles. The number of theſe plates may amount to about 15. They are continued outwards, deſcribing a curve, of which the convexity is always towards the uterus, and the concavity towards the vagina. Their margin is grooved, except towards the outer end, which is ſmooth. The breadth of the laminæ diminiſhes inſenſibly, and they diſappear on the ſides of the cavity, where the anterior and poſterior ones are confuſed with each other. The ſuperior are broader than the inferior. Theſe laminæ are not ſimple, they produce other ſmaller ones. More or leſs deep grooves ſeparate the plates from each other: in the bottom of theſe are obſerved ſmall eminences, like the teeth of a comb, paſſing from one lamina to another.

The diſpoſition of theſe wrinkles is regularly ſuch as we have deſcribed in newly-born infants; but, when the cervix uteri is enlarged in pregnancy, the eminences are flattened, and the whole ſtructure is confuſed; this is ſtill more remarkably the caſe juſt after parturition; the laminæ are then nearly deſtroyed, and the arboreſcent appearance almoſt entirely effaced.

The ſuperior opening of the cavity communicates with that of the body, ſo that they form indeed but one. The inferior has been already deſcribed under the name of os tincæ.

In the cervix uteri we may notice the openings of numerous lacunæ or ſhort ducts ending in cul-de-ſacs, concealed among the rugoſities already deſcribed. Moſt of theſe are ſmall; ſome are larger and longer. There are ſix or ſeven juſt above the os tincæ, the fundus of which is towards the inferior end of the uterus. Theſe are large, and receive the terminations of ſeveral ſmaller ones. They are filled with a mucous fluid, which can be ſqueezed out, and they will often admit of a fine briſtle for a certain length. They are beſt ſeen in a woman who has juſt been delivered, or who has died in the latter periods of utero-geſtation; the prominences being flattened, the lacunæ are more expoſed. Theſe organs ſecrete the mucous fluid, with which the cervix uteri is moiſtened.

We ſee alſo ſometimes in this cavity a conſiderable number of round or oblong, larger or ſmaller follicles, formed of a thin membrane, filled with a clear mucous fluid, and not poſſeſſing any excretory duct. They adhere to the trunk or branches of the arboreſcent ſtructure already deſcribed, and their number is not conſtant. Sometimes they are half buried in the ſubſtance of the uterus, ſometimes they are completely iſolated, and hold only by a pedicle. Their nature and uſe are not known. Probably they are one ſource of the mucous ſecretions of the part although we cannot explain how the ſecreted fluid is evacuated.

The thickneſs of the ſides of the uterus varies from four or ſix lines to fifteen; but it is not uniform in all parts of the organ. It is much the ſame on the ſurfaces and edges. The fundus is generally the thickeſt; and this is thicker in the middle than towards the angles. The neck is rather thinner than the body. The ſubſtance of the organ is of a greyiſh colour, and a firm conſiſtence, eſpecially towards the neck, which is more compact than the reſt of the organ. It conſiſts of an external membrane, of a proper tiſſue, of an internal membrane, of arteries, veins, lymphatics, and nerves.

The external membranous covering is contributed by the peritoneum, which is reflected from the poſterior ſurface of the bladder over the uterus, of which it covers the anterior ſurface, the fundus, and the poſterior ſurface, is continued to the upper half of the poſterior ſurface of the vagina, and is reflected from that viſcus to the rectum. It adheres every where to the proper tiſſue of the uterus by means of a very fine and cloſe cellular texture, without any fat. It is very difficultly ſeparable, particularly at the fundus.

The proper tiſſue forms nearly the whole thickneſs of the organ. It is a greyiſh, denſe, and very compact ſubſtance, very reſiſting to the ſcalpel or ſciſſars, cutting almoſt like cartilage, and containing numerous ſmall veſſels. This ſubſtance, which appears cellular, ſpongy, and to contain fluids, is manifeſtly fibrous: but the order and arrangement of the component fibres cannot abſolutely be determined in the unimpregnated ſtate, on account of their being ſo inextricably interwoven. They are paler and more condenſed in the cervix than in other ſituations, where they are ſofter and more red. Although in the empty ſtate of the organ theſe fibres have ſcarcely any of the characters of muſcularity, their nature ſeems to be ſufficiently pointed out by the contractile powers which they exhibit in parturition.

The external membrane of the uterus is continuous on one ſide with the mucous lining of the vagina; and gives origin, on the other, to two prolongations, which enter into the Fallopian tubes. It is extremely thin, and ſo cloſely united to the proper tiſſue of the organ, that it ſeems to form one ſubſtance with it. It is reddiſh in the body of the uterus, and whiter in the neck. It is perforated by an infinite number of pores, which are merely the extremities of exhaling veſſels, and give iſſue to the menſtrual diſcharge.

Appendages of the Uterus.—Under this name are included the round ligaments which have been already deſcribed, the ovaries, and the Fallopian tubes.

The *Fallopian* or *uterine tubes* are two (a right and left) conical, tortuous, and vermiform canals, ariſing from the ſuperior and lateral parts of the uterus. They float looſely in the cavity of the pelvis, being enveloped in the upper and anterior edge of the broad ligament, and fixed by their inner extremities. Their length is four or five inches ; and the direction of their courſe very uncertain : it may be ſtated in general that they go tranſverſely outwards, and that they bend backwards at their outer ends, ſo as to turn towards the ovaries. But, as they are in great meaſure looſe, and as the edge of the broad ligament reſtrains them but ſlightly, the inteſtines, when diſtended with air or aliment, may diſplace them in different directions. The calibre of the tube is ſo narrow towards the uterus, that the orifice by which it communicates with this viſcus will only admit a hog's briſtle. It enlarges gradually to the middle, where it is ſlightly contracted, and dilates again to terminate by an aperture which communicates with the cavity of the abdomen. The tube is conſiderably broader at its end than at the uterus, but rather narrower than in the portion immediately preceding. The internal membrane of the tube, together with the external, which is formed of peritoneum, is produced to ſome length beyond this orifice, and forms round it a fringed and radiated kind of ornament, called the fimbriæ (pavillon de la trompe ; morceau frangé). When this part is examined in water, it has a very beautiful appearance, and ſeems compoſed of ſmall ſeparate leaves, like ſome flowers. The breadth of this membranous fringe is not equal at all parts : its circumference has ſomewhat of an oval figure. All the portions into which it is divided are not of the ſame length : the longeſt extends to the ovary, and is firmly fixed to its outer extremity, ſo that the fringed end of the tube is conſtantly retained near to that body. The fimbriæ are conceived to poſſeſs a muſcular ſtructure.

The Fallopian tube is compoſed : 1ſt. Of an external membrane, furniſhed by the peritoneum, which covers it as it does the inteſtines ; 2. Of an internal, ſoft and pulpy membrane, the ſurface of which preſents every where more or leſs prominent longitudinal lines, conſidered by ſome authors to be muſcular fibres. Indeed the office of the tubes ſeems to require the exiſtence of contractile fibres in their compoſition ; 3. Of a ſpongy tiſſue, compared to that of the urethra and corpus cavernoſum, but the real nature of which is not underſtood. Very numerous blood-veſſels are diſtributed in this ſubſtance, which appears to ſwell and experience a kind of erection in the act of copulation : in conſequence of this the fimbriæ are applied to the ſurface of the ovary ; 4. Of blood-veſſels, derived from the ſpermatic arteries and veins, of lymphatics, and nerves furniſhed by the renal plexuſes.

That the office of the tubes is immediately connected with the buſineſs of generation, and that they convey the germ from the ovarium to the uterus, cannot be doubted : but we do not underſtand how they execute this function. We may obſerve that they form a communication between the uterine cavity and that of the abdomen : and, as the former communicates externally through the medium of the vagina, the ſerous membrane of the abdomen has thus a continuity with the ſurface of the body :—a circumſtance that is obſerved in no other inſtance.

The *ovaries*, called by the ancients the female teſticles, are two oblong, flattened, and whitiſh bodies, placed at the poſterior ſurface of the broad ligaments, in which they are included. They nearly equal the ſize of ſmall pigeons' eggs in the adult ; but their flattened form gives them a different figure. Their long diameter is placed tranſverſely. They preſent two ſurfaces, two edges, and two extremities. The ſurfaces and the upper edge are looſe, and preſent nothing remarkable except ſlight tubercular riſings. The inferior margin adheres to the poſterior edge of the broad ligament. The external extremity is connected to the longeſt of the Fallopian fimbriæ ; and the ligament of the ovary is attached to the internal end. This ligament is a ſmall fibrous cord, about 1½ inch long, contained in the poſterior part of the broad ligament, and fixed to the angle of the uterus behind the Fallopian tube. Some old anatomiſts regarded it as a canal deſtined to convey into the uterus the ſemen, which they ſuppoſed to be ſecreted by the ovaries ; but it is in reality a ſolid faſciculus, ſimilar in its nature to the round ligament, and having no other office than that of fixing the ovarium in its place. Yet the latter organ poſſeſſes conſiderable mobility ; its ſituation in the broad ligament, which is itſelf moveable, gives it a power of motion. The inteſtines and the urinary bladder may make it change its poſition ; and we know that it has ſometimes been contained in a rupture.

The ovaria are compoſed ; 1ſt. Of an external membrane, derived from the peritoneum forming the broad ligament ; 2. Of a proper membrane, of a white colour, and firm fibrous texture, hardly ſeparable from the proper tiſſue of the organ ; 3. Of a fleſhy ſubſtance, which is denſe on the outſide, more ſoft on the inſide, where it is greyiſh, and in ſome degree cellular and ſpongy. In this ſubſtance are lodged ſome ſmall, roundiſh veſicles, amounting in number to between fifteen and twenty. Scarcely viſible in infancy ; theſe are very apparent in adult and fruitful women. Generally, in old women, theſe veſicles are no longer viſible, and their place is occupied by hardiſh tubercles. The veſicles are not all of the ſame ſize : thoſe which are near the ſurface of the organ are as large as hemp-ſeeds ; while the others, being more deeply ſeated, are conſiderably ſmaller. Theſe bodies are placed in the cellular or ſpongy ſubſtance of the ovary, in which they may be ſaid to be enchaſed ; but they form for the moſt part ſmall prominences under the external membrane. Others are completely elevated on the ſurface of the organ, and others again are concealed in the interior. They are not ſuſpended by ſtalks, nor do they form any particular cells different from the cellular matter compriſing the parenchyma of the ovary. They were very particularly deſcribed by De Graaf, and have often been called, after him, ova, or ovula Graafiana. They are generally regarded as ſo many germs, or rudiments of new beings. They are compoſed of a ſimple and very thin membrane, ſmooth internally, and containing a clear, ſometimes yellow or reddiſh liquor, coagulable by heat and alcohol, and forming white threads, like the albumen of an egg.

The arteries of theſe parts are derived from two ſources ; *viz.* the ſpermatic branches of the aorta, and the uterine branches of the internal iliacs. The former are more tortuous than the correſponding veſſels in the male ; they paſs between the two layers of peritoneum, which form the broad ligaments, and are chiefly diſtributed to the ovaries. But they ſend numerous ramifications to the Fallopian tubes ; others to the ſides of the uterus, and ſome along the round ligaments, which communicate with ſmall branches of the epigaſtrics. The chief arteries of the uterus are the uterine branches of the internal iliac trunks ; the right and left. This artery firſt runs downwards, then turns up at the neck of the uterus, and enters between the layers of the broad ligament. It gives large branches to the vagina, then runs along the ſide of the uterus, from the neck towards the fundus, producing numerous arteries, which ramify over the organ in every direction. Theſe have a tortuous courſe, and communicate freely with each other, and with thoſe of the oppoſite ſide.

Some aſcend to the upper edge of the broad ligament, are diſtributed in the Fallopian tube and round ligament, and communicate with the ſpermatic.

The veins, like the arteries, may be referred to two diviſions; the ſpermatic and uterine. Numerous branches come from the uterus, ovary, and Fallopian tube, and form a large venous plexus in the upper part of the broad ligament; under the name of corpus pampiniforme, this aſcends towards the loins, and terminates in forming a ſingle vein, which has the ſame termination in the male ſubject. A great number of venous ramifications accompany the arteries all over the viſcus, but are in general leſs tortuous. They communicate freely with the ſpermatics. They form a large plexus running along the ſide of the uterus, with the uterine artery, and end in one or more conſiderable venous trunks, which join the internal iliac.

The uterus poſſeſſes numerous lymphatic veſſels, which are divided into three orders: one of theſe aſcends with the round ligaments, and goes to the inguinal glands; another joins thoſe of the vagina, and paſſes to the pelvic glands; and the third, together with thoſe of the ovary and tube, aſcends with the ſpermatic veſſels, to terminate at the glands in front of the aorta and vena cava near the kidneys.

The nerves come from the great ſympathetic (the hypogaſtric and ſpermatic plexuſes), and from the ſacral pairs.

Vital Properties of the Uterus.—Until the period of impregnation, this organ ſeems to poſſeſs only that modification of ſenſibility and contractility, which are neceſſary for the purpoſes of nutrition, and the menſtrual evacuation. It ſeems doubtful whether or no it is endowed with animal ſenſibility in its healthy ſtate. It has been imagined, and aſſerted, that the contact of the glans penis with the os tincæ, in copulation, is one ſource of the phyſical ſenſation experienced by the female on that occaſion: this we conceive to be problematical. Haller ſtates, that a wound of this organ by a leaden bullet produced very violent ſymptoms; *viz.* repeated faintings, and ſpeedy death. It muſt be doubtful how far this could be referred to the uterus merely, as much other injury muſt have been inflicted in ſuch a caſe. Animal ſenſibility is certainly developed in the uterus by diſeaſe, whether it exiſt in the natural ſtate or no. The ſame obſervations may be applied to the vital properties of the Fallopian tubes and the ovaries. However obſcurely the vitality of theſe organs may be exhibited, when not immediately engaged in the exerciſe of their important functions, it is manifeſted in a much more ſtriking point of view by the ſympathies eſtabliſhed between them and other parts of the body. We have already ſhewn, that the removal of the ovaries at an early age entirely changes the ſubſequent characters of the animal; affecting even the organization of the bony and muſcular parts of the frame. From the time of puberty, when the organs now under conſideration acquire a fitneſs for exerciſing their particular functions, we ſhall find that their condition and various changes affect in the moſt ſtriking manner all the other vital phenomena of the female conſtitution. The previous ſymptoms, the commencement and periodical returns of menſtruation; the firſt impulſes of love; the change to a new temperament; pregnancy and its various epochas; parturition and its conſequences; laſtly, the ceſſation of the ſexual life, and the ſymptoms of the critical age, are ſo many remarkable changes in the organization of the female, keeping up a conſtant alternation of ſuffering and diſeaſe, of lively impreſſions, nervous and ſpaſmodic affections, the influence and general reſult of which muſt be carefully attended to in appretiating the nature of woman, and the part which ſhe has to fill in ſociety. When we conſider theſe facts, and reflect that the inclinations, the appetites and taſtes, in a word, all thoſe qualities which impreſs the diſtinctive character on any animal, flow from the conformation and predominating influence of certain organs, and are modified by their degree of perfection, and the energy of their functions, we ſhall have little heſitation in referring the peculiarities of the female frame and conſtitution to the action of the generative organs taken altogether; an opinion which is expreſſed in a more limited way by Van Helmont, "propter uterum ſolum, mulier eſt id quod eſt."

Developement of the female Organs of Generation.—Theſe, like the correſponding parts in the male, are very early in their original formation; but they grow leſs rapidly in proportion towards the latter periods of geſtation. This muſt be underſtood of other internal parts; for the vulva, which beſtows the diſtinctive external ſexual character, aſſumes a more decided figure towards the time of birth. From the various parts compoſing it we muſt except the clitoris; for although it poſſeſs in a fœtus at the full time a conſiderable ſize compared to its magnitude, when the formation of the generative apparatus is complete, it is nevertheleſs much leſs developed at the time, in proportion, than at the third or fourth month: and we may obſerve, in general, that it is more prominent in proportion as the fœtus is younger.

Although the female organ preſent no phenomenon analogous to the deſcent of the teſtis in the male, the round ligament is ſometimes accompanied by a ſmall cul-de-ſac of peritoneum, ſimilar to that which forms the tunica vaginalis. The exiſtence of this canal was firſt recogniſed by Nuck, who called it a diverticulum, deſcribed it as being about half an inch in length, and by no means conſtant: (Adenographia curioſa, cap. 10. De peritonæi diverticulis novis.) The fact was queſtioned by ſome; but the ſame circumſtances have been obſerved by other accurate anatomiſts. Camper found the canal in three out of fourteen newly born children: and Le Cat obſerved, in a woman of 46, a canal of the ſize of a gooſe's quill, leading through the ring into a ſmall canal that would admit the finger. (Phil. Trans. v. 47.) Wriſberg has particularly inveſtigated theſe diverticula. In nineteen out of two hundred female ſubjects, he found an opening, generally on both ſides, but ſometimes on one only, leading through the ring into the groin or labium, lined by peritoneum, and placed over the round ligament. Theſe canals, in different inſtances, would admit a probe, a quill, or the finger. (De teſticulorum deſcenſu, &c. in the Göttingen Commentaries for 1778.) We do not know that this canal is cloſed before birth, as the tunica vaginalis is in the male, nor that its exiſtence in the adult at all favours the occurrence of herniæ.

At the time of birth, there is a conſiderable proportion of fat under the integuments of the pubes; the labia are very well formed, and the clitoris is proportionally larger than it will be in the ſequel. The latter circumſtance, which is very ſingular and unaccountable, has ſometimes occaſioned miſtakes in the ſex of newly born children. The nymphæ are ſo broad as to exceed the level of the labia, and are remarkably thick and long: they do not in general end by a point, as in the adult, but by a rounded extremity. The foſſa navicularis is large. The entrance of the vagina, although the hymen exiſt conſtantly at this time, is larger in relation to the diameter, which it preſents at puberty, when the parts have experienced no unnatural violence. The opening does not appear to participate in that developement which the reſt of the vulva undergoes after birth. The vagina, conſiderably advanced in its formation in compariſon with the uterus and its appendages, is particularly remarkable for its length. Its inner membrane, of which the rugoſities are very well marked, is nearly white, and does not exhibit thoſe ſucceſſive ſhades which, at a more advanced age, diſtinguiſh its orifice, its middle, and its poſterior extremity. In the newly born child, and during the firſt years of life, the uterus does not occupy the cavity of the pelvis: together with the ovaria and tubes, it is placed above the ſuperior aperture. At this time it is very ſmall, and has a very different figure from what it preſents when perfectly developed. The neck is larger and thicker than the body, which narrow, and elongated, has not the triangular figure. The parietes of both are thin, and the cavity very ſmall. The tubes are proportionate in length to their future ſtate.

From birth till puberty, the generative organs of women experience ſtill fewer changes than thoſe of men: yet they grow in proportion as the body encreaſes; and thoſe, which at firſt were remarkable for their ſize, as the clitoris and nymphæ, gradually loſe this diſtinction. The uterus appears leſs elevated above the pubes, in proportion as the pelvis changes its form and proportions, and as the ſuperior aperture becomes leſs inclined. It encreaſes principally in breadth and thickneſs, but its growth is not very rapid. The changes which occur at the time of puberty, conſidered in an anatomical point of view, are not conſiderable: there is a remarkable revolution in the vital powers of the generative ſyſtem, rather than any conſiderable increaſe of the organs. The internal parts, however, at this time, have acquired their complete ſize, and the external organs become covered, in the ſituations already particularized, with hairs.

In extreme old age, the generative organs of the female, already reduced for a conſiderable time to complete inaction, bear the marks of decrepitude common to the whole frame. The vulva preſents the moſt remarkable changes; this is the part moſt affected by the performance of the ſexual functions, and many parts of it partake the general emaciation. The prominence of the mons veneris is nearly effaced, and a great part of the hair, which covered it, is loſt; the remainder becoming grey and ſtraight. The labia and nymphæ are ſoft and flaccid; the latter ſometimes can ſcarcely be ſaid to exiſt: the mucous membrane is whitiſh, or at leaſt very pale in its colour. The ſtate of the vagina preſents nothing very remarkable. The volume of the uterus is diminiſhed, its parietes having become thinner. The tubes and round ligaments are alſo in ſome degree reduced. The ovaria do not exceed half the ſize which they had in the adult age; they are ſometimes very denſe, and marked with deep grooves, ſo as to render the ſurface tubercular; in other inſtances, their ſubſtance is removed, ſo that they are reduced to a very thin appearance. The veſicles contained in their parenchyma are no longer diſcernible.

State of the Generative Organs during Pregnancy.—The uterus, intended to ſerve as a receptacle for the fœtus, dilates after it has received the germ from the ovary, and enlarges in proportion as this is developed: its blood-veſſels bring an additional quantity of fluid, from which the fœtus draws its ſupport: laſtly, at a certain period, fixed by the laws of nature, it diſcharges the produce of conception by virtue of the vital properties, with which it has been endowed, during the remarkable change of its organization. Such are the threefold objects, to the attainment of which are directed the new diſpoſitions acquired by this organ during geſtation.

The anatomy of the gravid uterus has been moſt fully elucidated by Dr. William Hunter, whoſe ſplendid and beautiful plates form an epocha in the hiſtory of our knowledge of this ſubject. "The anatomical Deſcription of the human gravid Uterus and its Contents," London, 4to. 1794, drawn up by Dr. Baillie, from the papers of Dr. Hunter, contains a very clear account of the ſubject; this, with the plates already mentioned, is the ſource from which the following deſcription is principally derived. The obſervations, unleſs where it is otherwiſe expreſſed, apply to the ſtate of the organ as it is found in the 9th month.

Conſiderable variety exiſts in the ſize of the organ. The child and placenta may be twice as large in one caſe as in another: there may be ſix or eight times more water in one caſe than in another: not to mention the differences ariſing from there being only one child or twins, &c.

The developement of the uterus appears to be immediately produced by the general diſtention of the liquid ſurrounding the fœtus, and not by the fœtus itſelf, ſince the latter does not come in contact with the organ. The ſize of the part depends principally upon the quantity of the liquor amnii. For, though women who have twins, or a very large child, are commonly obſerved to be very big, yet the greateſt number of thoſe who are really very much ſwelled out, are ſo only from a vaſt quantity of water. In ſuch caſes there is frequently but one child, and that very often a ſmall one.

The general figure of the uterus is oviform; the fundus anſwering to the largeſt extremity of the egg, and the cervix and os uteri to the ſmall end: but the fundus is larger and more flat, or leſs pointed, in proportion to the lower extremity of the uterus, than one end of an egg is to the other; and the whole uterus ſeems more or leſs compreſſed, ſo as to be broader from right to left, than it is from the forepart backwards. Beſides theſe more conſtant deviations, the figure of the uterus differs from the regular oviform, from a variety of accidental cauſes, as it adapts itſelf to the neighbouring parts, to the attitude of the body, and to the poſition of the contained child. In order to conceive theſe varieties more eaſily, we muſt remember that in moſt caſes the uterus is not ſo completely filled as to be upon the full ſtretch. Were it out of the body, and filled artificially, it would eaſily contain more than it actually does. Thus the uterus, like a bladder of water not quite full, is plaſtic, and moulds itſelf into various ſhapes from accidental circumſtances. The figure of the organ, in particular ſituations, is modified by the preſſure of the ſurrounding parts: the brim of the bony pelvis has the effect of a belt girding the lower part of the organ, and the projections of the ſpine, and of the pſoæ muſcles and iliac veſſels, mould the outſide of the uterus into correſponding cavities. The attitude of the body influences the figure of the uterus, as the parts againſt which it reſts vary in different poſtures. The poſition of the child is another cauſe influencing the figure of the uterus. Not only in dead bodies do we ſee the parts of the child making various different projections on the outſide of the uterus; but we can frequently obſerve the ſame variety in the living ſtate, by examining the outſide of the abdomen. The round projecting ball, made by the child's head or buttocks, is commonly very perceptible, and in many inſtances ſmaller parts, as the knees or elbows, can be diſtinctly felt. Dr. Mackenzie met with a caſe of twins, where the uterus, inſtead of making one compacted oval body, had ſtretched into two diſtinct bags, for containing the reſpective fœtuſes; ſo that its outſide was marked by a notch, dividing it into two apartments, as deep and diſtinct in proportion, as that in the heart repreſented on cards. The organ often ſtretches unequally in the correſponding oppoſite parts; ſo that either the right or the left half may be conſiderably larger than the other. It may ſwell unequally on the front or back part, ſo that the diſtance between the inſertions of the Fallopian tubes may be much ſmaller either before or behind than in the oppoſite directions. In the unimpregnated ſtate, it has commonly one triangular cavity: but it is ſometimes ſubdivided, at its upper part, into two lateral cavities, ſo as to bear ſome analogy to the two horns of the uterus in a quadruped. This peculiar conformation may explain the unequal extenſion of the two ſides in ſome caſes of pregnancy; and may elucidate the above-mentioned caſe of Dr. Mackenzie.

The ſmall or lower end of the organ is placed in the cavity of the pelvis. This generally contains the greater part of the child's head, and fills up the cavity ſo completely, as to preſs the bladder againſt the pubes, and the rectum againſt the ſacrum. The os uteri is directed againſt the coccyx, or the lower part of the ſacrum. The body and fundus, which contain the reſt of the child and the placenta, are ſo placed in the front of the abdomen, from the brim of the pelvis upwards to the epigaſtric region, as to be under and before all the other bowels, and in immediate contact with the parietes abdominis, and to occupy the whole ſpace from one hip-bone to the other, and a proportional extent from theſe bones upwards. As it riſes up from the cavity of the pelvis into the hypogaſtric and umbilical regions of the abdomen, the looſe connections of the inteſtines and omentum eaſily account for theſe parts being puſhed up before it.

The axis of the uterus is oblique, its lower end being turned backwards, and the upper proportionally forwards. This obliquity is changed by the attitude of the body, and by many other cauſes. In the erect poſture, the weight of the uterus preſſes the forepart of the organ into a greater rotundity, and its axis then approaches the neareſt to a tranſverſe or horizontal line. In the recumbent poſture, the contrary ſituation is exhibited. In a firſt pregnancy, the uterus ſtretches itſelf higher up in the epigaſtric region, and its axis comes nearer to the longitudinal or vertical direction, becauſe the parietes of the abdomen do not eaſily give way: but in a woman who has had many children, the abdomen, by repeated diſtention, is rendered more looſe and pendulous, and the uterus extends forwards rather than upwards. This poſition is more remarkable in very ſhort ſubjects; becauſe in them the cheſt is ſo near the pelvis, that the uterus is ſtopped in aſcent. The ſame circumſtance happens, and for a ſimilar reaſon, when the pelvis is very narrow: as no part of the organ, in ſuch a caſe, can be lodged in the pelvis, it muſt be placed proportionally higher. In a very ſhort and crooked woman, on whom the cæſarean ſection was performed, the fundus uteri was not only turned forwards, but even a little downwards. As ſhe lay upon the table, the navel could not be ſeen, as it was placed on the poſterior and inferior part of the abdominal tumour. In order to expoſe that part of the abdomen to the ſurgeon, it was neceſſary to lift up the fundus uteri, without which the hypogaſtric region would have been inacceſſible. The deviation of the organ towards the right or left ſide cannot, in general, be very conſiderable; as it poſſeſſes nearly the whole ſpace between the hip-bone, and its lower extremity is fixed to the pelvis. A ſmall lateral obliquity is very common; and we can eaſily ſuppoſe, that in a reclined poſture, the projection of the lumbar vertebræ will throw rather more than one-half of the uterus into the lateral cavity between the ſpine and one hip-bone. We know, indeed, that in all the laſt months, the abdomen is often more full on one ſide than on the other. Women ſay in ſuch a caſe, that the child lies on one ſide, and they judge rightly. Where the child lies the bulk muſt be both more conſiderable and more permanent, but where there is only uterus, placenta, and water, the ſwelling will be ſofter, and project leſs. The preſſure of the child, when it lies more in one ſide than in the other, makes the limb of that ſide weaker, more benumbed, and more liable to cramps, and œdematous ſwellings.

Of the Ligaments, Tubes, and Ovaria of the Pregnant Uterus.—It has been commonly obſerved that the ligaments and tubes of the pregnant uterus are attached lower upon the ſide of the organ than they were in the unimpregnated ſtate; and the reaſon is very obvious. The peritoneal coat of the uterus makes the broad ligament on each ſide, much in the ſame manner as the analogous membrane of the inteſtinal tube makes the meſentery. When the woman is not pregnant, the ligament is of conſiderable breadth, the ſpermatic veſſels paſs between its two laminæ, the round ligament runs downwards and outwards, on its anterior ſurface, and the tube runs in looſe ſerpentine turns on its upper edge. But in proportion as the circumference of the uterus grows larger, the broad ligaments become narrower, their poſterior lamella covering the poſterior ſurface, and their anterior lamella the anterior ſurface of the uterus itſelf. We obſerve now, that the round ligaments do not run down on the forepart of the broad ligaments, but upon the forepart of the body of the uterus itſelf. In proportion as the fundus riſes upwards, and increaſes in ſize, the upper part of the broad ligament is ſo ſtretched, that it clings cloſe to the ſide of the uterus, ſo that in reality the broad ligament diſappears, no more of it remaining than its very root; namely, its upper and outer corner, where the group of ſpermatic veſſels paſſes over the iliacs, to the ſide of the uterus. In this ſtate, although the ſmall end of the tube opens into the ſame part of the uterus, as before impregnation, yet the tube has a very different direction; inſtead of running horizontally outwards, it paſſes downwards, cloſely attached to the ſide of the uterus. Behind the fimbriæ lies the ovarium, alſo connected to the uterus. The fimbriæ and ovarium are commonly placed upon the iliac veſſels, or fleſhy brim of the pelvis, behind the group of ſpermatic veſſels.

The round ligaments run almoſt perpendicularly downwards from the fundus uteri to their paſſage through the muſcles; they are conſiderably enlarged in thickneſs, and are ſo vaſcular, that when injected they ſeem to be little more than a bundle of arteries and veins. Their arteries are all convoluted. Both their arteries and veins proceed principally from the ſpermatics, and anaſtomoſe evidently with the external veſſels in the groin or upper part of the labia. Even in this enlarged ſtate of the round ligaments, it is very difficult to ſay how they terminate in the groin; they appear to be inſenſibly loſt. The tubes are more fleſhy, vaſcular, and ſoft in their ſubſtance, and are leſs convoluted than in the unimpregnated ſtate. The fimbriæ and internal rugæ are larger and much more beautiful, eſpecially when their veſſels are well injected. The ovaria, excepting that which contains the corpus luteum, ſeem to have undergone no remarkable change. The latter body can be diſtinguiſhed by a rounded fullneſs, and frequently a conſiderable prominence, ſenſible both to the ſight and touch, upon the middle of which there is a ſmall pointed cavity or indentation, like a cicatrix. Upon ſlitting the ovarium at this part, the corpus luteum appears a round body, of a very diſtinct nature from the reſt of the ovarium. Sometimes it is oblong or oval, but more generally round. Its centre is white, with ſome degree of tranſparency; the reſt of its ſubſtance has a yellowiſh caſt, is very vaſcular, tender and friable, like glandular fleſh. The larger veſſels appear round its circumference, and ſend ſmaller branches inwards. A few of the larger veſſels are ſituated at the cicatrix or indentation on the outer ſurface of the ovarium; and are there ſo little covered, as to give that part the appearance of being bloody, when ſeen at a little diſtance. When there is only one child, there is only one corpus luteum; and two in caſe of twins. There may be, in the latter caſe, two diſtinct ones in one ovarium, or one in each ovarium. The ſex of the fœtus has no relation to the corpus luteum being formed in the right or left ovary.

Thickneſs of the Uterus.—Thoſe who ſay that the uterus grows thicker in proportion as its bulk is increaſed, have probably been deceived by examining the uterus of a woman who died ſome hours or days after delivery. In that contracted ſtate the uterus is often found even two inches thick: but in the natural diſtended ſtate, though there may be ſome difference, the thickneſs, in general, is but little more conſiderable than before impregnation. When not injected, its ordinary thickneſs is from one to two-thirds of an inch; when its veſſels, and particularly the veins, are pretty well filled with wax, its thickneſs is thereby conſiderably increaſed, more eſpecially where the placenta is fixed, on account of the number and ſize of the veſſels at that part. For this reaſon only, perhaps, the uterus is thickeſt at that part, and for the ſame reaſon it is thicker towards the fundus than near the cervix. Much variety may be obſerved with reſpect to thickneſs: and ſuch inequalities in the ſame individual, that even where the placenta did not adhere, the uterus may be almoſt twice as thick at one part as at another. On opening the organ, its thickneſs is generally found more conſiderable than external examination would have led us to expect. For its ſubſtance is ſoft, and a fluctuation, like that of water in a thin bladder, may be felt.

Blood-veſſels.—There is no circumſtance, in which the gravid uterus differs more from the unimpregnated, than in the ſize and termination of its veſſels. The arteries, both ſpermatic and hypogaſtric, are very much enlarged. There are infinite numbers of anaſtomoſing arteries through the whole ſubſtance of the part, ſo that the whole ſyſtem makes a general net-work, and the branches are convoluted or ſerpentine in their courſe. None of the larger ramifications are ſeen for any length of way upon the outſide of the uterus. As they branch from the ſides, they diſappear by plunging deeper and deeper into the ſubſtance. The arterial branches, which are much enlarged, are thoſe which run towards the placenta; ſo that, wherever it adheres, that part appears evidently to receive by far the greateſt quantity of blood; and the greateſt number, both of the large and ſmall arteries at that part, paſs through to the placenta, and are neceſſarily torn through upon its ſeparation. The veins of the uterus appear to be ſtill more enlarged, in proportion, than the arteries. From the ſides of the uterus they ramify through its ſubſtance, running deeper and deeper as they go on, and without following preciſely the courſe of the arterial branches. They form a plexus of the largeſt and moſt frequent communications which we know of among the veſſels of the human body. And this they have in common with the arteries, that their larger branches go to, or rather come from that part of the uterus to which the placenta adheres; ſo that, when the venous ſyſtem of the uterus is well injected, that part is evidently the chief ſource of the returning blood. Here, too, both the large and ſmall veins are continued from the placenta to the uterus, and are always neceſſarily broken upon the ſeparation of theſe two parts. The veins are without valves, and are therefore eaſily injected. In injecting them, we obſerve that at firſt they become turgid, and project on the outer ſurface of the uterus; but in proportion as we throw a greater quantity of wax into theſe veſſels, they grow more flat and obſcure; becauſe the uterus itſelf becomes more filled and tenſe, which has the effect of compreſſing the veins that run in its ſubſtance. On account of the large ſize of theſe veſſels, and the appearance of cavities, which they exhibit on a ſection, the name of *ſinuſes* has ſometimes been given to them.

The *lymphatics* are more numerous, and many of them larger than could have been imagined. They pervade the ſubſtance of the organ univerſally. Its peritoneal coat appears, like that of a calf's ſpleen, to be interwoven with a crowded plexus of theſe veſſels; and where they get to the ſides of the uterus, when filled with mercury, ſome of them are even larger than a gooſe's quill. Some are remarkably varicous, or enlarged at particular places.

We do not know that any change takes place in the nerves of the uterus during pregnancy.

Muſcular Fibres of the Uterus.—The ſubſtance of the organ is rendered remarkably ſoft and looſe in its texture by pregnancy; ſo that, when an inciſion is made into it, the wound can be eaſily made to open wide; or if a narrow ſtrip be cut out, it can readily be extended to at leaſt twice its original breadth. This laxity appears to depend on two cauſes; *viz.* the great quantity of large veſſels in its compoſition; and the looſe connection between the faſciculi of its fibres. When we ſpeak of the muſcular fibres, it is difficult to treat the ſubject with preciſion. We neither know their external appearance, nor their internal compoſition. They only manifeſt themſelves to our ſenſes, where numbers of them are collected into bundles, and make what we commonly call muſcular faſciculi. In the quadruped, as, for inſtance, the cat or rabbit, the muſcular action of the uterus is ſeen as evidently as that of the inteſtines, when the animal is opened immediately after death. In many parts, particularly of the internal ſurface of the uterus, theſe fibres have the ſame ſtriking faſciculated appearances as we obſerve in common muſcles; yet they are of a paler colour and harder texture. Dr. Hunter examined the fibres very carefully in a woman who died ſeven days after delivery. He ſtretched it gradually in warm water, and then inverted it, to have a full view of the inner ſurface. The remains of the decidua had paſſed off with the lochia, ſo that the faſciculated ſtratum of muſcular fibres appeared to be bare, and to make the internal ſurface of the uterus. In many places, but particularly where the placenta had been fixed, the faſciculi left oval ſpaces between them, for the paſſage of arteries and veins, ſomewhat like thoſe ſeparations in the tendinous fibres of the abdomen and loins, where veſſels paſs out to the cellular membrane and integuments. The cervix uteri, where the rugæ are ſituated, had not ſuch regular nor ſo large faſciculi as the reſt of the uterus. In the body of the organ the fibres were very regularly circular. The fundus was made up of two planes of concentric fibres, at the very centre of which was the orifice of the Fallopian tube. When this internal ſtratum was removed, the faſciculated appearance and regular direction of the fibres was leſs and leſs apparent, in proportion as the diſſection was continued outwards; which ſeemed to be owing in great meaſure to the infinite number of branches and communications of the large veins. Afterwards, ſays the doctor, I had the moſt favourable occaſion that could be deſired, for examining the fibres on the inſide of the uterus. It was in a woman who died at the end of the ninth month, without being in labour, and without having any flooding or diſcharge of waters. When I had examined, and taken out all the contents, I attended particularly to the internal ſurface of the uterus. I found it every where covered with a thin ſtratum of the decidua, through which the muſcular fibres appeared, but with ſome degree of obſcurity. Upon rubbing off this tender membrane with a cloth, it gave me pleaſure to ſee how exactly the above deſcription agreed with the appearances.

The exiſtence of muſcular fibres in this organ has not, however, been univerſally acknowledged. "Reſpecting the alleged muſcular texture of the uterus," ſays Blumenbach, "I muſt obſerve that all the human uteri, which I have carefully examined both in the pregnant and unimpregnated condition (and I have had opportunities of ſuch inveſtigations, not merely in preparations, but in the moſt recent ſtate after death) have not exhibited any thing that could be taken for genuine muſcular fibres. The advocates for the muſcularity of this organ muſt allow that the fibres differ moſt remarkably from all others in the body. I am more and more convinced every day that the uterus poſſeſſes no true irritability; but that it poſſeſſes, if any part of the body can be ſaid to poſſeſs, a peculiar modification of vitality (vita propria) correſponding to its peculiar motions and functions, and not referrible to the common laws of irritability. Theſe functions appeared ſo ſingular and peculiar to the old phyſicians and philoſophers, that they called the uterus an animal contained in an animal." Inſtitut. Phyſiolog. p. 422.

The mouth of the uterus differs conſiderably in the different times of utero-geſtation. For the greateſt part of the nine months, that is, till the cervix uteri be fully diſtended, there is a projection of both the anterior and poſterior lip of the os tincæ; and in ſome women this continues till the very time of labour. But in moſt women, when they are at their full time, or very near it, the os uteri is flat, and makes only a ſmall rugous hole, often not readily diſcoverable by the touch on the lower or poſterior part of the rounded lower end of the uterus. The border of this orifice, and the internal ſurface of the uterus, for an inch or more all around, is full of little irregular cavities. Theſe contain a tough gluten, which ſhoots acroſs, and plugs up the inner part of the orifice. This gluten is commonly ſqueezed out from all the lacunæ, by the dilatation of the os uteri in the beginning and progreſs of the labour; and ſo loſing its hold, it falls out. In the dead body, when the part is kept ſome days in water, the gluten ſwells out more and more from all theſe cavities, and then ſeparates entirely. Then the innumerable lacunæ, which contained it being empty, are very viſible. And if the gluten be thus carefully taken away, and be floated in water, its external ſurface is ſeen beautifully ornamented with all the proceſſes which were drawn out of the innumerable lacunæ.

Dr. Hunter gives us the following account of the uterus in the earlier months of pregnancy. "In the third and fourth months, the ſubſtance of the uterus is become more ſoft than before conception, and all its veſſels being proportionably enlarged, it appears to be much more vaſcular. We may, therefore, reaſonably believe, even if we knew nothing from diſſections of quadrupeds, that the uterus changes its nature in that reſpect from the time of conception, and receives a greater quantity of blood. Its thickneſs is only a little increaſed in its natural ſtate, but conſiderably when the veins and arteries are artificially diſtended with any fluid. At this time the conception is lodged entirely in the fundus uteri, or in that part which in the unimpregnated ſtate has a ſmooth internal ſurface; no portion of the conception ſtretching then down into the cervix uteri, or that part of the uterus, which is narrow and rugous within.

"The cervix uteri remains contracted and hard in its ſubſtance, and contains a tough and firm jelly, which cements and fills up its cavity ſo completely, that upon attempting to puſh a probe through it, the probe will as readily force its way through the hard ſubſtance of the uterus itſelf, as through the cementing jelly. When the uterus is kept a conſiderable time in water, ſix or eight days perhaps, this cementing jelly ſwells, grows in proportion ſofter, and at laſt comes away, or falls off in one maſs. Then the internal ſurface of the cervix exhibits a moſt beautiful appearance; being variegated with projecting rugæ, and innumerable intermediate narrow, but deep cavities, which lodged ſo many proceſſes of the jelly. In ſeparating the jelly, when by previous maceration it had been fit for ſuch an operation, I have ſeen thoſe proceſſes drawn out of the little cavities as diſtinctly as we can ſee a hand drawn out of a glove: and when the jelly is carefully ſeparated and floated in clear water, it preſerves its figure, and exhibits a moſt elegant appearance, produced by the proceſſes that ſhoot out from its ſurface all around.

"The os uteri, or very extremity of the uterus, is in ſome women narrow or pointed, with a very ſmall orifice, that will juſt admit the point of a very ſmall finger; and in ſome it is large, ſoft, or ſpongy to the touch, granulated upon its ſurface, and the orifice ſo wide as to admit the end of the finger full half an inch up with great eaſe. There the paſſage becomes narrow, and is cloſed with the gelatinous cement. The os uteri, all around its paſſage, is crowded with ſmall cavities, containing the ſame ſort of jelly, which by maceration ſwells, puſhes out from the cavities, and comes away, leaving the cells void. This, no doubt, is part of the jelly which naturally comes away in labour. Some women have much more of it than others; and, in comparing different diſſections, I have obſerved more of the jelly within the cervix uteri, and more likewiſe in the cells round the os uteri, in one ſubject than another.

"The uterus, at the time of three or four months, is by no means ſo tightly filled but that it would eaſily contain more. It is like a bladder therefore, ſo filled with water, that it would eaſily contain a third part more. Hence it is ſoft and ſwagging, and eaſily changing its ſhape, accommodates itſelf to the neighbouring parts.

"The ſituation of the uterus, which at firſt is in the cavity of the pelvis, but afterwards gradually riſes up into the cavity of the abdomen, and the changes which its ligaments undergo, may be eaſily conceived by any perſon acquainted with the ſtate of thoſe parts before conception, and who has conſidered what has been already ſaid about the ſame things in the ninth month of pregnancy.

"The peculiarities of the ovarium are very different at the different periods of utero-geſtation. In the earlier months the corpus luteum is conſiderably larger and more vaſcular; and within it there is a conſiderable and evident cavity containing a fluid. When the uterine veſſels have been injected, I have obſerved that the wax very eaſily extravaſates into that cavity. On the outſide of the ovarium there is a little pit, which looks like a hole, leading into the cavity of the ovarium. But in the caſes which I have ſeen, no briſtles would paſs; it appeared to be an obliterated duct, or paſſage grown together."

The ſerous covering of the uterus, derived from the peritoneum, undergoes very conſiderable extenſion during the enlargement of the uterus in pregnancy. We have already ſhewn that the broad ligaments nearly diſappear at this time, but there is no acceſſion of the ſame kind either before or behind, as the bladder and rectum ſtill continue to be covered to the uſual extent by that membrane. The increaſed ſurface of the peritoneal coat muſt be aſcribed therefore to an extenſion of the membrane.

As the mucous ſurface of the organ is the medium of communication between the uterus and the ſecundines, its changes refer to the purpoſes accompliſhed by this connection. In the natural ſtate, it exhibits merely the fine orifices of exhaling-veſſels, but after conception a large number of conſiderable arteries and veins paſs from it to the ſurface of the ovum; and theſe are more numerous and large in the ſituation of the placenta than elſewhere. Theſe communicating veſſels have been deſcribed already in the article Embryo. Towards the latter periods of geſtation the vulva becomes ſwoln and relaxed, aſſuming a ſtate which favours its dilatation in the act of parturition.

The vital properties of the uterus, as well as its organization, are conſiderably altered after conception. The organ acquires animal ſenſibility; hence women feel the motions of the child, and even experience very conſiderable pain in particular poſitions of the fœtus; hence too the ſharp pains felt in parturition. We do not know whether much pain is experienced by the inciſion of the uterus in the cæſarean ſection. But, ſuppoſing that it is not, the fact would not prove that the organ is not poſſeſſed of animal ſenſibility. Its powers may render it ſuſceptible of ſome ſtimuli and not of others. When no circumſtances interrupt the ordinary phenomena of pregnancy, we have no proof, until the natural period of this condition arrives, that the organ poſſeſſes ſo ſtrong a contractile power as that which we ſee exerted in parturition. We might even believe that this property is not developed until the end of pregnancy; but there is no epocha of geſtation, from the firſt preſence of the germ in the uterus, at which this contraction may not be excited by the action of particular cauſes, which, under certain circumſtances, are powerful enough to produce the expulſion of the child. Violent contuſions of the abdomen, and penetrating wounds affecting the uterus, are frequently followed by abortion. Violent paſſion may cauſe this premature expulſion of the fœtus. The ſame effect is produced by the evacuation of the waters of the amnios, independently of any other cauſe; the uterus, when no longer diſtended, contracts, and abortion enſues. This contractile power, with which the uterus becomes endowed on the change of its organization, partakes of the characters of animal contractility and of irritability. The inactivity of the uterine parietes, until the termination of utero-geſtation, reſembles, in ſome reſpects, the quieſcent ſtate of the voluntary muſcles, when they are not excited by the influence of the brain; and the contraction, by means of which this organ expels its contents, can be compared only to the exertion of thoſe muſcles. On the other hand, the contractility of the uterus is independent of the cerebral influence, and its exerciſe is abſolutely involuntary; this circumſtance particularly characterizes irritability in thoſe organs which poſſeſs it in the moſt remarkable degree, as the heart. Like the latter power, it may be ſympathetically rouſed, when the action of the uterus is ſuſpended during or after parturition; and it continues for ſome time after apparent general death.

The attention of phyſiologiſts has been much occupied in inveſtigating the immediate cauſe of parturition; that is, the cauſe which calls into action the contractile power of the uterus at the end of utero-geſtation. Many adopt the following explanation. They admit a ſpecies of oppoſition between the body and neck of the uterus, during geſtation, the reſiſtance of the latter overcoming the tendency of the former to contract. As the neck is gradually obliterated, its oppoſition is diminiſhed, and it then gives way to the contractions of the body and fundus. Againſt this explanation we may urge that the ſuppoſed ſtruggle between two oppoſing forces is purely hypothetical, that there is no evidence of any contraction or attempt at it during pregnancy, and that it comes on quite ſuddenly at the expiration of the term. It is this ſudden exerciſe of the contractile power, at the end of the ninth month in the human ſpecies, that marks the term of geſtation, and for which we can aſſign no other cauſe than the immutable laws by which the operations of nature are regulated. However this queſtion may be decided, it is clear that the contraction of the uterus alone does not accompliſh the expulſion of the fœtus. The diaphragm and abdominal muſcles aſſiſt in the operation; and hence parturition is in ſome degree voluntary, is accelerated in ſome caſes by the courage of the individual, while in others it cannot be concluded without the aſſiſtance of art, in conſequence of the ſtrength being exhauſted. Yet this action of the abdominal muſcles is not ſo indiſpenſible, but that the uterus can get rid of its contents without ſuch aid. We know the extraordinary facility with which parturition takes place in ſome women, who, in conſequence of particular circumſtances in their condition, exert themſelves even to retard the proceſs; and the expulſion of the child is ſometimes completed at the approach of death, when the abdominal muſcles can hardly be ſuppoſed to contribute.

After the expulſion of the child, and of the ſecundines, the action of the uterus ſtill continues, and the organ is gradually reduced in its bulk. For a ſhort time its parietes are in a ſtate of increaſed thickneſs; the veſſels, being compreſſed by this permanent ſtate of contraction, pour out but a very ſmall quantity of blood, notwithſtanding the preceding dilatation of their orifices. This blood, effuſed very ſlowly, is ſoon ſucceeded by an abundant ſecretion of mucus from the ſurface of the uterus, conſtituting a ſpecies of diſcharge peculiar to women recently delivered, and known by the name of lochia. This evacuation laſts for a longer or ſhorter time, and probably does not ceaſe altogether, until the uterus has regained its original ſtate. The contraction of the organ is owing at firſt to the evacuation and contraction of its veſſels; but ſoon nutrition is carried on in it with leſs activity, while abſorption proceeds vigorouſly until the exceſs of matter depoſited for its developement has been removed.

Phyſiology of the Female Organs of Generation.

Puberty and Menſtruation.—From the uterus of every healthy woman (at leaſt with very rare exceptions) who is not pregnant, or who does not give ſuck, there is a diſcharge of blood at certain periods, from the time of puberty to the approach of old age (during a period in general of about 30 years); which, from the periods or returns of the diſcharge, is called the menſes or catamenia, and, from the general regularity of its appearance, is termed in French les regles. The commencement of menſtruation is coëval with that ſignal revolution in the female conſtitution, which indicates the power of executing the generative functions, and may be regarded as the developement of the ſexual life. It is therefore one of thoſe circumſtances which, taken altogether, mark the period of puberty in females. At the ſame time their complexion is improved, their countenance is more expreſſive and animated, their attitudes graceful, and their converſation more intelligent and agreeable; the tone of their voice becomes more harmonious, their whole frame, but particularly the breaſts, are expanded and enlarged, and their minds are no longer engaged in childiſh purſuits and amuſements. Theſe phenomena have been deſcribed very elegantly by Harvey: "nec minus notum eſt, quanta virgini alteratio contingat, increſcente primum et tepefacto utero; pubeſcit nempe, coloratior evadit, mammæ protuberant, pulchrior vultus renidet, ſplendent oculi, vox canora, inceſſus, geſtus, ſermo, omnia decora fiunt."

The whole human race is ſubject to this law, and the accounts of ſome travellers, ſtating that the Braſilian or Samoied women are exempt, have not been confirmed by more recent and accurate inquiries. It is a general and eſſential phenomenon in the life of woman, and if different climates, or the varieties of the ſavage and civilized ſtates, are capable of modifying the phenomenon, their influence is not ſufficient to annihilate it altogether, even in the frozen and inhoſpitable regions, where ſome writers have ſuppoſed that it does not occur in a conſtant and regular manner. It is hardly neceſſary to refute an opinion, which has prevailed very generally, that whole nations, particularly Americans, are not liable to this diſcharge. In their viſits to thoſe countries, Europeans ſaw numerous females in a ſtate of nakedneſs, without obſerving any ſigns of the diſcharge, which may be accounted for by two circumſtances. The women at that time are generally ſuppoſed to be in an impure ſtate, and to communicate a malignant influence; they are conſequently compelled to ſhun ſociety while the diſcharge laſts, and to avoid the ſight of man by hiding themſelves in ſolitary huts. Travellers have alſo obſerved that their ſcrupulous attention to perſonal cleanlineſs, and to the modeſt attitude of the lower extremities, would prevent the ſpectator from diſcovering any traces of the catamenia. The diſcharge is peculiar to the female of the human ſpecies, which, in the language of Pliny, is the only "animal menſtruale." Many naturaliſts, ſays Blumenbach, and among others Buffon, have aſcribed a periodical flux of this kind to ſome other animals, particularly of the monkey kind. But having had the opportunity of obſerving ſeveral individuals for many ſucceſſive years, I diſcovered that theſe ſuppoſed catamenia did not exiſt at all in ſome, while in others there was a ſmall occaſional uterine hæmorrhage appearing at no regular intervals. (Inſtitut. Phyſiolog. ſect. 37.) There is a great determination of blood to the organs in animals when they are in heat; this is attended with a mucous ſecretion, and ſometimes even blood has been diſcharged, ſo as to give riſe to the erroneous notion of their being ſubject to the menſtrual flux. Such a caſual and unfrequent occurrence can by no means be compared to the regular periodical diſcharge obſerved in women almoſt without an exception. On the other hand there are examples of women who have never menſtruated, and of others, in whom this diſcharge has not appeared through long periods of their lives, without any ill conſequence. Dr. Denman knew two inſtances in which the menſes had never been diſcharged; the individuals married, but had no children. (Introd. to the Pract. of Midwifery, 4to. p. 115.) Some continue to menſtruate during the time of ſuckling, and the circumſtance is not very rare, although it is the general rule that the diſcharge ſhould ceaſe at this time. The vital powers are differently employed, and their exerciſe has a different object and direction. Pregnancy almoſt invariably interrupts the proceſs. The important functions carried on in the uterus at this time require all the powers of the mother; and the adheſion of the ovum to the uterus ſeems to form an inſuperable mechanical obſtacle to the diſcharge. Hence Mr. Denman ſtates that he has never known an inſtance of menſtruation during pregnancy. The ceſſation of the diſcharge without the preſence of any unhealthy cauſe, is the only ſign by which women know that they have conceived. Authors relate many examples, however, where the catamenia have flowed during geſtation; but very ſtrong evidence would be neceſſary to prove a circumſtance ſo unlikely in itſelf.

The menſes may appear prematurely in ſome women, from peculiarity of organization, as the phenomena of puberty have occurred at unnaturally early periods in men; and the circumſtance muſt be referred to original difference of conſtitution. Haller knew a girl of good family, nine years of age, well conſtituted both in mind and body, who had been ſubject to the regular periodical return of the catamenia for ſome years, without any other apparent diſadvantage than that of being rather ſhort and delicate in her make. He mentions another inſtance in Switzerland of a girl having a child by her uncle at nine years. Many of the accounts of menſtruation in early infancy muſt be deemed morbid or ſymptomatic diſcharges, and cannot be referred to the catamenia. When the female conſtitution from any cauſe is diſpoſed to, or requires a ſanguineous diſcharge, it is commonly made from the veſſels of the uterus.

The early or late appearance of the menſes may depend upon the climate, the conſtitution, the delicacy or hardineſs of living, and upon the manners of thoſe with whom young women converſe. In general, the warmer the climate the ſooner the menſes appear. In Greece, and other warm countries, girls begin to menſtruate at eight, nine, and ten years of age. According to Thevenot and Chardin they even marry and bear children at eight and nine years of age in ſome parts of Aſia. The diſcharge does not appear in Europe until the female has nearly attained her full growth. Haller mentions the twelfth and thirteenth years as the uſual periods in Switzerland; the diſcharge appears ſooner in the more ſouthern countries of Europe, and later as we approach to the north. According to Linnæus, in his "Flora Lapponica," the women of Lapland do not menſtruate until a maturer age, and then in ſmall quantities, at long intervals, and ſometimes only in the ſummer. But if the proceſs does not go on according to the general prevailing rule in the country, they ſuffer equal inconveniences as in warmer climates, where the quantity diſcharged is much greater, and the periods ſhorter. In this country girls begin to menſtruate from the fourteenth to the eighteenth year of their age, and ſometimes at a later period, without any ſigns of diſeaſe; but if they are luxuriouſly educated, ſleeping upon down beds, and ſitting in hot rooms, menſtruation uſually commences at a more early period.

The variety in the time at which women arrive at puberty has given riſe to ſome moral deductions. It has been aſſigned as the reaſon why women in hot climates are almoſt univerſally treated as ſlaves, and why their influence is ſo powerful and extenſive in cold countries, where perſonal beauty is in leſs eſtimation. In hot climates, women are at the height of their beauty when they are ſtill children in underſtanding; and, when their underſtanding is matured, they are no longer the objects of love. In temperate climates their perſons and their minds acquire perfection at the ſame time, and the united power of their beauty and faculties is irreſiſtible.

At the approach of old age women ceaſe to menſtruate, but the time of the ceſſation is commonly regulated by the original early or late appearance of the menſes. About the fortieth year, a little ſooner or later, the regular periods of the catamenia are interrupted; and before the fiftieth year, profuſe diſcharges occur followed by long intervals; about the time juſt mentioned, the catamenia generally ceaſe, and the power of reproduction is loſt. With thoſe who began to menſtruate at ten or twelve years of age, the diſcharge will ſometimes ceaſe before they arrive at forty; but if the firſt appearance was protracted to ſixteen or eighteen years of age, independently of diſeaſe, ſuch women may continue to menſtruate until they have paſſed the fiftieth, or even approached the ſixtieth year of their age. In this country, the moſt frequent time of the ceſſation is from the forty-fourth to the forty-eighth year, after which women never bear children. By this conſtitutional regulation of the menſes the propagation of the ſpecies is, in every country, confined to the moſt vigorous part of life, and, had it been otherwiſe, children might have become parents, and old women might have had children, when they were unable to ſupply them with proper or ſufficient nouriſhment. Yet the rules juſt mentioned are not free from all exceptions. The catamenia, with powers of fecundity, have continued in particular inſtances much beyond the age we have ſpecified. Some of theſe have had regular catamenia; in others, after a long ſuppreſſion, the diſcharge has returned. We muſt be careful, however, here, as in the caſe of premature appearance, not to confound with the menſes accidental and morbid hemorrhages. A relation of Haller's had two ſons after her fiftieth year, and in colder countries, where the acceſs of puberty is late, children have been born when the mother was even above 60.

The proper menſtrual blood is generally preceded, ſometimes even for ſome months, by a whitiſh ſerous fluid. Symptoms of more or leſs violence, indicating the accumulation of blood about the hypogaſtric veſſels, ſuch as pain in the loins and about the pelvis, laſſitude with painful affection of the lower extremities, and various nervous and hyſteric feelings, are then obſerved. Pains in the head, fluſhing of the cheeks, and even pimply appearances in the face ſometimes take place. In younger virgins theſe ſymptoms are milder, and in the firſt inſtances often go off ſpontaneouſly: but they return with greater intenſity, attended with conſiderable colic pains, and quick and ſtrong pulſe, until a bloody ſerum, and then more genuine blood flows more or leſs rapidly from the vulva. The duration of the flux is uncertain; it may be accompliſhed in three or four days, or be protracted till the ſeventh or eighth. The quantity is ſubject to no ſettled law: it is greater in warm countries, where it may amount to a pint or more; while in colder regions it does not exceed five, four, or three ounces. "Yet," ſays Dr. Denman, lib. cit. p. 118, "there is a common quantity, to which, under ſimilar circumſtances, women approach, and it may be eſtimated in this manner. Suppoſing the quantity to be about eighteen ounces in Greece, and two ounces in Lapland, there will be a gradual alteration between the two extremes, and in this country it will amount to about ſix ounces." Manners and way of life make a conſiderable difference. Luxurious and laſcivious women have a more copious diſcharge: while thoſe who take much exerciſe, or are weak or inſufficiently nouriſhed, furniſh a more ſparing quantity. The pain ſubſides as the diſcharge proceeds; the inflammatory ſymptoms about the uterus go off as the determination to that organ ceaſes, the pulſe is diminiſhed, and the blood is followed by a ſerous fluid. Signs of debility ſucceed, with a hollowneſs about the eye, and a dark circle ſurrounding the organ. The firſt appearance in a young girl is generally followed by an interval of ſome months, and this period approaches gradually to a ſolar month; ſo that a healthy woman, in whom the diſcharge is eſtabliſhed, will have it return on the ſame day of the month for many ſucceeding years. If ſeven or eight days are occupied by the flow of the catamenia, there is an interval of twenty-two or twenty-three, making up the menſtrual period. Such is the courſe obſerved in healthy temperate ſubjects, whoſe bodily and mental powers are not abuſed or overſtrained. Improper regimen and manners may precipitate or retard the diſcharge. Luxurious manners, with high living, may occaſion returns after fifteen days: under various other circumſtances there is a ſimilar protraction of the period, which recurs however at regular intervals. Similar ſymptoms to thoſe which attend the firſt menſtruation, but in a milder form, accompany each return. In this reſpect conſiderable varieties are obſerved; the affection recurring with conſiderable violence, at every period, in ſome women, while others do not ſeem to ſuffer at all.

The nature of the diſcharged fluid has not been aſcertained by any accurate inveſtigations, but its obvious characters are ſo exactly like thoſe of blood, that it has been generally conſidered and called blood. This remarkable difference, however, at leaſt, ſeems to diſtinguiſh the two fluids; *viz.* that the catamenia do not coagulate. They are blood deprived of fibrine. Coagula are ſometimes ſeen, but are conſidered to denote unhealthy menſtruation, as they occur when the proceſs is obviouſly diſturbed, and attended with great pain, &c. Opinions have been very generally received that the menſtrual diſcharge poſſeſſes ſome peculiar malignant properties. Theſe notions ſeem to have originated in the Eaſt; they appear in all their force in the ordinances of the Jewiſh legiſlator, were adopted by the Arabian phyſicians, and have been credited in moſt countries. The ſevere regulations which have been made in ſome countries, for the conduct of women at the time of menſtruation, the expreſſions uſed, the diſpoſal of the blood diſcharged, or of any thing contaminated with it, the complaints of women attributed to its retention, and the effects enumerated by grave writers, indicate the moſt dreadful apprehenſions of its baneful influence. The following quotation exhibits theſe abſurd notions in very elegant language. "Penis cum menſtruata concumbentis excoriatur; ſi novella vitis eo tangatur, in perpetuum læditur; ſteriles fiunt tactæ fruges; moriuntur inſitæ; exuruntur hortorum germina; ſi mulier prægnans alterius menſtrua ſupergrediatur, aut illis circumlinatur, abortum facit; ei autem, quæ ultro non geſtat, concipiendi ſpem adimit; purgantis ſpiritus, et vapor ab ore, ſpecula atque eboris nitorem obſcurat. Guſtatus hic ſanguis canes in rabiem agit, homines vero diris cruciatibus affligit; comitialem morbum, pilorum effluvium, aliaque elephanticorum vitia inducit; idcirco a veteribus inter venena relatus; pari malignitate exiſtimatur, atque ſanguinis elephantici potus." De Graaf.

Under peculiar circumſtances of health, or ſtates of the uterus, particularly in hot countries, if cleanlineſs be not obſerved, and the evacuation take place ſlowly, the diſcharge may eaſily become acrimonious and offenſive. But there is nothing of this kind belonging to healthy menſtruation in a cleanly woman, where the effuſed fluid differs from any other blood only in the circumſtances already mentioned. Nay, when the catamenia are retained in the body for many months, in caſes of imperforate vaginæ, they produce no ill effect whatever, and are diſtinguiſhed by no particular odour or offenſive qualities when diſcharged by an operation. We have, therefore, no reaſon for thinking otherwiſe than that this diſcharge is of the moſt inoffenſive nature.

That the catamenia come from the uterus is tolerably evident from the change in the lining of that organ during the period of their flow. Its mucous ſurface is rendered ſofter and more villous; and exhibits bloody ſpots, with numerous pores, from which the fluid may be expreſſed. The appearance of the menſtrual blood in its cavity during the period is a further proof: to which we may add the ſuppreſſion of the diſcharge in various morbid conditions of the uterus, and in pregnancy, where its ſurface is occupied by the adheſion of the ovum. Direct evidence of the fact is furniſhed in caſes of prolapſus, where the fluid may be actually ſeen diſtilling from the os tincæ. To theſe arguments we may add the obvious connection of the menſtrual flux with the functions of the uterus. Some have contended that the vagina is partly or wholly the ſource of the catamenia; but the opinion reſts on no ſufficient ground: the ſtructure and functions of the vagina, as well as the direct evidence of facts, ſtrongly oppoſe the opinion.

Whether the menſes come from the arteries or veins of the uterus has been a point of diſcuſſion with phyſiologiſts; and alſo whether it be a ſimple efflux of blood from the veſſels or a ſecretion. The ſtructure of the organ reſembles that of glands, and the appearance of the fluid, on many occaſions, differs widely from mere blood; which indeed it never reſembles entirely in the healthy ſtate; ſo that we are diſpoſed to conſider it as a ſecretion performed by the uterus like fluids that are formed by any other glands. A circumſtance is ſometimes obſerved in this proceſs, which muſt be referred to the ſecretory action of the uterine veſſels. This is the diſcharge of a membranous ſubſtance, of the figure of the uterine cavity, ſmooth on one ſurface, and flocky on the other, and much reſembling the decidua on the whole. The fact is mentioned by Dr. Denman, who firſt ſaw it in married women, and afterwards in unmarried ones under circumſtances which proved undoubtedly that it was formed independently of connubial communication. The menſtruation has been painful in all theſe caſes, and conception has never occurred while the habit remained.

The efficient cauſe of menſtruation has afforded an ample field for thoſe who delight in ſpeculations and hypotheſes. As the periods of the moon agree nearly with thoſe of the diſcharge, the influence of this body has been reſorted to in explanation of the occurrence. If we admit the ſolution, the effect of lunar attraction ought to be very different in the various relative poſitions of the moon and earth: but the obſervation of ſeveral individuals will immediately ſhew that there is no day of the month in which ſeveral do not begin to menſtruate, and that the moon's apogee or perigee has no influence at all in this reſpect. We ſhall ſee, too, that the diſcharge begins in ſome, is diminiſhed or entirely ended in others, at the very ſame time; conſequently that the moon can have nothing to do with the matter. Moreover, as the menſtrual period rather follows ſolar time, the ſame woman menſtruates at one time in the new moon, and at another in the full moon. The exiſtence of ſome ferment, cauſing an inteſtine motion in the veſſels of the part, meets now with no advocates. Local or general plethora have been aſſigned as the reaſons of the menſes, and many of the circumſtances which accelerate or increaſe, or on the contrary retard and diminiſh the flow, favour theſe opinions. But we ſtill cannot adopt the opinion; the loſs of ſeveral times the quantity of blood previous to or in the very act of menſtruation, from the arm, or any other part of the body, does not prevent or interrupt the flowing of the menſes; and in thoſe complaints which ariſe from their obſtruction, greater relief is afforded by a few drops of blood from the uterus itſelf, than by ten times the quantity from any other part. A curious circumſtance muſt be noticed reſpecting the effects ſometimes produced by obſtructed menſes; *viz.* that their place is ſupplied by periodical emiſſions of blood from various other parts of the body, as the noſe, lungs, ears, eyes, breaſts, and almoſt every other part. Theſe probably ſhould be deemed in many caſes rather as diſcharges belonging to ſome diſeaſe under which the patient may labour, than as connected with menſtruation. Hemorrhages of every kind, in either ſex, are frequently obſerved to be periodical.

That the catamenia are a ſecretion from the mucous lining of the uterus, of which we cannot underſtand the direct mechaniſm, any more than the method in which any other ſecretions are performed; and that we are ignorant of the cauſes which determine their appearance to the monthly period, ſeem to be nearly the ſum of our knowledge on this ſubject. It is clear that the proceſs, being a part of the healthy operations of the organ, and therefore indicating its general condition, is neceſſary to preſerve the uterus in a ſtate fit for conception. Obſervation has fully proved that women, who do not menſtruate from the uterus, or who are not in a ſtate diſpoſed to menſtruate, cannot conceive, even though they ſhould have a periodical diſcharge of blood from any other part of the body. All animals, at the time of their being ſalacious, or in a ſtate fit for the propagation of the ſpecies, have a diſcharge, analogous and perhaps equivalent to menſtruation, which is generally mucous, but in ſome inſtances, in any hot ſeaſons and climates, becomes ſanguineous.

That the menſtruous blood contributes to the formation or nutriment of the fœtus may be reaſonably doubted. The time of the diſcharge is not the moſt favourable to conception, which occurs moſt readily juſt after the period. Since all animals, whether they menſtruate or not, ſupply the offspring of conception with nouriſhment of a proper kind, and in a ſufficient quantity to bring it to perfection, we may conclude that the end is accompliſhed by ſome more common principle. The mucous diſcharge from the generative organs of animals, proves that they are in a ſtate favourable to the propagation of their ſpecies, and the catamenia prove the ſame circumſtance in women.

From the time when the phenomena of puberty announce the aptitude of the female for the exerciſe of her ſexual functions, the generative organs exert an influence which modifies the whole organization, and beſtows on woman the moſt ſtriking traits of her phyſical and moral character. The various revolutions to which her conſtitution is ſubject, the nervous affections, the frequent returns of indiſpoſition and ſuffering, the ſtrange and unaccountable anxieties and caprices, and ſometimes the increaſed acuteneſs of the imagination and judgment; all depend on this influence; and if it be true that man is male only at certain times, while woman is female during her whole life, it muſt be attributed chiefly to this cauſe. It is this that conſtantly recals woman to her ſex, and marks her whole exiſtence with ſo characteriſtic a phyſiognomy. We ſhall not be ſurpriſed to find, that a cauſe of ſuch power and extenſive influence is liable to irregularities which have very marked effects on the conſtitution. When the new powers with which the organs are endowed exceed the juſt ſtandard, and deviate into a kind of unnatural irritability, they affect ſympathetically the whole frame, and particularly the nervous ſyſtem. This, in an extreme degree, conſtitutes furor uterinus. Generally, however, this exceſſive vitality of the ſexual organs, without going to ſuch an extent, produces various ſpaſmodic and nervous ſymptoms, conſtituting what are called hyſterical diſorders, and ariſing evidently from the artificial and forced ſtate of celibacy. Theſe affections are removed by marriage, which re-eſtabliſhes the balance of the various functions by giving its natural employment to an organ, whoſe exceſſive ſenſibility deranged the whole ſyſtem. Other and very various phenomena may be referred to the ſame cauſe; and thoſe phyſicians who have collected, in particular works, obſervations on the diſeaſes occaſioned by celibacy, or by the imperfect and unnatural enjoyments of the cloiſter, preſent us with an alarming catalogue. "Ut reliqui ſtimuli a natura dati inobſequioſos puniunt, ita et veneris abſtinentiam, ut naturæ inimicam, hæc ipſa ulciſcitur. Ipſa animalia ex deſiderio veneris languent et pereunt. Cyprini ex retentis ovis laborant. In ſacris ædibus, de quibus ſevera religio venerem arcet, multa, parum cognita, neque ſanabilia morborum genera vigere idoneus auctor exſtat. Frequenter eæ potiſſimum, quæ veneris dulcedinem deguſtarunt, quia nunc privantur, in chloroſin, in hyſterica mala, in convulſiones,

ſiones, in maniam, in furorem uterinum incidunt; quam nec ſemel vidi; inque earum feminarum apertis cadaveribus ſchirri, et ſteatomata, & hydropes ovarii reperiuntur. Quare, niſi morum cuſtodia vetuerit, ea mala pleraque, et furor uterinus, et vera mania, veneris uſu ſolvuntur." Haller, Elem. Phyſiol. t. 8. p. 14. We may affirm, in ſhort, that from the time when the organs, which characterize theſe amiable and ſenſible beings, are fully endowed with all their vital powers, woman is conſtantly ſubject to their influence, until the period arrives when ſhe is no longer capable of the life of the ſpecies, when ſhe has paſſed through the revolution of her latter age, and enjoys quietly her individual life, during the remainder of which women differ much leſs, in every reſpect, from the other ſex.

A delineation of the effects, which the phyſical changes occurring at the time of puberty produce on the moral character and ideas of women, may be ſeen in the eloquent work of Cabanis, "Rapports du Phyſique et Moral de l'Homme." The various morbid derangements of the menſtrual proceſs will be conſidered in the medical department of this dictionary.

The generative proceſs is ſubject to very different laws in animals and in the human ſpecies. In the former, particular ſeaſons of the year are appropriated to theſe functions, and the organs undergo certain phyſical changes, by which they are rendered fit for the proceſs. It is a peculiarity belonging to the human race, that they are confined to no ſeaſon in exerciſing theſe functions. Moſt animals, and particularly birds, copulate in ſpring: and that warmth has much influence in the affair is evident from this, that animals of warmer countries ſeldom copulate or are fecundated in Europe. Perhaps women conceive rather more frequently in ſpring; at leaſt accoucheurs have obſerved that there are moſt labours in the months of December and January.

As the effect of ſexual communication is ſo important, it cannot be indifferent to the deſign of nature to what part of the uterine ſyſtem the ſemen ſhould be conveyed. It admits of no doubt, that it either remains in the vagina, paſſes into the uterus, or elſe extends its courſe along the Fallopian tubes to be applied to the ſurface of the ovaries, which it ſtimulates, and from which the new animal derives its exiſtence; but the queſtion whether it be one or other of theſe, has given birth to more phyſiological controverſy than perhaps any other operation of a living animal. Thoſe who have entered the liſts have ranged themſelves either on the ſide of application of the ſemen to the ovaries, by means of the tubes; or on that of the inutility of this proceſs. Theſe latter contend for an abſorption of this fluid by the vagina, and a peculiar excitement of the whole frame as a conſequence, of which excitement the changes produced on the ovaries are to be regarded as the local effects. The advocates for the firſt opinion allege, that the ſemen has been ſeen both in the uterus and tubes, and quote as their authority the obſervations of Morgagni for the former, and Ruyſch for the latter. When ſeen in this laſt ſituation, ſome have thought that it was conveyed thither by the muſcular power of theſe parts, in the manner of a periſtaltic motion, beginning at the uterus, and ending at the fimbriated termination of the tube; and when at this laſt, it was ſuppoſed that the ſemen was applied to the ſurface of the ovaries, and impregnated them by actual contact. Various analogies, drawn from the animal and vegetable kingdoms, have been adduced for and againſt theſe different opinions: but ſuch arguments muſt be received with caution. Where different inſtruments are employed to produce the ſame ultimate effect, we may reaſonably conclude that the means uſed are eſſentially different. On this principle no direct concluſions can be drawn reſpecting the human ſpecies, from obſervations either on vegetables, or even on frogs, toads, and newts. The impregation of birds, being effected by ſemen conveyed into the body, reſembles that of the human ſubject more than the former; but they differ ſo widely in the mode of perfecting the fœtus from the ovum, that we cannot reſt with much confidence on their general analogy.

To the obſervations of Morgagni and Ruyſch a numerous train of facts has been oppoſed, aſcertained by the experimental labours of Harvey, De Graaf, Haller, and others, in which no ſemen was ever ſeen beyond the vagina in animals, examined at various periods after coition. One experiment of Haller, on a ſheep, conſtitutes a ſingle exception to this obſervation: he once ſaw ſemen in the uterus forty-five minutes after coition. Theſe facts bring the advocates for the neceſſity of a contact of ſemen with the ovaries into a dilemma, from which they attempt to extricate themſelves by contending, that fecundation does not require the application of ſemen to the ovaries in a palpable form; but that there is exhaled from it a ſubtile fluid in a vaporific ſtate, called aura ſeminalis, and that the contact of this vapour is fully ſufficient to impart to the ovaries their due quantity of ſtimulus.

The opinion, that the preſence of the ſemen in the vagina alone was ſufficient to account for impregnation, was defended by the ſtatement of caſes, in which, from ſome anatomical peculiarities, it ſeemed almoſt impoſſible that the fecundating fluid could be conveyed into the uterus; yet in ſeveral of theſe caſes impregnation really took place. Thoſe who hold a contrary opinion either cavil at the accuracy of the ſtatement, or draw a different concluſion. In order to throw ſome light on this ſubject by direct arguments, Dr. Haighton undertook a ſeries of experiments, the reſults of which are detailed in the 87th vol. of the Philoſophical Tranſactions. He divided the tubes which form the cornua uteri in rabbits, and admitted them to the male, when they had completely recovered from the experiment; but this operation ſeemed to deſtroy entirely not only the power of conception, but alſo the diſpoſition to employ the means. After ſeveral ineffectual trials, he varied the experiment by dividing one tube only, and in many inſtances the animals conceived afterwards. Corpora lutea were found on both ſides of the body, but fœtuſes only on the ſound ſide. If the former bodies are produced only after conception, which the doctor aſſumes, then conception muſt have taken place here, although the direct acceſs of ſemen to the ovarium was interrupted; for the operation in queſtion completely obliterates the tube. It muſt be acknowledged that the proof is incomplete in theſe caſes; we cannot juſtly aſſert that conception has taken place, when no fœtus was formed. Dr. H. attempts to elude this objection, by ſhewing that the diviſion of the tube at any period after coition, but before the paſſage of the germs from the ovary, will equally prevent the appearance of fœtuſes; accordingly no fœtuſes were ſeen in the tube, when it was divided as late as forty-eight hours after coition. But if the operation be deferred until the time at which the rudiments of the new animal have paſſed into the tube, the actions of the parts ſuffer no interruption, and fœtuſes are formed in the tube of the mutilated ſide. "If," adds the Dr. "the ovaries are ſuſceptible of their proper excitement only from the contact of ſemen, how did it happen that the effects of that excitement were not more obvious where nothing had been done to intercept its courſe for 48 hours, than in thoſe where all communication between the uterus and ovary had been cut off before the means of impregnation had been employed? I think it muſt appear, on tracing nature's ſteps through the different ſtages of this work, that they are the product of that law in the conſtitution, which is called ſympathy or conſent of parts. That the ſemen firſt ſtimulates the vagina, os uteri, cavity of the uterus, or all of them. By ſympathy the ovarian veſicles enlarge, project, and burſt. By ſympathy the tubes incline to the ovaries, and having embraced them, convey the rudiments of the fœtus into the uterus. By ſympathy the uterus makes the neceſſary preparation for perfecting the formation and growth of the fœtus. And, by ſympathy the breaſts furniſh milk for its ſupport after birth."

Phyſiologiſts have certainly not yet aſcertained, by direct obſervation, whether or no the ſemen enters the uterus and tubes; and conſequently all explanation of the mode in which it co-operates in conception muſt be, in a great meaſure, hypothetical. If we cannot ſpeak from actual knowledge on a point, which muſt be ſo important as the preſent, in the generative proceſs, and the determining of which muſt be ſo eſſential towards forming right notions of the nature of the buſineſs, how uncertain muſt our repreſentation be of the more intricate and obſcure parts of the ſubject!

Haller's work furniſhes us with the following account of "quæ feminis in coitu accidant." Primum voluptas eſt. Eam pleræque nullam fatentur, et etiam eæ, quæ poſſunt abſque dedecore fateri, confirmant, ſe abſque grato ſenſu concepiſſe. Sinceriores aliæ et appetunt venerem, et ſe ea delectari agnoſcunt. Poteſt autem is ſenſus in alia et alia muliere major eſſe minorve. Cum ea voluptate congeſtio humorum ad partes genitales & calor conjungitur. Dixi oſtium internum uteri ſentire. Clitoris ſenſu eſt acerrimo, ſed in venere parum afficitur. Vaginæ columnas putes eſſe ſenſu acriori; neque carent papillis, ut neque vulvæ oſtium, neque nymphæ. Poteſt in his partibus voluptas locum habere, et ab ea ſanguis in organa genitalia concieri, ut caleant, turgeant & acrius ſentiant. Certum eſt tamen in iis puellis, quæ cum voluptate coeunt, vaginam tumeſcere, ut maritum propius amplectatur. Id poteſt partim muſculi ſphincteris officio fieri, quem vis nervoſa ad contractionem irritat, partim ex tumentibus vaſis plexuum venoſorum, et corporum cavernoſorum vaginæ et clitoridis." Elem. Phyſiol. 8. p. 23.

The circumſtances juſt deſcribed do not appear to be eſſential to the buſineſs of fecundation; they contribute to the important object of reproduction in a ſecondary manner. The ſtrong deſire implanted in all animals, and the phyſical gratification experienced in its indulgence, enſure the union of the ſexes, and conſequently the continuation of the ſpecies. The celebrated Spallanzani has given to the world a very intereſting ſeries of experiments, by which it is proved that impregnation in many caſes may be effected by artificial means. He proved the firſt in the caſe of various amphibia, as the frog, newt, and toad: and afterwards in the bitch. He experimented on a ſpaniel bitch, which had before had whelps. He confined her very cloſely until ſhe was in heat, and then proceeded in the following manner: "A young dog, of the ſame breed, furniſhed me, by a ſpontaneous emiſſion, with 19 grains of ſeed, which were immediately injected into the matrix, by means of a ſmall ſyringe introduced into the vagina. As the natural heat of the ſeed in animals of warm blood may be a condition neceſſary to render fecundation efficacious, I had taken care to give the ſyringe the degree of heat which man and dogs are found to poſſeſs, which is about 30°. Two days after the injection, the bitch went off her heat, and in twenty days her belly appeared ſwollen, which induced me to ſet her at liberty on the twenty-ſixth. Meanwhile the ſwelling of the belly increaſed; and ſixty-two days after the injection of the ſeed, the bitch brought forth three lively whelps, two male, and one female, reſembling in colour and ſhape not the bitch only, but the dog alſo from which the ſeed had been taken." (Diſſertations, vol. ii. p. 250.) The experiment was repeated with ſucceſs by Dr. Roſſi, ibid. 476. We have an account of a ſimilar trial in the human ſubject, made at the ſuggeſtion of Mr. Hunter. It was in an inſtance of malformation, where the urethra opened in the perineum. "Under theſe circumſtances the perſon married. When he had connection the emiſſion was complete, which proved that the teſticles were perfect, but the ſemen always paſſed out at the perineum. The late Mr. Hunter was conſulted to remedy, if poſſible, this inconvenience, and to enable the perſon to beget children. He adviſed that the huſband ſhould be prepared with a ſyringe fitted for the purpoſe, previouſly warmed; and that, immediately after the emiſſion had taken place, it ſhould be taken up by the ſyringe, and injected into the vagina, while the female organs were ſtill under the influence of the coitus, and in the proper ſtate for receiving the ſemen. This experiment was actually made, and the wife proved with child. On a ſubject of this kind it is proper to ſpeak with caution; but, from all the attending circumſtances, no doubt was entertained by Mr. Hunter, or the huſband, that the impregnation was entirely the effect of the experiment." Home on Hermaphrodites, in Philoſ. Tranſact. for 1799.

Various circumſtances have been enumerated, as proofs that conception has taken place; as peculiar feelings during coition, horripilation, and even ſtridor dentium, &c. Haller's ſenſible remarks on this ſubject ſeem to us to be nearer the truth. "Hæc omnia quidem mihi nimia videntur, et difficillima expertu. Neque enim femina, dum maritum admittit, otioſo eſt ad experimentum animo: neque, niſi longo abhinc tempore norunt fere ſe concepiſſe, quando jam ejuſmodi phenomena de memoria elapſa ſunt. A feminis certe, a quibus verum poteram expectare, nihil de horripilatione, neque de dolore potui diſcere." Ibid.

The opinions concerning the effuſion of a ſeminal fluid by the female, and its mixture with that of the male, are altogether imaginary. That a mucous fluid is ſometimes poured out in coition, from the apparatus already deſcribed in the external organs and the vagina, is undoubted; but this happens only in laſcivious women, or ſuch as live luxuriouſly; it conſiſts merely of mucus, and is diſcharged externally, inſtead of paſſing into the uterus.

Circumſtances do not admit of the internal changes which accompany and follow copulation and conception, being accurately aſcertained in the human ſubject; and, conſequently, theſe have been inveſtigated in various animals. Mr. Cruikſhank gives the following deſcription of the parts in a rabbit at heat. The orifice and internal ſurface of the vagina are as black as ink from the great determination of blood. The ovaria had, under their external ſurfaces, a great number of black, round, bloody ſpots, ſomewhat leſs than muſtard-ſeeds. Theſe black ſpots are the calyces or cups which ſecrete the ova; they are extremely vaſcular; the ova themſelves are tranſparent, and carry no viſible blood-veſſels. Theſe calyces, on the expulſion of the ova, enlarge and become yellow, projecting above the external ſurface of the ovaria, and form the corpora lutea: a certain mark of conception in all quadrupeds, and in women themſelves, whether the embryo is viſible or not. The uſe of the corpora lutea is not yet made out; but the orifice, through which the ovum burſts into the Fallopian tube, is often extremely manifeſt, and always has a ragged border, as lacerated parts uſually have. The Fallopian tubes, independent of their black colour, were twiſted like wreathing worms, the periſtaltic motion ſtill remaining very vivid; the fimbriæ were alſo black and embraced the ovaria (like fingers laying hold of an object,) ſo cloſely and ſo firmly, as to require ſome force, and even laceration, to diſengage them. Haller and other obſervers ſupport this ſtatement of the erection of the tube, and its cloſe application to the ſurface of the ovarium. But Dr. Haighton ſeems not to have found it ſo until a later period. He examined a female rabbit in high ſeaſon a few minutes after coition, and found the fimbriæ in their natural ſituation. He found, moreover, from a regular ſeries of obſervations made on different rabbits, at every hour between the firſt and the ninth, that the fimbriæ remained nearly in their uſual ſituation; and the only difference he noticed in the laſt hours was a greater turgeſcency of veſſels, as if preparatory to ſome important action. That the prominent veſicles or calyces of the ovaria, already mentioned, burſt, and allow ſomething to eſcape into the Fallopian tube, which conveys it into the uterus, is what all obſervers ſeem to agree in: and they concur, moreover, in repreſenting the corpora lutea as produced by a particular proceſs carried on in the empty ovarian calyces, and conſequently, as exhibiting inconteſtible proofs of impregnation having been effected. Theſe circumſtances have all been aſcertained by the obſervations of animal bodies, and transferred by analogy to the human ſubject; in which, indeed, the formation of a corpus luteum is very evident, although the earlier ſtages of the proceſs have not been traced. Obſervers by no means agree as to the time at which theſe changes are effected. Mr. Cruikſhank repreſents the burſting of the calyces as following a fruitful coition very ſpeedily. "I opened," ſays he, "a female rabbit two hours after ſhe had received the male: the black bloody ſpots juſt mentioned now projected much above the ſurfaces of the ovaria, *ſome of the ruptured orifices were juſt viſible;* but in many of theſe ſpots there was not the leaſt veſtige of an orifice; whence I conclude that they heal very quickly in general." The narrative of Dr. Haighton's experiments would lead us to conclude that this eſcape of the germs from the ovarian calyces does not take place till a much later period. In twelve hours after coition "ſeveral of the veſicles evidently projected; they had loſt their tranſparency, and were become opaque and red. When punctured a fluid of the ſame colour eſcaped. The corpora lutea, which are formed by the thickening of the parietes of the veſicles, were not very evident." At 24 hours after coition the fluid in the veſicles was ſimilar to that of the laſt experiment. They projected more evidently, and their thickened parietes, manifeſting the commencement of corpora lutea, were become more apparent. At 48 hours paſt coition, *the veſicles ſeemed to be in the very act of burſting*, and a ſemi-tranſparent ſubſtance of a mucus-like conſiſtence was beginning to protrude from ſome of them; others, indeed, were leſs advanced. The fimbriated extremities of the Fallopian tubes were preparing to receive their contents, as appeared by their having quitted their uſual poſition, and embraced the ovaries in ſuch a degree, that only a ſmall portion could be ſeen until the tubes were taken away. Sections being made into the thickened veſicles, the formation of corpora lutea appeared to have made further advances. From the appearance of an incipient rupture of the veſicles in this experiment, it was but reaſonable to expect that their contents would ſoon have eſcaped. In two days and twelve hours after coition the fœtal rudiments had eſcaped; but the cavity of the ovarian veſicles had ſuffered but little diminution. Briſtles were eaſily introduced by the ruptured orifices. In this experiment the advances towards the formation of a perfect corpus luteum were ſuch as the period of examination would naturally lead us to expect. The contents of the veſicles having eſcaped, it was but reaſonable now to look forwards to a ſpeedy obliteration of the cavity. I therefore examined theſe parts, under ſimilar circumſtances, on the 3d, 4th, and 5th days. In the laſt experiment there was but little veſtige of cavity, conſequently the corpora lutea might be conſidered as perfectly formed."

That a ſomething, which is the germ of the future animal, and is ſuppoſed to be of a veſicular figure, eſcapes from the ovarium after conception, is received into the Fallopian tube, and conveyed by it into the uterus, is rendered highly probable by the facts juſt related: and various additional proofs may be adduced on this ſubject. Almoſt the whole animal kingdom poſſeſs ovaries, in which the rudiments of the future being are obviouſly contained previouſly to impregnation; and it is the development of theſe rudiments after impregnation that forms the future animal. The formation of the germ in the ovary, and its paſſage into the oviduct, are particularly clear in birds and reptiles; and analogy ſtrongly leads us to aſſign to the ovaries of the mammalia the ſame function of producing theſe germs. The removal of theſe bodies renders the woman completely ſterile; and Mr. Hunter has ſhewn that the extirpation of one has a very marked effect on the fecundity of the animal. In the Philoſophical Tranſactions for 1787 he has detailed the reſult of "an experiment to determine the effect of extirpating one ovarium on the number of young produced." He ſelected two ſows of the ſame colour and ſize, and one boar from the ſame farrow, and removed one ovarium from one of the ſows. About the beginning of the year 1779, they both took the boar; but the one which had been ſpayed earlier than the perfect female. The diſtance of time, however, was not great, and they continued breeding at nearly the ſame times. The ſpayed animal continued to breed till Sept. 1783, when ſhe was ſix years old, which was a ſpace of more than four years. In that time ſhe had eight farrows, conſiſting of 76 pigs; but did not take the boar afterwards. The perfect animal continued breeding till December 1785, when ſhe was about eight years old, a period of almoſt ſix years, in which time ſhe had thirteen farrows, conſiſting of 162 pigs. "From this experiment," ſays Mr. Hunter, "it ſeems moſt probable, that the ovaria are from the beginning deſtined to produce a fixed number, beyond which they cannot go, though circumſtances may tend to diminiſh that number; that the conſtitution at large has no power of giving to one ovarium the power of propagating equal to two; for, in the preſent experiment, the animal with one ovarium produced ten pigs leſs than half the number brought forth by the pig with both ovaria. But that the conſtitution has ſo far the power of influencing one ovarium, as to make it produce its number in a leſs time than would probably have been the caſe, if both ovaria had been preſerved, is evident from the above recited experiment." Certain irregularities in the proceſs throw much light on the ſubject, and tend to ſtrengthen the argument juſt adduced. Fœtuſes may be detained in the ovarium, and developed there to a certain point. Or, the germ may eſcape from the ovary, and not be admitted into the Fallopian tube; in which caſe it has often become attached to ſome part of the abdominal cavity, inſtead of the uterus, conſtituting what is termed a ventral extra-uterine fœtus. After it has attained a certain degree of developement, labour pains come on, but parturition cannot be effected; and the bones of the child are, perhaps, diſcharged through an abſceſs, or gain admiſſion into the alimentary canal, and are voided per anum. Laſtly, the germ may be detained in the Fallopian tube, without arriving at the uterus. The ſtructure of the part does not allow it to dilate ſufficiently to contain a full-ſized child, and it accordingly burſts, in general, long before that time, and the patient periſhes from bleeding.

We muſt allow, that the eſcape of any thing from the ovarium in the human ſubject, or other mammalia, is rather inferred than directly proved; and that we cannot ſee the germs in the Fallopian tube, on their paſſage to the uterus; in ſo obſcure a ſtate are the rudiments of the future animal at the time, and immediately after conception.

We have repreſented the corpus luteum as the conſequence of a fruitful copulation; but there is ſome doubt whether the latter circumſtance be an eſſential condition of its production. It is well known that birds lay eggs without the concourſe of the male, and ſuch eggs are unproductive. Valiſneri aſſerts, that he has ſeen corpora lutea in the ovaries of virgins; and Blumenbach appears, in the following quotation, to agree with him in opinion on the ſubject. "Porro autem non minus verum eſt innuptas aves ejuſmodi ova ſubventanea ex mechanica titillatione genitalium concipere poſſe, quod quidem phyſiologiæ comparatæ, adeoque omnis zoologiæ vere ſcientificæ parens Ariſtoteles, et preterito ſeculo oculatiſſimus Harveius animadvertit, quorum hic adeo libidinoſas interdum aves eſſe aſſeruit, ut ſi dorſum earum manu ſolum leniter tangas, ſtatim procubant, et orificium uterinum nudent et exporrigant, quod ſi blande digito demulſeris, vago murmure, alarumque geſticulatione, gratam veneris dulcedinem eaſdem exprimere; quin etiam femellas ova inde concipere, in turdo, merula, aliiſque ſe eſſe expertum. Idem de pſittaco refert, quem uxor ejus diu in delitiis habuerat, ſæpe hunc ludibundum et laſcivum ſedentis gremium adiiſſe ubi dorſum ſibi demulceri geſtiverit quaſſatiſque alis et blando ſtrepitu ſummam animi ſui lætitiam teſtatus fuerit. Non diu autem poſt blandas has contrectationes eundem ægrotaſſe, crebriſque tandem convulſionibus obortis exſpiraſſe. Diſſecto itaque cadavere ovum fere perfectum ſe in utero ejus reperiiſſe; ſed, ob defectum maris, corruptum. Ignoſcunt mares iſtarum virginum, ſi lutea in earum ovariis corpora non abſimilem originem agnoviſſe ſuſpicor; utpote qui in puellari corpore, non minus quam in turdis et merulis eundem æſtri venerei in ovarii veſiculas effectum eſſe reor, ſitve is viri amplexu, ſitve leſbio quodam artificio excitatus. Quadrant in eam ſuſpicionem, quas diximus circumſtantiæ, ſub quibus corpora lutea in innuptis obſervârunt auctores; ætas ſcilicet, a decimo quarto inde anno, hyſterica quarundam affectio, &c. Num climati quoque aliquid tribuendum, decidere non audeo, annotans tantummodo, quotquot mihi hactenus apud auctores occurrerunt ejuſmodi haud inficiandi caſus, eos non niſi in Italicis virginibus obſervatos fuiſſe." Specimen phyſiologiæ comparatæ, Goetting, 1789, p. 4—9.

Phyſiologiſts have queſtioned whether a ſecond impregnation can take place after a fruitful copulation. Inſtances of twins, born with different degrees of developement, have been conſidered as proofs of ſuperfetation. The reaſoning does not ſeem very concluſive, the fact does not clearly prove that the two fœtuſes were conceived at different and diſtant periods, ſince the growth and developement of one germ may have been prevented by various cauſes. The queſtion is, whether a woman, having only a ſingle uterus, can conceive two or more months after a fruitful copulation; and at preſent we have no facts to prove the affirmative, while preſumption is ſtrongly againſt it. The thing appears more eaſy, if we ſuppoſe the two conceptions to be ſeparated by a very ſhort interval. Thus we can conceive that the American lady mentioned by Buffon, who received the embraces of her huſband, and of a negro ſlave, in the ſame morning, may have brought forth twins of different colours.

On the ſubjects of the preceding paragraphs, the reader may refer to the ample collection of facts, in the eighth volume of Haller's Elementa; to Spallanzani's diſſertations relative to the natural hiſtory of animals and vegetables, vol 2d.; to Haighton's experimental inquiry concerning animal impregnation, in the Philoſophical Tranſactions for 1797; to Cruikſhanks's experiments, in which, on the third day after impregnation, the ova of rabbits were found in the Fallopian tubes, and on the fourth day after impregnation in the uterus itſelf, with the firſt appearances of the fœtus; ibid.

The various opinions concerning the ſource from which the new animal is derived, and the manner in which its formation is effected, form the laſt ſubject of the preſent article. In the ſcience of life, as in all others, the ſpeculations and hypotheſes concerning any matter are in an inverſe ratio to the number of aſcertained facts; and perſons are diſpoſed to talk more, in proportion, as they know leſs. Hence the vaſt abundance of theories of generation, which almoſt exhauſted the patience even of Haller, and extorted from him the following very ſenſible obſervations. "Iterum ingratiſſimum mihi impendet opus, ſcribere de iis, quæ multis a natura circumjectis tenebris velata, ſenſuum luci inacceſſa, hominum agitantur opinionibus; erit de iis ferenda ſententia, in quibus quod diſpliceat, quod infirmum ſit, ubique ſe offert, id autem parciſſime, in quo animus, tanquam in firmo aliquo fundamento, adquieſcat. Erunt libranda cum phænomenis contraria phænomena, cum argumentis contraria argumenta, ut demum nihil doceam certius, quam nihil me docere. Et eſt tamen etiam in deſperatione de problematis ſolutione ſua utilitas, proximumque eſt vero, nihil docere, quod falſum ſit." The firſt ſubject of our inquiry will be, from what quarter the materials of the new animal are derived; then, by what cauſes theſe materials are formed into an animal, ſuch as we have ſhewn to be produced in the female by conception. The opinions concerning the ſource of the offſpring may be reduced to three; one gives to woman only the humble office of affording a proper nidus for the due evolution of the fœtus, which, according to this theory, already exiſts in the male ſemen, and requires only a fruitful habitation. Another directly reverſes this poſition; it puts the female in poſſeſſion of every requiſite for the formation of a new animal, and conſiders the male a mere ſtimulating engine, to call the latent powers of the female into life. The third gives not pre-eminence to either ſex, but, with the mutual embrace, ſuppoſes a mutual effect to be produced; it regards both the male and female, as concurring eſſentially in the work of reproduction, by each affording a ſomething, which, when united under proper circumſtances, becomes the proximate cauſe of impregnation.

The ancients admitted a ſeminal liquor in both ſexes, and concluded, not unnaturally, that the fœtus was formed by the union of theſe. Hippocrates and Ariſtotle held this opinion, and conceived that the ſex of the offspring depended on ſome predominance in quality of one or the other fluid. However obſcure the mode of this mixture may ſeem, ſpecious arguments are not wanting in ſupport of the opinion. The neceſſity of the co-operation of the two ſexes, in producing a fœtus, in almoſt every inſtance in the animal kingdom, may be alleged in favour of the doctrine. Alſo the exiſtence of different ſexes in almoſt all plants; the fecundating power of the male duſt, and the perpetual preſence of the ſeed before fecundation; which, however, remains unfruitful without the influence of the former. The reſemblance of the fœtus to both parents in the human race, in animals and even in plants, may be urged in ſupport of the ſame doctrine.

The old opinion, which ſuppoſes that males are produced by the right teſtis and right ovary, and are contained in the right ſide of the uterus, while females are formed on the left, is deſtitute of all foundation. A male with one teſtis has produced children of both ſexes; and male or female fœtuſes are ſeen indifferently in the right and left cornua uteri of animals.

The hypotheſis of Hippocrates and Ariſtotle was adopted by Buffon, and is preſented in his natural hiſtory with all the advantage it can derive from his warm imagination and eloquent diction. But figurative language recompenſes us very imperfectly in ſcientific matters for want of obſervation, and haſty generalizations; and the theory of Buffon is ſo deſtitute of foundation, that we can hardly think it worthy of notice. He conceives that there is a matter in nature, compoſed of incorruptible molecules, always living and active, and deſtined to the nutrition and evolution of all organized beings. Theſe particles are received in the food, and are applied to every part of a plant or animal. Every animal is an interior mould, by which theſe particles are faſhioned to their particular ſhape. When there is more of this matter than is required for purpoſes of nutrition, the overplus is conveyed from all parts of the body to the teſticles of each ſex, which are its reſervoirs. It exiſts here in a liquid form, and contains molecules analogous to all parts of the frame, ſufficient to form a ſmaller being, exactly ſimilar to the large one, from which it is produced. The molecules compoſing the new being are analogous to thoſe of all parts of the body, from which they have been conveyed to the teſtes, and may be deemed a kind of extract of the old body. This matter, having paſſed through the interior mould, and finding the uterus in a favourable ſtate, generates a new animal. We ſhall not abuſe our reader's patience by the further detail of ſuch vague chimeras; they more than juſtify the ſarcaſm of Voltaire in his "Homme aux quarante ecus." "Ah! monſieur le ſavant, ſays the man aux quarante ecus, could not you inform me how children are made? no, my friend! replies the ſavant; but I will tell you what philoſophers have imagined on this ſubject, or, in other words, how children are not made." This jeu d'eſprit contains a lively ironical account of the various theories of generation, which the reader will find much more entertaining, and quite as inſtructive as the original accounts of theſe reveries.

Of thoſe, who conſider that the father has the principal ſhare in producing the child, Leeuwenhoeck is the foremoſt. He conſiders the ſpermatic vermiculi as men in miniature; and conceives that one of theſe crawls in ſome way or other into the ovarian veſicle, and is there developed.

That the fœtus is produced by the mother has been more generally ſuppoſed; and ſeems more probable on the firſt glance, ſince the child moſt certainly comes from the mother, although it is by no means clear that it ever went to her from the father. The analogy of almoſt all animals, and of plants, favours this opinion. The generation of the aphides has been adduced in its ſupport; where a ſingle fecundation ſuffices for ſeveral generations. In the frog and toad, and in the bird, it is very clear that the fœtus pre-exiſts in the ovarium; and that the contact of the ſemen produces at firſt no perceptible change in its appearance. Indeed the wonderfully ſmall portion of fecundating fluid neceſſary to produce the requiſite effect in the frog or toad would lead us to conclude that it cannot excite any very great change at the firſt moments of its application; and this circumſtance, together with the obvious exiſtence of the ſomething, which is afterwards evolved into a tadpole, in the ovarium before copulation, clearly proves the pre-exiſtence of the germ in the females of this ſpecies of animals. "A quantity of ſeed," ſays Spallanzani, "far more inconſiderable than we ſhould ever have imagined, is ſufficient to animate a tadpole. We have ſeen that it is not neceſſary to cover the fœtus completely with this prolific fluid: a drop will ſuffice. Further, three grains mixed with twelve, and even with eighteen ounces of water, communicate to every part of it the power of fecundation, ſince tadpoles placed in any part of the mixture are fecundated. The three grains of ſeed muſt therefore have been diffuſed through the whole maſs of water. But, what an enormous diviſion of its particles muſt ſuch a diffuſion occaſion! How ſmall a ſhare of prolific liquor muſt fall to the ſhare of each tadpole! Yet there are facts which prove that the ſemen ſtill retains its virtue after this exceſſive diviſion; for I have found a globule 1-50th of a line in diameter, taken out of a mixture of three grains of ſeed with eighteen ounces of water, was often capable of fecundating a tadpole. Deſirous of knowing the proportion, which the tadpole (that of a frog is 2-3ds of a line in diameter) bears to the particles of ſeed diffuſed in a drop of this dimenſion, I have found, on calculation, that it is as 1064777777 to 1. How infinitely ſmall, therefore, is the quantity of ſeed in compariſon with the bulk of the fœtus, which it fecundates! This deduction led me to calculate the weight of the particles of ſemen diſperſed in this drop of water: it is [illegible] of a grain. That I might view theſe particles under every poſſible aſpect, I reduced their bulk to cubic lines, when it appeared to be about equal to [illegible] of a cubic line." Diſſertations, vol. ii. p. 212. The reſearches of Haller, and of others on the formation of the chick, have clearly proved the pre-exiſtence of the fœtus in the female of birds.

But, although this hypotheſis appears to be ſupported by the moſt numerous and ſatisfactory proofs, there are difficulties oppoſed to its adoption. "It is very certain," ſays Haller, "that children often reſemble the parents in the human race; ſo that you may diſtinguiſh one brother by his reſemblance to another, or know a ſon by his likeneſs to the father or mother, or even grandfather or grandmother. All the individuals of ſome families are characterized by particular lines of countenance. My own family have now been diſtinguiſhed for tallneſs of ſtature for three generations, without excepting one out of many grandſons deſcended from one grandfather. Families of red-haired perſons are not uncommon: the diſagreeable colour being derived from the father or mother or grandmother. But this reſemblance of children to parents is diſcerned moſt plainly when there is any defect or peculiar formation tranſmitted from one to the other. The tranſmiſſion of diſeaſe may perhaps not be deemed ſo ſurpriſing, ſince nobody denies that the maſs of fluids is derived from the mother; but the father contributes the ſmalleſt drop poſſible, if any. Yet we find various diſeaſes, or diſpoſitions to diſeaſe, paſſing from either parent to the offspring. This is matter of common notoriety with reſpect to gout, rheumatiſm, inſanity, ſcrofula, conſumption, &c. but there is more doubt of ſome others, as cataract, hernia, aneuriſm, ſquinting, harelip, clubfoot, fatuity, &c. of which, however, authors relate many examples. We know a very remarkable inſtance of two noble females, who got huſbands on account of their wealth, although they were nearly ideots, and from whom this mental defect extended for a century into ſeveral families, ſo that ſome of all their deſcendants ſtill continue ideots even in the fourth and fifth generations. Perhaps the reſemblances of the mother are rather the moſt common. The ill-made Perſians have improved themſelves into a very beautiful nation by their repeated marriages with the celebrated Georgian females. The offspring of Negroes and Europeans partakes of the characters of both parents in colour, form of the lips, noſe, &c.; and we may obſerve in general, of all ſuch mixed breeds, that the children produced ſeem to conſtitute a mean between the father and mother. Peculiarities of formation are not uncommonly tranſmitted; as a very hollow palate, which I myſelf have ſeen, and many others. A man covered univerſally with hard, elaſtic, cylindrical, warty excreſcences, begot ſons and daughters with the ſame deformity. An exceſs in the number of thumbs (four) paſſed from the father to the children: and there are curious examples of ſimilar facts in individuals poſſeſſing five fingers on each hand. Pliny mentions that Q. Horatius, who had this ſtructure, begot two daughters reſembling him in this reſpect. A family mentioned by Reaumur is more remarkable: the grandfather had a ſupernumerary finger on each hand, and a toe on each foot. His firſt ſon produced three children with the ſame peculiarity: the ſecond, who had the uſual number of fingers, but in whom the thumb was very thick, and appeared as if compoſed of two united together, had three daughters with the ſupernumerary members: the third had the natural ſtructure. A daughter, with a very thick thumb, brought forth a boy with the additional finger. That too much influence may not be attributed in this caſe to the influence of the male, it may be obſerved that another daughter, who had large thumbs, produced ſome ſons with ſupernumerary members. Maupertuis has alſo recorded a family of children diſtinguiſhed by this character, produced by a mother with the ſame peculiarity. The thick lip in the Auſtrian family was introduced by the marriage of Mary of Burgundy with Maximilian. It is aſſerted that caſual mutilations, as blindneſs, &c. have been tranſmitted to the offſpring, in horſes: and ſome complain of the plan of employing Arabian ſtallions rather than mares for improving the breed. There is a peculiar breed of four-horned ſheep, deſcending from the female; and another of pigs with undivided hoofs. The difficulty of the ſubject is increaſed by the circumſtance that theſe defects and peculiarities do not in general paſs to the offspring. Blind, lame, or mutilated parents have perfect children. In the family with the ſupernumerary fingers, already mentioned, ſeveral individuals had the ordinary formation. Fowls without the rump breed with the common kind of chicken, both with and without that particular formation; and the ſame mother has children like herſelf and the father, and others without ſuch reſemblance." Elementa Phyſiologiæ, lib. 29, ſect 8.

The phenomena afforded by hybrid generations are curious. It is only in the caſe of animals very nearly allied in their general characters that any hybrid offspring is produced: and this has the mixed characters of both parents. The relations of women in Africa breeding with monkeys are not ſufficiently authenticated. "The mule (produced from the mare by the aſs) does not," ſays Haller, "ſeem to me to be an aſs, which however it reſembles in its tail, ears, and obſtinacy, ſince the form of the body, the ſtrength and ſize, the hocks, the hair, and colour are thoſe of the mother. The voice is more like that of the father, and there is a farther reſemblance of the aſs in the peculiar hollow of the larynx. As the mule ſeems to be ſtronger and more lively than the aſs, ſo the hinny begotten by the ſtallion on the ſhe-aſs, ſeems rather to follow the mother: it is ſaid to have the ears of the horſe, the mane and tail of the aſs; and to be ſmaller than the mule. The offspring of the common ſhe-goat with the Angora he-goat has the long hair of the father; while that of the Angora female with the European male has not that character. The fine hair of the former breed was continued in Sweden to the third generation. This fact ſhews the prevalence of the male, which, being born in a warmer region, exceeds in ſtature the European animal. The pheaſant breeds with the common hen: the offspring has the mother's colour, with the form of the father, whom on the whole it moſt reſembles. If the animal produced from ſuch a connection breeds again with the male pheaſant, the young are complete pheaſants. When theſe and various other analogous facts are compared, we remain in as much doubt as before. It appears that the offspring is affected by both parents, in ſome caſes more by the father, and in others more by the mother. And I think, that where the father is greater in ſize, his characters prevail, and *vice verſa*." Ibid.

Neither is it merely the form and external appearance that are changed in the caſes of hybrid animals; we have already obſerved that the mule has the peculiar laryngeal cavity of the aſs; and it is further known that this animal, and all other hybrids, very rarely propagate: ſo that we may conclude that ſome general internal change is effected in theſe caſes. A more accurate anatomical deſcription of hybrid animals would probably contribute to illuſtrate the ſubject: the facts at preſent in our poſſeſſion lead us to conclude that the fœtus is not produced entirely by the mother or father, that both parents contribute ſomething to the offspring, and that the new being is rather generated *de novo* than evolved.

In conſidering the powers by which the admirable ſtructure of the animal frame is raiſed, we encounter a vaſt hoſt of the moſt wild and viſionary hypotheſes: we deſcend, to uſe the expreſſion of Haller, from twilight into regions of utter darkneſs. In the firſt place we reject entirely the operation of fortuitous cauſes: the notions concerning equivocal generation have been ſufficiently refuted by modern naturaliſts, even in the lower orders of animals, where the phenomena, on a ſuperficial view, tend to confirm the vulgar opinions, and there is not even the ſhadow of probability in favour of ſuch explanations in any of the higher claſſes.

In theſe times, however, men of conſiderable reputation have not been wanting to defend opinions very much reſembling the hypotheſis of equivocal generation. Buffon has contended that all the parts of an animal are not formed at once, but ſucceſſively, by epigeneſis. His obſervations concerning the organic molecules of the ſemen have been already noticed: he even admits the formation of new beings by putrefaction and by the fortuitous concourſe of particles. His aſſociate, Turberville Needham, does not allow of equivocal generation, but ſuppoſes the exiſtence of a power, which forms the body from the ſmalleſt germ by the aſſimilation of aliment. He thinks that the primitive germs alone are created at once, but that there are no compound germs at all reſembling animals. He quotes the phenomena obſervable in vegetable infuſions; and conceives that animal and vegetable ſubſtances are the ſame in their origin, and admit of being changed into each other. The firſt germ of an organized body is very ſimple, and not yet organized, nor poſſeſſing any lineaments of the animal. Hence the ſmalleſt animalcula, as conſiſting of the feweſt germs, are formed the ſooneſt; and thoſe of a more compound ſtructure, more ſlowly. The whole affair of vegetation conſiſts of an expanſile force reſiding in matter, and a reſiſting power. The former is perfectly elaſtic, and exiſts in every ſenſible point of matter; it is aſſiſted by heat. There is a power, in every point of vegetable matter, to produce filaments, from which microſcopic animalcula may be formed. A real generating cauſe exiſts in nature. The expanſive force is increaſed, and the reſiſtance diminiſhed, when matter is elevated to a ſtate of vitality. This is effected by the developement of the active principles; it returns again to a vegetable nature, when the contrary cauſes obtain. He does not, however, admit of equivocal generation, but conceives it neceſſary, that the ſeminal fluids, both of the male and female, characterized by their peculiar properties, ſhould be preſent.

In this hypotheſis the power of the ſemen is not neglected, nor is any attraction or fortuitous concourſe of atoms admitted. But the experiments on infuſion animalcula are employed to authorize concluſions, which cannot be very eaſily admitted. We find a great difficulty in admitting how any blind force, not regulated by deſign, can form animals deſigned for certain purpoſes, and fit to fill their place in the chain of beings. Hence we find that theſe animalcula are not produced when the experiments are ſo conducted as to remove all poſſibility of the introduction of ova from without. The experiments of Spallanzani clearly prove this point.

The ſyſtem of epigeneſis met with an able defender in C. F. Wolf: ſee his Theoria Generationis, Halle, 1759, 4to. He explains the mode of growth, and the formation of parts in animals and vegetables, by the action of a power which he calls *vis eſſentialis*, without any mould or model. This power, together with the fixation or coagulation (ſoli deſcentia) of juices, accompliſhes the whole work of formation. The heat of the air in plants, and the heart in animals, are acceſſory cauſes of generation. The primordia of animals are globules, which cannot be reduced into ſmaller component parts; neither arteries, veins, nor heart exiſt in the egg at 24 hours. The vis eſſentialis, different from the power of the heart, now begins to act, and, in the globular matter of the area umbilicalis, forms grooves, which gradually grow red, and conſtitute veſſels. Theſe at firſt are large intervals of the globular matter, but gradually become ſmaller. Membranes are formed round theſe paſſages. All parts are firſt fluid and inorganic, and then formed into veſſels. Trunks are formed to the branches, and at laſt the great trunk of all, the heart. New parts are formed, from the juices of the firſt; and thus the organs appear in ſucceſſion, one after the other. Haller refutes this theory from his accurate obſervations on the formation of the chick; he ſhews that in fact parts exiſt, diſtinguiſhed by their form and other characters, when ſuperficial obſervation would lead us to infer that there was only an inorganic homogeneous maſs. The tranſparency of the whole prevents the outlines and diſtinction from being viſible, but coagulation by acids brings theſe differences into view. Becauſe the original gelatinous maſs, which forms the animal, ſeems to have no obvious ſtructure or ſmaller diſtinguiſhable component parts, we are not therefore to conclude that it has none. Spirit of wine, poured on this jelly, hardens it ſo, that we can ſee fibres, veſſels, and viſcera, where there ſeemed at firſt to be a mere tranſparent concrete. There is no eſſential power in the alcohol to model rude matter into an organic ſtructure; but the deſtruction of the tranſparency allowed the outlines of parts to be diſtinguiſhed: ſimilar explanations may be given of all his obſervations on this ſubject. Moreover, we can by no means underſtand how this ſingle power can form ſuch different parts always in the ſame place in one animal, and according to one archetype, if the materials be inorganic, mutable, and ſuſceptible of any configuration. Why ſhould this matter always produce, without any error, a chicken in the common fowl, a pea-chick in the pea-fowl? Nothing is aſſumed but a dilating force acting progreſſively; this might give origin to a vaſcular net-work, growing conſtantly larger as long as the expanſive force exceeded the reſiſtance; but how does it produce a heart, a head, brain, and kidneys? Why is a peculiar order of parts formed in each animal?

Some again have explained the formation of the body according to mechanical principles, by the power of fermentation, &c. We cannot, ſays Haller, conceive that any power, unleſs guided by intelligence, can act on matter in a manner conſtantly changing, and ſo directed, that inorganic materials are formed into bones, muſcles, veſſels, and viſcera, arranged in a certain order with reſpect to each other. All ſpontaneous productions, as for inſtance the beautiful figures ſeen in ſnow, are arranged in an uniform and invariable manner. Let any perſon, in order to eſtimate the value of ſuch hypotheſes, reflect merely on the eye. How can this organ be moulded by any expanſive force into ſuch various ſucceſſive layers, all differently fabricated, where the light paſſes through tranſparent bodies, every where ſurrounded by others perfectly opaque, and ſo arranged, that in the millions of men and animals the rays of light conſtantly converge upon the retina? Yet this blind material cauſe knows nothing of light, nor of the laws by which it is refracted, although we muſt ſuppoſe it to have adapted all the parts ſo accurately, even to the hundredth part of a line, in order to the collection of the rays in the retina. Again, this unintelligent cauſe has furniſhed the eye with eye-lids and eye-brows, and has given to the iris a power of contraction and dilatation, by which the organ is accommodated to too great or too ſmall a quantity of light.

Buffon ſuppoſes the nutritive matter to penetrate all parts of the body, and to be formed in them, as in an internal mould; and he conceives that the ſuperfluous particles are carried back to the ſemen, conveying into that fluid every thing neceſſary to the production of a new being, ſimilar to the former. The ſeminal fluid of either ſex contains the particles neceſſary for forming an individual of the ſame ſex.

Theſe muſt be mixed for the production of a new being. The generative organs are the baſis of the new animal, and theſe are firſt formed of themſelves: the other organic particles of the body are arranged round them as a centre, according to the order, which they held in the body, from which they were produced. That ſex prevails, of which the particles are the moſt numerous. The author of this hypotheſis conſiders that it explains completely the reſemblance of the offspring to either or both parents, the formation of twins, &c.

The illuſtrious name of Buffon can hardly induce us to animadvert ſeriouſly on ſuch dreams. In the firſt place, what is an internal mould or model? The authors of the hypotheſis are ſo far from ſatisfying us on this fundamental point, that they confeſs we could not underſtand it, unleſs we had a ſeventh ſenſe. How then came they to know it? So far from underſtanding what this model is, we have no heſitation in aſſerting that its exiſtence is purely ideal. But if we ſhould grant this, there are ſtill inſuperable difficulties remaining. Many children are unlike both parents, and they ſometimes have parts which both the father and the mother wanted, and with which, therefore, neither parent could have ſupplied them; this is the caſe with the offspring of mutilated individuals, and particularly with the male children of fathers who had loſt one teſtis; a caſe which was not uncommon when caſtration was an ordinary mode of treating ruptures. The mother cannot beſtow on her daughter the hymen, which ſhe has loſt; nor can we ſee the ſource from which the foramen ovale, the ductus arterioſus, and venoſus, the umbilical veſſels, the placenta, the cord, &c. are derived. The teeth too muſt puzzle us greatly. The various transformations, and every other phenomenon in the lower orders of animals, are altogether irreconcileable with the hypotheſis. The adult frog has no branchiæ, which are yet ſeen in the tadpoles. In the bee kind, the males, females, and working bees differ in ſtructure. The offspring might reſemble the father or mother, but whence do the working bees come, which reſemble neither parent, and have no generative organs. How entirely does the caterpillar differ, in all points of its organization, from the butterfly! How can the particles unite, when the male and female are ſo entirely different, as in the caſe of many inſects, where one is winged, and the other not, &c.

The ſuppoſition of the ſucceſſive fixation of parts round the generative organs is quite inadmiſſible; for thoſe very parts cannot be recognized until a comparatively late period, and after others have been ſome time formed.

This fact was confirmed, ſays Blumenbach, by an obſervation which I lately made on abortive twins of different ſexes, about ſixteen weeks old. Although theſe were remarkable for the beauty of their proportions, and were moſt perfectly formed according to the ſtandard of their tender age, the difference of the ſexual organs could be aſcertained only by the moſt careful inveſtigation: in every other reſpect, as in the figure, phyſiognomy, meaſurement of the lines, &c. they reſembled each other completely. Inſtitut. Phyſiolog. p. 387.

In reply to ſome of theſe objections it has been affirmed, that thoſe parts of the fœtus, which the parents have not, are formed by intelligent nature from the ſuperfluity of the organic molecules: that ſhe adds a ſecond teſticle from the exceſs furniſhed by the ſingle gland of the father; and that the placenta and fetal coverings are produced in the ſame way from the exceſs of nutritious molecules; but if nature can make wings, inteſtines, nerves, feet, teſtes, placenta, and membranes, &c. without any mould, why ſhould ſhe not form the whole body in the ſame way: and, whence ariſes this abundance of particles, produced by the teſtis of a man, who has only one gland, when the mould muſt be one half leſs than in a perfect individual? How came this intelligent nature to be ſo ſuddenly produced in a mere machine, when we had before heard nothing of her? Can any one underſtand how particles tranſmitted from ſo vaſt an extent as the father's whole body, can occupy ſo ſmall a ſpace, even when united to thoſe of the mother, as to be inviſible for ſeveral days after conception? In ſhort, there is no female ſemen, no corpus luteum before copulation, and conſequently no fluid from the mother to be mixed with that of the father, and convey to the fœtus the female generative organs, the mammæ and the other diſtinctions of the female ſex.

A very different theory from that which we have juſt conſidered, and a very old one, aſcribes the formation of the fœtus to a formative power of the mind or ſoul (anima ſtructrix, vis plaſtica): and ſome conceive that the object is effected by the mind of the fœtus. The partiſans of theſe opinions rely much on the effects ſaid to be produced on the body of the fœtus by cauſes operating on the mother's mind. They alledge that the ſtructure of the offspring is often materially changed and impaired by the longing of the mother, or by various violent emotions: that theſe effects are produced, not from any corporeal cauſe, but from the action of the mind on the anima ſtructrix of the fœtus: that there is a harmony between the mind of the mother and her body, and between the bodies of the mother and child. Various attempts have been made to explain the manner and nature of this influence and connection. But it would have been better to have eſtabliſhed the fact incontrovertibly in the firſt place. The records of medicine abound with inſtances of almoſt all imaginable effects produced on the fœtus from the cauſes above-mentioned:—of the likeneſs of fruits or flowers, &c. on the body, of various animals, of bruiſes;—of parts being cut, deſtroyed, or otherwiſe injured, &c. &c. That credulity and ignorance have given birth to moſt of theſe narratives, cannot be doubted. Our faith in them muſt be moſt ſeriouſly ſhaken, when we obſerve that there are endleſs examples of the moſt vehement mental diſturbances, as terrors, longing, paſſion, occurring repeatedly during pregnancy, particularly in delicate and hyſterical women, without any thing unnatural appearing afterwards in the child, even when the mother has expreſſed her ſtrong perſuaſion that her child would be mutilated. Nor can women foretel when the marks above alluded to (nævi) will appear. Deformed and monſtrous children, and others marked with nævi, have been repeatedly obſerved by the moſt judicious and accurate obſervers, when the mother was not conſcious of any ſuch cauſe as thoſe above alluded to. Children are born blind of healthy parents without the circumſtance being conſidered as extraordinary or requiring any thing accidental to account for it. When women obſerve any deformity in their offspring, they recal to their memory every thing which has happened during their pregnancy; and if they can remember any fall or fright, or ſuddenly ſeeing any uncommon animal, the carcaſe of a beaſt opened, or a wound, &c. they immediately ſet it down as the cauſe of the phenomenon. And, from the various turns which ſuperſtitious and whimſical fancies take in different countries, the ſame appearances are aſcribed to very different cauſes.

In weighing the teſtimonies of authors, we ſhall find that the moſt experienced and judicious indulge the common notions about nævi much leſs than others. In the numerous collections, where monſters and extraordinary productions of all kinds are carefully collected and preſerved, we ſee no example of a genuine nævus, according to the common notions, that is, of the reſemblance of a ſauſage, or a pig's foot, or a wound, &c. in any part of the body of a fœtus. In further ſupport of our opinions we may quote the numerous inſtances of monſters, vegetable productions, which cannot be aſcribed to any power of imagination, or any mental affection whatever. We cannot doubt that the ſeed and the ovum contain the cauſe of the future ſtructure, which is always preſerved uniform in the ſame ſpecies. That various external circumſtances, as a copious or deficient ſupply of nutrition, and many cauſes of a nature entirely unknown to us, may have an effect in altering or variouſly modifying the original fabric, within certain limits, we do not pretend to deny.

If the phenomena of nævi afford no proof of a plaſtic ſoul; if we acknowledge that the beautiful ſtructure of an animal body cannot be reared by chance, nor by any blind force with which inorganic parts may attract each other, it remains for us to conſider whether the fœtus is formed before the time of conception, according to the hypotheſis of evolution. This opinion has been chiefly held in modern times: it is ably defended by Haller, and has been ſupported by the experiments and writings of Spallanzani and Bonnet.

If, ſays Haller, the germ or original of the fœtus be contained in the mother, if it be already formed in the ovum, and ſo far perfected as to require merely a ſupply of nouriſhment for its growth, the grand difficulty of forming ſuch an artificial and complicated ſtructure from inorganic matter is overcome. In this hypotheſis, the Creator, with whom nothing is difficult, forms the machine: he has arranged dead matter, in conformity with his previous deſigns, and according to the archetype fixed by his wiſdom, before the acceſſion of the influence furniſhed by the male. In the ſame way you may have in plants a perfect flower, capſules, and well-formed ſeeds, differing from fruitful ſeeds only in the circumſtance, that they would not grow into a new plant. The metamorphoſes of inſects have been adduced in ſupport of this notion of evolution: the butterfly, ſo entirely different from the chryſalis, was entirely contained in the former, and needed only to be diſengaged by the removal of the ſkin, and have its parts unfolded. The rudiments of the tracheæ, which are to contain air in the bee, exiſt in the fatty ſubſtance of the worm from which the perfect inſect is formed, and numerous examples of a ſimilar deſcription might be adduced. The phenomenon of incubation, and the ſucceſſive appearance of various parts until the whole animal is completed, afford a convincing argument for the hypotheſis of evolution. After recounting the gradual and progreſſive unfolding of the body of the chicken, Haller obſerves, that the progreſs is nearly the ſame in quadrupeds. "In the human fœtus, which at firſt ſeems a mere unorganized maſs, Leeuwenhoeck already diſcerned, by means of his microſcopes, diſtinct organization. Thus it is clear, that an animal without any limbs, or diſcernible arrangement of parts, is gradually changed by various ſtages into a perfect being, nouriſhed by food, and ſuſceptible of voluntary motion. It may be inquired, whether the animalcule, before it can be recognized by the ſenſes of the diſſector, exiſts in the father or the mother: whether it were formed by epigeneſis, or the ſucceſſive union of particles; or ſuddenly produced. Epigeneſis is altogether impoſſible. Whoever has contemplated the ſtructure of the body with a little attention, muſt be convinced that an animal could not exiſt without a heart, ſince the principle of life and motion exiſts in that organ. But the heart muſt be furniſhed with arteries to carry the vital fluid to all parts, and with veins to carry it back again.

It is eaſily proved that the fœtus does not conſiſt of a mere ſkeleton of blood-veſſels. Viſcera muſt accompany theſe, of which, with ſome cellular ſubſtance, they are entirely compoſed. But no one has ſeen the viſcera compoſed by particles ſucceſſively depoſited: they are perfect, although ſmall, as ſoon as they can be diſcerned. Muſcles muſt have been preſent from the firſt: for the young animal, in the incubated egg, is capable of motion, and from its ſtraight ſtate bends the body. It is moreover irritable, and muſt conſequently have muſcles, although they are concealed under the appearance of a mere gelatine. The head is large, and the eyes are viſible among the firſt parts, together with the heart. The muſcles require the preſence of nerves, the brain muſt have been preſent with the head and heart." The hypotheſis then, to which theſe arguments lead, is, that the perfect animal exiſts previouſly to conception; that nothing now is generated, but that the parts, which were folded up, and contracted into a ſmall ſpace, are expanded, unfolded, enlarged, and rendered conſpicuous. In this mode of explication, we muſt, it ſeems, admit, that the germs of all the human race, as well thoſe who have already lived, as thoſe who may hereafter be born, were contained in the ovaria of Eve: a propoſition of ſo ſtrange a nature, and ſo completely unſuſceptible of proof, that we cannot value very highly the hypotheſis, which renders it neceſſary.

The pre-organized germ would remain in a kind of torpid ſtate in its ovarian receptacle, were it not ſtimulated by the male ſemen. This fluid rouſes it from its lethargy, and cauſes its growth and developement. The ſtimulating properties of the ſemen are ſuppoſed by Haller to excite the motion of the heart; and he conceives that the ſubſequent developement of the new being is eaſily underſtood.

The great reputation of Haller has not however gained to his opinions on this ſubject univerſal aſſent. The accurate and well-informed Blumenbach of Göttingen has oppoſed the hypotheſis of evolution with great effect, and has arrayed againſt it a number of objections, which its advocates will not eaſily elude. His opinions on this ſubject are, on the whole, the moſt rational that have been hitherto promulgated: the following ſtatement of them is derived from his manual of natural hiſtory, and his inſtitutes of phyſiology. "The hypotheſis of evolution has been employed, particularly in modern times, in order to explain the origin of organized bodies; it has been ſtated that no man, no other animal, and no plant is generated, but that they have all exiſted in their parents and anceſtors, in the ſtate of complete previouſly formed germs, ſince the firſt creation. The various generations have been continued, one within the other, like a ſeries of pill-boxes, and have been only gradually unfolded and brought to light by fecundation, in their reſpective turns." Haller, who was the leader of the modern evolutioniſts, roundly aſſerted, "that the viſcera, and all the bones of the future fœtus, exiſt before conception in the maternal germ, but nearly in a fluid ſtate, and therefore inviſible." This opinion muſt be deemed, on the firſt view of it, irreconcileable with reaſon, on account of the ſuppoſition involved in it, of the uſeleſs creation of innumerable germs, which are never to be evolved; and it is utterly at variance with all chaſte and ſound phyſiological reaſoning, on account of the great aid which it requires from preternatural agency, and the uſeleſs complication of natural powers which it ſuppoſes in oppoſition to all the laws of philoſophical inveſtigation. According to the unanimous repreſentations of the moſt celebrated and zealous advocates of evolution, the pre-organized germs lie ready in the mother, are rouſed at the time of fecundation, and proceed to their developement by this agency of the male ſeminal fluid. What we call conception is, therefore, nothing but the excitation of the torpid germ by the affuſion of the male liquor. Here then, in the firſt place, we muſt ſuppoſe an exciting power. But children often reſemble moſt ſtrikingly their father only: bitches, after copulating with different dogs, often have puppies reſembling their different fathers: two individuals of different races, as a Negro and an European, produce together offſpring of a middle character, or a mulatto: and, where the ſpecies of animals or plants is different, mongrels are produced, having as many characters of the father's formation as of the mother's. All theſe facts cannot be overlooked; and, in order to account for them, the evolutioniſts ſuppoſe in the ſemen, in addition to its exciting influence, a formative power, by which it can change the pre-organized germ contained in the mother into ſomething of the form of the father. Thus we find two powers in the ſemen, an exciting, and a formative one. But, by means of an artificial hybrid impregnation, repeated through ſeveral generations, we can, at laſt, change one ſpecies of organized bodies entirely into another. One ſpecies of plant, fecundated with the male duſt of another, produced ſeeds, from which hybrid fecundable plants were produced. Theſe were again fecundated with duſt of the ſame male plant; and, after this had been repeated four times, a complete metamorphoſis had taken place, by which the characters of the male were ſubſtituted for thoſe of the female plant. The ſame circumſtances will occur in the human ſpecies if the offspring of an European woman by a negro be fecundated by a negro; and the produce of that conception again by a negro, &c. Thus, at laſt, the preformation of the maternal germ, which has been preſerved ſince the creation of the world, avails nothing, but yields entirely to the formative power of the male fluid, which, according to the hypotheſis of evolution, ſhould merely excite it to action. We may affirm, in ſhort, on the whole, that of all the phenomena adduced in ſupport of this hypotheſis, not one can be eſtabliſhed ſufficiently clear to be admitted as a proof; while there are numerous unexceptionable obſervations directly oppoſing it.

But, in proportion as this hypotheſis of evolution is inconſiſtent with the phenomena, and with the rules of philoſophiſing, ſo, on the contrary, the opinion, not that any fictitious germs are evolved by means of conception, but that the new being is in fact generated, and gradually and ſucceſſively formed from the generative fluids, commends itſelf to our approbation by its ſimplicity, and its accordance with the other proceſſes of nature.

Since this affair of a true generation by ſucceſſive formation has been variouſly explained by phyſiologiſts, I conceive that we ſhall approach moſt nearly to the truth, by adopting the following propoſitions. 1ſt. The materials, of which organized bodies, and conſequently the human frame is compoſed, differ from all other matter in being regulated ſimply and excluſively by vital powers. 2d. Of theſe the moſt remarkable, and that, whoſe exiſtence and agency can be the leaſt queſtioned, is the force which acts on organized matter, when prepared for its deſtination, but not yet moulded into ſhape, and beſtows on it, according to its various natures, various but determined and definite forms. In order to diſtinguiſh this vital power properly from all others, I give it the name of niſus formativus. 3d. This niſus formativus is imparted to the materials of generation, when they are contained in a mature ſtate, under the requiſite conditions, in the uterine cavity, builds up in it the rudiments of the embryo, and gradually forms its organs to correſpond to their pre-ordained purpoſes: it preſerves the ſame ſtructure by the proceſs of nutrition, as long as life continues; and it obviates the effects of caſual mutilation, as far as that can be accompliſhed, by means of reproduction.

This gradual formation of new organized bodies can be moſt manifeſtly diſcerned in thoſe, which combine, with a conſiderable magnitude, a rapid growth, and ſuch a kind of delicate ſemi-tranſparent texture, that they can be clearly ſeen through, particularly in a ſufficient light, and with moderate magnifying powers. This is the caſe in the vegetable kingdom, with ſome ſimple aquatic productions, as the conſerva fontinalis, which is propagated in the early part of ſpring; in the bloodleſs diviſions of the animal kingdom, with the polypes (hydra); in the animal kingdom, with the incubated egg, on the firſt appearance of the chicken, and its ſubſequent daily developement.

' It muſt be obſerved here, that the expreſſion niſus formativus is employed ſimply for the purpoſe of diſtinguiſhing this from the other kinds of vital powers, and by no means with any intention of explaining the cauſe of generation. I believe the latter to be concealed by no leſs impenetrable darkneſs than that which involves the cauſes of gravitation and attraction, which are only names for effects, recognized like the niſus formativus, a poſteriori. I have employed the word niſus chiefly in order to denote that the nature of this force is truly vital, and to diſtinguiſh it as clearly as poſſible from the merely mechanical powers, by means of which ſome philoſophers formerly endeavoured to explain the buſineſs of generation. The very point on which the whole of this doctrine concerning the niſus formativus hinges, and which alone ſufficiently diſtinguiſhes it from the vis plaſtica of the ancients, the vis eſſentialis of Wolf, and other hypotheſes of the like nature, conſiſts in the combination of the two principles, by which the nature of organized bodies is explained, *viz.* the phyſico-mechanical and the teleological.

I hold it moſt probable, that in the firſt place, a definite time is required for the various fluids of each ſex, which ſeem to be united in the cavity of the uterus after a fruitful copulation, to be more intimately mingled, and brought to maturity. When the period of this preparation is completed, the mature and intimately blended fluids become animated by the niſus formativus, by which the hitherto unformed materials of generation are partly moulded into the elegant coverings of the ovum, partly into the figure of the contained embryo. Hence we can underſtand, why the ſmalleſt veſtige of a formed fœtus cannot be diſcerned, even with the aſſiſtance of the excellent modern dioptrical inſtruments, during the firſt week after conception, excepting the unformed fluids contained in the uterine cavity; while the embryo appears as it were on a ſudden in the third week.

I ſhould exceed the limits of theſe inſtitutions, if I were to recount at greater length thoſe arguments drawn from nature herſelf, by which the influence of the niſus formativus in generation ſeems to me to be rendered very highly probable. I ſhall advert very ſhortly to a few of theſe points, the force of which will be eaſily diſcovered by a more attentive conſideration. On this principle I explain the memorable experiment in the hiſtory of hybrid productions, where prolific hybrids, fecundated during ſeveral generations, by the male ſeed of the ſame ſpecies, have produced an offspring gradually deviating from the original maternal form, and aſſuming the characters of the father, until at laſt the former has been completely changed into the latter by a kind of arbitrary metamorphoſis.

The well-known fact of the great frequency of monſtrous productions in ſome ſpecies of domeſticated animals, particularly ſwine, and their rarity in the wild condition of the ſame animals, can only be explained on the principles already ſtated. The evolutioniſts are compelled to aſſert that all theſe monſtroſities muſt have exiſted in the germs from the firſt creation of things. The phenomena of re-production, taken altogether, can be much more aptly explained by the agency of the niſus formativus, than on the notion of pre-exiſtent germs; and ſome particular examples, as, for inſtance, of nails growing on the middle, after the loſs of the firſt phalanx, cannot well be ſolved on any other principle.

After conſidering, and carefully weighing the arguments on both ſides of the queſtion, it appears, that even thoſe who aſſume pre-exiſtent germs, muſt allow to the male ſeminal fluid a conſiderable formative influence, in addition to the exciting power, which they recognize in it, and conſequently that the doctrine which they defend requires, in fact, the aſſiſtance of the niſus formativus; while the latter ſufficiently explains the phenomena of generation, without the aid of pre-exiſting germs." Whatever theory of generation we adopt, we muſt ultimately aſcend to the agency of the Creator, the primary cauſe of all exiſtence.

The circumſtances belonging to the ſtate of pregnancy; the period and phenomena of parturition and its conſequences, are treated under thoſe articles of the Cyclopædia which relate to the ſubject of midwifery.

GENERATION *of Birds, Fiſhes, Foſſils, Inſects, Metals, Minerals, Muſhrooms.* See BIRD, FISH, FOSSILS, INSECTS, &c.

GENERATION *of Plants.* See FECUNDATION and GEMMA.

GENERATION *of Shells.* See SHELLS.

GENERATION *of Stones.* See STONES, SPAR, TROCHITES, and CRYSTALS.

GENERATION, in *Theology.* The father is ſaid, by ſome divines, to have produced his Word, or Son, from all eternity, by way of generation; on which occaſion the word generation raiſed a peculiar idea: that proceſſion which is really effected in the way of underſtanding, is called generation, becauſe in virtue thereof the Word becomes like to him from whom he takes his original; or, as St. Paul expreſſes it, is the figure or image of his ſubſtance, *i. e.* of his being and nature. See TRINITY and PERSON.—And hence it is, they ſay, that the ſecond perſon in the Trinity is called the Son.

GENERATION is alſo uſed, though ſomewhat improperly, for genealogy, or the ſeries of children iſſued from the ſame ſtock. Thus the goſpel of St. Matthew commences with "the book of the generation of Jeſus Chriſt, &c." The latter and more accurate tranſlators, inſtead of generation, uſe the word *genealogy.*

GENERATION is alſo uſed to ſignify a people, race, or nation, eſpecially in the literal tranſlations of the ſcripture, where the word generally occurs wherever the Latin has *generatio,* and the Greek γενεα, γενεσις.

Thus, "A wicked and perverſe generation ſeeketh a ſign," &c. "One generation paſſes away, and another cometh," &c.

GENERATION is alſo uſed in the ſenſe of an age, or the ordinary period of a man's life.

Thus we ſay to the third and fourth generation. In this ſenſe, hiſtorians uſually reckon a generation the ſpace of thirty-three years, or thereabouts. See AGE.

Herodotus makes three generations in an hundred years; which computation appears, from the latter authors of political arithmetic, to be pretty juſt. See CHRONOLOGY and POLITICAL *arithmetic.*

GENERATOR, in *Muſic,* ſignifies the principal ſound or ſounds by which others are produced. (See GENERATE.) Thus, the loweſt C for the treble of the harpſichord, beſides its octave, will ſtrike an attentive ear with its twelfth above or G in alt, and with its ſeventeenth above, or E in alt. The C, therefore, is called their "generator," and the G and E its products or harmonics. But in the approximation of chords for G its octave below is ſubſtituted, which conſtitutes a fifth from the generator, or loweſt C; and for E is likewiſe ſubſtituted its fifteenth below, which, with the above-mentioned C, forms a third major. To the loweſt notes, therefore, exchanged for thoſe in alt, by ſubſtitution, the denominations of products or harmonics are likewiſe given, whilſt the C retains the name of their "generator." But ſtill, according to the ſyſtem of Tartini, two notes in concord, which, when ſounded, produce a third, may be termed the "concurring generators" of that third.

GENERICAL NAME, in *Natural Hiſtory,* the word uſed to ſignify all the ſpecies of natural bodies, which agree in certain eſſential and peculiar characters, and therefore all of the ſame family or kind; ſo that the word uſed as the generical name equally expreſſes every one of them, and ſome other words expreſſive of the peculiar qualities or figures of each are added, in order to denote them ſingly, and make up what is called a ſpecific name.

Thus the word roſa, or roſe, is the generical name of the whole ſeries of flowers of that kind, which are diſtinguiſhed by the ſpecific names of the red roſe, the white roſe, the apple roſe, &c. The ignorance of former ages, in the true principles of natural hiſtory, has occaſioned the bodies, which are the objects of it, to be arranged into very unnatural ſeries under the name of genera; and theſe have been called by names as improper as the characters they were diſtinguiſhed by. Linnæus has done a great deal in exploding the bad generical names in botany, and Artedi has applied his rules about the formation of theſe names with very little difference to the ſubjects of ichthyology.

Many of the generical names of fiſh, till the time of this author, were ſo barbarous and obſcure, that it was not eaſy to trace them to their original, or to find whether they were truly Teutonic, Engliſh, Dutch, Swediſh, French, Italian, Spaniſh, Portugueſe, Latin, or Indian.—The ignorance of the writers on theſe ſubjects, or their too ſcrupulous adherence to the cuſtoms of their predeceſſors, ſeem to have been principally the cauſes of this, and often an entire negligence. Artedi's rules for generical names for fiſh are theſe: whatever fiſh there are which agree in the ſame generical characters, and are properly of the ſame genus, theſe ought all to be called by the ſame generical name, their differences being only expreſſed by ſpecific ones. This appears ſo plain, ſo juſt, and ſo neceſſary a rule, that it is almoſt a ſhame to lay it down; yet the writers on fiſh, till the time of this author, had very ſeldom obſerved it.

Another barbariſm and impropriety in the generical names of fiſh among the old authors, is the uſing of the ſame words to expreſs them, which are alſo the names of other animals, quadrupeds, birds, and reptiles. Theſe are ſubject to great objection; becauſe when they are uſed, it is not eaſy to ſee, in ſome caſes, whether the author is ſpeaking of a bird, a beaſt, or a fiſh. It is therefore one of the general rules of Artedi, that all theſe names are to be aboliſhed, as alſo all thoſe which are common to fiſh, and to plants, minerals, and to the tools of huſbandry, or other ſervices.

Another rule of this excellent author is, that generical names that are compoſed of two whole words, unnaturally tied together, are to be aboliſhed, it being eaſy to contrive names leſs barbarous, and as expreſſive: next to theſe are to be exploded thoſe names which are formed of two generical words before in uſe, the one broken or cut ſhort, the other preſerved entire.

Another general rule in regard to theſe names is, that all ſuch as are not of either Latin or Greek origin, are to be proſcribed and wholly rejected. This rule cuts off a prodigious number of barbarous words, with which we find the books of authors of former ages on theſe ſubjects crowded.

A ſixth rule for the regulating generical names is, that all ſuch are to be aboliſhed as terminate in *oides,* as expreſſing a reſemblance often imaginary, and often alluding to ſomething unknown, or rendered difficult to trace from the changes which the names of other things have undergone ſince the time when it was formed. Theſe words convey no idea of the character of the genus expreſſed by them, except that they are like the other thing alluded to in ſome external, though perhaps not eſſential, character: of this kind are the rhomboides, ſcorpoides, &c.

A ſeventh rule in regard to theſe names is, that all ſuch are to be rejected as are barely diminutives, and terminate in *ulus* or *ula.* Theſe convey no other idea, but that of the fiſh being like ſome other fiſh, only leſs: now bigneſs is no generical character; therefore if this genus, and that referred to, differ only in ſize, they have no generical difference at all; if they do differ otherwiſe, they ſhould be expreſſed. What makes many of theſe names alſo more intolerable is, that they allude not to fiſh, but to other things ſo different in their nature, that there muſt needs be many other more eſſential varieties between them, beſide ſize.

Another general rule is, that ſuch generical names as are pure Latin, but are mere adjectives, are to be exploded, there being no reaſon for uſing them as ſubſtantives.

A ninth general rule is, that ſuch names as are formed of Latin words, unknown to the ancient Romans, and formed by the later writers, are to be expelled as barbarous, and others of better credit placed in their ſtead.

Finally, ſuch generical names as have been given to fiſh from the places where they are caught are to be rejected; of this kind are the ſardella and ſardina from the iſland of Sardinia, and the ſturio from Aſturia, a province of Spain. Theſe ſorts of names can convey no idea of the nature of the fiſh, and may belong as well to one genus as to another. Artedi, Ichthyolog. p. 10. 69. 73. 79.

Theſe rules of proſcription baniſhed ſo many of the received generical names of fiſh, that it might be ſuppoſed the whole number was exhauſted, and all the fiſh in the world to be named anew. But this is not the caſe; the genera are in reality much fewer in number than they have been uſually ſuppoſed, and therefore fewer words will ſerve to expreſs them, and there yet remain many truly Latin words uſed by the ancient Romans, by which the far greater part of the genera may be expreſſed, and the few remaining may be beſt denominated by compound Greek words, expreſſive of their real characters.

Among the true and genuine Latin, and Græco-Latin names of the genera of fiſh, are theſe: accipenſer, amia, anthias, balæna, blennius, clupea, cobites, cyprinus, delphinus, elops, eſox, exocœtus, gobius, labrus, lamia, liparis, mugil, mullus, muræna, perca, phyſeter, priſtis, raja, ſalmo, ſalpa, ſcarus, ſcomber, ſilurus, ſparus, ſqualus, thynnus, torpedo, triton, turſio, uranoſcopus, xiphias, zeus. Theſe will go a great way toward the naming of the true genera. Artedi has merited greatly of the world, in thus reforming the names of fiſh; and the rules he has laid down, thus given at large, may, with little variation, be made to ſerve for any other author, in whatever branch of knowledge he has occaſion to write.

GENERIS SECUNDI. See SECUNDI.

GENEROSA, *a Gentlewoman.* See GENTLEWOMAN and SPINSTER.

GENEROSITY, *Order of*, an order of knighthood, eſtabliſhed in 1685, by Frederick III., elector of Brandenburg and king of Pruſſia, whilſt he was electoral prince. The badge was a gold croſs of eight points enamelled azure, bearing in the centre this inſcription "LA GENÉROSITÉ," and pendent to a blue ribband.

GENESAN, in *Geography*, a town in the Arabian Irak; 90 miles S. of Bagdad.

GENESAR, or GENESARETH, called alſo *Cinereth*, and afterwards *Tiberias*, a town of Paleſtine on the lake of the ſame name, called alſo *Sea of Galilee*, which ſee.

GENESEE, a townſhip of America, in the ſtate of New York, and county of Ontario, having 217 electors.

GENESEE *Country*, a large tract of land in the ſtate of New York, deriving its name from Geneſſee, one of its rivers, and bounded N. and N.W. by lake Ontario, S. by Pennſylvania, E. by the weſtern part of the military townſhips in Onondago county, and W. by lake Erie and Niagara river. This is a rich tract of country, and well watered by lakes and rivers, it is flattiſh, its rivers are ſluggiſh, the ſoil is moiſt, and its lakes are numerous.

GENESEE, or *Geneſſee River*, riſes in Pennſylvania, near the moſt elevated ſpot of this ſtate, where alſo the eaſternmoſt water of Alleghany river, and Pine creek, a water of Suſquehanna, and Tioga river riſe. It has ſeveral falls, which furniſh excellent mill-ſeats, that are improved by the inhabitants. After a courſe of about 100 miles, chiefly N.E. by N., it diſcharges itſelf into lake Ontario, $4\frac{1}{2}$ miles E. of Irondequat, or Rundagut bay, and 80 miles E. from the falls of Niagara. The ſettlements on this river, from its mouth upwards, are Northfield, Northampton, Hartford, Geneſſee, and Williamſburgh. When the weſtern canals and locks are completed, there will not be any carrying place between the city of New York and Williamſburgh. The Geneſee flats lie on the borders of this river, about 20 miles in length and about four in breadth. Theſe are moſtly the property of the Indians.

GENESEE, or *Geneſſee County*, is bounded N. by lake Ontario, W. by Niagara river and lake Erie, S. by Pennſylvania, and E. by the counties of Tioga and Orondago. It comprehends the counties of Ontario, Steuben, and Geneſee, and contained, in the year 1800, upwards of 17,000 perſons. This county is finely watered by the Geneſee river and its tributary ſtreams, ſeveral creeks, and alſo lakes, which are from 20 to 40 miles in length. The ſouthern part is watered by ſeveral branches of the Suſquehanna. This county is large, and comprehends the weſtern part of the ſtate of New York.

GENESIS, in *Biblical Hiſtory*, the firſt book of the Old Teſtament, containing the hiſtory of the creation, and the lives of the firſt patriarchs.

The book of Geneſis ſtands at the head of the *Pentateuch*; which ſee. Its author is held to be Moſes: it contains the relation of 2369 years, *viz.* from the beginning of the world to the death of Joſeph. The Jews are forbid to read the beginning of Geneſis, and the beginning of Ezekiel, before thirty years of age.

The Hebrews called this book *Bereſchith*, becauſe it begins with that word, which in their language ſignifies *in principio*, or *in the beginning* The Greeks gave it the name Geneſis, Γένεσις, *q. d.* production, generation, becauſe it begins with the hiſtory of the production or generation of all beings.

This book, beſides the hiſtory of the creation, contains an account of the original innocence and fall of man; the propagation of mankind; the riſe of religion; the general defection and corruption of the world; the deluge; the reſtoration of the world; the diviſion and peopling of the earth; and the hiſtory of the firſt patriarchs to the death of Joſeph. It was eaſy for Moſes to be ſatisfied of the truth of what he delivers in this book, becauſe it came down to him through a few hands: for from Adam to Noah, there was one man, *viz.* Methuſelah, who lived ſo long as to ſee them both: in like manner Shem converſed with Noah and Abraham; Iſaac with Abraham and Joſeph, from whom the records of this book might eaſily be conveyed to Moſes by Amram, who was contemporary with Joſeph.—Patrick.

GENESIS, in *Geometry*, denotes the formation of a line, plane, or ſolid, by the motion or flux of a point, line, or ſurface. See each reſpectively; alſo FLUXION and CURVE, and GENERATION.

The geneſis, or formation, *e. gr.* of a globe or ſphere, is conceived by ſuppoſing a ſemi-circle to revolve upon a right line, drawn from one extreme thereof to the other, called its axis, or axis of circumvolution: the motion or revolution of that ſemi-circle is the geneſis of the ſphere, &c. See Globe and Sphere.

In the geneſis of figures, &c. the line or ſurface that moves, is called the deſcribent; and the line round which, or according to which, the revolution or motion is made, the dirigent.

GENEST, Charles-Claude, in *Biography*, was born at Paris in 1639. Being of an unſettled diſpoſition, he reſolved to go to the Indies to ſeek his fortune, but the veſſel in which he ſailed having been captured by the Engliſh, he was brought to London, where he ſubſiſted for ſome time by teaching the French language. On his return to his own country, he obtained the poſt of preceptor to Mademoiſelle de Blois, afterwards ducheſs of Orleans, and other conſiderable offices among the great. He became a member of the French academy in 1698, and died at Paris in 1719. Though a courtier, he was ſincere and ſimple in his manners, and eſtimable in his character. He derived a taſte for natural philoſophy from the lectures of Rohault, the diſciple of Deſcartes, and for metaphyſics from the inſtructions and converſation of Boſſuet. He was an elegant ſcholar, and greatly devoted to poetry and polite literature. His works are numerous, of which the principal are "Principes de Philoſophie," in which the author adduces many arguments in defence of a God, and of the immortality of the ſoul. "Occaſional Pieces of Poetry." Several tragedies, and "A diſſertation upon Paſtorals." Moreri.

GENEST-DAMBIERRE, St. in *Geography*, a town of France, in the department of the Vienne; ſeven miles W. of Châtellerault.

GENEST-MALLISAUT, St. a town of France, in the department of the Loire, and chief place of a canton in the diſtrict of St. Etienne; four miles S. of St. Etienne. The place contains 1987, and the canton 5648 inhabitants, on a territory of 150 kiliometres, in five communes.

GENET, Francis, in *Biography*, was born at Avignon in the year 1640; here he received his grammatical learning, and having acquired a conſiderable knowledge in the Latin and Greek, he entered upon philoſophy, and was for a time a diſciple of Scotus, but he afterwards relinquiſhed his ſyſtem, and became zealouſly attached to the philoſophy and theology of Aquinas. In 1670, he was admitted to the degree of doctor in civil and canon law at Avignon, and acquired much reputation by the theſes, which he delivered on that occaſion, againſt ſimony. His talents recommended him to the notice of the archbiſhop of Aix, who for ſome time made uſe of him in the management of the eccleſiaſtical concerns of his metropolitan diſtrict. He was afterwards employed and patronized by M. Le Camus, biſhop of Grenoble, who engaged him in the compoſition of a ſyſtem of moral theology, which was afterwards publiſhed in ſix volumes 12mo. under the title of "Morale de Grenoble." This work was well received, has gone through many editions, and has been tranſlated into the Latin language. Soon after its publication, the pope, Innocent XI. created M. Genet canon and prebend of the cathedral church at Avignon, and in 1685 appointed him biſhop of Vaiſon. He diſcharged all the duties of his epiſcopal functions with exemplary watchfulneſs and zeal, till the year 1688, when he was proſecuted for having admitted into his dioceſe the religious belonging to a new convent at Toulouſe, which Louis XIV. had ſuppreſſed. By the arbitrary mandate of the king, the good biſhop was arreſted, and impriſoned for fifteen months in the iſle of Rhe, whence he was releaſed by the interpoſition of the pope. He was accidentally drowned in 1702. Moreri.

Genet, or *Jennet*, ſaid to be derived from ευγενης, *bene natus*, in the *Manege*, &c. a ſmall-ſized, well-proportioned Spaniſh horſe.

Some alſo give the name *geneta* to well-made Italian horſes.

Genet, *Order of*, an order of knighthood, inſtituted in France by Charles Martel in the year 726, for commemorating a ſignal victory, which he obtained in that year over the Arabian army, commanded by Abdiramo. The badge of the order was a genet ſeiant, enamelled azure, ſpotted or freckled gules, and collared or, on a mount vert, enamelled with flowers proper. This badge was worn pendent to a collar compoſed of three chains of gold interlaced with red enamelled roſes. This order was inſtituted for ſixteen knights, and continued in great repute till the reign of king Robert, when it was aboliſhed on his deviſing the order of the ſtar, in honour of the holy virgin.

GENETHLIA, Γενεθλιον, in *Antiquity*, a ſolemnity kept in memory of ſome perſon deceaſed.

GENETHLIACI, formed of the Greek γενεθλη, *origin, generation, nativity*, in *Aſtrology*, perſons who erect horoſcopes, or pretend to foretel what ſhall befal a man, by means of the ſtars which preſided at his nativity.

The ancients called them *Chaldæi*, and by the general name *mathematici*: accordingly, the ſeveral civil and canon laws, which we find made againſt the mathematicians, only reſpect the genethliaci, or aſtrologers.

They were expelled Rome by a formal decree of the ſenate; and yet found ſo much protection from the credulity of the people, that they remained therein unmoleſted. Hence an ancient author ſpeaks of them as "hominum genus, quod in civitate noſtra ſemper & vetabitur, & retinebitur."

Antipater and Archinapolus have ſhewn, that genethliology ſhould rather be founded on the time of the conception than on that of the birth. Vitruvius.

GENETHLIACUM, Genethliac *Poem*, is a compoſition in verſe, on the birth of ſome prince, or other illuſtrious perſon; wherein the poet promiſes him great honours, advantages, ſucceſſes, victories, &c. by a kind of prophecy or prediction: ſuch is the eclogue of Virgil to Pollio, beginning,

"Sicelides Muſæ, paulo majora canamus."

There are alſo genethliac ſpeeches or orations, made to celebrate a perſon's birth-day.

GENETIDES, in *Natural Hiſtory*, a name given by the ancients to the ſtone more generally known under the name enchymonites. This was the ſpar incruſted on the tops and ſides of ſubterranean caverns, which they ſuppoſed daily to bring forth more, and therefore gave the powder of it to women at the time of their lying-in, to promote their ſpeedy delivery.

GENETTA, *To ride à la*, is to ride in the Spaniſh faſhion, *i.e.* with the ſtirrups ſo ſhort, that the ſpurs bear upon the flanks of the horſe. This is deemed a piece of gallantry in Spain, but not among us.

Genetta, in *Zoology*, a ſpecies of *Viverra*, which ſee.

GENETTE, in the *Manege*, a Turkiſh bit, the curb of which is all of one piece, and made like a large ring, and placed above the liberty of the tongue. When they bridle a horſe, they make his chin paſs through this curb, which ſurrounds his beard. This ſort of bit was much uſed at the court of France when Guillet wrote.

GENETYLLIS, Γενετυλλις, in *Antiquity*, a ſolemnity celebrated by women, in honour of Genetyllis, the goddeſs of that ſex.

GENEVA, or Gin, a popular name for a compound water, which is, or ought to be, procured from the berries of the juniper-tree, diſtilled with brandy or malt-ſpirits. See Juniperus.

The word is formed from *genevre*, the French name of the juniper-berry.

The beſt geneva we now have, is made from an ordinary ſpirit, diſtilled a ſecond time with an addition of ſome juniper berries; but the original liquor of this kind was prepared in a very different manner. It was a cuſtom in the diſtilling of ſpirits from wort, or other fermented liquors, to add in the working ſome aromatic ingredient, ſuch as ginger, cortex Winteranus, or grains of paradiſe, to take off the bad flavour, and to give a pungent taſte to the ſpirit. Among other things uſed with this intent, ſome tried the juniper-berries, and finding that they gave not only an agreeable flavour, but very valuable virtues alſo to the ſpirit, [illegible] brought it to a general cuſtom, and the liquor ſold [illegible] the name. The method of adding the berries was to the malt in the grinding: a proper proportion was allowed, and the whole was reduced to meal together, and worked in the common way. The ſpirit thus obtained was flavoured *ab origine* with the berries, and exceeded all that could be made by any other method. Our common diſtillers leave out the juniper-berries entirely from the liquor they now make and ſell under that name. Our chemiſts have let them into the ſecret, that the oil of juniper-berries, and that of turpentine, are very much alike in flavour, though not in price: and the common method of making what is called geneva in London, is with common malt ſpirit, and a proper quantity of oil of turpentine diſtilled together. Shaw's Eſſay on Diſtill. p. 7. See Distiller.

Geneva, in *Geography*, a city of France (ſince the revolution), principal place of a diſtrict, and capital of the department Leman, but formerly capital of a republic, in alliance with the Swiſs; ſituated on the confines of Savoy, France, and Switzerland, at the ſouthern extremity of the "lake of Geneva," or "Leman lake," upon the narroweſt part of it; where the Rhone iſſues in two large and rapid ſtreams, which ſoon afterwards unite, and, paſſing through the city, divides it into two unequal parts. The adjacent country is uncommonly pictureſque, and abounds in magnificent views, formed by the town, the lake, the numerous hills and mountains, particularly the Saleve and the Mole, riſing ſuddenly from the plain in a variety of fantaſtic forms, backed by the glaciers of Savoy, with their frozen tops gliſtening in the ſun, and the majeſtic Mont Blanc rearing its head far above the reſt. Geneva, which ſtands partly in the plain, upon the borders of the lake, and partly upon a gentle aſcent, is irregularly built: the houſes are high, and many in the trading part of the city have arcades of wood, which are raiſed even to the upper ſtories. Theſe arcades, ſupported by pillars, give a gloomy appearance to the ſtreet, but are uſeful to the inhabitants in protecting them from the ſun and rain. This is the moſt populous town in Switzerland; and the inhabitants are eſtimated to be from 23,000 to 25,000. This population is owing to the induſtry and activity that prevail in this place, to its extenſive commerce, to the facility of purchaſing the burgherſhip, and to the privileges which the government allows to all foreigners. The members of this city are diſtinguiſhed into citizens and burgeſſes, inhabitants and natives, beſides a fifth claſs, eſtabliſhed after the revolution in 1782, and called "domiciliés," who receive from the magiſtrates an annual permiſſion to reſide in the city. The citizens and burgeſſes were, under the old police, admitted to a ſhare in the government; the inhabitants are ſtrangers allowed to ſettle in the town with certain privileges, and the natives are the ſons of theſe inhabitants, who poſſeſs additional advantages: theſe two laſt claſſes form a large majority of the people.

The liberal policy of this government, in receiving ſtrangers, and conferring the burgherſhip, is the more remarkable, as it is contrary to the ſpirit and uſage of the Swiſs. Here it is peculiarly neceſſary; as the territory of this ſtate is ſo very ſmall, that its very exiſtence depends upon the number and induſtry of the people; for, excluſively of the city, there are ſcarcely 16,000 perſons in the whole diſtrict of the Genevois.

Geneva boaſts, and not without reaſon, of its antiquity. The preciſe time of its commencement is not known; but it exiſted before the Chriſtian era, and is particularly mentioned by Cæſar. (De Bell. Gall. l. i. c. 1.) It belonged to the Allobroges (ſee this article), and flouriſhed under the ſucceſſors of Cæſar. The Chriſtian religion was introduced among the Genevans in the third century, and about the middle of the 4th century Geneva appears to have been the ſee of a biſhop. It ſuffered, however, in a conſiderable degree, and in common with other parts of the weſtern empire, from the incurſions and ravages of the northern barbarians. About the middle of the fifth century the Vandals, who, having ſettled in the country of Vaud, and built ſeveral boroughs, aſſumed the name of Bourguignons, or, according to modern orthography, Burgundians, had poſſeſſion of it; and in the year 620, it was transferred to the Franks. Towards the end of the 8th century, Charlemagne convened an aſſembly of his ſtates at Geneva, to conſult about a war with the Lombards, and confirmed both the civil and religious privileges of this city. In the year 1032, it was annexed to the German empire; but the authority of the emperor was little regarded in diſtant provinces, and they found it expedient to protect aſſociations of the common people, and to enlarge their liberty, in order to counteract the tyranny of the lords and clergy. In proceſs of time, the clergy acquired a great degree of ſecular power and juriſdiction in connection with their ſpiritual authority: and thus the biſhops of Geneva had obtained of the emperor the title of princes and ſovereigns over the town and the adjacent country. On the other hand, the counts of the Genevois, or of the diſtrict in the vicinity of Geneva, who were originally officers of the empire, though afterwards they became vaſſals of the biſhops, aſpired to an excluſive adminiſtration of juſtice both in the town and the country. The people availed themſelves of the conteſt between their ſuperiors in rank and power to confirm and extend their own privileges. In the mean time, the liberty of the city was menaced by a third power, no leſs formidable than either of the other two. The counts of Savoy became powerful by the ſucceſſive poſſeſſion of ſeveral provinces; and among the reſt the Genevois favoured the pretenſions of the ancient counts, and aſpired to the ſovereignty of a flouriſhing town, which was alſo a convenient and ſtrong frontier.

It would not be very intereſting to recite, in minute detail, the conteſts that were from time to time renewed between the Geneveſe and the counts of Savoy. We ſhall content ourſelves with obſerving that in the year 1415, the emperor Sigiſmund viſited Geneva, and that two years afterwards he erected Savoy into a dukedom in favour of Amadeus, the 8th count, who, in the year 1420, petitioned the pope for the ſovereignty of the city. The duke's ſuit was referred by the pope to the biſhop, who ſummoned a general aſſembly of the people, to deliberate upon the duke's requeſt, which had obtained the approbation of the pope. The inhabitants unanimouſly rejected it, and at the ſame time required the biſhop to be true to his charge, aſſuring him of their concurrence in maintaining his juſt rights, and thoſe of the city. This noble ſpirit encouraged the biſhop, and produced a moſt excellent act in favour of liberty; for he entered into a formal agreement with the people and the ſyndics, never to alter the conſtitution without their conſent. This act, having been engroſſed in Latin, and the obſervance of it ſworn to by the biſhop, the ſyndics, and the council, was ſubſcribed by all the magiſtrates, commonalty, and clergy of Geneva; and in the following year was confirmed by the emperor Sigiſmund, who declared Geneva to be an imperial city, under the title of "Nobile Imperii Membrani," and took it into his immediate protection againſt all powers, the duke of Savoy in particular. The Geneveſe, however, maintained their liberties againſt the repeated attacks made upon them by the dukes of Savoy under very great diſadvantages. Nevertheleſs, they perſevered till about the beginning of the 16th century, when an alliance was entered into between Geneva and Friburg, the conteſt continued, and was the occaſion of many acts of oppreſſion and perſecution. When the treaty was concluded, in conſequence of the active interference of a young citizen of Geneva, named Berthelier, two parties aroſe in Geneva, one of which retained an attachment to the intereſt of the duke of Savoy, and the other declared itſelf on the ſide of liberty. Thoſe of the latter deſcription were called "Eignots," which in Swiſs, or High German, ſignifies "confederates by oath," and from which the term "Hugonots" is probably derived; whilſt thoſe of the former were denominated "Mamalukes," in reference to the Egyptian ſoldiery, who being originally Chriſtians, renounced both their religion and liberty, to become ſlaves to the ſultan. The duke, irritated by this conduct, entered Geneva with an armed force, and compelled the people to renounce their new alliance, whilſt he perſuaded Friburg to withdraw from the treaty, promiſing not to injure the liberties of the Geneveſe. Berthelier, the Genevan patriot, was however ſacrificed to his vengeance, and the magiſtrates of the city were depoſed by the biſhop. In the year 1526, a new alliance was formed between the towns of Bern, Friburg, and Geneva, which the duke of Savoy was not able to prevent, and occaſioned wars of long continuance between the republic and Savoy. This alliance was confirmed by the biſhop; and may be conſidered as the true era of the independence of Geneva. Soon after this period, *viz.* in 1533, the doctrines of the reformation were preached at Geneva by William Farel, a native of Gap in Dauphiné, and Peter Viret, of Orbe; and the people, animated by the enthuſiaſm of liberty, determined to emancipate themſelves from the yoke of bondage, both eccleſiaſtical and civil. The biſhop, who had always acted a weak and deceitful part, became deſpicable both to the Geneveſe and to the duke; and by his imprudent menaces and precipitate retreat, ſerved to ſtrengthen the cauſe of the reformation. In 1535, the doctrines of the reformation were adopted in full council; and in conſequence of this deciſion, the canton of Friburg renounced the alliance. In the following year, the famous John Calvin, driven from France by perſecution, arrived at Geneva, and completed the reformation, that had been already begun by Farel and others. So great was the aſcendancy which Calvin, though a foreigner, acquired over the citizens, that he poſſeſſed conſiderable influence even in civil matters; and was eminently inſtrumental in ſettling the political conſtitution. To this end, as well as to encourage theological erudition, he prevailed upon government to eſtabliſh a public academy, the preſidentſhip of which he obtained for his friend and fellow labourer, Theodore Beza. In this new ſeminary, Calvin, Beza, and others, eminent for their ſuperior knowledge, read lectures with ſuch uncommon reputation and ſucceſs, as attracted ſtudents from all quarters. It had alſo a public library, which owed its origin about this period to the liberality of Bonnivard, prior of St. Victor, who was twice impriſoned for having aſſerted, againſt the dukes of Savoy, the independence of Geneva. He was a principal promoter of the reformation by gentle means and gradual inſtruction. He cloſed his benefactions to his beloved city, by the gift of his valuable manuſcripts and books, and by bequeathing his fortune towards the eſtabliſhment and ſupport of the ſeminary. Geneva was now regarded as the aſylum of the reformed religion: and by the acceſſion of perſecuted proteſtants from other cities and countries, its arts and commerce flouriſhed, and its population increaſed.

In 1584, Geneva concluded a treaty of perpetual alliance with Zuric and Bern, by which it formed a part of the Helvetic confederacy. The laſt attempt of the houſe of Savoy againſt Geneva took place in 1602, when Charles Emanuel attacked the town during a profound peace. The inhabitants, however, nobly defended themſelves, repulſed the enemy, and obliged him to abandon his treacherous deſign. This perfidious attack was followed by a war, which was terminated in the following year by a ſolemn treaty. Since that period, uninterrupted peace has been maintained between Geneva and the duke of Savoy; although the king of Sardinia did not, till the year 1754, formally acknowledge the independence of the republic. From that period, the hiſtory of Geneva contains little more than a narrative of contentions between the ariſtocratical and popular parties. The conſtitution of Geneva, which had then been eſtabliſhed, and which continued for ſeveral years, under a certain modification and improvement of the year 1768, was a kind of mean between thoſe of the ariſtocratical and popular cantons; more democratical than any of the former, as the ſovereign and legiſlative authority were veſted in the general aſſembly of the citizens; but more ariſtocratical than the other, becauſe the powers entruſted with the great and little councils were very conſiderable. The ſalaries of the magiſtrates were ſo inconſiderable, as not to offer any temptation of pecuniary emolument; and the revenues of government, at the higheſt calculation, generally amounted to 30,000 pounds a year. Their conſtitution, indeed, was defective, as they had no preciſe code of penal law; but that of civil law was the moſt perfect part of their government. In Geneva, as well as in all the other principal towns of Switzerland, a public granary was eſtabliſhed, and they had always in reſerve a ſufficient quantity of corn to ſupply the inhabitants during a year and a half. Geneva was the only republic in Switzerland which had no regular companies of ſoldiers in any foreign ſervice. Geneva was always more or leſs diſtracted by internal diſſenſions and tumults. In 1782, theſe had prevailed to ſuch a degree, that the kings of France and Sardinia, together with the canton of Bern, interfered, and threatened to beſiege the city. The peaſants of the territory joined the Geneveſe, and offered to ſerve in their cauſe without pay, to mount guard, and work at the fortifications. M. de Jaucourt, the commander of the French troops, threatened, in caſe of reſiſtance, to enter the town by force, and inſiſted that no perſon ſhould appear in the ſtreets, that all arms ſhould be delivered up, and that the chief of the "repreſentants," as the popular party was called, ſhould retire from Geneva, and that the depoſed magiſtrates ſhould be reinſtated. Reſiſtance in theſe circumſtances muſt have been altogether unavailing, and muſt, indeed, have terminated in the deſtruction of the city. The repreſentants, therefore, reſtored the confined magiſtrates to liberty, and left the city in a body. The Sardinians, who firſt entered the gates, found the city almoſt deſerted; and ſoon after the two other commanders made their entry at the head of their reſpective troops, with drums beating and colours flying. The ariſtocratical party celebrated their triumph with balls, feaſts and every ſpecies of public diverſion. A committee, appointed by the great and little councils, prepared, in concert with the three generals, an edict for new modelling the conſtitution, which, being approved at the courts of Verſailles and Turin, and by the canton of Bern, was confirmed by the great and little councils. Much as the Genevans ſeemed to deplore the conſequences of this revolution, the change that was made in their conſtitution, and the diminution of that liberty to which they had been accuſtomed, and to which they aſcribed the increaſe of their population and riches, the ferment ſoon ſubſided: and excepting the principal leaders, thoſe of the popular party who were baniſhed, and ſome few others who renounced their country under the influence of their political principles, the greater number of the emigrants returned, and again ſettled in the place of their nativity. According to Mr. Coxe, this revolution cauſed ſcarcely 600 perſons to leave Geneva. The emigrants principally eſtabliſhed themſelves at Bruſſels and Conſtance; where they introduced manufactures of linen and of watches. A plan was alſo formed for giving an aſylum to the Genevan emigrants in Ireland. (See *New* Geneva.) The form of government eſtabliſhed in 1782 underwent another very conſiderable change in conſequence of the revolution in 1789. The ariſtocratical party was obliged to yield, on this occaſion, to the tumultuous demands of the people; and when the ſolicitor-general, in the name of the citizens and burghers, requeſted the recovery of their ancient liberties, the permiſſion of bearing arms, the re-eſtabliſhment of the militia, and of their circles or political clubs, the removal of the garriſon from the barracks, and the recal of the repreſentants baniſhed in 1782; ſuch moderate demands were received with ſatisfaction; and the new edict of pacification, under the title of "Modifications à l'Edit de 1782," was approved by the Senate, Great Council, and General Council. In this latter council, the "Modifications" were carried by 1321 ſuffrages againſt 52. The publication of the new edict was followed by loud acclamations and general rejoicings. This new conſtitution was judiciouſly modelled into a mean between the too popular form eſtabliſhed in 1768, and the too ariſtocratical form eſtabliſhed in 1782. It is natural to imagine that the widely extended influence of the French revolution would very ſoon reach the Genevan republic. Many, ſeduced by the principles of infidelity actively diſſeminated by Voltaire, and faſcinated by the ſyſtem of general equality laid down in the "Social Contract" of Rouſſeau, whom they proudly ſtyled the philoſopher of Geneva, became the apoſtles of irreligion and democracy. Accordingly, a large party was pre-diſpoſed to admit the French doctrines; and in the beginning of 1791, a club, called the "Circle of Light," gave energy and direction to the advocates of general equality. Their efforts were oppoſed by all the friends of the conſtitution, and two parties were again formed, which threatened the renewal of paſt commotions. In this criſis, emiſſaries from France excited an inſurrection among the peaſants of the Genevois, and a large body of them marched towards Geneva, to demand the extenſion of the burgherſhip. Although this firſt hoſtile attempt proved unſucceſsful, the government, apprehenſive of another inſurrection, and anxious to remove every cauſe of complaint, granted additional privileges to the natives, and particularly general admiſſion to the burgherſhip for the ſmall ſum of ſix guineas. (March 1791.) Soon after the abolition of monarchy, the Briſſotine party, in conformity with their plan of ſurrounding France with a chain of petty republics, propoſed to ſeparate Geneva from the Helvetic confederacy, and either form it into a ſmall dependent commonwealth, or incorporate it with the French republic. Although this attempt failed, the independence of Geneva was at length annihilated, and it was incorporated, together with its territory, with the French republic in 1798; and now forms part of the department of *Leman*, (which ſee.) Geneva, according to this new diviſion, comprehends three cantons, 22 communes, on a territory of 125 kilometres, N. lat. 46° 12′ 17″. E. long. 6° 8′ 30″. Mod. Un. Hiſt. vol. xxxii. Coxe's Travels in Switzerland, vol. ii.

Geneva, a poſt-town of America, in the county of Ontario, and ſtate of New York, in the great road from Albany to Niagara, ſituated on the bank of the N.W. corner of Seneca lake, about 74 miles W. of Oneida caſtle, and 92 W. of Whiteſtown. It has nearly 100 houſes. N. lat. 42° 52′. W. long. 74° 6′.

Geneva, *Lake of*, or *Lake of Leman*, a large lake of Switzerland, which ſtretches from Geneva to Villeneuve, being in length 54 miles, in the ſhape of a creſcent; the hollow is formed by Switzerland, and the convex part by Savoy; the greateſt breadth, from St. Sulpice to Grande Rive, is 12 miles. Savoy affords a rude and awful boundary of aſpiring Alps, craggy and covered with ice of long ſtanding. From Geneva to the environs of Lauſanne the country ſlopes for a conſiderable diſtance to the margin of the lake, and is enriched with all the varieties which nature can beſtow: the long ridge of the Jura, fertile in paſturage, and varied with woods, backs this beautiful tract. Near Lauſanne the banks riſe very conſiderably, and form a moſt charming terrace. A few miles beyond is a rapid deſcent. Near Vevay begins a plain, which is continued far beyond the end of the lake, but contracting, by the approach of the mountains, towards the lake. The colour of the water is extremely beautiful, clear, and at a diſtance ſeems of a moſt lovely blue.

Near Geneva the coaſt abounds in ſmall pebbles covered with a brown incruſtation; from thence, as far as Lauſanne, the ſhores are ſandy; between that town and Chillon appear ledges of rocks, hard and calcareous; and the extremity of the lake is a marſh formed by the collected mud of the Rhone. The depth is various; M. De Luc aſſerts, that on ſounding it, he had found the greateſt depth to be 160 fathoms. The ſurface of the lake is ſaid to be 1230 feet, and its deepeſt part 837 feet above the Mediterranean; like all inland lakes encloſed within high mountains, it is ſubject to ſudden ſtorms. The ſkins of the tippet grebes, which appear in December and retire in February, becauſe this lake is almoſt totally deſtitute of reeds and ruſhes, in which they form their floating neſt, are an elegant article of luxury, and ſell for about 12 or 14 ſhillings each. This lake abounds in fiſh, remarkable both for their quality and ſize.

Geneva is alſo a lake in Upper Canada, which forms the weſtern extremity of lake Ontario, to which it is joined by a ſhort and narrow ſtait.

Geneva, *New*, a thriving poſt-town of America, on the bank of the Monongahela river, juſt below George's creek, about 18 miles N. of Morgantown; this town is rendered famous as a place of much buſineſs, partly by the glaſs-works in its vicinity, which not only ſupply the neighbourhood with window-glaſs bottles, &c. but ſend large quantities down the river. Here is alſo a paper-mill, and a manufactory for muſkets. Small boats are alſo built in this place.

Geneva, *New*, a village of the county of Waterford, Ireland, nearly oppoſite to Duncannon fort, where many good houſes were erected ſeveral years ago by government for the reception of the expatriated citizens of Geneva, but they having relinquiſhed the deſign of ſettling in Ireland, the place remains uninhabited.

Soon after the revolution of 1782, a memorial, ſigned by more than 1000 Genevans of both ſexes, who were either perſons of ſome property, or verſed in trade or manufactures, expreſſing a deſire of ſettling in Ireland, was preſented to earl Temple (marquis of Buckingham) then the lord-lieutenant of Ireland. His excellency, apprized of the advantage which would redound to Ireland from the reception of ſo many induſtrious artiſts, many of whom poſſeſſed property in the Engliſh, Iriſh, and French funds, communicated, in September 1782, the propoſal to the privy-council of Ireland for giving an aſylum to the Genevan emigrants. This propoſal, patronized by the lord-lieutenant, and unanimouſly conſented to by the privy-council, was approved by the king. The Iriſh parliament voted 50,000*l.* towards defraying the expences of their journey, and building a town for their reception; lands were purchaſed for 8000*l.* and part of the town was actually completed at the expence of 10,000*l.*; a charter was granted, with very conſiderable privileges; the ſtandard of gold was altered for the accommodation of the new manufacturers; the foundation of an academy, approved, upon an uſeful, extenſive, and economical plan; in July 1783, ſeveral Genevans landed in Ireland; and when the nation had expended near 30,000*l.* the project was ſuddenly relinquiſhed, and the ſettlement finally abandoned. The failure has been attributed to delays in the arrangement of ſo complicated a plan, occaſioned by the high demands of the Genevan commiſſioners, who, in preparing the charter, required many privileges, that were contradictory to the laws of the land, and by the building of New Geneva. In conſequence of theſe delays, and the reſentment of the Genevans, many returned and took the oaths of allegiance to the new government. The project became gradually leſs popular; the few Genevans, who prematurely landed in Ireland, were diſcontented, at not finding the new town ready for their immediate reception; and the emigrants who poſſeſſed moſt property, having withdrawn their names, the reſt wanted ſufficient capital to ſettle in a foreign country, and to eſtabliſh an extenſive manufacture without ſtill farther aſſiſtance. In conſequence of this deficiency, the Genevan commiſſioners petitioned to appropriate 10,000*l.* of the 50,000*l.* for the purpoſe of forming a capital. But, as that ſum had been voted by parliament for other purpoſes, the petition was rejected; and the Genevans, in an addreſs to the duke of Rutland, who ſucceeded lord Temple as lord-lieutenant, relinquiſhed the ſettlement, and ſoon afterwards quitted Ireland.

GENEVIEVE, St., a town of France, in the department of Paris; 6 miles W. of Paris.—Alſo, a town of France, in the department of the Aveiron, and chief place of a canton, in the diſtrict of Eſpalion; 27 miles N. of Rhodez. The town contains 1241, and the canton 6077 inhabitants, on a territory of 175 kiliometres, in 17 communes.—Alſo, a town, or village, of America, in Louiſiana, on the weſtern bank of the Miſſiſippi, 12 miles ſoutherly of fort Chartres. It contained, ſome years ago, more than 100 houſes, and 460 inhabitants, beſides negroes. N. lat. 37° 35'. W. long. 90° 44'.—Alſo, a town of Canada, on the Batiſcan. N. lat. 46° 38'. W. long. 72° 14'.

Genevieve, *St. Genevieve*, or *St. Genevieſve*, fathers or religious of St. Genevieve, the name of a congregation of regular canons of the order of St. Auguſtine, eſtabliſhed in France.

The congregation of St. Genevieve is a reform of the Auguſtine canons. It was begun by St. Charles Faure, in the abbey of St. Vincent de Senlis, whereof he was a member, in the year 1618.

In the year 1634, the abbey was made elective; and a general chapter, compoſed of the ſuperiors of fifteen houſes who had now received the reform, choſe F. Faure coadjutor of the abbey of St. Genevieve, and general of the whole congregation. Such was its beginning.

It has ſince increaſed very much, and has conſiſted of above a hundred monaſteries; in ſome of which the religious are employed in the adminiſtration of the pariſhes and hoſpitals; and in others, in the celebration of divine ſervice, and the inſtruction of eccleſiaſtics in ſeminaries for the purpoſe.

The congregation takes its name from the abbey of St. Genevieve, which is the chief of the order, and whoſe abbot is the general of it. The abbey itſelf took its name from St. Genevieve, the patroneſs of the city of Paris, who died in the year 512. Five years after her death, Clovis erected the church of St. Genevieve, under the name and invocation of St. Peter, where her relics have been preſerved, her ſhrine viſited, and her image carried with great proceſſions and ceremonies, upon extraordinary occaſions, as when ſome great favour is to be intreated of heaven.

Genevieve *Bay*, in *Geography*, a bay on the W. coaſt of Newfoundland, in the ſtraits of Belleiſle; 20 miles N. of St. John's bay.

GENEVOIS, or Duchy *of* Geneva, a province of Savoy, bounded on the N. by the Swiſs territories, on the E. by Faucigny, on the S. by Savoy Proper, and on the W. by France, from which it is ſeparated by the Rhône. Geneva and its territory formerly made a part of it. It is now annexed to France.

GENEVRAY, a town of France, in the department of the Iſere; 10 miles S. of Grenoble.

GENEURO, a mountain which divides Piedmont from the ancient Dauphiny, in the road from Briançon to Suſa.

GENGA, Girolamo, in *Biography*, a painter of very conſiderable celebrity in his day. He flouriſhed at the early period of the revival of the art, being born at Urbino in 1476. At the age of 15 he ſtudied under Luca Signorelli of Cortona, then in great eſteem, and aſſiſted his maſter in moſt of his undertakings in different parts of Italy, but particularly at Orvieto, being acknowledged the beſt diſciple of that ſchool. He afterwards ſpent three years with Pietro Perugino, at the ſame time that Raphael was under the tuition of that artiſt; and that intercourſe laid the foundation of a moſt cordial friendſhip between Raphael and Genga, which never was impaired.

He was highly encouraged by Guido-Baldo II., and his ſucceſſor, Franceſco Maria III., dukes of Urbino, in their palaces and theatres, and in deſigning triumphal arches. In Rome, Sienna, Forli, Peſaro, and many other places, he left behind him an incalculable number of works, both in painting and architecture, which were held in great eſteem, and which procured him honour and riches. He died of a fever in 1551, aged 75, leaving two ſons, one of whom, Bartolomeo, followed the profeſſion of his father in the ſame ſtyle, and was moreover an eminent ſtatuary and architect.

Genga, Bernardin, a doctor in philoſophy and medicine, was born in the duchy of Urbin. He was a teacher of anatomy and ſurgery at Rome about the middle of the 17th century; and, according to Mangetus, ſurgeon to the hoſpital of the Holy Ghoſt in that city. He was a man of firm underſtanding, and maintained the doctrine of the circulation of the blood, when it was not generally admitted in Italy; but he attributed the diſcovery of it to Paul Sarpi, He alſo ventured to accuſe Hippocrates of committing ſuch errors, in the cure of ſeveral ſurgical diſeaſes, as would not be pardoned in a ſtudent. His works are, 1. "Anatomia Chirurgica;" or "Iſtoria dell' oſſa e muſcoli del corpo umano, con la deſcrizzione de' vaſi;" Rome, 1675, 1687. 2. "Anatomia per uſo ed intelligenza del deſigno;" Rome, 1691. This work contains ſome good figures of the ancient ſtatues. Genga prepared the bodies, by diſpoſing the bones and muſcles in the forced attitudes of the gladiators in their combats: and Lanciſi added explanations of the figures. 3. "Commentaria Latina et Italica ad Hippocratis Aphoriſmos, ad Chirurgiam pertinentia;" Rome, 1694, 8vo. Bonon. 1697, 8vo. Eloy.

GENGENBACH, in *Geography*, an imperial town of Germany, in the circle of Swabia, ſituated on the Kinzig, in the Ortenau: in this town is an abbey, whoſe prelate was a prince of the empire. Among the indemnities agreed on at Ratiſbon in 1802, this town and abbey were given to the margrave of Baden; 15 miles S.E. of Straſburg. N. lat. 48° 27′. E. long. 8° 1′.

GENGOU-LE-ROYAL, St., a town of France, in the department of the Saône and Loire; celebrated for its wine; 11 miles N. of Cluny.

GENIAL, Genialis, an epithet applied by the ancients to certain deities, whom they ſuppoſed to preſide over generation.

They were thus called *a gerendo, from bearing*; or, according to the correction of Scaliger and Voſſius, *a genendo, to yean, produce*: yet Feſtus ſays, that they were alſo called *geruli*, which ſeems to require the former reading. M. Dacier, in a note, ſhews that *genere* has the ſenſe of πράττειν.

Among the genial gods, *dii geniales*, ſays Feſtus, were water, earth, fire, and air, which the Greeks called *elements*. The twelve ſigns were ſometimes alſo ranked in the number; as alſo the ſun and moon.

GENICULATUS, Culmus, in *Botany*, a ſtraw bent like the knee, as in *Alopecurus geniculatus*; ſee Culmus; and Caulis, n. 19.

GENICULI, the joints or knots which appear in the ſhoots of plants; whence botaniſts call thoſe marked therewith geniculate plants.

GENIE. See Genius.

GENIES, St., in *Geography*, a town of France, in the department of the Aveiron, and chief place of a canton, in the diſtrict of Eſpalion; 18 miles E.N.E. of Rhodez. N. lat. 44° 28′. E. long. 3° 3′. The place contains 3333, and the canton 7988 inhabitants, on a territory of 202½ kiliometres, in 8 communes.—Alſo, a town of France, in the department of the Gard; 9 miles N.W. of Niſmes.—Alſo, a town of France, in the department of the Lower Alps; 6 miles N.E. of Siſteron.

GENII, in *Mythology*. See Genius.

GENILLE, in *Geography*, a town of France, in the department of the Indre and Loire; 3 miles N. of Loches.

GENIO-GLOSSUS, in *Anatomy*, (from γενειον, the *chin*, and γλωσσα, the *tongue*,) a large muſcle belonging to the tongue. See Deglutition.

GENIO-HYOIDEUS, from γενειον, the *chin*, and υοειδης, an epithet given to the bone of the tongue, is a muſcle belonging to the os hyoides. See Deglutition.

GENIO-PHARYNGEUS, from γενειον and φαρυγξ, a name given by Winſlow to a particular ſlip of the conſtrictor pharyngis ſuperior.

GENIOSTOMA, in *Botany*, from γενειον, a *beard*, and στομα, the *mouth*, becauſe the orifice of the flower is beſet with a denſe fringe. Forſt. Gen. t. 12. Schreb. 131. Willd. Sp. Pl. v. 1. 998. Mart. Mill. Dict. v. 2. Juſſ. 420. Lamarck Illuſtr. t. 133, merely copied from Forſter.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. "uncertain," Juſſ. *Apocineæ?*

Gen. Ch. *Cal.* Perianth inferior, turbinate, permanent, with five acute ſegments. *Cor.* of one petal, funnel-ſhaped; tube dilated upwards, longer than the calyx, its orifice bearded; limb ſpreading, in five deep, ovate, rather pointed ſegments, as long as the tube. *Stam.* Filaments five, ſhort, in the tube of the corolla; anthers oblong, prominent. *Piſt.* Germen ſuperior, ovate; ſtyle thread-ſhaped, longer than the tube; ſtigma cylindrical, obtuſe, furrowed. *Peric.* Capſule? oblong, of two cells. *Seeds* numerous, ſomewhat angular, ranged along a thread-ſhaped receptacle.

Eſſ. Ch. Corolla funnel-ſhaped, bearded at the mouth. Calyx inferior, with five ſegments. Stigma cylindrical, abrupt, furrowed. *Pericarp* of two cells, with many ſeeds.

1. G. *rupeſtris*. Forſt. Prod. 17. Native of rocky places in the iſland of Tanna. *Stem* ſhrubby, climbing without tendrils, branched in an oppoſite manner, round, with a ſmooth grey bark. *Leaves* oppoſite, about three inches long, elliptic-lanceolate, pointed, entire, ſlightly wavy, ſmooth, opaque, with one rib, and a few remote, curved, interbranching veins. *Footſtalks* ſlender, ſmooth, channelled, half an inch long. *Stipulas* intrafoliaceous, united, ſhort, acute, rather membranous. *Flowers* ſmall, in ſolitary, forked, oppoſite, ſomewhat downy, axillary panicles, rather longer than the footſtalks. *Bracteas* ſhort, acute, united at their baſe, in pairs under each fork of the panicle. *Calyx* minutely fringed. *Corolla* apparently reddiſh.—From one of Forſter's own dried ſpecimens. Juſſieu probably never ſaw the plant, or we think he would have referred it to his *Apocineæ*. No figure has been publiſhed, except of the fructification.

GENIPA. (See Gardenia.) The name is barbarous, of Weſt Indian origin, and appears to be ſometimes called *Genipat*. See Tournefort, 658.

GENIPABU, in *Geography*, a river of Braſil, which runs into the Atlantic, S. lat. 5° 35′. W. long. 34° 46′.

GENIS, St. a town of France, in the department of the Lower Charente, and chief place of a canton, in the diſtrict of Jonſac; 24 miles S. of Saintes. The place contains 862, and the canton 12,600 inhabitants, on a territory of 212½ kiliometres, in 17 communes.—Alſo, a town of France, in the department of Mont Blanc, and chief place of a canton, in the diſtrict of Chambery, near the conflux of the Rhône and Guiers; 15 miles W. of Chambery. The place contains 1550, and the canton 7960 inhabitants, on a territory of 112½ kiliometres, in 12 communes.

Genis *la Val, St.* a town of France, in the department of the Rhône, and chief place of a canton, in the diſtrict of Lyons; 4 miles S. of Lyons. The place contains 2400, and the canton 15,522 inhabitants, on a territory of 97½ kiliometres, in 10 communes.

GENISTA, in *Botany*, Green-weed, or Dwarf Broom. The etymology ſeems not very clear, either from *genu*, a knee, in alluſion to the bending of the twigs, or from *geno*, to produce, becauſe it grows wild in abundance; yet ſuch are propoſed by the learned, and we have no better to offer. Linn. Gen. 368. Schreb. 488. Willd. Sp. Pl. v. 3. 936. Sm. Fl. Brit. 754. Mart. Mill. Dict. v. 2. Juſſ. 353. Lamarck Illuſtr. t. 619. Gærtn. t. 151. Claſs and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, ſmall, tubular, two-lipped; the upper lip with two teeth, more deeply divided; lower with three nearly equal teeth. *Cor.* papilionaceous: ſtandard oblong, remote from the keel, entirely reflexed; wings oblong, lax, ſhorter than the other petals; keel ſtraight, emarginate, longer than the ſtandard. *Stam.* Filaments ten, all united, emerging from the keel; anthers ſimple. *Piſt.* Germen oblong, enveloped by the common filament; ſtyle ſimple, directed upwards; ſtigma acute, involute. *Peric.* Legume roundiſh or oblong, turgid, of one cell and two valves. *Seeds* ſeveral, moſtly kidney-ſhaped, with a ſmooth elevated border round the ſcar.

Eſſ. Ch. Calyx two-lipped, the upper lip with two teeth, lower with three. Standard oblong, bent backwards from the reſt of the flower.

A genus of ſhrubs, almoſt entirely European, with tough angular ſtems and branches, either ternate or ſimple leaves, and yellow flowers. Willdenow has twenty-five ſpecies, eighteen of which are unarmed, the other ſeven furniſhed with ſpines, in many inſtances remarkably compound. The ſpinous ones have all ſimple leaves. Three *Geniſtæ* are natives of Britain.

G. *tinctoria*. Engl. Bot. t. 44. Dyer's Green-weed. So called from its uſe in dyeing yellow, and, with the addition of woad, green. Ray ſays it gives a bitter flavour to the milk of cows that feed upon it.

G. *piloſa*. Engl. Bot. t. 208. Hairy Green-weed. Found only on high ſandy ground about Bury, Suffolk, at the foot of Cader Idris, North Wales, and on ſoap rocks near the Lizard point. It grows quite proſtrate, and is difficult to find except in May, when it flowers copiouſly and forms a rich golden carpet. Mr. Roſe firſt deſcribed this as an Engliſh plant, and figured it in his Introduction to Botany, appendix 452. t. 3.

G. *anglica*. Engl. Bot. t. 132. Needle Green-weed, or Petty Whin. This is our only ſpinous ſpecies, and its ſpines are very conſpicuous, long, ſimple, and ſpreading. *Stem* of humble growth, but nearly erect. *Flowers* not inelegant, turning green when dried. It is frequent on moiſt turfy or ſandy heaths, bloſſoming in May and June.

G. *candicans*, *ſibirica*, *florida*, and *triquetra*, are hardy garden plants, worthy of cultivation for their beauty or ſingularity. The firſt eſpecially has a ſhowy appearance when trained againſt a wall. G. *canarienſis*, and *linifolia*, Curt. Mag. t. 442, are rather greenhouſe ſhrubs, and the latter is very elegant on account of its ſilky ſilvery leaves. It grows in Switzerland as well as in Spain, but like many other alpine plants, does not well bear our winters.

Geniſta, in *Gardening*, comprehends plants of the low ſhrubby evergreen and deciduous kinds, of which the ſpecies chiefly cultivated are, the common dyer's broom (G. tinctoria); the jointed broom (G. ſagittalis); the Spaniſh dyer's broom (G. florida); the hairy broom (G. piloſa); the Engliſh geniſta petty-white, or needle furze (G. Anglica); the hoary geniſta, or Montpelier cytiſus (G. candicans); and the Canary geniſta or cytiſus (G. canarienſis.)

Method of Culture.—The ſix firſt ſorts are all of the hardy kind, and capable of being increaſed by ſowing the ſeeds in beds of common mould, and, which is better, in the borders or clumps where they are to remain; but which ſhould be done in the early autumnal or ſpring ſeaſons, though the former is by much the better, as a great deal of time will be ſaved. In caſes where they are raiſed in beds, the plants ſhould be carefully taken up and removed, as ſoon as they have attained about twelve months' growth, into the ſituations in which they are to continue. In the latter mode of cultivation, they however require no other management than that of properly thinning them out, and keeping them free from all ſorts of weeds.

The laſt, or Canary ſort, may likewiſe be raiſed by ſowing the ſeeds in pots of good garden mould in the ſpring ſeaſon, but the aid of a moderate hot-bed is neceſſary to bring them forward. As ſoon as the plants have acquired a little growth they ſhould be removed into ſeparate ſmall pots, and be immediately replunged in the hot-bed. In their after-management they demand the ſame ſort of attention as other leſs tender kinds of green-houſe plants.

Each of the firſt ſix ſorts are proper for the more forward parts of the clumps and borders in ornamented grounds, and have a good effect from the fine appearance of their flowers.

The laſt kind produces a variety among other evergreen plants in the green-houſe collections.

GENITA Bridge, in *Geography*, a town of America, in Powhatan county, Virginia, 166 miles from Waſhington.

Genita-*mana*, in *Mythology*, a goddeſs who preſided over child-birth, to whom the Romans ſacrificed a dog.

GENITAL, Genitalis, in *Anatomy*, ſomething that relates to *generation*; which ſee.

Genital *gods*, *dii genitales*, are ſometimes uſed in the ancient Roman poets for thoſe we otherwiſe call *indigites*.

Auſonius, in the argument of the fourth book of the Æneid, takes the word in a different manner: the *dii genitales*, he obſerves, were ſuch as were not born of human parents, and were not thus called *quaſi genitii ex hominibus*, but rather becauſe they themſelves had begot human children.

GENITALIA, or Genitores, in *Anatomy*, a name ſometimes given to the teſtes or teſticles of a man, on account of their office in *generation*, which ſee.

GENITE, in *Geography*, a town of France, in the department of the Correze; 18 miles W. of Brive.

GENITED, in *Geometry*. See Generated.

GENITES, Γενηται, or *Geneſei*, among the *Hebrews*, thoſe that deſcended from Abraham, without any mixture of foreign blood.

The Greeks diſtinguiſhed by the names of genites ſuch of the Jews as were iſſued from parents who, during the Babyloniſh captivity, had not allied with any gentile family.

GENITIVE, in *Grammar*, the ſecond caſe of the declenſions of nouns.

When one thing is repreſented as belonging to another, in the relation of cauſe, origin, or author, its name has a termination given to it, called the *genitive* caſe; and as the author is properly the owner of a thing, the genitive is alſo called the *poſſeſſive* caſe.

In Engliſh, the genitive caſe is made by prefixing the particle *of*; or it is expreſſed by an apoſtrophe, with the letter *s* coming after it, as "thy father's houſe:" when the plural ends in *s*, the other *s* is omitted, but the apoſtrophe is retained, as "on eagles' wings:" ſometimes alſo, when the ſingular terminates in *ſs*, the apoſtrophic *s* is not added; as "for righteouſneſs' ſake." In French the genitive is expreſſed by *de*, or *du*, &c. though, in ſtrictneſs, there are no caſes at all, or at moſt only two, in either of theſe languages, inaſmuch as they do not expreſs the different relation of things by different terminations, but only by additional prepoſitions. (See Case.)

An ingenious grammarian obſerves, that though the termination called the genitive caſe be rendered by *of*, it means invariably *from*, *beginning*, *motive*; and this, he ſays, ſeems to be the true ſignification of *of*, if we regard its etymology, it being taken from αφ, απο, *ab*, *from*; and though cuſtom ſeems to have aſſigned it ſome different undefinable meaning, it is in all caſes reſolvable into the ſenſe of *from*. Thus, a table *of* wood is a table *from* wood, wood being the origin or beginning of it. Again, he is ſick *of* love, *i. e.* ſick *from* love, love being the cauſe of his ſickneſs; and ſo in all other inſtances. And this is the reaſon why ſome prepoſitions which ſignify *origin* or *beginning* in Greek, Latin, and French, are rendered in our tongue by *of*.' Jones's Greek Grammar, p. 194.

In the Latin, this relation is expreſſed in divers manners, thus we ſay, *caput hominis, the head of a man; color roſæ, the colour of a roſe; opus Dei, the work of God*, &c.

As the genitive caſe ſerves to expreſs very different, and even oppoſite relations, there ſometimes ariſes an ambiguity from this circumſtance; thus, in the phraſe, *vulnus Achillis*, the *wound of Achilles*, the genitive, *Achillis*, may either ſignify paſſively the wound Achilles has received, or actively the wound Achilles has given: thus in that paſſage of St. Paul, *Certus ſum quod neque mors, neque vita, &c. nos poterit ſeparare a charitate Dei in Chriſto, &c.* the genitive *Dei* has been taken by interpreters in two different ſenſes; ſome, giving it the relation of object, underſtand the paſſage of the love which the elect bear to God in Jeſus Chriſt; whereas others give it the relation of ſubject, and explain it from the love which God bears the elect in Jeſus Chriſt.

In the Hebrew tongue, the genitive caſe is marked after a manner very different from that of the Greek and Latin: for whereas in thoſe languages the noun governed is varied, in the Hebrew the noun governing undergoes the alteration.

GENITO, St. in *Geography*, a town of Naples, in Calabria Citra; 21 miles N. W. of Biſignano.

GENIUS, in *Mythology*, a good or evil ſpirit, or dæmon, whom the ancients ſuppoſed ſet over each perſon, to direct his birth, accompany him in life, and be his guard until death. Thoſe that attended women were females, and called *Junones*, but thoſe that attended men were males, and called *Genii*. They ſeem, in their original, to be nothing elſe but the particular bent and temper of each perſon deified; and as every one's own temper is in a great meaſure the cauſe of his happineſs or miſery, each of theſe were ſuppoſed to ſhare, and have an equal feeling in all the enjoyments and ſufferings of the perſons they attended. (See Horace, lib. ii. ep. ii. ver. 189.) The ancients had their Genii of nations, of cities, of provinces, &c. Nothing is more common than the following inſcription on medals: GENIUS POPULI ROM. "the Genius of the Roman people:" or, GENIO POP. ROM. "to the Genius of the Roman people." The ancient Gauls acknowledged Genii, who took care of each particular province and canton: but the foundation of the worſhip, which they paid to their deified cities, or rather to the genius who protected them, and became their tutelar divinity, was to engage them to take care of them, to defend them againſt enemies, and to remove from them all evils, with which they might be diſtreſſed; ſuch as epidemical diſtempers, and other calamities. The names of theſe tutelar Genii were kept ſecret, leſt, if they ſhould be known, they ſhould be conjured away, and forced to abandon the cities that were committed to their charge, and paſs into others, where they were promiſed a more ſolemn worſhip.

In this ſenſe, *genius* and *lar* were the ſame thing; as, in effect, Cenſorinus and Apuleius affirm they were.

Of theſe genii or dæmons, Plato ſuppoſes that every man has his own, who is his guardian, and the witneſs, not only of his actions, but of his very thoughts; but that, at death, the genius delivers up to judgment the perſon who had been committed to his charge; and if, when the perſon is interrogated by the judge, his anſwer be found not agreeable to truth, the genius cenſures and reprimands him very ſeverely, as, on the other hand, he pronounces an encomium upon him when what he ſays is true; and it is upon the approbation of the genius, that the doom is pronounced; for this dæmon knows whatever paſſes in the man, even his moſt ſecret thoughts.

Although Plato and Jamblichus were of opinion that every individual had but one of theſe genii to conduct him, and to preſide over all his actions, other philoſophers of the ſame ſchool were perſuaded, that he had two, the one good, the other bad. To this purpoſe Servius upon Virgil (Æn. l. vi. c. 743.) ſays, "Volunt unicuique genium oppoſitum, Dæmonem bonum et malum; hoc eſt, rationem quæ ad meliora ſemper hortatur, et libidinem quæ ad pejora; hic eſt Larva et genius malus; ille bonus genius et Lar. "They will have it that every one has two genii, the one good, and the other bad; that is, reaſon, which always excites men to good, and luſt, which prompts them to ill: the latter is what they call "Larva," or evil genius: the other good Genius, or "Lar."

The Platoniſts, and other eaſtern philoſophers, ſuppoſed the Genii to inhabit the vaſt region, or extent of air, between earth and heaven. They were a ſort of intermediate powers, who did the office of mediators between gods and men. They were the interpreters and agents of the gods; communicated the will of the deities to men; and the prayers and vows of men to the gods. As it was unbecoming the majeſty of the gods to enter into ſuch trifling concerns, this became the lot of the genii, whoſe nature was of a middle kind between the two; who derived immortality from the one, and paſſions from the other; and who had a body framed of an aerial matter. Moſt of the philoſophers, however, held that the genii of particular men were born with them, and died. Thus Plutarch attributes the ceaſing of oracles partly to the death of the Genii.

The heathens, who conſidered the Genii as the guardian ſpirits of particular perſons, believed that they rejoiced and were afflicted at all the good and ill fortune that befel their wards. They never or very rarely appeared to them; and then only in favour of ſome perſon of extraordinary virtue or dignity. They likewiſe held a great difference between the Genii of different men; and that ſome were much more powerful than others; on which principle it was, that a wizard in Appian bids Antony keep at a diſtance from Octavius, becauſe Antony's Genius was inferior to, and ſtood in awe of, that of Octavius.

There were alſo evil Genii, who took a pleaſure in perſecuting men, and bringing them evil tidings: ſuch was that in Paterculus, &c. which appeared to Brutus the night before the battle of Philippi. Theſe were alſo called *larvæ*, and *lemures*.

According to the theogony of Heſiod, the men of the golden age became dæmons, or good genii; thoſe, according to him, are the guardians of men, the earth having fallen to their lot. Thoſe of the ſilver age were changed into manes, or ſubterraneous genii, happy though mortal. Thoſe of the brazen age went down to the infernal regions. Thoſe of the heroic age took poſſeſſion of the Fortunate iſlands, or the Elyſian fields, ſituate at the extremities of the world. See DÆMON, and DÆMON *of Socrates*.

The Mahometans alſo admit the exiſtence of Genii, ſuppoſed by them to be a claſs of intermediate beings, between angels and men; of a groſſer fabric than the former, and more active and powerful than the latter. Some of them are good, and others bad; and they are, like men, capable of future ſalvation or condemnation.

GENIUS is more frequently uſed for the force or faculty of the ſoul conſidered as it thinks or judges.

Thus, we ſay, a happy genius, a ſuperior genius, an elevated genius, a narrow confined genius, &c. in like ſenſe we alſo ſay, a work of genius, a want of genius, &c.

Genius is alſo uſed, in a more reſtrained ſenſe, for a natural talent, or diſpoſition to one thing more than another. In which ſenſe we ſay, a genius for verſe, for the ſciences, &c.

Dr. Blair, in his "Lectures on Rhetoric, &c." (vol. i.) diſtinguiſhes between Taſte and Genius. Taſte, he ſays, conſiſts in the power of judging: Genius, in the power of executing. One may have a conſiderable degree of taſte in poetry, eloquence, or any of the fine arts, who has little or hardly any genius for compoſition or execution in any of theſe arts. But genius cannot be found without including taſte alſo. Genius, therefore, deſerves to be conſidered as a higher power of the mind than taſte. Genius always imports ſomething inventive or creative; which does not reſt in mere ſenſibility to beauty, where it is perceived, but which can, moreover, produce new beauties, and exhibit them in ſuch a manner, as ſtrongly to impreſs the minds of others. Refined taſte forms a good critic: but genius is further neceſſary to form the poet, or the orator. Beſides, genius is a word, which, in common acceptation, extends much further than to the object of taſte. It is uſed to ſignify that talent, or aptitude, which we receive from nature, for excelling in any one thing whatever. Accordingly, we ſpeak of a genius for mathematics, as well as a genius for poetry; or a genius for war, for politics, or for any mechanical employment. This talent or aptitude, for excelling in any one particular, is received from nature; and though it may be greatly improved by art and ſtudy, it cannot by them alone be acquired. As genius is a higher faculty than taſte, it is more limited in the ſphere of its operations. Whilſt we find many perſons, who have an excellent taſte in ſeveral of the polite arts, ſuch as muſic, poetry, painting, and eloquence, all together; it is much more rare to meet with one who is an excellent performer in all theſe arts. Indeed, an univerſal genius, or one who is equally and indifferently turned towards ſeveral different profeſſions and arts, is not likely to excel in any. The rays muſt converge to a point, in order to glow intenſely. A genius for any of the fine arts always ſuppoſes taſte; and the improvement of taſte will ſerve to forward and correct the operations of genius. But genius, in a poet or orator, may ſometimes exiſt in a higher degree than taſte; that is, genius may be bold and ſtrong, when taſte is neither very delicate, nor very correct. This is often the caſe in the infancy of arts; a period when genius frequently exerts itſelf with great vigour, and executes with much warmth; while taſte, which requires experience, and improves by ſlower degrees, hath not yet attained its full growth. Homer and Shakſpeare may be referred to as examples in proof of this aſſertion. (See Taste.) Longinus, in his "Treatiſe on the Sublime," remarks, that liberty is the nurſe of true genius: it animates the ſpirit, and invigorates the hopes of man; excites honourable emulation, and a deſire of excelling in every art. It is obſervable, that writers and artiſts moſt diſtinguiſhed for genius have generally appeared in conſiderable numbers at the ſame period. Beſides the moral cauſes which have been alleged to account for this phenomenon, ſuch as favourable circumſtances of government and manners, encouragement from great men, and emulation excited among men of genius, the Abbé du Bos, in his "Reflections on Poetry and Painting," has collected a great many obſervations on the influence which the air, the climate, and other natural cauſes, may be ſuppoſed to have upon genius. The opinion of the Abbé du Bos, that genius chiefly depended on ſoil, food, air and climate, has been favoured by Monteſquieu in his "Spirit of Laws:" and it occaſionally occurs in other writers. Mr. Hume, however, has attacked this hypotheſis with great ingenuity and ſtrength of reaſoning in his "Eſſay on National Characters." In that Eſſay he has clearly proved, that the differences we obſerve in nations, with regard to genius, ſcience, and manners, ariſe from moral, and not from phyſical cauſes. (See Climate.) The fact, however, is unqueſtionable, that ſome periods or ages of the world have been much more diſtinguiſhed than others for the extraordinary productions of genius. (See Age, *in the Hiſtory of Literature*, &c.) If we inſtitute a compariſon between the ancients and moderns in this reſpect, we muſt allow, that while the advancing age of the world brings along with it more ſcience and more refinement, its earlier periods may lay claim to more vigour more fire, more enthuſiaſm of genius. Among the ancients, we find higher conceptions, greater ſimplicity, more original fancy: among the moderns, ſometimes more art and correctneſs, but feebler exertions of genius. Admitting this to be in general a mark of diſtinction between the ancients and moderns, it cannot be admitted without exceptions; for, in point of poetical fire and original genius, Milton and Shakſpeare are not inferior to any poets in any age.

Genius, is not a muſical term, nor does it appertain to one of the polite arts more than another; but Rouſſeau (Dict. de Mus.) has volunteered an article for it among muſical terms, and has written it with peculiar eloquence and enthuſiaſm.

Rouſſeau, paradoxical on almoſt all other ſubjects, is ſometimes not only capricious, but miſchievous; yet his bittereſt enemies admit, that muſic is his bright ſide: and though he is not allowed by the preſent French muſical critics to be a profound contrapuntiſt, yet his taſte in muſic and poetry was refined, and of the higheſt claſs; and his views concerning dramatic muſic were enlarged, rational, ingenious, and free from all caprice and paradox.

GENLIS, in *Geography*, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the diſtrict of Dijon. The place contains 707, and the canton 8599 inhabitants, on a territory of 187½ kiliometres, in 27 communes.

GENNABA, a town of Perſia, in Farſiſtan, in the Perſian gulf; 15 miles N.W. of Bender Rigk.

GENNADIUS I., in *Biography*, patriarch of Conſtantinople, was elected to that dignity, having been ſome years an ordained preſbyter of the church, in the year 458, on the death of Anatolinus. In the following year, in a council of 73 biſhops, he procured the paſſing of a canon againſt ſimoniacal ordinations, and eſtabliſhed the equitable regulation, that the oblations made in the churches, which it had been cuſtomary to claim for the patriarch's treaſury, ſhould thenceforward belong to the officiating clergy. He died in 471, leaving behind him a high character for great zeal and diſintereſtedneſs in correcting the relaxed ſtate of diſcipline which prevailed in his ſee. He is placed by thoſe who lived about the ſame period among the eccleſiaſtical writers of the day, and is applauded for the extent of his learning and the elegance of his ſtyle. The proofs of this have not come to us, excepting in "A ſynodal Epiſtle" againſt ſimony, inſerted in the fourth volume of the Collect. Concil.; and fragments againſt the anathemas of Cyril of Alexandria, quoted by Facundus, biſhop of Hermiana, and another from a treatiſe addreſſed to Parthenius, and quoted by Leontius. Moreri.

Gennadius II., another patriarch of Conſtantinople, in the fifteenth century, aſſumed the name upon embracing the eccleſiaſtical life, having, prior to this, the name of George Scholarius. He was a native of Conſtantinople, where he was educated, and attracted much notice by his talents and remarkable progreſs in the different branches of learning. He became ſecretary to the emperor John Palæologus, and afterwards chief judge of the Greeks. In 1438 he accompanied the emperor to the council at Florence for the purpoſe of bringing about an union between the Greek and Latin churches: it is, however, a matter of much doubt whether Scholarius was in favour of the meaſure which his duty to his maſter required him to ſanction and ſupport. After his return to Conſtantinople he united with Mark of Epheſus, in oppoſing the reception of thoſe terms of union to which the emperor had acceded, as well by his influence as by his writings, which brought on him for a time the diſpleaſure of the emperor. After the death of Palæologus in 1448, Scholarius was as violent as ever againſt the propoſed union, and finding that his oppoſition muſt ſubject him to danger with the new emperor, Conſtantine, he reſolved to relinquiſh his civil employments, and to embrace the eccleſiaſtical life. He accordingly, in 1459, after ſending a valedictory oration to the emperor, entered into a monaſtery adjoining Conſtantinople, and lived a ſecluded life for two years, which is ſuppoſed to have been the reſult of the emperor's orders, to prevent him from taking part againſt the propoſed union. During his retreat from the world he compoſed ſeveral homilies, which could offend no one; but he did not engage in any controverſy until the union was completed. This called forth his zeal in behalf of the Greek church: he wrote letters to all the eccleſiaſtics of Conſtantinople, and to the different monaſtic orders, exhorting them to adhere to the faith of their anceſtors, and not to ſubmit to the Florentine union: he alſo remonſtrated with the emperor on the ſubject, but the monarch was not to be turned from his plan, and made every effort, by perſuaſion and by threats, to bring over Gennadius. The attempt was futile; he had gone too far to retract, and had obtained a multitude of adherents whom he had converted by his writings and exhortations, which repreſented the union to be a deſertion of the cauſe of God and his truth. The emperor ſubſcribed the act of union at Conſtantinople, as it had been ratified in the council of Florence. On the 12th of December 1452, the two nations, in the church of St. Sophia, joined in the communion of ſacrifice and prayer. But the dreſs and language of the Latin prieſt who officiated at the altar were objects of ſcandal; and it was obſerved, with a feeling of horror, that he conſecrated a wafer of unleavened bread, and poured cold water into the ſacramental cup. From the dome of St. Sophia, the inhabitants of either ſex, and of every degree, ruſhed in crowds to the cell of Gennadius to conſult him, as the oracle of the church. He was inviſible, and entranced, as it ſhould ſeem, in deep meditation, or divine rapture; but he had expoſed on the door of his cell a tablet, on which were written theſe words: "O miſerable Romans, why will ye abandon the truth; and why, inſtead of confiding in God, will ye put your truſt in the Italians? In abandoning your faith, you will loſe your city. Have mercy on me, O Lord! I proteſt, in thy preſence, that I am innocent of the crime. O miſerable Romans, conſider, pauſe, and repent! At the ſame moment that you renounce the religion of your fathers by embracing impiety, you ſubmit to a foreign ſervitude." This was the ſignal for inſurrection, (ſee CONSTANTINOPLE); and, after the capture of the city, the ſultan Mahomet, deſirous of conciliating thoſe inhabitants who had ſurvived the immenſe ſlaughter made by his army, and of recalling the Greeks, who had eſcaped, to their deſerted houſes, ordered Gennadius to be ſought for, and offered him to the choice of the clergy and people, by whom he was immediately elected their patriarch. In the election and inveſtiture of Gennadius, the ceremonial of the Byzantine court was revived and imitated. With a mixture of ſatisfaction and indignation, they beheld the ſultan on his throne, who delivered into the hands of Gennadius the paſtoral ſtaff, the ſymbol of his eccleſiaſtical office, who conducted the patriarch to the gate of the ſeraglio, preſented him with an horſe richly capariſoned, and directed the vizirs and baſhaws to lead him to the palace which had been allotted for his reſidence. The churches of Conſtantinople were ſhared between the two religions: their limits were marked, and till it was infringed by Selim, the grandſon of Mahomet, the Greeks enjoyed above ſixty years the benefit of this equal partition. Gennadius preſided over the ſee of Conſtantinople between five and ſix years, when he reſigned his dignity, and retired into a monaſtery. He died about the year 1460. He was author of "An Explanation of the Chriſtian Faith, delivered before the Turkiſh emperor Mahomet." This work was the reſult of a long converſation which he had with the emperor, ſoon after his inſtallation, when Mahomet ſuffered him to produce all the arguments he was able in ſupport of the truth of Chriſtianity. It is to be found in Cruſius's Turco-Græcia; and is alſo in David Chytræus's "De ſtatu Eccleſiarum in Græcia." Gennadius wrote likewiſe a treatiſe concerning predeſtination, and another on the trinity. He compoſed many homilies in the early part of life, which were delivered before the emperor, as orations, which laymen were, in that age, accuſtomed to pronounce in the imperial dining-room. Moreri. Gibbon's Hiſt.

GENNADIUS, an eccleſiaſtical writer, flouriſhed towards the cloſe of the fifth century, and became prieſt of Marſeilles. He was a great writer, and is ſaid to have compoſed eight books againſt all hereſies, ſix againſt Neſtorius, three againſt Pelagius, and a treatiſe concerning the millennium and the book of Revelation; but the only works remaining of this author are entitled "De viris illuſtribus," which is a continuation of St. Jerome's catalogue of Eccleſiaſtical Writers; and a treatiſe "De Fide, ſeu de dogmatibus Eccleſiaſticis Liber ad Gelaſium Papam miſſus." This laſt was for a conſiderable time attributed to St. Auguſtine, and was generally inſerted in the editions of his works. The time of Gennadius's death is not known, but it did not take place before the year 395.

GENNARI, CESARE and BENEDETTO, two brothers who both made painting their profeſſion. They were nephews, heirs, copyiſts, and imitators of Guercino; they frequently repeated his pictures, but not with adequate ſweetneſs or force. At firſt they wrought together at ſeveral places in Italy: but ſeparating, Ceſare remained at Bologna, and Benedetto went to England, where there are many of his works, particularly at Windſor Caſtle, diſcoverable by a laboured, dry imitation of Guercino; with a mixture of the flutter and parade exhibited by the French painters of that period. He was made painter to James II. and executed a picture of that prince and his family. At their expulſion he returned to Italy: and as his manner, by the mixture of French art he had introduced, was novel, he obtained applauſe and employment. He died in 1715, aged 82.

GENNE, in *Geography*, a town of France, in the department of the Maine and Loire, near the Loire; 9 miles N.W. of Saumur.

GENNEP, a town of France, in the department of the Roer, ſituated on the Niers, near the Meuſe. It contains two churches, one for Roman Catholics, and another for Proteſtants; 9 miles S. S. W. of Cleves. N. lat. 51° 47'. E. long. 5° 50'.

GENNES, a town of France, in the department of the Maine and Loire, and chief place of a canton, in the diſtrict of Saumur; 5 miles N.E. of La Guerche. The place contains 1455, and the canton 8248 inhabitants, on a territory of 190 kiliometres, in 15 communes.

GENOA, and ſince the French revolution the "Ligurian republic," is a ſmall, mountainous territory, in the northern part of Italy, forming a kind of creſcent along the Mediterranean ſea on the ſouth, and covered on the land ſide by the Apennines, which ſeparate it from the countries of Milan, Piedmont, the Montſerrat, the Milaneſe, and Parmeſan. Its length from the town of Vintimiglia on the weſt, almoſt to the territory of the republic of Lucca on the eaſt, is about 150 miles, and its greateſt breadth, from the ſea to the interior of the country, is not more than 20 miles. The mountains that encloſe it are, in ſome places, covered with foreſts, in others they are barren rocks, and in ſome few parts they yield excellent paſture. There is but a ſmall quantity of arable land in this country, ſo that it is under a neceſſity of ſeeking a ſupply of corn from Naples, Sicily, and other places; but the inhabitants avail themſelves of every ſpot which is capable of cultivation. They are furniſhed throughout the year with excellent legumes and vegetables for the table; they alſo make a conſiderable quantity of wines, and are amply provided with various kinds of fruit, eſpecially citrons, oranges, pomegranates, almonds, and figs. They raiſe a great number of mulberry trees for feeding ſilk-worms, and olives grow in great plenty, particularly round the gulf of Spezzia. Salt is produced for exportation. The Apennines, and ſome other hills, ſupply them with excellent marble, while Polzevera, in the Bocchetta, yields the beautiful ſtone ſo called, being ſerpentine of various colours veined with marble, which is eaſily conveyed by a magnificent road formed, in 1778, from the Bocchetta, or mountains to the north of Genoa, through the Polzevera, by three years' labour of from five to eight hundred men, at the expence of one patriotic and noble family, the Cambiaſi. The inhabitants of this country, amounting to about 400,000, are Roman Catholics, though the papal power is not much venerated; the people being devoted to commerce, and diſpoſed to receive monied heretics, without any religious ſcruples. The manufactures were formerly very conſiderable, but they have of late declined; the principal are velvet, pluſh, damaſk, different kinds of ſilk, for which they are ſupplied with the raw material from Meſſina and other places; gold and ſilver ſtuffs, lace, gloves, ſtockings, ribbons, ſoap, paper, &c. Other articles of commerce are, oil, fruit, macaroni, confectionary, Parmeſan cheeſe, anchovies, &c. Although Genoa is a free port, Leghorn, which is likewiſe free and indulged with greater liberty, interferes with its trade, and diminiſhes it. This country is part of the ancient Liguria (ſee LIGURIA); which, in the ſecond Punic war, eſpouſed the intereſt of the Carthaginians; but the city of Genoa, which was then a celebrated emporium, taking part with the Romans, was plundered and burnt by Mago the Carthaginian. It was afterwards rebuilt by the Romans, and continued under their dominion, together with the reſt of Italy, till the concluſion of the fifth century, about A. D. 498, when Theodoric, king of the Goths, having defeated the uſurper Odoacer, was proclaimed by the army king of Italy, even with the conſent of the emperor Zeno. Genoa was afterwards recovered by Beliſarius, when he entirely ſubdued the Goths; and when the Lombards invaded Italy, this city remained for ſome time unmoleſted, deriving an acceſſion of wealth and inhabitants by the refugees who fled from the vicinity of the Po, in order to eſcape the fury of the invaders. At length, in the ſeventh century, Genoa was plundered and burnt by the Lombards, and remained under their power till Italy was conquered by Charlemagne, when the territory of Genoa, diſtinguiſhed by its wealth and populouſneſs, was erected into a marquiſate. It ſoon afterwards became ſo powerful, under the Genoeſe empire, and after it had obtained a kind of independence, that, in 806, it reduced the iſland of Corſica, and in 935 defeated the Saracens, who had plundered and burnt the city, in their return to Africa, on the coaſt of Sardinia. About the year 950, when the Franks having loſt all authority in Italy, the Genoeſe began to form themſelves into a kind of ariſtocratical republic, under a chief called *doge*, (ſee DOGE,) elected every two years, and to be governed by their own magiſtrates, who were freely elected, and took the name of conſuls. In order to maintain their independence, they applied, with great aſſiduity, to navigation and commerce, and thus became rich and powerful. Their commerce extended from Spain to Syria, and from Egypt to Conſtantinople, and was carried on in veſſels, that were fitted for war as well as traffic. In the year 1017 they united with the Piſans in an expedition againſt Sardinia; and about 33 years after this expedition, the Genoeſe and Piſans were engaged in a deſtructive war, which laſted nearly 18 years; but when a treaty of peace and alliance was concluded between them, they concurred in a ſucceſsful expedition againſt the Moors, in Africa. What contributed more than any other circumſtance to the opulence and grandeur of the Genoeſe, was the part they took in the cruſades, and the important ſervices they rendered to the religious warriors, towards the cloſe of the eleventh and commencement of the twelfth centuries. During the latter century, they ſubjected the half of Sardinia, and the city of Syracuſe; they alſo made themſelves maſters of the Black ſea, formed eſtabliſhments in the Crimea and in the ſuburbs of Pera, at Conſtantinople, where they remained till the Turks took that city. In the thirteenth century, they added to their conqueſts the towns of Albengo, Savona, Vintimiglia, and others in their neighbourhood; and for the ſuperiority of the ſea, they engaged in a long and obſtinate conteſt with the Venetians, which did not terminate till the year 1381. In their various conflicts with neighbouring powers, their ſtrength was enfeebled, ſo that, in 1471, they were expelled from the Crimea; though their maritime power ſtill continued reſpectable. Exhauſted by the Venetian war, in particular, Genoa offered voluntary ſubjection to France and to Milan; but after many revolts and conflicts, with a view of recovering their independence, they were at length, *viz.* in 1528, reſcued from the dominion of foreign princes, by the vigorous exertions of Andrew Doria. Doria, having driven out the French, and gained poſſeſſion of Genoa, aſſembled the nobility, and reſtored the government into their hands, declaring that he pretended to no greater ſhare in it than became him as a nobleman. He re-eſtabliſhed the ancient form of the republic, and received from his country all thoſe teſtimonies of gratitude, which a conduct ſo diſintereſted ſeemed to deſerve. (See DORIA.) Towards the end of the ſixteenth century, Genoa was diſtracted by a civil war; but after a reconciliation had been effected between the two contending parties, diſtinguiſhed by the appellations of the old and new nobility, the republic enjoyed peace and felicity for an interval of 48 years, during which period ſcarcely an incident, domeſtic or foreign, occurred, that is worth recording. In the year 1624, a diſpute aroſe between the republic and Charles Emanuel, duke of Saxony, in which Lewis XIII. bore a ſhare; and a treaty was concluded between France and Savoy, that was hoſtile to the Genoeſe. On this occaſion the Spaniards declared in favour of Genoa; and a peace with France and Savoy reſtored the republic to its former ſituation, at the commencement of the war. In 1636, the Spaniards attempted to ſurpriſe the city; but their enterpriſe was fruſtrated; and from this time till the year 1656, Genoa enjoyed all the bleſſings of peace and commerce. In the following year Hippolito Centurioni, the Genoeſe admiral, gained ſeveral advantages over the corſairs of Barbary, which paved the way for a treaty of commerce that was concluded with the piratical ſtates, and the grand ſignior. The treaty with the Porte was conſiderably extended by the marquis Durazzo, who went in quality of ambaſſador to Conſtantinople in the year 1666. The reſult of this treaty renewed the vigour of the Genoeſe trade, to a pitch beyond what any of the maritime towns had experienced ſince the Dutch founded their commercial republic, and extended their trade not only to the Levant, but to every quarter of the globe. For ſome years Genoa lived in peace with all the neighbouring powers, enjoyed domeſtic harmony, and aſſiduouſly cultivated commerce, and whatever ſhould render the republic powerful and happy. Some little jealouſies and differences aroſe between her and Venice, the ſiſter and rival republic; but they were ſuch as terminated amicably, and never cauſed any diſturbance to the repoſe of Italy. In the year 1684, the Genoeſe unfortunately incurred the reſentment of Lewis XIV., who looked with jealouſy on their attachment to Spain; and could not bear to ſee the republic under the protection of that crown. His attempts for humbling them proved too ſucceſsful; but in conſequence of their ſubmiſſion, and the interpoſition of the pope, peace was obtained. The terms ſtipulated by the French were peculiarly ſevere and oppreſſive; among others, they required that the doge and four counſellors ſhould appear in perſon at Verſailles, in order to ſue for pardon; and that the ſtate ſhould diſarm all their gallies, ſix excepted, with a promiſe not to fit out more, without the knowledge and conſent of the king. During the enſuing war, kindled by the ambition of Lewis, which embroiled the greateſt part of Europe, the republic of Genoa adhered wiſely to a neutrality, and enjoyed the advantages of peace and commerce, while the dominions of their neighbour, Victor Amadeus, duke of Savoy, underwent all the calamities of war. In 1713, Charles VI. ſold the marquiſate of Finale to the republic for a conſiderable ſum of money. In 1743, the queen of Hungary, having at the treaty of Worms ceded to the king of Sardinia all her rights to the town and marquiſate of Finale, and demanding that the Genoeſe ſhould deliver up the marquiſate, they entered into an alliance with France, Spain, and Naples; and, in 1745, declared war againſt the king of Sardinia who had made himſelf maſter of a great part of the ſtate; ſeveral Genoeſe ports were bombarded by an Engliſh fleet; and the Imperialiſts ſeized upon the city of Genoa; but after a dreadful ſlaughter on both ſides, they were again driven out by the inhabitants; and, in 1747, miſcarried in their attempt to recover it. The treaty of Aix-la-Chapelle, in 1748, reſtored its tranquillity. The ancient nobility conſiſt of 28 families, whom Andrew Doria, in 1528, ſeparated from all the reſt, and declared to be only capable of holding the chief offices and dignity of doge; all the other inhabitants being reduced by him to the claſs of commoners. Since that time it has been found neceſſary to create other nobility. The nobility of Genoa were allowed to keep manufactures of velvet, ſilk, and cloth; to farm the duties, and to have ſhares in merchant veſſels; but all other buſineſs and handicrafts were forbidden. The form of government in this republic was ariſtocratical; the chief being called doge. This government continued till the year 1798, when the French form was choſen, and the new ſtyle aſſumed of the Ligurian republic, confirmed by the more recent treaty of February 1801. The troops of this ſtate, including the militia, may amount to about 30,000; and the fleet, anciently ſo celebrated for its victories over the Saracens, the Piſans, the Venetians, Spaniards, and Turks, and for maintaining during a long period a conſiderable dominion over Sardinia, Corſica, Malta, Majorca, Minorca, Candia, Cyprus, and many other places in and near the Mediterranean and Archipelago, and even the Black ſea, the Crimea and other parts, is now reduced to a few gallies.

Genoa, or *Janua*, frequently, though corruptly, called by the Latin writers *Januta*, is the capital of the country deſcribed in the preceding article. It is ſituated partly on a level ſtrand near the ſea, and in part riſes gradually to the top of the hill. It is about 10 miles in circumference, and is defended towards the land by a double wall. Several baſtions are erected along the ſea-ſhore, on rocks which appear above the water. The ſtreets are in general narrow, but clean and well paved; two of which, called the "Strada Nuova" and "Strada Balbi," are filled with magnificent palaces, fronted with marble. It is the ſee of an archbiſhop. The cathedral is built in the Gothic ſtyle, and paved with black and white marble; in the treaſury is preſerved a curious hexagonal diſh, ſaid to be made of a ſingle emerald, found at Cæſarea in the time of the Cruſades, which the Genoeſe received as their ſhare of the plunder. Beſides the cathedral, it contains 32 pariſh churches, ſome of which are magnificent, and adorned with ſculptures and pictures by the beſt maſters. The doge's palace is large, without decoration, except two ſtatues of John Andrew Doria, and Andrew Doria, larger than life, at the entrance. The arſenal contains arms for 34,000 men, models for bridges, the armours worn by a number of the Genoeſe women in the cruſades, a ſhield containing 120 piſtols, made by Julius Cæſar Vacche, for the purpoſe of aſſaſſinating the doge and ſenate at one time. Other public buildings are the Albergo, which ſerves as a poor-houſe, and houſe of correction, where is a beautiful relievo, the Virgin ſupporting a dead Chriſt, by Michael Angelo, and the aſſumption of the Virgin, in white marble, by Puget, an inimitable piece of ſculpture; a large hoſpital for the ſick of all nations and religions; the conſervatory, for educating and portioning 300 poor girls; and a great number of palaces belonging to the nobility; and the number of convents for men and women is reckoned to be 69. Such was the ſtate of Genoa before the late revolution; what devaſtation it has ſuffered by its new maſters, we are not able to ſay. It is certain, that the ſiege in 1799 was very deſtructive. The harbour is large and deep, but expoſed to the ſouth-weſt wind; but it has a mole for the ſecurity of gallies and ſmall veſſels; neverthleſs the city is much expoſed to a bombardment. The number of inhabitants is eſtimated at 80,000. N. lat. 44° 25'. E. long. 8° 58'.

Genoa *Bar*, a reef of rocks, extending ſome miles from the north coaſt of the iſland of Bahama. N. lat. 26° 20'. W. long. 79° 36'.

Genoa *Balſam*, in *Medicine*, the name of a famous compoſition, called alſo the balſam of Aquapendente. Its great virtues are the curing pains in the extremities of the body, and allaying the violent pains in the bowels, to which many women are ſubject after delivery. The preſcription is given at large in Velſcius, but the medicine is now out of uſe.

GENOLA, in *Geography*, a town of France, in the department of the Stura; three miles N. E. of Savigliano.

GENOLHAC, a town of France, in the department of the Gard, and chief place of a canton, in the diſtrict of Alais; 15 miles N. W. of Alais. The place contains 1,502, and the canton 9,579 inhabitants, on a territory of 195 kiliometres, in 13 communes.

GENOPLESIUM, in *Botany*, from γενος, *a genus*, and πλησιον, *nearly akin*, indicating its great affinity to *Praſophyllum*, another new orchidean genus of Mr. Brown's. The name is but too expreſſive of many genera recently eſtabliſhed, inſomuch that it is wonderful no writer has hit upon it before. Brown Prod. Nov. Holl. v. 1. 319. Claſs and order, *Gynandria Monandria*. Nat. Ord. *Orchideæ*.

Gen. Ch. *Cal.* Perianth ringent, helmet-like in front, its two lower or poſterior leaves longer and ſpreading. *Cor.* Petals, (inner calyx-leaves of Mr. Brown,) attached below to the column. Nectary, or lip, aſcending, undivided, hooded at the baſe, without a ſpur. *Style*, or column, cloven half way down, without any lateral membranous ſegments, in which laſt particular alone it differs from *Praſophyllum*. *Anther* parallel to the ſtigma, permanent, its cells cloſe together. Maſſes of pollen not obſerved. The only ſpecies is

G. *Baueri*, ſeen by Mr. Brown growing near Port Jackſon, New South Wales, but the above character was drawn up by him from Mr. Ferdinand Bauer's coloured figure.

GENOSA, in *Geography*, a town of Naples, in the province of Otranto; 10 miles S. E. of Otranto.

GENOVESI, Anthony, in *Biography*, a man of letters, and philoſopher, was born of parents of very moderate circumſtances, at Caſtiglione, a ſmall town in the diſtrict of Salerno, in the year 1712. He was intended for the church, and received an education ſuitable to the purpoſe. An early attachment to the daughter of a neighbouring peaſant induced his father to place him, at a diſtance from home, under the care of a lay eccleſiaſtic, who was an able claſſical ſcholar, as well as deeply ſkilled in theology and juriſprudence. Here the young man made ſuch progreſs in learning as aſtoniſhed all about him. His reſolution to marry the object of his love created in him a zeal and diligence that ſurmounted all difficulties; before, however, he was in a ſituation to maintain a wife, ſhe, at the inſtigation of his father, married. This diſappointment made him reſolve to devote himſelf to the church, and he was in due time conſecrated a prieſt, and obtained the patronage of the archbiſhop of Conza. Unfortunately for Genoveſi the prelate died, which made him repair to Naples, to follow the practice of the law, an employment highly lucrative in that city. He was ſoon diſſatisfied with his buſineſs, and after diligently ſtudying the elements of modern and ancient philoſophy, he obtained the office of extraordinary-profeſſor of metaphyſics. He began his lectures in November 1741, and his ſchool was crowded with pupils; the boldneſs of his manner, and the novelty of many parts of his ſyſtem, excited his enemies, who accuſed him not only of infidelity, but of opening the door of free-thinking in Italy; merely, it is ſaid, becauſe he recommended the works of Galileo, Grotius, and Newton. His friends, however, powerfully ſupported him, and by the influence of Galiani, the director of the Neapolitan univerſities, he was appointed to the office of profeſſor of ethics, which afforded him ample field for combating the ignorance and prejudices of the ſchools. The principle of his ſyſtem was, that the happineſs of man is the only object of the philoſophical doctrine of morals, and he deduced his duties from analytical conſiderations. He interwove in his lectures the hiſtory of the human paſſions, and enlivened them by a boldneſs and ſpirit peculiarly his own. He compoſed a new ſyſtem of logic, which he dictated in his lectures, and which was afterwards publiſhed in 1745, under the title of "Elementorum Artis Logico-criticæ, Libri quinque." This might be conſidered as an introduction to his metaphyſics, the firſt part of which had been publiſhed before this period, but the ſecond and third parts made their appearance in the years 1747—1751. In 1748, he put up for the vacant chair of theology, but, as this was always connected with the epiſcopal dignity, he was immediately regarded as unfit for ſo high an office in the church, on account of his heretical notions. His enemies now diſcovered the moſt ſerious and alarming doctrines, in the publiſhed and unpubliſhed pieces of which he had been the author. He was obliged therefore to renounce the ſcience of theology, and to ſuppreſs ſome valuable works on this ſubject. He now turned his attention to political economy, and in a few years he not only made himſelf maſter of every thing deſerving of notice on this ſcience, but ſtruck out ſome new lights. He publiſhed, in 1753, the firſt fruits of his reſearches, entitled "Eſſays on Agriculture, with conſiderations on the true Object of the Sciences." He was now, at the inſtance of his friend Intieri, made profeſſor of political economy, with a conſiderable ſalary. The office had been inſtituted ſolely for him, and it was agreed that the lectures ſhould always be delivered in the Italian language, a circumſtance, at that time, wholly unknown at Naples. His lecture room was crowded, and in a ſhort ſpace of time he was obliged to take a ſtill larger place for the diſplay of his talents, which alſo was inſufficient to contain all who came to be benefited by his inſtructions. His chief and avowed object was, while he taught the principles of political economy, to inſpire the Neapolitan youth with the ſocial and civil virtues, and above all with a public ſpirit of patriotiſm, without which no nation, he contended, could attain to that height of proſperity of which it is ſuſceptible. He cauſed to be tranſlated Carey's Hiſtory of the Engliſh Trade into the Italian, and then publiſhed it with uſeful notes. After this he pointed out in a ſhort treatiſe the cauſes of the decline and neglect of agriculture in the kingdom of Naples. In 1765 he publiſhed another work, in which he examined the queſtion, "Why countries, the moſt fruitful by nature, are often expoſed to the miſeries of ſcarcity." He was author of many other works, but his maſter-piece was the "Italian Syſtem of Morality," of which the firſt part was publiſhed in the year 1767, under the title of "Dicoſyna." His health now gave way, and he was unable to proſecute his ſtudies, and, in 1768, he was obliged to diſcontinue his lectures, and in the following year he expired, in the fifty-ſeventh year of his age. He had attained, as a man of ſcience, a very high reputation, and his moral character was in every reſpect worthy of a true philoſopher. He poſſeſſed a moſt ardent love of truth, and a deſire to extend its dominion, in which he was aware the happineſs of his fellow-creatures was deeply concerned. "He was," ſays his biographer, "an irreconcileable enemy to injuſtice and deception: his countenance diſplayed cheerfulneſs, tranquillity, and invincible courage. He was too proud to ſtoop to flattery in order to become rich, and was contented with a very moderate income." He died poor, and would have been in diſtreſſed circumſtances in the latter years of his life, had not the ſovereign ſupported him unſolicited. He was held in high eſtimation by pope Benedict XIV. and many of the cardinals; and by inſpiring in the breaſts of his pupils an ardent love of their country, with a well regulated zeal for its beſt intereſts, he was the means of introducing them to offices of diſtinction, which they filled with honour to themſelves, and high advantage to the beſt intereſts of the ſtate. Gen. Biog.

GENS D'ARMES. See GENDARMES.

GENSERIC, in *Biography*, a famous king of the Vandals, ſucceeded his brother Gonderic in his Spaniſh dominions in the year 428. He had already ſignalized his courage and ſkill in war, and was enured to toil and hardſhips of every kind. Soon after his ſucceſſion he invaded Africa, at the head of 50,000 men, and made himſelf maſter of the greater part of the country on the ſea-coaſt. The perſecution of the Donatiſts was an event highly favourable to the deſigns of Genſeric. Seventeen years before he had landed in Africa, a public conference was held at Carthage by order of the magiſtrate, which ended in a moſt ſevere perſecution. Under theſe circumſtances, Genſeric, himſelf a Chriſtian, but an enemy of the orthodox faith, avowed himſelf the vindicator of the rights of the Donatiſts, who, in their turn, looked up to him as their deliverer, from whom they might reaſonably expect the repeal of the odious and oppreſſive edicts of the Roman emperors. Genſeric obtained the moſt ſignal victories over his enemies, but notwithſtanding his ſucceſs, he agreed to a treaty with the emperor Valentinian, whom he conſented to leave in poſſeſſion of the three Mauritanias. He delivered to the Romans his own ſon Hunneric, as a hoſtage for the obſervance of his treaty; but they, truſting to his good faith, ſent back the youth. Genſeric abuſed this indulgence by ſeizing upon the city of Carthage in 439, at a time when the empire was engaged in a war with the Goths. From Carthage he ſailed with a large fleet, and landed in Sicily. He ravaged almoſt the whole of that iſland, and made a vaſt booty, but was unable to effect the conqueſt of Palermo. The object of this prince was to render himſelf formidable by ſea; and he ſucceeded ſo completely, that the eaſtern and weſtern emperors, Theodoſius and Valentinian, thought it neceſſary to join againſt him. They fitted out a powerful fleet, with a large army, deſtined for the recovery of Africa; but Genſeric deluded them by propoſals of accommodation, and the irruption of the Huns obliged Theodoſius to recal his forces. When Maximus aſcended the weſtern throne, he compelled Eudoxia, the widow of Valentinian III., to marry him; ſhe in a ſhort time ſecretly applied for the dangerous aid of Genſeric to free her from his tyranny. He, ſeizing the occaſion, appeared at the mouth of the Tiber with a numerous fleet; and in the conteſt Maximus was ſlain, which afforded Genſeric an opportunity of marching to the gates of Rome, where he was admitted almoſt without oppoſition. For fourteen days the city was abandoned to all the licentiouſneſs of a barbarian ſoldiery; and on his return he carried away an immenſe quantity of treaſure, beſides multitudes of captives, chiefly of the female ſex, among whom were the empreſs and her two daughters, one of whom he married to his ſon Hunneric; and after the lapſe of ſeveral years, he reſtored the other and her mother to their native place. Genſeric continued to annex to his dominion the remaining Roman provinces in Africa; and then ſent a fleet, conſiſting of ſixty gallies, into the Italian ſea, which was deſtroyed. But the loſs of his ſhips did not prevent him from renewing his ravages on the coaſt of Italy, till his power received a ſevere check from the emperor Majorian, who now began to act on the offenſive, and formed the ſpirited reſolution of attacking the Vandals, in Africa. He fitted out a formidable fleet for the purpoſe, which obliged Genſeric to ſue for peace. His ſuit being rejected, he ſent out a ſquadron, which coming unawares upon the Roman navy, in the bay of Carthagena, almoſt deſtroyed it. Peace was now made between the two warriors, the terms of which were obſerved till the death of Majorian, in 461. After this, Genſeric prepared to repeat his aggreſſions, and he again ravaged the coaſts of Italy and Sicily, and even took poſſeſſion of Sardinia. He extended his hoſtilities to all parts of the Mediterranean, and frequently indulged in acts of the moſt brutal atrocity. At one time he is reported to have maſſacred five hundred noble citizens of Zacynthus, and to have thrown their dead bodies into the ſea. Leo, the eaſtern emperor, reſolved to make an effort to free his dominions from this terrible ſcourge, and made vaſt preparations for the invaſion of Africa. The conduct of the expedition was given to Baſiliſcus, who might have extinguiſhed for ever the kingdom of the Vandals, had he ſeized the moment of conſternation, and boldly advanced to the capital. Genſeric beheld the danger with firmneſs, and eluded it with his veteran dexterity. He profeſſed himſelf ready to ſubmit his perſon and dominions to the will of the emperor; but requeſted a truce of five days to regulate the terms of his ſubmiſſion. Baſiliſcus conſented to the fatal truce; and during the ſhort interval, the wind became favourable to the deſigns of Genſeric. He manned his largeſt ſhips of war with the braveſt of the Vandals and Moors; and they towed after them many large barks filled with combuſtible materials. In the obſcurity of the night theſe deſtructive veſſels were impelled againſt the unguarded and unſuſpecting fleet of the Romans, who were ſoon awakened to a ſenſe of their inſtant danger. "Their cloſe and crowded order," ſays the hiſtorian, "aſſiſted the progreſs of the fire, which was communicated with rapid and irreſiſtible violence; and the noiſe of the wind, the crackling of the flames, the diſſonant cries of the ſoldiers and mariners, who could neither command, nor obey, increaſed the horror of the nocturnal tumult." Baſiliſcus returned ingloriouſly to Conſtantinople with the remainder of his ſhattered fleet; and thus the fruits of all this mighty effort were loſt. Genſeric put to ſea, recovered Sardinia, which had been taken from him, reduced Sicily and all the iſlands between Italy and Africa, and became a greater terror to the empire than ever. In 476, he made a peace with Odoacer, king of Italy, to whom he reſtored Sicily, but on condition of receiving tribute. The emperor Zeno likewiſe relinquiſhed to him and his ſucceſſors all claims to the African provinces. Genſeric died in the year 477. In his early youth he had renounced the orthodox communion; and as an apoſtate he could neither grant nor expect a ſincere forgiveneſs. He was exaſperated to find that the Africans, who had fled before him in the field, ſtill preſumed to diſpute his will in ſynods and churches; and his ferocious mind was incapable of fear, or of compaſſion. His catholic ſubjects he oppreſſed with intolerant laws, and arbitrary puniſhments. The language of Genſeric was furious and formidable; the knowledge of his intentions might juſtify the moſt unfavourable interpretation of his actions; and the Arians were reproached with the frequent executions which ſtained the palace, and the dominions of the tyrant, Gibbon. Univer. Hiſt.

GENTIAH, in *Geography*, a town of Aſia, in the country of Aſſam; 370 miles E. of Patna. N. lat. 25° 10'. E. long. 92° 10'.

GENTIAN, in *Gardening*, the common name of a large hardy perennial herbaceous plant, which has a root that affords an extremely ſtrong bitter. See GENTIANA.

GENTIANA; in *Botany*, γεντιανη of the Greeks, named after Gentius, a king of Illyria, who is ſaid to have diſcovered it, or at leaſt to have firſt experienced its virtues as a cure for the plague, which infected his army. Gentian, or Fell-wort. The latter name, we preſume, is derived from *fel*, gall, alluding to its extreme bitterneſs, and not from fell, the north-country appellation of a mountain. It therefore ought to be, as Gerarde writes it, Fel-wort.—Linn. Gen. 126. Schreb. 175. Willd. Sp. Pl. v. 1. 1331. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 284. Juſſ. 141. Lamarck Illuſtr. t. 109. Gærtn. t. 114. Claſs and order, *Pentandria Digynia*. (*Monogynia*; Lamarck.) Nat. Ord. *Rotaceæ*, Linn. *Gentianæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, in five deep, oblong, acute, permanent ſegments. *Cor.* of one petal, tubular in the lower part, without pores; in the upper five-cleft, regular, various in form and direction, withering. *Stam.* Filaments five, awl-ſhaped, ſhorter than the corolla, connected with its tube; anthers oblong, ſimple, ſometimes united into a cylinder. *Piſt.* Germen ſuperior, ovate or oblong, cylindrical, as long as the ſtamens; ſtyles none; ſtigmas two, ovate, recurved. *Peric.* Capſule oblong, roundiſh, pointed, ſlightly cloven at the ſummit, of one cell and two concave inflexed valves. *Seeds* numerous, ſmall, flattiſh. *Receptacles* two, affixed longitudinally to each valve.

Eſſ. Ch. Corolla tubular at the baſe, deſtitute of nectariferous pores. Capſule ſuperior, of one cell and two valves, with many ſeeds.

Obſ. The figure of the fruit is conſtant, but the corolla is very different in different ſpecies, being either wheel-ſhaped, bell-ſhaped, or funnel-ſhaped. In ſome there are ſmall intermediate ſegments, in others a fringe to the corolla; in ſome it is plaited, in others plain. A few ſpecies have a four-cleft tetrandrous flower; but the remark in Linn. Gen. 176, that there is a ſpecies with three additional parts of the flower, alludes to *Chlora*, once reckoned a *Gentiana*. Linnæus has eraſed the line from his own copy, and his editors might eaſily have made the ſame correction. G. *lutea*, and ſome others, however, have frequently a ſuperabundance of diviſions and ſtamens in a few of their bloſſoms.—The upper part of the germen ſo much reſembles a ſtyle, that Lamarck has perhaps offered no great violence to nature, or the Linnæan ſyſtem, in conſidering it ſuch.

This very noble and beautiful genus of herbaceous plants is chiefly of alpine origin, where the lovely blue flowers of many ſpecies enamel the turf in a moſt ſplendid manner. Moſt are perennial, ſome few annual. All are intenſely bitter in flavour, eſpecially the roots of the larger perennial kinds, G. *lutea*, Woodv. Med. Bot. t. 156, which is the officinal Gentian; *purpurea*, Fl. Dan. t. 50, which is the Curſuta of the Edinburgh Pharmacopœia; *pannonica*, Jacq. Auſtr. t. 136; *punctata*, ibid. app. t. 28; and *campanulata*, t. 29. Theſe are ſcarcely even ſeen in gardens, except the firſt, which is not eaſily eſtabliſhed; but few plants are more ſtately and ornamental. The North American G. *ſaponaria*, Curt. Mag. t. 1039; and the alpine *aſclepiadea*, t. 1078, are both very handſome, and we have found the latter thrive for many years in a bed of peat, earth and loam, as well as on its native mountains. See Curt. Mag.—G. *acaulis*, Curt. Mag. t. 52. Engl. Bot. t. 1594, is one of the moſt common in gardens, but requires rather a pure air. G. *verna*, nearly allied to it in habit and beauty, ſee Engl. Bot. t. 493, though wild in the mountainous parts of Durham, and abundant on the Swiſs and Italian Alps, will ſcarcely live in a garden at all. G. *Pneumonanthe*, ibid. t. 20, found on turfy heaths in many places, is likewiſe very handſome, and rather impatient of culture. We have never ſeen the culture of the annual kinds attempted; ſuch are *nivalis*, Engl. Bot. t. 896; Amarella, t. 236; and *campeſtris*, t. 237.

Linnæus was by no means well acquainted with the different ſpecies of this genus, having never viſited the more ſouthern alps of Europe, where alone they are to be ſtudied to advantage. Hence his *verna* and *bavarica* are one ſpecies, and he confounded with *lutea*, which he ſeems never to have ſeen, or at leaſt to have afterwards forgotten, the G. *floribus terminantibus diaphanis*, Gmel. Sib. v. 4. 106; G. *algida*, Pallas. Roſſ. t. 95. Hence the erroneous remark under *lutea*, "petala punctis ſparſis creberrimis, flava." There is ſome doubt whether G. *ſeptemfida*, Sims in Curt. Mag. t. 1229, be the ſame as Pallas's t. 92. f. 3. In the former the flower appears to us very rarely, if ever, with more than five diviſions, nor do the habits of the two figures accord. Willdenow has fifty-ſix ſpecies of *Gentiana*, ſome of which among the annual kinds we are not able to determine to our ſatisfaction. He quotes a monograph by Froelich, which appears to have great merit, but which has not come to our hands.—Six ſpecies only of this genus are wild in Britain, the *Chlora* and *Chironia* being now, with the greateſt poſſible propriety, ſeparated from it.

GENTIANA, in *Gardening*, compriſes plants of the hardy, herbaceous, perennial, flowery kind; of which the ſpecies cultivated are the yellow gentian (G. *lutea*); ſpotted flowered gentian (G. *punctata*); ſwallow-wort-leaved gentian (G. *aſclepiadea*); and the dwarf gentian, or gentianella.

Method of Culture.—In the three firſt ſorts it is eaſily effected by ſowing the ſeeds in pots ſoon after it is ripe, as when kept till ſpring it will not ſucceed: the pots ſhould be placed in a ſhady ſituation, and kept clean from weeds. Some adviſe their being ſown where they are to remain, but the firſt is probably the beſt method. In the ſpring the plants appear, when they muſt be duly watered in dry weather, and kept clean from weeds till the following autumn; then be carefully ſhaken out of the pots, ſo as not to break or injure their roots; and a ſhady border of loamy earth ſhould be well dug and prepared to receive them, into which they ſhould be put at about ſix inches diſtance each way, the tops of the roots being kept a little below the ſurface of the ground, and the earth preſſed cloſe to the roots. If the following ſpring prove dry, they ſhould be duly watered to forward their growth. The plants may remain here two years, by which time they will be fit to tranſplant where they are deſigned to grow, removing them in the autumn as ſoon as their leaves decay; great care being taken in digging them up not to cut or break their roots, as that greatly weakens them. They require afterwards no other culture but to dig the ground about them early in the ſpring before they begin to ſhoot, and in the ſummer to keep them clean from weeds. The roots continue many years, but the ſtalks decay every autumn;

the ſame roots not flowering two years together, or ſeldom oftener than every third. When they flower ſtrong, they have, however, a fine appearance among other ſimilar plants.

In reſpect to the laſt ſort it is moſtly propagated by offſets or parting the roots, and planting them where they are to remain in the early autumn; but in order to have the plants flower well, they ſhould not be often tranſplanted or parted. And they are alſo capable of being raiſed from ſeeds managed in the ſame way as in the firſt kinds.

All theſe plants ſucceed the moſt perfectly in moiſt loamy ſoils, where there is a degree of ſhade afforded.

They are uſeful as ornamental plants, for the clumps, borders, and quarters of pleaſure-grounds; thoſe of low growth being planted towards the fronts, and the latter kinds more backward in them.

Gentiana, *Gentian*, in the *Materia Medica*. The root, which is the only medicinal part of the plant, has little or no ſmell, but to the taſte it manifeſts great bitterneſs; a quality which is extracted by aqueous, ſpirituous, and vinous menſtrua, though not in ſo great a degree by water as by ſpirit; and the extract of this root, prepared from the watery infuſion, is leſs bitter than that made from the ſpirituous tincture. Gentian is the principal bitter now employed by phyſicians; and as the intenſe bitters are generally admitted to be not only tonic and ſtomachic, but alſo anthelmintic, antiſeptic, emmenagogue, antiarthritic, and febrifuge, this root has a better claim to the poſſeſſion of theſe powers than moſt of this kind. Many diſpeptic complaints, though ariſing from debility of the ſtomach, are more effectually relieved by bitters than by Peruvian bark; and hence may be inferred their ſuperior tonic power on the organs of digeſtion; but we are told by Dr. Cullen (Mat. Med. vol. ii.) that the gentian, joined with equal parts of tormentil or galls, conſtantly ſucceeded in curing intermittents, if given in ſufficient quantity. As a ſimple bitter the gentian is rendered more grateful to the ſtomach by the addition of an aromatic: and for this purpoſe orange-peel is commonly employed. The officinal preparations of this root are, the "infuſum gentianæ compoſitum," and "tinctura gentianæ compoſita," (Ph. Lond.) and the "infuſum amarum," "vinum amarum," "tinctura amara," ſive "elixir ſtomachicum" (Ph. Ed.) which latter is ſaid by Dr. Cullen to be the ſame as Stoughton's elixir, (ſee *Stomachic* Elixir) and by both Pharmacopœias the extract is directed. The "compound infuſion" is prepared by taking gentian root ſliced and orange-peel dried, of each a dram, of freſh lemon-peel two drams, and boiling water twelve ounces; and macerating for an hour in a covered veſſel, and then ſtraining the liquor. For the "tincture," take of gentian root dried, two ounces, orange-peel dried, an ounce, cardamom ſeed bruiſed, half an ounce, and proof ſpirit two pints; macerate for fourteen days, and ſtrain. For the "extract," take of gentian-root ſliced, a pound, and boiling water, a gallon; macerate for twenty-four hours, then boil down to four pints; ſtrain the hot liquor, and evaporate it to a proper conſiſtence. The extracts are made into pills, with or without aromatic additions. Wines and malt liquors are likewiſe impregnated with the virtues of this root in different proportions. An ounce of the gentian root, the ſame quantity of freſh lemon-peel, and two drams of long pepper, communicate by maceration, without heat, a grateful warmth and bitterneſs to a quart of mountain. There is an Indian gentian brought from America by the Portugueſe, of a pale yellowiſh colour, jointed and marked with knots and circles like ipecacahuna, more intenſely bitter than any of the officinal bitter drugs. This root is greatly commended in obſtinate intermittents, and other diſorders; a ſcruple is ſaid to be more effectual than repeated half drams of bark.

There was a mixture of henbane root brought over ſome years ago with the common gentian, which occaſioned violent diſorders, and in ſome inſtances proved fatal.

This root is of a paler colour than gentian, and its longitudinal wrinkles finer and cloſer; the poiſonous root, when cut, appears white, without any degree of the yellow hue, which is deep in gentian; and its taſte is not bitter, but mucilaginous. Phil. Tranſ. vol. xlv. p. 240. Lewis's Mat. Med. Woodville's Mat. Med.

Gentian *Water*. See Water.

GENTIANÆ, the forty-ſixth natural order of plants in Juſſieu's ſyſtem, or the thirteenth of his eighth claſs, ſo named from the principal genus contained in it. The character of this eighth claſs is *Cotyledons* two. *Flowers* of one petal, inſerted below the germen, regular or irregular. *Calyx* of one leaf. *Stamens* of a definite number, inſerted into the corolla, and uſually alternate with its diviſions, when they agree in number. *Germen* ſuperior, ſimple; ſtyle one, (ſometimes none in the *Apocineæ*, with a double germen); ſtigma ſimple or divided. *Fruit* ſuperior, conſiſting either of naked ſeeds, or for the moſt part encloſed, either in a pulpy or a capſular ſeed-veſſel, of one or many cells.

The characters of the *Gentianæ* are theſe. *Calyx* divided, permanent. *Corolla* regular, often withering before it falls, with a limb equally divided, whoſe ſegments agree in number with thoſe of the calyx and are moſt commonly five, ſometimes oblique. *Stamens* as many, inſerted into the middle or upper part of the corolla; anthers incumbent. *Style* one, or rarely, by ſplitting, double; ſtigma ſimple or lobed. *Capſule* ſimple or of two parts, of two valves, and one or two cells, the valves inflexed at the margin, involute where there is but one cell, flat and conſtituting the partition where there are two. *Seeds* numerous, ſmall, inſerted into a marginal receptacle connected with the valves. *Stem* herbaceous, rarely ſomewhat ſhrubby. *Leaves* oppoſite, moſtly undivided and ſeſſile; floral ones occaſionally ſmaller, reſembling bracteas, the flowers in ſuch caſe becoming, as it were, doubly bracteated.—The firſt ſection has a ſimple capſule, of one cell, and contains *Gentiana*, *Lita* of Schreber (*Vohiria* of Aublet,) *Picrium* of Schreber (*Coutoubea* of Aublet), *Swertia* and *Chlora*; the ſecond, with a ſimple capſule of two cells, contains *Exacum*, *Liſianthus*, *Myrmecia* of Schreber (*Tachia* of Aublet), *Chironia* and *Nigrina*; the third with a didymous or two-lobed capſule of two cells, contains only *Spigelia* and *Ophiorrhiza*. In a fourth ſection ſtands as a kin to this order, by itſelf, *Nicandra* of Schreber (*Potalia* of Aublet.) The plants of this natural order are chiefly remarkable for their intenſe bitterneſs, and conſequent ſtomachic virtues. Their flowers are uſually beautiful, either blue, yellow or red, ſcarcely white, except by occaſional variation of the blue or red.

GENTIANELLA, in *Gardening*, the common name of the dwarf gentian, and which properly ſignifies the *little gentian*, which has a broad leaf and large flower. See Gentiana.

GENTILE, Gentilis, a pagan, or perſon who adores falſe gods. The Hebrews applied the name גוים, *gentes*, *nations*, to all the people of the earth who were not Iſraelites or Hebrews.

Some will have it that the gentiles were thus called in contradiſtinction to the Jews, becauſe the latter had a poſitive law to obſerve in matters of religion, whereas the gentiles had only the natural law: hence they are called "gentiles, quia ſunt uti geniti fuerunt," becauſe they remain as in a ſtate of nature.

The Jews apply the denomination gentiles much as the Chriſtians do that of infidels. St. Paul is called the *doctor*, or *apoſtle of the gentiles*, which appellation he firſt gave himſelf, Rom. xi. 13. "As I am the apoſtle of the gentiles, I magnify mine office."

The calling of the gentiles to Chriſtianity had been predicted in the Old Teſtament, as it was accompliſhed in the New. See Pſal. ii. 8. Iſa. ii. Joel ii. 29. Matth. viii. 11. xii. 18. Acts, xi. 18. xiii. 47, 48. xxviii. 28. Rom. i. 5. iii. 29. xi. 12, 13. 25. Eph. ii. 11. Rev. xi. 2. xxii. 2.

Some account may not be improperly given in this place of the ſtate of Chriſtianity both before and after the time of Conſtantine's converſion. The oppoſition of the Jews to its reception and prevalence appears in the Acts of Apoſtles, and the epiſtles of the New Teſtament. Our preſent object is to conſider, firſt, the ſtate of its progreſs in gentile countries, and under heathen emperors, from about the middle of the firſt century, when it began to be preached among the gentiles, and to make ſome progreſs among them, to the period when Conſtantine embraced the Chriſtian religion; and, ſecondly, its ſtate under the Chriſtian emperors, and their treatment by the gentiles. In the former period, we find from St. Luke's account in the Acts of the Apoſtles (ch. xiv. 19, 20. ch. xvi. 19—24.) that St. Paul met with ſome difficulties in preaching the goſpel in gentile cities; but no imperial edicts were iſſued againſt the Chriſtians, before that of Nero in the year of Chriſt 64 or 65, at which time the two apoſtles, Peter and Paul, were put to death. For an account of the *ten* perſecutions, as they have been uſually reckoned, which the Chriſtians ſuffered under heathen emperors, we refer to the article Persecution. Theſe perſecutions were ordered by edicts of emperors, beginning with Nero's and ending with Diocleſian's. During the whole of this period Chriſtianity had been in a ſtate of perſecution. At the commencement of the ſecond period, in 313, Conſtantine and Licinius iſſued a law or edict, giving liberty to all men, Chriſtians and others, to follow that way of worſhip which ſhould be moſt agreeable to them. However, it appears that Conſtantine did not ſtrictly obſerve his own edict; for, according to the utmoſt of his power, by various methods, by laws, inſtitutions, rewards and encouragements, he endeavoured to root out the ancient religion, and to promote the Chriſtian doctrine. Conceiving that neither he nor the Roman empire could be ſafe, as long as the ancient ſuperſtition ſubſiſted, he openly oppoſed the gods of the gentiles, and their worſhip, as dangerous to the public welfare. After the death of Conſtantine in the year 337, the whole empire was divided between his ſons. Conſtans, with whom his brother Conſtantius concurred, paſſed a law in 341, ordering ſuperſtition to ceaſe, and the madneſs of ſacrificing to be aboliſhed; under the menace of a proper and convenient puniſhment. This law was followed by another law of Conſtans in the next year, 342, forbidding the demolition of temples, which ſtood without the walls of the city of Rome. Another law, which was the firſt of Conſtantius, and paſſed, as it has been ſuppoſed, in the year 353, ordained that in all places, and in all cities, temples ſhould be immediately ſhut up, and that the people ſhould abſtain from ſacrifices, under the penalty of death and the confiſcation of their eſtates to the treaſury. The ſecond law of Conſtantius, in the ſame year, prohibited nocturnal ſacrifices; and a law, publiſhed by the ſame emperor in the year 356, appointed capital puniſhment to ſuch as were convicted of performing ſacrifices or worſhipping images. Three other laws of Conſtantius were alſo publiſhed in the year 356 or 357, with the penalty of death againſt all who conſulted any of the maſters of divination, who are enumerated under their ſeveral titles of haruſpices, mathematicians, Chaldæans, harioli, augurs, vates, and magicians. The emperor Julian is well known for his zeal in favour of gentiliſm, and for his injurious treatment of the Chriſtians. At his acceſſion we may reaſonably ſuppoſe, that all the laws of preceding Chriſtian emperors againſt gentiliſm and its rites, were abrogated, and that it was actually eſtabliſhed by imperial edicts; whilſt Chriſtians were deprived of magiſtracy, and all honours and dignities, as well as alſo of equal rights of citizenſhip. The emperors Jovian, Valentinian, and Valens were Chriſtians; and they encouraged their ſubjects in the profeſſion of Chriſtianity, and protected them in the enjoyment of the privileges conferred upon them by Conſtantine: but it does not appear that during this period any new laws were iſſued againſt gentiles and their ſacrifices. Jovian, indeed, publiſhed a law of univerſal toleration; and Valentinian was remarkable for the moderation of his government. In the year 381 was iſſued a law of Theodoſius, with the joint authority of Gratian, and the younger Valentinian, enacting, that apoſtates from Chriſtianity to paganiſm ſhould loſe the power of making a will. This law was afterwards ratified, and followed by other laws of Theodoſius the Great, Valentinian the Younger, Arcadius, Honorius, and Theodoſius II., with the addition of other clauſes. In the ſame year, 381, and by the ſame authority, was enacted a law, forbidding all ſacrifices in the way of divination, either by day or by night, in the temples or elſewhere, upon the pain of proſcription. By another law of Theodoſius, in the following year, the magnificent temple in the province of Oſrhoené, or Edeſſa, was allowed to be open, and to be frequented, provided no ſacrifices were performed there. In 385 Theodoſius publiſhed another law, forbidding ſacrifices, eſpecially ſuch as were made in the way of divination, and for diſcovering futurities, upon pain of death. In 391 was publiſhed a law of Theodoſius, in which all ſacrifices of innocent victims, and acceſs to the temples, and the worſhip of ſenſeleſs images, are prohibited. This law was particularly deſigned for Rome and Italy; and in the ſame year a ſimilar law was publiſhed for Egypt, forbidding ſacrifices and acceſs to temples. In 392 was publiſhed a ſevere law of Theodoſius, forbidding to men of all ranks every kind of heatheniſh worſhip; and in 399 Arcadius publiſhed a law for deſtroying temples in country places. Several other laws were publiſhed by Theodoſius the younger againſt all Pagan oblations and ſacrifices, and ordering the deſtruction of chapels, temples, and conſecrated places. Nevertheleſs gentiliſm ſtill ſubſiſted. Upon the whole it may be obſerved, that the period of 20 or 25 years, from the death of Conſtantius to the acceſſion of Theodoſius, or thereabout, is remarkable for the mildneſs with which the gentiles were treated, and the few laws that were iſſued againſt them; and theſe laws againſt gentiliſm were not rigorouſly executed; but many gentiles were admitted into civil offices of great truſt and profit; and many inſtances occur, which evince the moderation of Chriſtian magiſtrates under Chriſtian emperors; and, indeed, it is true both with reſpect to Chriſtians and gentiles, that all wiſe and underſtanding men, of every ſect and religion, recommended moderation, and concurred in condemning force and compulſion in religious matters. See more on this ſubject in Lardner's Works, vol. ix. 98—218.

Gentile, *Gentilis*, in the Roman *Law* and *Hiſtory*, a name which ſometimes expreſſes thoſe whom the Romans otherwiſe call Barbarians; whether they were allies of Rome, or not. In which ſenſe the word occurs in Ammianus, Auſonius, and the Notitia Imperii.

Gentilis was alſo uſed, in a more peculiar ſenſe, for all ſtrangers, or foreigners, not ſubject to the Roman empire; as we ſee in the Theodoſian Code, in the title "De Nuptiis Gentilium;" where the word gentiles ſtands oppoſed to *provinciales*, or the inhabitants of the provinces of the empire.

The word is likewiſe uſed, in this ſenſe, in the Greek; but it was not introduced either into that, or the Latin tongue, till after Chriſtianity was eſtabliſhed; it being taken from ſcripture. See Esquire and Gentleman.

GENTILESCHI, Orazio, in *Biography*, a painter, born at Piſa in 1563. His parental name was Lomi, but he choſe to adopt that of his maternal uncle. He firſt learnt the art under his half brother Aurelio Lomi, but afterwards ſtudied at Rome. After diſtinguiſhing himſelf at Florence, Turin, and Genoa, he paſſed to Savoy and France, and thence was invited into England by Charles I. who gave him lodgings, and a conſiderable ſalary; and employed him in painting ceilings, &c. at Greenwich. He was alſo employed by Villiers, duke of Buckingham, at York Houſe, on a picture of himſelf and his family. After reſiding here about twelve years, he died at the age of 84 in 1647. The clearneſs and brilliancy of the ſtyle in which he painted may be ſeen to the greateſt perfection in a picture at Hampton Court of Joſeph and Potiphar's wife. He made king Charles a preſent of a large book of drawings, and was deſervedly reſpected and admired for his abilities.

Gentileschi, Artemisia, daughter of Orazio, and his pupil, who obtained almoſt as much ſkill and credit as her father. She followed him to England, where ſhe practiſed in portraits with great ſucceſs. She alſo exerciſed her talents in hiſtorical painting, and has left many highly creditable works behind her.

Her picture of Judith with the head of Holofernes at St. James's palace, is in the ſame ſtyle of deſign as her father's, but though very ſkilful, is not ſo bright, or ſo finely wrought as his pictures uſually are. After the death of Orazio, ſhe retired to Naples, where Graham ſays ſhe became as famous for her amours as for her ſkill in painting. She died in 1642.

GENTILI, Alberico, was born in 1550, at Caſtel S. Geneſio, in the marche of Ancona. He ſtudied the law, and took his degrees at the univerſity of Perugia, and was prætor at Aſcoli, when his father, becoming a convert to the reformed religion, determined to quit Italy, and take with him his ſons Alberico and Scipio. The former, the ſubject of this article, came to England, and in 1582 was choſen profeſſor of juriſprudence in the univerſity of Oxford, which he held with much reputation till his death in 1608. He was a man of great learning, and publiſhed various works. One, entitled "Six Dialogues on the Interpreters of Law," he dedicated to his patron the earl of Leiceſter. He is author of three books "De Jure belli," which are highly applauded by Grotius: of three others "De Legationibus," and ſeveral tracts relative to antiquities. His "Lectiones Virgilianæ" prove that he had cultivated polite literature very ſucceſsfully. Bayle.

Gentili, Scipio, brother of the preceding, was born in 1563, and, while a child, was ſent to Tubingen for his education. Here he diſtinguiſhed himſelf in the ſtudy of the claſſics and juriſprudence, which he afterwards purſued with increaſing ſucceſs at the univerſities of Wittemberg and Leyden. In 1589 he took his degree of doctor at Baſil, and then went to Wittemberg as a public expounder of the law. Shortly after he removed to Altdorf, and became principal profeſſor of law. His fame extended very far, and he received invitations to ſettle at ſeveral univerſities, and one from pope Clement VIII. to ſettle at Bologna, which he declined. He died at Altdorf in 1616, leaving behind him many works as monuments of his deep erudition. Theſe were afterwards collected and printed in 8 vols. 4to.; they are chiefly on ſubjects connected with juriſprudence. As a teacher, his manner was clear and intereſting. He was a good Latin poet, and tranſlated ſeveral of the Pſalms, and the firſt two cantos of Taſſo's Jeruſalem. Bayle.

GENTILIS, Gentilis, was born at Foligni, in Italy, about the year 1230. He ſtudied medicine under the tuition of Thaddeus of Florence, with great diligence and reputation, ſo that on his return to his native place he was regarded by his fellow-citizens as the firſt phyſician of the time; and his fame ſoon extended through Italy. He was alſo eſteemed one of the beſt commentators upon Avicenna, whoſe writings were then held in high veneration in moſt of the univerſities of Europe. Gentilis died at Bologna about the year 1310, and left ſeveral treatiſes, which were collected and publiſhed at Venice, in four volumes folio, in 1484, 1486, and 1492. The following works were likewiſe printed ſeparately: 1. "Expoſitiones in textu Avicennæ."—2. "De Febribus," Venice, 1484.—3. "Expoſitio cum Commento Ægidii Monachi Benedictini Libri de Judiciis Urinarum, et Libri de Pulſibus." Ibid. 1494.—4. "Conſilia peregregia ad quævis morborum totius corporis genera," with ſome other tracts, Venice, 1503.—5. "Quæſtiones et Tractatus extravagantes." Ibid. 1520.—6. "De Lepra Tractatus." Ibid, 1536, with the ſurgery of Dinus de Garbo.—7. "De proportionibus Medicinarum," with different diſſertations upon the ſubject of doſes of medicines by the moſt celebrated phyſicians, Padua 1556, &c. See Eloy. Dict. Hiſt.—Several other individuals of the family of Gentilis were diſtinguiſhed for their knowledge of medicine and the ſciences.

Gentilis, John-Valentine, was born at Coſenza in Calabria. Educated in the principles of the Roman Catholic religion, and becoming a convert to the principles of the Reformation, he was obliged to quit his native country, and take refuge in Geneva, where ſeveral Italian families had already formed a congregation. His enquiries did not ſtop by the open renunciation of papal errors; he became diſſatisfied with the orthodox doctrine of the Trinity. He was required to ſubſcribe to the articles of faith which the perſecutor John Calvin had eſtabliſhed againſt hereſy, to which a promiſe was annexed, never to do any thing, directly or indirectly, that ſhould controvert the doctrine of the Trinity. At firſt Gentilis refuſed the teſt, but was afterwards prevailed on to comply, dreading probably, in caſe of his reſiſtance, a ſimilar treatment to that which Servetus had experienced. What his hand had ſigned, and his tongue confeſſed, his heart abhorred, and in private he did not ſcruple to avow the truth, which coming to the ears of the magiſtrates, they committed him to priſon. From the dungeon he attempted to expoſtulate with his perſecutors, ſhewing the inoffenſiveneſs of his opinions, but their hearts were ſteeled againſt the ſupplications of a heretic, till he offered to abjure his errors, conſented to throw his writings into the fire, and take an oath not to quit Geneva without leave of the magiſtrates. Being thus, in a meaſure, freed from ſuſpicion, and feeling conſcious that he would be juſtified in breaking an oath which had been extorted by terror, he withdrew from the city, but finding no place of ſafty he returned, was again impriſoned, but in a ſhort time liberated. From this period he ſeems to have wandered from place to place, and we find him at Lyons, in various parts of Poland and Germany, in Savoy, and at laſt of Bern, where he was accuſed of hereſy. He underwent a long and tedious trial, and being convicted of obſtinately oppugning the myſtery of the Trinity, he was ſentenced to loſe his head. This ſentence was carried into execution, but death, which, at a greater diſtance, ſeemed ſo formidable to him, was now diſarmed of his terrors, and by a manly fortitude he was enabled to triumph over his enemies, who expected that his mind was ill-adapted to ſo trying a ſcene; his laſt moments were probably the happieſt of his life. He died exulting that he was thought worthy of ſuffering for the cauſe of truth, and that he was admitted to ſeal, with his blood, the doctrine of the ſupremacy and unrivalled glory of the Father. Moreri. Bayle.

GENTILITIA, Sacra, among the Romans. See Sacra.

GENTILITIUS, an epithet uſed by ſome authors to expreſs diſeaſes propagated from father to ſon, and running through whole families; ſuch as are more uſually called hereditary diſorders. Such are the gout very frequently, and often many others.

GENTILLET, Valentine, in *Biography*, a native of Dauphiné, who flouriſhed in the ſixteenth century. He had in early life ſtudied juriſprudence, and was a civilian by profeſſion. He was an advocate in the parliament of Toulouſe, and afterwards a ſyndic of the republic of Geneva, and at one period of his life he was preſident of the parliament of Grenoble. He became diſtinguiſhed by his writings againſt popery, but by the edicts publiſhed in France againſt thoſe of the reformed religion, he was driven into exile. His principal works are, “An Apology for the Proteſtants,” which went through ſeveral editions in the French, and was afterwards tranſlated into Latin and enlarged, under the title of “Apologia pro Chriſtianis Gallis Religionis, Evangelicæ ſeu Reformatæ, qua docetur hujus Religionis fundamenta in Sacra Scriptura jacta eſſe:” and “Le Bureau du Concile de Trente, &c.” This was printed in French in 1586, and in the ſame year a Latin tranſlation of it was publiſhed, which was frequently reprinted at different places. Its deſign is to ſhew that many of the decrees of that council were contrary to the ancient councils and canons. He was author alſo of “Anti-machiavel,” and the “Anti-ſocinus.” Bayle.

GENTIMANETOUR, in *Geography*, a town of Hindooſtan, in the Carnatic; 30 miles W. of Cuddalore.

GENTIOUX *et* Pallier, a town of France, in the department of the Creuſe, and chief place of a canton in the diſtrict of Aubuſſon; 9 miles S.W. of Felletin. The place contains 907, and the canton 6,507 inhabitants, on a territory of 327½ kiliometres, in 8 communes.

GENTLE Pit Ore, in *Mineralogy*, a name given by our miners in Suſſex, to a kind of iron ore found in conſiderable plenty in that county, and very readily running in the fire, though not over rich in metal. It is a ſtrong ſubſtance, and lies in ſeveral parts of that county in form of a moderately thick ſtratum. It is of a duſky brown colour, and in ſome places much paler than in others. It has always a great number of glittering ſpangles in it, and very often contains foſſile ſhells, and other extraneous ſubſtances in it.

GENTLEMAN, a perſon of good family, or deſcended of a family which has long borne arms, the grant of which adds gentility to a man's family.

The word is formed of the French *gentilhomme*, or rather of *gentil, fine, faſhionable*, or *becoming*; and the Saxon *mon*, q. d. *honeſtus*, or *honeſto loco natus*. The ſame ſignification has the Italian *gentilhuomo*, and the Spaniſh *hidalgo*, or *hijodalgo*, that is, the ſon of ſomebody, or of a perſon of note. If we go farther back, we ſhall find gentleman originally derived from the Latin *gentilis homo*, which was uſed among the Romans for a race of noble perſons, of the ſame name, born of free or ingenuous parents, and whoſe anceſtors had never been ſlaves, or put to death by law. Thus Cicero, in his Topics, “gentiles ſunt, qui inter ſe eodem ſunt nomine ab ingenuis oriundi, quorum majorum nemo ſervitutem ſervivit, qui capite non ſunt diminuti, &c.” Some hold that it was formed from *gentile*, i. e. *pagan*; and that the ancient Franks, who conquered Gaul, which was then converted to Chriſtianity, were called gentiles by the natives, as being yet heathens. Others relate that towards the declenſion of the Roman empire, as recorded by Ammianus Marcellinus, there were two companies of brave ſoldiers; the one called *gentilium*, and the other *ſcutariorum*; and that it was hence we derived the names gentleman and eſquire. This ſentiment is confirmed by Paſquier, who ſuppoſes the appellation *gentiles* and *ecuyers* to have been tranſmitted to us from the Roman ſoldiery; it being to the *gentiles* and *ſcutarii*, who were the braveſt of the ſoldiery, that the principal benefices and portions of lands were aſſigned. (See Benefice.) The Gauls obſerving, that during the empire of the Romans, the *ſcutarii* and *gentiles* had the beſt tenements, or appointments of all the ſoldiers on the frontiers of the provinces, became inſenſibly accuſtomed to apply the ſame names, *gentilhommes*, and *ecuyers*, to ſuch as they found their kings gave the beſt proviſions or appointments to. Paſq. Rech. lib. ii. cap. 15.

In ſtrictneſs, Chamberlayne obſerves, a gentleman is one whoſe anceſtors have been freemen, and have owed obedience to none but their prince: on which footing, no man can be a gentleman who is not born ſo.

Among us, the term gentleman is applicable to all above yeomen; ſo that noblemen may be properly called gentlemen.

In our ſtatutes, *gentilis homo* was adjudged a good addition for a gentleman, 27 Edw. III. The addition of knight is very ancient: but that of eſquire, or gentleman, was rare before 1 Hen. V.

We read that J. Kingſton was made a gentleman by king Richard II.

As it may juſtly be aſked what conſtitutes a gentleman with us? the reply is eaſy; being a gentleman, is being entitled to bear arms. And Mr. Camden obſerves, that the diſtinction of a gentleman of coat-armour, or an upſtart, and a gentleman of blood, is the bearing of arms from the grandfather; and that he who bears arms from his grandfather is to all intents and purpoſes a gentleman of blood; for which cauſe it is requiſite by the ſtatutes of the Bath that every knight, before his admiſſion, proves himſelf to be ſo qualified, which done, it carries with it, if his merit be equal, a paſſport alſo to the order of the Garter. Notitia Anglicana, p. 24. See alſo Doddridge's Honour's Pedigree, p. 147. Smith, De Republ. Angl. & Forteſcue, fol. 82.

Guillim, in his chapter of gentlemen, ſays, that they have their beginning either of blood, as being born of worſhipful parents; or that they have done ſomething, either in peace or war, whereby they deſerve to bear arms, and be accounted gentlemen. He farther ſays, chap. xxiv. if a gentleman be bound apprentice to a merchant or other trader, he hath not thereby loſt his gentility; and he deſires it may be remembered, for the honour of trade, that king Henry VIII. thought it no diſhonour to him, when he quitted his queen, to take to his wife Anne, the daughter of Thomas Bullen, ſome time mayor of London. To which may be added the thought, that the firſt William, who founded our royal race, was the grandſon of a tanner.

Sir Edward Coke ſays, that eſquires and gentlemen are only names of worſhip, and not of dignity. And before theſe the heralds rank all colonels, ſerjeants at law, and doctors in the three learned profeſſions. See Precedence.

Sir Thomas Smith (ubi ſupra) ſays, that whoſoever ſtudieth the laws of the realm, or ſtudieth in the univerſity, or profeſſeth the liberal ſciences; and (in ſhort) who can live idly, and without manual labour, and will bear the port, charge, and countenance of a gentleman, ſhall be called maſter, and ſhall be taken for a gentleman.

Gentleman *Uſher of the Black Rod,* is the chief gentleman uſher to the king, called in the black book "Lator virgæ nigræ, et haſtiarius," and elſewhere "Virgæ bajulus." His duty is to bear the rod before the king at the feaſt of St. George at Windſor; he has alſo the keeping of the chapter-houſe door, when a chapter of the order of the garter is ſitting; and in time of parliament attends the houſe of peers. His badge is a "black rod," with a lion in gold at top. This rod has the authority of a mace; and to his cuſtody all peers queſtioned for any crime are firſt committed.

Gentleman *of the Bed-chamber.* See Bed-Chamber.

Gentlemen *of the Chapel,* are officers whoſe duty and attendance are in the royal chapel, being in number thirty; ten whereof are prieſts, and the other twenty called *clerks of the chapel,* who aſſiſt in the performance of Divine ſervice. One of the firſt ten is choſen for confeſſor of the houſhold, whoſe office it is to read prayers every morning to the houſhold ſervants; to viſit the ſick, examine and prepare communicants, and adminiſter the ſacrament.

Another, well verſed in muſic, is choſen firſt organiſt: who is maſter of the children, to inſtruct them in muſic, and what is neceſſary for the ſervice of the chapel: a ſecond is likewiſe an organiſt; a third a luteniſt; and a fourth a violiſt.

There are likewiſe three vergers, ſo called from the ſilver rods they uſually carry in their hands; being a ſerjeant, yeoman, and groom of the veſtry: the firſt attends the dean and ſub-dean; finds ſurplices and other neceſſaries for the chapel: the ſecond has the whole care of the chapel; keeps the pews, and ſeats the nobility and gentry; the groom has his attendance within the chapel-door, and looks after it.

Gentlemen *Penſioners.* See Pensioners.

GENTLEN, in *Geography,* a town of Germany, in the duchy of Magdeburg; 30 miles N.E. of Magdeburg.

GENTLEWOMAN, Generosa, is a good addition for the eſtate and degree of a woman, as *generoſus* is for that of a man; and if a gentlewoman be named ſpinſter in any original writ, appeal, &c. it hath been held that ſhe may abate, and quaſh the ſame. (2 Inſt. 668.) But it ſeems that ſpinſter is in general a good addition for an unmarried woman, as ſingle woman is for one who, being unmarried, hath had a baſtard.

GENTOOS, in *Modern Hiſtory,* according to the common acceptation of the term, denote the profeſſors of the religion of the Bramins (ſee Brachmans), who inhabit the country called Hindooſtan, in the Eaſt Indies, from the word *ſtan,* a *region,* and *hind* or *hindoo*; which Feriſhteh, as we learn from colonel Dow's tranſlation of his Hiſtory, ſuppoſes to have been a ſon of Ham, the ſon of Noah. It is obſerved, however, that Hindoo is not the name by which the inhabitants originally ſtyled themſelves, but according to the idiom of the Shanſcrit, which they uſe, *jumbodeep,* from *jumboo,* a *jackall,* an animal common in their country, and *deep,* a large portion of land ſurrounded by the ſea, or *bhertekhunt,* from *khunt,* i. e. a *continent,* and *bherrut,* the name of one of the firſt Indian rajahs. It is alſo obſerved, that they have aſſumed the name of Hindoos only ſince the era of the Tartar government, to diſtinguiſh themſelves from their conquerors, the Muſſulmen. The term *Gentoo,* or *Gent,* in the Shanſcrit dialect, denotes *animal* in general, and in its more confined ſenſe *mankind,* and is never appropriated particularly to ſuch as follow the doctrines of Brhima. Theſe are divided into four great tribes, each of which has its own ſeparate appellation; but they have no common or collective term that comprehends the whole nation under the idea affixed by the Europeans to the word Gentoo. Mr. Halhead, in the preface to his tranſlation of the "Code of Gentoo Laws," conjectures that the Portugueſe on their firſt arrival in India, hearing the word frequently in the mouths of the natives, as applied to mankind in general, might adopt it for the domeſtic appellation of the Indians themſelves, or, perhaps, their bigotry might force from the word Gentoo a fanciful alluſion to gentile or pagan. The Hindoos, or Gentoos, vie with the Chineſe as to the antiquity of their nation. They reckon the duration of the world by four jogues, or diſtinct ages; the firſt is the Suttee jogue, or age of purity, which is ſaid to have laſted about 3,200,000 years, during which the life of man was 100,000 years, and his ſtature twenty-one cubits; the ſecond, the Tirtah jogue, or the age in which one-third of mankind were reprobate, which conſiſted of 2,400,000 years, when men lived to the age of 10,000 years; the third, the Dwapaar jogue, in which half the human race became depraved, which endured to 600,000 years, when mens' lives were reduced to 1,000 years; and fourthly, the Collee jogue, in which all mankind were corrupted, or rather diminiſhed, which the word *colle* imports. This is the preſent era, which they ſuppoſe will ſubſiſt for 400,000 years, of which near 5,000 are already paſt, and man's life in this period is limited to 100 years. It is ſuppoſed by many authors, that moſt of the Gentoo *ſhaſters* or ſcriptures, were compoſed about the beginning of the collee jogue or cal jug, of which, according to Mr. Dow, the year of Chriſt 1769 was the 4887th; but an objection occurs againſt this ſuppoſition, *viz.* that the ſhaſters take no notice of the deluge; to which the Bramins reply, that all their ſcriptures were written before the time of Noah, and the deluge never extended to Hindooſtan. Nevertheleſs it appears from the ſhaſters themſelves, that they claim a much higher antiquity than this; inſtances of which are recited by Mr. Halhead.

After all, it muſt be allowed, that perſons of ſagacity and good judgment have made it appear with ſufficient evidence, that the oldeſt accounts of the Hindoo nation do not, in reality, go further back than to the deluge mentioned in the books of Moſes, and that their religious inſtitutions were conſequently poſterior to that event. Sir William Jones ſays, (Diſſertations relating to Aſia, vol. i. p. 199.) that the firſt corruption of the pureſt and oldeſt religion, which conſiſted in the worſhip of one God, the maker and governor of all things, was the ſyſtem of the Indian theology, invented by the Bramins, and prevailing in thoſe territories, where the book of Mahabad, or Menu, is at this time the ſtandard of all religious and moral duties. In his preface to the "Inſtitutions of Menu," (ſee Menu) he ſays, they are ſuppoſed by the Bramins to have been promulgated by Menu, the ſon or grandſon of Brahma, or the firſt of created beings. This work he ſuppoſes to have been written about 300 years after the Vedas, or about 1280 years B. C. Sir W. Jones is of opinion, that the origin of the Hindoo nation and government is to be looked for in Iran, or Perſia, where a great monarchy was eſtabliſhed before the Aſſyrian, called by the oriental hiſtorians the "Piſhdadian dynaſty;" and they ſay, that the firſt of theſe ancient monarchs, whom they call Mahabad, or Menu, received from the creator a ſacred book, in a heavenly language, meaning the “Vedas,” (Diſſ. relating to Aſia, vol. ii. p. 111.) This firſt monarch, they alſo ſay, divided the people into four orders, the religious, the military, the commercial, and the ſervile. (Diſſ. &c. vol. i. p. 197. 206.) In the reign of Huſhang, the third of the Piſhdadian race, a reformation, he ſays, was made in the religious ſyſtem, when the complex polytheiſm of the preceding times was rejected, and religion was reduced to what is called “Sabaiſm,” which conſiſted chiefly in the worſhip of the ſun, moon, and ſtars; but it is probable, that ſabaiſm, being a more ſimple form of religion than that of the Hindoos, muſt have preceded it. The laws of Mahabad, however, were retained, and his ſuperſtitious veneration for fire. Upon this change, the favourers of the old religion retired to Hindooſtan, and their oldeſt exiſting laws forbad them ever to return, or to leave the country they now inhabit.

Another reformation, or change, in the ſyſtem, was made, he ſays, under Guſhtaſp, in the next, or “Kaianite dynaſty,” thought to have been the ſame with Darius Hyſtaſpis. This was effected by Zeratuſht, or Zoroaſter; he introduced genii, or angels, preſiding over months and days, new ceremonies in the veneration ſhewn to fire, and gave out a new work, which he ſaid came from heaven, but at the ſame time eſtabliſhed the adoration of the Supreme Being. This work was loſt at the conqueſt of Perſia by the Mahometans; but the prieſts of that religion have compoſed another from what they were able to recollect of their inſtitution. It is called “*Zendaveſta*,” which ſee. The followers of Zeratuſht, now called “Gebres,” or Parſis,” perſecuted thoſe of the religion immediately preceding, and theſe alſo took refuge in India, where they wrote a number of books, which are now very ſcarce. They reſemble, according to the account of ſir William Jones, the Hindoo ſects of “Sauras,” and “Saguinas,” of which the laſt is very numerous at Benares.

Another innovator in the religion of the Eaſt, before the Chriſtian era, was “Budda,” (ſee Boodh), generally ſuppoſed to have been the ſame with the Fo (ſee Fo) of the Chineſe, the “Somonocodom” of Siam, the “Xaca” of Japan, and the “Odin” of the north of Europe. According to ſir W. Jones, he diſapproved of the Vedas, becauſe they enjoined the ſacrifice of cattle; and made his appearance in the year 1027 B. C. His diſciples are thought to have been the ſame with the “Sammanes,” who were oppoſed to the Brachmans of the Greek hiſtorians. But theſe Sammanes were, it is probable, of much greater antiquity, as was alſo Somonocodom. The followers of Budda gave great umbrage to the Bramins, who never ceaſed to perſecute them till they had effected their extirpation from Hindooſtan by fire and ſword, about 500 years ago. There is, however, a great reſemblance between the ſyſtem of the Hindoos and that of Budda; and perhaps with a view to conciliate theſe people, the Bramins of Caſi make Budda the 9th *avatar* or transformation of Vichnow. This religion is that which prevails in India beyond the Ganges; it was received in China A. D. 65, and is eſtabliſhed in Japan. A religion, very ſimilar to this, is alſo that of the Lamas of Thibet. Indeed, all deviations from the original Hindoo ſyſtem, retained the ſame general principles. The advocates of them all held the doctrine of the pre-exiſtence of ſouls, their ſubſiſting and acting independently of bodies, and their tranſmigration into other bodies after death. They had the ſame low opinion of matter, and the ſame veneration for the elements of fire and water, as purifiers of the ſoul. They had ſimilar reſtrictions with reſpect to food, the ſame addictedneſs to divination, and the ſame idea of the uſe of corporeal auſterities for the expiation of ſin.

There can be no doubt of the very high antiquity of the religion of the Hindoos, and it is not improbable that the commencement of all thoſe ſyſtems which deviated from the religion of the patriarchs, preſerved in the writings of Moſes, was prior to the general diſperſion of mankind. A ſyſtem ſo ancient as that of the Hindoos muſt have been formed about the ſame time with that of the Egyptians, from which that of the Greeks, and other weſtern nations, was in ſome meaſure derived; and accordingly many points of reſemblance have been obſerved between them; too many, and too ſtriking to have been altogether fortuitous. Even ſome of the inhabitants of Ethiopia appear to have been of the ſame origin with thoſe of Hindooſtan (ſee Diſſ. relating to Aſia, vol. i. p. 112.); and both the Egyptians and Ethiopians ſeem to have had ſome connection or intercourſe with the Hindoos; but of what kind it was, or when it ſubſiſted, we have no certain account; and they have been ſo long ſeparated, that at preſent they are in total ignorance of each other. According to Euſebius and Syncellus, ſome people from the river Indus ſettled in the vicinity of Egypt in the reign of Amenophis, the father of Seſoſtris, and many Egyptians, baniſhed by their princes, ſettled in other countries, and ſome went ſo far as India. It is alſo ſuppoſed, that many of the prieſts of Egypt left the country on the invaſion of it by Cambyſes. But ſuch circumſtances as theſe are not of themſelves ſufficient to account for the great reſemblance between the two ſyſtems. The Hindoos themſelves ſay, that their ſacred books came from the weſt, (ſee Ezourvedam, p. 15—17.) But the Hindoos, as well as their books, moſt probably came from that quarter, and their ſacred books were compoſed while the ſeat of the empire was in Perſia. The affinity of the Egyptians and Hindoos may be inferred from the ſimilarity that ſubſiſts between ſome Egyptian words and thoſe that occur in the ancient language of Hindooſtan. The names and figures of the 12 ſigns of the zodiac, among the Hindoos, are nearly the ſame with ours, which came from Egypt through Greece, and each of theſe is divided into 30 degrees. Moreover, both the Egyptians and Hindoos had alſo the ſame diviſion of time into weeks, and they denominated each day by the names of the ſame planets. The reſemblance between the oriental and occidental ſyſtems extends much farther than Egypt. The office and power of the Druids in the northern parts of Europe did not differ much from thoſe of the Bramins; and the Etruſcans, from whom the Romans derived the greateſt part of their learning and religion, had a ſyſtem very much reſembling that of the Perſians and Indians, and they wrote alternately to the right hand and left. (See Etruscans.) Several remarkable “general principles” were held alike by the ancient Egyptians and the modern Hindoos. They both believed that the ſouls of men exiſted in a prior ſtate, and that they go into other bodies after death. They had the ſame ideas of the body being a priſon to the ſoul, and imagined that they could purify and exalt the ſoul by the mortification of the body; and from the idea of the great ſuperiority of ſpiritual to corporeal ſubſtances, they held all matter in great contempt. They alſo both believed that plants had a principle of animation. Several religious ideas and cuſtoms were common to both countries. The Egyptians of Thebais repreſented the world under the figure of an egg, which proceeded from the mouth of Cneph; and this reſembled the firſt production according to the Hindoo ſyſtem. Several of the Egyptian deities were both male and female, which correſponds to the figure of the “lingam” with the Hindoos. This obſcene figure, or at leaſt the “phallus,” was much uſed in the Egyptian worſhip, and from Egypt it was carried into Greece, where it was uſed in the myſteries of Bacchus. Beſides, the laſcivious poſtures of the Egyptian women before their god Apis, were the ſame with thoſe of the Hindoo women, before their idols, (ſee BRACHMANS): and, moreover, the Hindoos chuſe their ſacred bulls by the ſame marks that were uſed by the Egyptians. The Egyptians worſhipped the Nile, as the Hindoos do the Ganges: the pyramidal or conical form of the Egyptian temples reſembled that of the pagodas: and the onion, which was held in veneration by the Egyptians, is not eaten by the Hindoos. Beſides this reſemblance of general principles, and religious cuſtoms, it is obſervable, that the Hindoos, Egyptians, and Greeks adopted the ſame gods, and paid homage to them under ſimilar repreſentations or images. The Egyptians held cows in much greater veneration than any other animal: they were ſacred to Iſis, and never ſacrificed. That the cow was reſpected by the Hindoos is well known. Upon the whole, it is undeniable that a ſyſtem, very ſimilar to that of the preſent Hindoos, muſt have been of very great antiquity, and prior to the general diſperſion of mankind. For though ſimilar ſituations may lead to ſimilar ſentiments, and correſponding practices, the above-mentioned ſimilarity, which might be traced in a much greater number of inſtances, extends to too many particulars, to admit our accounting for it in this way: nevertheleſs, it is impoſſible that a ſyſtem, ſo extenſive and complex, and implying ſuch abſtruſe metaphyſics, as that of the Hindoos, ſhould have been completed at a very early period. This muſt have been ſubſequent to the rudeſt age of mankind; and, therefore, we may well imagine, that it could not have had its origin long before the time of Moſes. Whether the Jewiſh law-giver was acquainted with it or not, it will appear to any candid as well as accurate examiner of the one or the other, that he was far from deriving any advantage from it; nor is there in his writings any alluſions to *books* pretended to be ſacred, ſuch as the Vedas, but only to ſuch *practices* as were common to the Hindoos and other heathen nations.

The Hindoos ſeem to have preſerved the knowledge of the Supreme Being, when the Greeks, and other more poliſhed nations in the weſtern parts of the world, had loſt ſight of him; their attention being ingroſſed by inferior objects of worſhip. Some of their deſcriptions of the deity are juſt, and truly ſublime. In the “Inſtitutes of Menu” he is ſaid to be “one whom the mind alone can comprehend, whoſe eſſence eludes the external organs, who has no viſible parts, who exiſts from eternity, the ſoul of all beings, whom no being can comprehend.” They alſo ſay, that “goodneſs is the very eſſence of God.” (See BRACHMANS.) Nevertheleſs, the moſt ſublime conceptions of Deity entertained by the Hindoos fall far below thoſe that were formed of him by the Hebrews, and which are recorded in the ſacred writings. In the Hindoo ſyſtem the firſt production of the Supreme Being was ſomething ſimilar to the chaos of Moſes, an earth covered with water; and they ſpeak of the “ſpirit of God” as moving upon it. One of the Hindoo fables, related by father Bouchet (Ceremonies of Religion, p. 38.) bears ſome reſemblance to the moſaic hiſtory of Paradiſe. The Hindoos ſay that the firſt man was called “Adam,” and the firſt woman “Manan-iva.” The Hindoos have alſo a peculiar day of the week, which they appropriate to acts of religion, as prayer and faſting: and in agreement, at leaſt in part, with the account of Moſes, the Hindoos ſay that in the firſt ages of the world men were greatly ſuperior to the preſent race both in the length of their lives, and in the powers both of body and mind; but that, in conſequence of vice, they gradually declined. The Hindoos have alſo preſerved an unequivocal tradition of an univerſal deluge; and according to the “Puranams,” books which are ſaid to contain a faithful account of their doctrines, eight perſons eſcaped the general deluge. A curious account of the intoxication of Noah, and of the behaviour of his three ſons on the occaſion, is given us from the Hindoo writings in the third volume of “Aſiatic Reſearches.” The 4th and 5th “avatar” of the Hindoos, as ſir W. Jones ſays (Diſſ. &c. v. i. p. 110.) relate to the puniſhment of impiety, and the humiliation of the proud; and refer, as he thinks, to the diſperſion from Babel. In the “Bagavadam” there are, beſides the moſaic account of the deluge, the principal circumſtances of the hiſtory of Iſhmael, and the ſacrifice of Iſaac. Several things occur in the Hindoo traditions, which greatly reſemble ſome in the hiſtory of Abraham; and Brahma, the Hindoo law-giver, very much reſembles this ancient patriarch.

The ſeveral inſtitutes contained in the collection of the Gentoo laws, which we ſhall preſently notice, are interwoven with the religion of the Gentoos, and revered as of the higheſt authority. The curious reader will diſcover an aſtoniſhing ſimilarity between the inſtitutes of this code and many of the ordinances of the Jewiſh law, between the character of the Bramins or prieſts, and the Levites; and between the ceremony of the ſcape-goat, under the Moſaic diſpenſation, and a Gentoo ceremony, called the *aſhummeed jug*, in which a horſe anſwers the purpoſe of a goat. In this code we find ſome of the more extraordinary laws and cuſtoms of the Hebrew nation, ſuch as were never received in the weſtern part of the world; as that of a man taking the widow of his brother, in order to keep up his family. Polygamy appears alſo to have been allowed to the Hindoos, as it was to the Hebrews. Many obſolete cuſtoms and uſages, alluded to in many parts of the Old Teſtament, may alſo receive illuſtration from the inſtitutes of this code. It appears from the code, that the Bramins, who are the prieſts and legiſlators of the country, have reſigned all the ſecular and executive power into the hands of another caſt or tribe; and no Bramin has been properly capable of the magiſtracy ſince the time of the ſuttee jogue; the only privilege of importance which they have appropriated to themſelves is an exemption from all capital puniſhment; they may be degraded, branded, impriſoned for life, or ſent into perpetual exile; but it is every where expreſsly ordained, that a Bramin ſhould not be put to death on any account whatſoever.

Among the Hindoos there is a conſiderable difference of opinion on the ſubject of creation; but in the following general outline they ſeem to be all agreed. They ſay, that after the Supreme Being had exiſted alone from all eternity, he reſolved to produce other beings. But this production was wholly “from his own ſubſtance;” and after a certain period, they believe that every thing will be abſorbed into him again, when he will exiſt alone as before. There will, however, be a ſucceſſion of theſe creations and abſorptions without end. At what time the firſt creation took place they do not ſay; but according to them, every thing that now exiſts has exiſted before, and will hereafter exiſt again. The great ſuperiority of the ſpiritual to the corporeal part of man is the fundamental doctrine of the Hindoo ſyſtem; and hence ſprings the ſatisfaction which the Hindoos always expreſs on the ſeparation of them. From the Indian philoſophy it is probable that the Manicheans had their idea of an original difference in ſouls, ſome being neceſſarily good, and others bad. That all nature is animated, and that the ſouls which animate the loweſt forms of things are capable of riſing to the higheſt ſtate, is aſſerted in the “Inſtitutes of Menu.”

Menu." Thus it is ſaid, "the ſouls that animate worms and inſects, ſerpents, moths, beaſts, birds and vegetables, attain heaven by the power of devotion."

The doctrine of tranſmigration is one of the diſtinguiſhing tenets of the Gentoos. With regard to this ſubject it is their opinion, according to Mr. Holwell, that thoſe ſouls which have attained to a certain degree of purity, either by the innocence of their manners, or the ſeverity of their mortifications, are removed to regions of happineſs, proportioned to their reſpective merits; but that thoſe who cannot ſo far ſurmount the prevalence of bad example, and the powerful degeneracy of the times, as to deſerve ſuch a promotion, are condemned to undergo continual puniſhment in the animation of ſucceſſive animal forms, until, at the ſtated period, another renovation of the four jogues ſhall commence, upon the diſſolution of the preſent. They imagine ſix different ſpheres above this earth, the higheſt of which, called *ſuttee*, is the reſidence of Brhimā, and his particular favourites. This ſphere is alſo the habitation of thoſe men who never uttered a falſhood, and of theſe women who have voluntarily burned themſelves with their huſbands; the propriety of which practice is expreſsly enjoined in the code of the Gentoo laws. This code, printed by the Eaſt India company in 1776, is a very curious collection of Hindoo juriſprudence, which was ſelected by the moſt experienced pundits, or lawyers, from curious originals in the Shanſcrit language, who were employed for this purpoſe from May 1773 to February 1775; afterwards tranſlated into the Perſian idiom, and then into the Engliſh language, by Mr. Halhed.

We have already obſerved, that the Hindoos are divided into four great and original tribes, which, according to the Gentoo theology, proceeded from the four different members of Brhimā, the ſuppoſed immediate agent of the creation under the ſpirit of the Almighty. Theſe tribes are the Bramins, which proceeded from his mouth, and whoſe office is to pray, read, inſtruct, and conduct the ſacrifices; the Chehteree, which proceeded from his arms, whoſe office is to draw the bow, to fight, and to govern; the Bice, proceeding from the belly or thighs, who are to provide the neceſſaries of life by agriculture and traffic; and the Sooder from the feet, which are ordained to labour, ſerve, and travel. See CAST.

Few Chriſtians, ſays the tranſlator of the Gentoo Code, have expreſſed themſelves with a more becoming reverence of the grand and impartial deſigns of Providence in all its works, or with a more extenſive charity towards all their fellow-creatures of every profeſſion, than the Gentoos. It is, indeed, an article of faith among the Bramins, that God's all-merciful power would not have permitted ſuch a number of different religions, if he had not found a pleaſure in beholding their varieties.

Mr. Holwell, and alſo Mr. Dow, attempt to exculpate the Hindoos from the charge of polytheiſm and idolatry. "Let us reſt aſſured," ſays the latter, "that whatever the external ceremonies of religion may be, the ſame infinite being is the object of univerſal adoration." But though the Hindoos acknowledge one Supreme Being, from whom all power is derived, they ſuppoſe that the immediate government of the world is placed by him in other hands. To theſe inferior deities their prayers and religious ſervices are externally addreſſed; and this worſhip is encouraged and enjoined in their ſacred books. According to their ſyſtem, there ſprung from the Supreme Being, as emanations of his divinity, an infinite number of ſubaltern deities and genii, of which every part of the viſible world was the ſeat and temple. Theſe intelligences did not barely reſide in each part of nature; but they directed its operations, each element being under the guidance of ſome being peculiar to it. Theſe inferior gods, being of various and oppoſite diſpoſition and character, their worſhippers adopted different methods of deprecating their anger, and ſoliciting their favour. Hence proceeded a great variety of whimſical and abſurd, and alſo of cruel and dreadful, as well as impure, rites. The veneration of the Hindoos for the images of their gods ſubjects them juſtly to the charge of idolatry and polytheiſm; although the learned Bramins pretend, that they do not worſhip the viſible idol, but the inviſible being repreſented by it. Mr. Sonnerat ſays that, beſides thoſe whom the Hindoos place in the rank of gods, they have alſo "ſaints," whoſe pictures they place in their temples, and that they addreſs prayers to them as well as to their gods. Nor let it be ſaid, that theſe are the accounts of travellers. In the ſacred books of the Hindoos mention is made of various divinities beſides the Supreme Being. The worſhip of the ſun, ſays ſir W. Jones (Diſſ. &c. v. i. p. 481.) is principally recommended in the Vedas. The "Inſtitutes of Menu" ſay, that "the Supreme Being created an aſſemblage of inferior deities, and divine attributes, and pure ſouls, and a number of genii exquiſitely delicate." In this work mention is alſo made of "orders of demi-gods that are wafted in airy cars, genii of the ſigns and lunar manſions, &c." The worſhip paid to the manes, or anceſtors, is a great article in the ſyſtem, and is mentioned almoſt in every page of the "Inſtitutes." All the neighbouring nations whoſe religions have ſome affinity to that of the Hindoos are polytheiſts. The ancient religion of the northern European nations was, in ſeveral reſpects, ſimilar to that of the Eaſt; and we find among them the acknowledgment of one Supreme God, with the worſhip of ſeveral inferior ones. Thus, their deities, Odin the god of war, Frea his wife, and Thor the god of thunder, were the principal objects of worſhip to all the Scandinavians.

It has been ſaid that the polytheiſm of the Hindoos, and others, was mild and tolerant in its nature; but the fact is, that like the ancient Egyptians, they quarrelled with one another on account of their attachment to different deities, eſpecially in Malabar; and mild as the religion of the Hindoos appears to be, and gentle as are their general manners, they can aſſume a very different character when their religion is concerned. The Bramins exterminated the Sammanians, and the followers of Budda, with fire and ſword, leaving none of them on the weſt ſide of the Ganges, under a pretence of their being atheiſts; and when any Hindoo is converted to Chriſtianity, he is not only baniſhed from his tribe, but abandoned to the inſults of the whole nation. Such alſo was the treatment of thoſe who were excommunicated by the Druids. The Hindoos regard all Chriſtians with the utmoſt abhorrence and deteſtation, as much below the loweſt of their own ſects. The Bramins themſelves can be cruel and malignant, where their religion is concerned. Nevertheleſs, when the Hindoos converſe with Chriſtians on the ſubject of religion, they profeſs to believe, as we have already obſerved, that the Supreme Being is equally pleaſed with all religions, and intended that all the different modes of it ſhould be adopted by different nations.

Although there are many points of reſemblance between the religion of the ancient Egyptians and that of the Hindoos, yet in many reſpects they are exceedingly different; ſo that though they may have gone together at the firſt, they muſt have ſeparated at a very early period. The Hindoos never worſhipped living animals, which is a principal feature in the religion of the Egyptians; and the names, the characters, and the images of their deities have very little reſemblance to each other. But between the religion and mythological fables of the Greeks and thoſe of the Hindoos, there is a very remarkable reſemblance; though we are unable to trace any connection that ever ſubſiſted between them.

The religion of the Hindoos ſeems to be much too complex to have been, as ſir W. Jones ſuppoſes, the oldeſt ſyſtem of polytheiſm and idolatry. It is evidently a refinement on ſomething much more ſimple, and this ſeems to have been the ſyſtem of the "Sammanes," whom the Greek writers mention as a ſect of philoſophers in India, oppoſed to the "Brachmanes," and to be the ſame with thoſe who are now called "Schamans" in Siberia. See SAMANCANS.

Nothing can be more humiliating than the ſituation to which the Hindoo inſtitutions reduce the female ſex. According to the Vedas, the ſouls of women, as well as thoſe of all individuals of the inferior caſts, are condemned to continual tranſmigrations, till they are regenerated in the bodies of men. The ſame unfavourable character is amply juſtified by the repreſentations that occur in the "Inſtitutes of Menu," and the "Code of Gentoo laws." Such being, in the opinion of the Hindoo law-givers, the natural character of women, it is no wonder that little regard is paid to their evidence in courts of juſtice; nor can we be ſurpriſed, that the birth of a female is no cauſe of rejoicing in a Hindoo family. In perfect agreement with ſuch degrading ideas of the female character, the women muſt always be under the abſolute controul of men; nor has the ſubjection of the wife to her huſband any bounds. As women are treated in this diſreſpectful manner, and conſidered as unqualified to read their ſacred books, they are in general very ignorant, ſo that few of them can either read or write.

The devotion of the Hindoos is ſuppoſed to compriſe all other duties; but their devotion conſiſts in the frequent repetition of the names and attributes of God. The firſt thing in their prayer is to pronounce the word *oum*, then excluding all ſenſible objects, even forbearing to breathe, and to think only on God. This kind of prayer ſerves for the pardon of ſin and purification. This word *oum*, on the pronunciation of which ſo much is ſuppoſed to depend, ſignifies, according to ſir W. Jones, Brahma, Vichnou, and Seva, or the three powers of creation, preſervation, and deſtruction. This myſtical word, he conceives, may be the Egyptian *on*, commonly ſuppoſed to mean the ſun, and by the ancient idolaters the ſolar fire. The religion of the Hindoos conſiſts principally in oblations to the gods, *i. e.* to the inferior deities, and to the manes of their anceſtors; and theſe oblations are accompanied with many frivolous ceremonies. Moreover, a great part of their religion conſiſts in the auſterities to which they ſubject themſelves. Among other things, all fermented or ſpirituous liquors are forbidden, and they ſubmit to various reſtrictions with regard to their food. To a genuine Hindoo nothing appears more heinous than the killing, and much more the eating of any thing that had life. The Hindoos are much devoted to pilgrimages for the purpoſe of bathing in diſtant rivers; and they generally prefer the Ganges. In theſe pilgrimages, they practiſe ſingular auſterities. Their faſts in honour of different deities are of long duration, and are very ſtrictly obſerved; and they are thought to have ſingular efficacy in effacing all ſins. See FAQUIRS.

It is not uncommon with the Hindoos to devote themſelves to certain and very painful death, under the influence of their wretched ſuperſtition. They throw themſelves on the large iron hooks that are faſtened to the wheels of the carriages, which carry the images of ther deities in proceſſion. Others lie ſprawling on the ground for the wheels to paſs over them, and cruſh them to death. But the moſt affecting inſtances of involuntary death are thoſe of the Hindoo women, who burn themſelves alive with the bodies of their deceaſed huſbands. In this way of terminating life they indulge the hope of attaining the ſame ſtate of happineſs with them after death. This is deemed a kind of religious duty, though it is not regarded as of univerſal obligation. On the deaths of perſons of high rank and celebrity, theſe victims of ſuperſtition, voluntary, or involuntary, are ſometimes very numerous. At the death of a king of Tanjore, no leſs than 300 of his concubines leaped into the flames, and 400 burned themſelves at the funeral of a naique, of Madura. (Maurice's Ind. Antiq. vol. ii. p. 165.) The Hindoo religion, which has been extolled as the mildeſt of all religions, formerly enjoined and countenanced human ſacrifices; and ſir William Jones ſays, that the ancient ſolemn ſacrifice of the Hindoos was that of a man, a bull, and a horſe. Among other ſuperſtitious notions and practices prevalent among the Hindoos, we may mention their exceſſive veneration for the cow, and alſo for the elements of fire and water. Penances of a ſingular and ſevere nature were enjoined for killing cows without malice; and if this crime was maliciouſly committed, it admitted of no expiation whatever. Mr. Wilkins informs us, (Sketches relating to the hiſtory, &c. of the Hindoos, vol. i. p. 234.) that the Bramins are enjoined to light a fire at certain times, and that it muſt be produced by the friction of two pieces of wood of a particular kind; that with a fire thus procured their ſacrifices are burned, the nuptial altar flames, and the funeral pile is kindled. Their veneration for water, eſpecially that of the Ganges, has already been mentioned; and perſons chuſe to die in rivers from an idea, that the ſoul paſſing through the water, as it leaves the body, is purged from its impurities.

The Hindoo religion is little, if at all, more unexceptionable than the ancient Egyptian, with regard to the extravagance and indecency of many of its ceremonies. Inſtances occur at their pagodas, which we have already noticed under the article BRACHMANS, and which it is needleſs here to repeat. (See alſo PAGODA.) Charms are alſo held in eſtimation among the Hindoos; a regard to them is authorized by their ſacred books, and the practice of incantation is profeſſed by their learned Bramins. From a veneration for the elements of fire and water, and an opinion of their poſſeſſing ſomewhat of divinity, they have been deemed proper teſts of guilt, or of innocence. Hence has proceeded the trial by *Ordeal;* which ſee. With regard to the Hindoo doctrine of a future ſtate, Mr. Dow ſays, that men firſt atone for their crimes in hell, where they remain for a ſpace of time proportioned to the degree of their iniquities; then they riſe to heaven, to be rewarded for their virtues, and thence they will return to the world to re-animate other bodies. The more learned Bramins, he ſays, affirms that the hell which is mentioned in the "Bedang" is only intended as a bug-bear to the vulgar; agreeably to the doctrine of the Greek philoſophers. On the other hand, Mr. Holwell, contrary to all other accounts, which repreſent future puniſhment as in all caſes finite, ſays, that whoſoever ſhall free himſelf by violence from this mortal body, ſhall be plunged in "Onderah" for ever. According to another account of the religion of Malabar, they who deſtroy themſelves go neither to heaven nor hell, but ſtroll about, and become what are called "Spirits," under the power of the chief of the devils. Sometimes they enter into men, and then they become demoniacs, and go about naked and mad, to diſturb the neighbourhood, eating graſs and raw fleſh. According to the Indians, ſays P. Della Valle, ſome very wicked men become devils. To conclude our account of the Hindoos, or Gentoos, we obſerve, that notwithſtanding the unreaſonable ſtreſs which they lay on mere external obſervances of various kinds, there are not wanting in their writings ſome excellent moral maxims, ſimilar to many in the books of the Old Teſtament, which repreſent every thing of this kind as inſignificant, without moral virtue. A peculiar ſtreſs, we find, even too great, is laid on the duties to parents; ſo as to ſuperſede the obligation, and to depretiate the importance of other duties. Upon comparing the Hindoo ſyſtem with that of Moſes, the abſurdity of the former is as apparent as the ſuperior wiſdom of the latter. With the Hindoos we perceive the rudiments, and more than the rudiments, of moſt of the arts and ſciences, eſpecially that of aſtronomy, of which moſt other nations are wholly ignorant. And yet while the Hebrews made no diſcoveries in ſcience, they had a religion perfectly rational; and that of the Hindoos was abſurd in the extreme. This, ſurely, is an argument of the internal kind in favour of the divine origin of the Hebrew religion, almoſt as irreſiſtible as any argument from miracles. From the preceding ſketch of the Hindoo religion, we muſt be led to acknowledge the neceſſity and utility of a divine revelation.

Thoſe who are deſirous of being farther acquainted with the principles, manners, and various inſtitutes of the Gentoos, may conſult Holwell's Intereſting hiſtorical Events, &c. 1766. Dow's Hiſtory of Hindooſtan, 4to. 1768. and the Code of Gentoo Laws. Prieſtley's Compariſon of the Inſtitutions of Moſes with thoſe of the Hindoos and other Ancient Nations, 8vo. Northumberland, in America, 1799. For a further account of the religious tenets and practices of the Gentoos, ſee Brachmans. See alſo Shastah and Viedam.

GEN-TSING, in *Geography*, a town of China, in Setchuen; 87 miles N.W. of Hoei-li.

GENUFLEXION, of *genu*, *knee*, and *flecto*, *I bend*, the act of bowing, or bending the knee; or rather of kneeling down.

The Jeſuit Roſweyd, in his Onomaſticon, ſhews, that genuflexion, or kneeling, has been a very ancient cuſtom in the church, and even under the Old Teſtament diſpenſation; and that this practice was obſerved throughout all the year, excepting on Sundays, and during the time from Eaſter to Whitſuntide, when kneeling was forbidden by the council of Nice.

Others have ſhewn, that the cuſtom of not kneeling on Sundays had obtained from the time of the apoſtles; as appears from St. Irenæus and Tertullian; and the Æthiopic church, ſcrupulouſly attached to the ancient ceremonies, ſtill retains that of not kneeling at divine ſervice. The Ruſſians eſteem it an indecent poſture to worſhip God on their knees. Add, that the Jews uſually prayed ſtanding. Roſweyd gives the reaſons of the prohibition of genuflexion on Sundays, &c. from St. Baſil, Anaſtaſius, St. Juſtin, &c.

Baronius is of opinion, that genuflexion was not eſtabliſhed in the year of Chriſt 58, from that paſſage in Acts xx. 36. where St. Paul is expreſsly mentioned to kneel down at prayer: but Saurin ſhews, that nothing can be thence concluded.

The ſame author remarks, alſo, that the primitive Chriſtians carried the practice of genuflexion ſo far, that ſome of them had worn cavities in the floor where they prayed: and St. Jerome relates of St. James, that he had contracted a hardneſs on his knees equal to that of camels.

GENUS, in *Algebra*. The ancient algebraiſts diſtributed that art into two genera, or kinds; the *logiſtic*, and *ſpecious*; which ſee.

Genus, in *Syſtematic Botany*, from γενος, a *family*, implies one or more ſpecies of plants, differing eſſentially in their parts of fructification from all others, and agreeing together in the general ſtructure of thoſe parts, as well as in one or more peculiar marks or characters. If a genus be perfectly natural and diſtinct, ſuch characters in the fructification are accompanied with more or leſs decided diſtinctions in the other parts of the plant, as well as in its general habit or aſpect. On this principle it is contended by Linnæus and his ſchool, that all genera are, or ought to be, natural, and that the genus ought to give the character, not the character the genus. The ſame principle is extended to the animal kingdom. Botaniſts of the French ſchool, on the contrary, maintain that all ſuch aſſociations and diſtinctions are merely arbitrary, ſerving to facilitate the ſtudy of plants, but not at all founded in nature. It is ſingular that, with ſuch ideas, theſe philoſophers ſhould not only ſtrenuouſly contend for a natural ſyſtem of arrangement, but object to the Linnæan method, whoſe *facility* cannot be diſputed, merely becauſe it is not *natural*, terming it in their language *léze nature*. If genera are not natural, certainly the more comprehenſive aſſemblages, of ſuch genera into orders and claſſes, can, in no ſenſe, be ſo. We nevertheleſs do not ſcruple to allow, that the principles of all ſuch diſtinctions are founded in nature, though we readily admit that no ſyſtem has as yet applied them correctly to practice, even with regard to generic, and far leſs to claſſical, diſtinctions. The latter indeed have been ſcarcely found capable of definition, or in ſo vague a manner as to leave us moſt in doubt where preciſion is moſt wanted; and were it not for that intuitive, or at leaſt practical, perception of affinities and differences, which is, by the French, contended to be inadmiſſible in judging of genera, we could certainly come at no knowledge of moſt of the natural orders of theſe learned writers.

Examples of natural genera, each characterized by an eſſential character of its own, which diſtinguiſhes it, not only from every other genus in its natural order, but from every one hitherto diſcovered, are found in *Quercus* the Oak, whoſe acorn affords ſuch a character; in *Trapa*, whoſe ſingular quadrangular nut is armed with ſpines that once conſtituted the calyx-leaves; in *Parnaſſia*, ſo well marked by the fringes and lucid balls that border its nectaries; in *Soldanella* with its many-cleft monopetalous corolla, and *Elæocarpus*, whoſe polypetalous one is ſimilarly cut; in *Geoffræa*, the only known inſtance of a papilionaceous flower with a drupa; not to mention a great number beſides. Inſtances of good natural genera, diſtinguiſhed by ſome one eſſential character from all others in their natural order, are found in *Echium*, whoſe irregular corolla keeps it diſtinct from all others of the *Aſperifoliæ*; *Cornucopia*, known from all other graſſes by its remarkable involucrum; *Pimpinella* diſtinguiſhed from its allies by the globoſe ſtigmas; *Ranunculus* by the nectariferous pore in the claw of each petal; *Vella* by the prominent dilated partition of its pouch, extending twice as far as the valves; to which may be added many genera of the claſs *Didynamia Gymnoſpermia*; ſee Smith's Introd. to Botany, 434. The Linnæan *Icoſandria Polygynia* affords one of the moſt perfect examples poſſible of a natural claſs and order, of which all the genera are natural, and ſo well diſtinguiſhed in habit, that any perſon at all obſervant of plants may know them by their foliage, infloreſcence, or general appearance, while their fruit affords clear eſſential generic characters. The natural family of *Orchideæ*, as arranged by Swartz and Brown, come very near the ſame point of perfection, but their differences of habit are leſs obvious. Such inſtances ought to ſtimulate the philoſophical botaniſt to "go on from one degree of perfection to another,"

another," though, like the chriſtian moraliſt, he cannot hope to reach the ſummit.

Lamarck has very well traced the indiſtinct origin, and gradual improvement of generic knowledge among botaniſts. In an early ſtate of the ſcience, ſome general aſſociations were formed, though founded on vague and unphiloſophical principles. The idea and name of a roſe ſoon embraced many different ſpecies, and hence the dog-roſe, the white-roſe, the damaſk-roſe, &c. were diſtinguiſhed from one another, and a ſort of generic and ſpecific nomenclature aroſe, finally extended ſyſtematically to every plant by Linnæus. Caſpar Bauhin in his *Pinax*, anno 1623, firſt diſtributed plants under a kind of generic ſections, with ſome mention of the peculiar characters of each; but he did not profit, as he ought to have done, of the great principle firſt inculcated by Conrad Geſner, that the parts of the flower and fruit afford the only clue to a ſcientific diſtribution of vegetables; a principle to which "the very exiſtence of botany, as a ſcience, is owing." Tournefort at length, adopting this maxim, undertook the arrangement of all known plants into genera, illuſtrating each by a figure of the parts of fructification, ſo as to diſplay their diſtinguiſhing characters; but it was reſerved for Linnæus to define thoſe characters in words, and thus to perfect the plan of Tournefort, as well as to reform it in many points, and correct ſome fundamental defects. He extended moreover his improvements to the clear definition and nomenclature of the ſpecies, which Tournefort had, without diſcrimination, merely collected, by their old appellations, under each of his genera, except indeed that he preſerved an uniformity in their generic names.

Linnæus did not at once hit upon the beſt manner of defining his genera. His firſt aim was to deſcribe all the ſeven parts of fructification in each, ſo that their differences might appear, which is the plan of all the editions of his *Genera Plantarum*. At length, in the ſixth edition of his *Syſtema Naturæ*, publiſhed in 1748, he undertook a ſynoptical table of the ſhort eſſential characters of the genera, and in the tenth he carried this plan nearly to the perfection in which he left it at his death. It has been adopted, not only by his pupils, and the followers of his ſyſtem of claſſification, but even by the celebrated Juſſieu and his ſcholars, who have widely differed from the learned Swede as to other principles of arrangement, and who have certainly not improved upon his ſtyle of definition, terminology, or nomenclature. Juſſieu indeed has, like Gouan, ſubjoined to the generic characters taken from the fructification, very uſeful indications of the habit, which invention of the latter botaniſt was highly applauded by Linnæus.

Linnæus termed the full deſcriptions in his *Genera Plantarum*, the *natural* character of each genus. They ought to accord with every ſpecies of each, but in large genera, many ſpecies of which have been diſcovered ſubſequently to their eſtabliſhment, this is ſcarcely poſſible. Such characters as ſerve merely to diſtinguiſh each genus from every other in its artificial order, in the Linnæan, or any other artificial, ſyſtem, are called *factitious*; theſe are much better extended ſo as to include ſufficient marks of diſcrimination between the genus under conſideration and every other, and they then become the *eſſential* characters above-mentioned, which ought in every ſyſtematic botanical work to ſtand at the head of each genus, or at leaſt to be indicated by a reference. Lamarck, though much diſpoſed to criticiſe the great Swediſh botaniſt, and differing totally from him reſpecting his opinion of natural genera, very candidly allows that "theſe eſſential characters are the reſult of one of Linnæus's moſt happy ideas, and cannot but contribute greatly to the perfection of Botany." The ſame able writer aſſents entirely to the Linnæan maxim, founded on the good ſenſe and penetration of Conrad Geſner, that "generic characters ought always to be taken from the parts of fructification alone;" "at leaſt," ſays Lamarck, "if that be always practicable." When it is not, he would borrow characters from any thing very decided in the habit; nor does he perceive that any inconvenience would reſult from it. To this we object the uncertainty of ſuch characters, even when taken from what is leaſt exceptionable, the infloreſcence. Of this no more ſtriking example can be found than the *Umbellatæ*, as diſtributed by Linnæus after the principles of his friend Artedi, in which, however it may be diſguiſed by ſophiſtry, the infloreſcence makes a leading part. Thoſe who juſtly, like Lamarck, complain of the errors, unjuſtly termed by him *arbitrary* and *voluntary* errors, which are found in this part of Linnæus's ſyſtem, cannot but allow that they all originate from his having had reſpect to the infloreſcence, that is, to the umbels and involucrums, inſtead of the flowers and ſeeds, which if truly obſerved are fully ſufficient in this, as, we believe, in every other natural order. Indeed the more we conſider the ſubject, the more we are convinced that, although the infloreſcence ought, like every part of a plant, to enter into our general contemplation before we decide upon a genus, it ought never to form a part of the technical or eſſential character. It is tempting enough to botaniſts who are not endowed with clear mathematical powers of diſcrimination and definition, to amplify their generic characters with any thing that, as they ſuppoſe, may give them additional ſtrength. But characters, when too long, rather indicate feebleneſs in themſelves and in their authors, and endanger a return towards barbariſm in a ſcience, which has been raiſed to its preſent pitch of perfection by the didactic preciſion and deciſive brevity of Linnæus. S.

Genus, *Kind*, in *Logic* and *Metaphyſics*, is that which has ſeveral ſpecies under it; or it is the origin and radix of divers ſpecies, joined together by ſome affinity, or common relation between them. See Classification.

Genus is a nature, or idea, ſo common and univerſal, that it extends to other general ideas, and includes them under it. Thus, animal is ſaid to be a genus, in reſpect of man and brute; becauſe man and brute agree in the common nature and character of animal; ſo a right-lined figure of four ſides is a genus in reſpect of a parallelogram, and a trapezium; and ſo, likewiſe, is ſubſtance in reſpect of ſubſtance extended, which is body; and thinking ſubſtance, which is mind.

A good definition, ſay the ſchoolmen, conſiſts of genus and difference.

In the general, genus may be ſaid to be a claſs of a greater extent than ſpecies; and which is not convertible therewith: for though we may ſay, that all body is ſubſtance; yet it cannot be ſaid all ſubſtance is body.

Add, that whatever may be ſaid of the genus may likewiſe be ſaid of the ſpecies under it: *e. gr.* whatever is ſaid of *ens*, being, will equally hold of the body.

The ſchoolmen define the *genus logicum* to be, an univerſal which is predicable of ſeveral things of different ſpecies; and divide it into two kinds: the one, the *ſummum*, which is the higheſt, or moſt general; and has nothing above it to reſpect as a genus: the other, the *ſubaltern*, which they likewiſe call *medium*.

Genus *ſummum* is that which holds the uppermoſt place in its claſs, or predicament; or that which may be divided into ſeveral ſpecies, each whereof is a genus in reſpect of other ſpecies placed below it.

Thus, in the predicament of things ſubſiſting of themſelves, *ſubſtance* has the place and effect of *genus ſummum*, and is predicated of all the things contained in that claſs: for Plato, and man, and animal, and even ſpirit, are properly called ſubſtance.

Accordingly there are as many *ſumma genera*, as there are claſſes of predicaments, or categories.

Genus, *ſubaltern*, is that which, being a medium between the higheſt genus and the loweſt ſpecies, is ſometimes conſidered as a genus, and ſometimes as a ſpecies.

Thus, bird, when compared with animal, is a ſpecies; when to a crow, an eagle, or the like, it is a genus.

Genus, again, is divided into *remotum*, remote, where between it and its ſpecies there is another genus; and *proximum*, or next, where the ſpecies is immediately under it; as man under animal.

Genus is alſo uſed for a character, or manner applicable to every thing of a certain nature or condition. In which ſenſe it ſerves to make capital diviſions in divers ſciences; as muſic, rhetoric, botany, anatomy, &c. *e. gr.*

Genus, in *Muſic*. See Genera.

Genus. By the word *genus*, in *Natural Hiſtory*, we underſtand a certain analogy of a number of ſpecies making them agree together in the number, figure, and ſituation of their parts in ſuch a manner, that they are eaſily diſtinguiſhed from the ſpecies of any other genus, at leaſt by ſome one article. This is the proper and determinate ſenſe of the word genus, whereby it forms a ſubdiviſion of any claſs or order of natural beings, whether of the animal, vegetable, or mineral kingdoms, all agreeing in certain common and diſtinctive characters. See Generical *name*, and Classification *of Animals*.

Genus, in *Rhetoric*, is one of the common places or topics, and contains under it two or more ſorts of things differing in nature. From this head logicians reaſon thus: Becauſe every animal is mortal, and man is an animal, therefore man is mortal. (See Genus, in *Logic*.) But orators make a further uſe of this argument, which they call aſcending from the hypotheſis to the theſis, that is, from a particular to a general. As if a perſon, ſpeaking in praiſe of juſtice, ſhould take occaſion from thence to commend and ſhew the excellency of virtue in general, with a view to render that virtue more amiable. For ſince every ſpecies contains in it the whole nature of the genus to which it relates, beſides what is peculiar to itſelf, whereby it is diſtinguiſhed from it; what is affirmed of the genus muſt, of neceſſity, be applicable to the ſpecies.

Beſides, authors diſtinguiſh the art of rhetoric, as alſo orations, or diſcourſes, produced thereby, into three genera, or kinds; *demonſtrative*, *deliberative*, and *judiciary*. See each term.

GENUSIUM, in *Ancient Geography*, a town of Italy, in that part of Magna Græcia called Meſſapia. It was ſituated a little S. of the road that led to Tarentum.

GENZANO, in *Geography*, a town of Naples, in Baſilicata; 12 miles E. S. E. of Venoſa.—Alſo, a town of Campagna di Roma, in Italy; 3 miles W. of Veletri.

GENZINGEN, a town of France, in the department of the Rhine and Moſelle; 5 miles N. E. of Creutznach.

GEOCENTRIC, of γη, *earth*, and κεντρον, *centre*, in *Aſtronomy*, is applied to a planet, or its orbit, to denote it concentric with the earth; or, having the earth for its centre, or the ſame centre with the earth.

All the planets are not geocentric: the moon, alone, is properly geocentric.

Geocentric *latitude* of a planet, is its latitude ſeen from the earth; or the inclination of a line connecting the planet and the earth, to the plane of the earth's (or true) ecliptic.

Or it is the angle which the aforeſaid line (connecting the planet and the earth) makes with a line drawn to meet a perpendicular let fall from the planet to the plane of the ecliptic. See Latitude.

Thus in *Plate* XIII *Aſtronomy*, *fig.* 116, the angle ♀ *T e* is the meaſure of that planet's geocentric latitude when the earth is in *T*: and the angle *e t* ♀ the meaſure of it when the earth is in *t*.

Geocentric *place* of a planet, is the place wherein it appears to us, from the earth, ſuppoſing the eye there fixed: or, it is a point in the ecliptic, to which a planet, ſeen from the earth, is referred.

Geocentric *longitude* of a planet, is the diſtance meaſured on the ecliptic, in the order of the ſigns between the geocentric place and the firſt point of Aries.

GEODÆSIA, that part of practical geometry which teaches how to divide, or lay out, lands, or fields, between ſeveral owners.

The word is Greek, γεωδαισια, formed of γη, *terra*, *earth*, and δαιω, *divido*, *I divide*.

Geodæsia is alſo applied, by ſome, to all the operations of geometry which are performed in the field.

This is more uſually called *ſurveying*, (which ſee,) when employed in meaſuring of lands, grounds, roads, countries, provinces, &c.

Vitalis defines geodæſia the art of meaſuring ſurfaces and ſolids not by imaginary right lines, as is done in geometry, but by ſenſible and viſible things: as by the ſun's rays, &c.

GEODES, in *Natural Hiſtory*, a genus of cruſtated bodies formed into large, and in great part, empty caſes, incloſing a ſmall quantity of earthy or arenaceous matter. See Siderochita.

Of this genus are five known ſpecies.

GEOFF, in *Rural Economy*, a term provincially applied to a mow of hay, corn, &c. See Stack.

GEOFFRÆA, in *Botany*, ſo named by Jacquin, in memory of Stephen Francis Geoffroy, M. D. of Paris, author of a Materia Medica, in which a chemical analyſis is given, to little purpoſe indeed, of every officinal plant; and of ſeveral ingenious chemico-botanical eſſays in the Memoires de l'Acad. des Sciences. Jacquin ſeems to confound him with his brother Claude Joſeph Geoffroy, author of an eſſay on the ſtructure and uſe of the principal parts of flowers, and of ſome other phyſiological papers, printed in the ſame Memoires.—Jacq. Amer. 207. t. 180. f. 62. Linn. Gen. 378. Schreb. 500. Willd. Sp. Pl. v. 3. 1129. Mart. Mill. Dict. v. 2. Juſſ. 363. Lamarck Illuſtr. t. 604.—Claſs and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, bell-ſhaped, five-cleft half way down; its two upper ſegments diverging, ſpreading. *Cor.* papilionaceous; ſtandard roundiſh, emarginate, flat, reflexed; wings equal to it in length, obtuſe, concave; keel compreſſed, the length and ſhape of the wings. *Stam.* Filaments in two ſets (ſingle and nine-cleft), the length of the keel; anthers roundiſh. *Piſt.* Germen ſuperior, roundiſh; ſtyle awl-ſhaped; ſtigma obtuſe. *Peric.* Drupa nearly ovate, large, with a longitudinal furrow at each edge. *Seed.* Nut nearly ovate, ſomewhat woody, a little compreſſed, with a furrow along each edge, acute, of two valves.

Eſſ. Ch. Calyx five-cleft. Drupa ovate. Nut compreſſed.

1. G. *ſpinoſa*. Linn. Sp. Pl. 1043. Swartz. Prod. 106.

(Umari; Marcgr. Bras. 121.)—"Spinous. Leaflets oblong, obtuſe."—Native of Braſil, and the country about Carthagena, in woods on a ſandy ſoil near the ſea. Jacquin deſcribes it as an inelegant *tree*, twelve feet high, with a few ſpines on the trunk and larger branches, which are awl-ſhaped, and generally an inch long. *Leaves* pinnate, about ſeven pair, with an odd one, of oblong, obtuſe, ſmooth, entire leaflets, on a ſtalk four inches in length. *Cluſters* nearly as long, axillary, ſimple, denſe. *Flores* on ſhort partial ſtalks; their colour a dirty orange, and their ſcent extremely powerful and offenſive. *Fruit* like that of an almond in its coat, ſlightly downy, greeniſh-yellow; the pulp ſoft, ſweet, but of a nauſeous ſmell, yellowiſh, ſtaining the hands with a ruſty hue, very difficult to waſh off. This coat adheres firmly to the nut, whoſe kernel is white, mealy and aſtringent. Jacquin was juſtly ſurpriſed at meeting, for the firſt time, with a drupa to a papilionaceous flower, but he juſtly ſo named it, in ſpite of any preconceived theory.

2. G. *ſurinamenſis.* Willd. n. 2. Bondt. Monogr. 13, with a figure.—"Without ſpines. Leaflets oblong, obtuſe, emarginate."—Native of Surinam. *Willdenow.*

3. G. *inermis.* Swartz. Prod. 106. Woodv. Med. Bot. t. 112. (Cabbage-bark tree of Jamaica; Wright in Phil. Tranſ. v. 67. 507. t. 10.)—"Without ſpines. Leaflets lanceolate."—Native of Jamaica and Martinico. A tall *tree*, whoſe wood is white, and ſo tough as to be preferred beyond all others for the ſhafts of carriages. The *bark* is a celebrated remedy for worms in the inteſtines, adminiſtered in a decoction, ſyrup, powder, or extract, and given in gradually increaſed doſes, till a nauſea is produced. The *leaves* conſiſt of five or ſix pair, with an odd one, of elliptic lanceolate, pointed leaflets, about three inches long. *Flowers* light-red, in very large much-branched, terminal, downy panicles. *Fruit* the ſize of a ſmall plum.

Geoffræa, or Geoffroya, *inermis*, *cabbage-bark* tree, or *worm-bark* tree, in the *Materia Medica,* is a native of Jamaica. (See the preceding article.) The bark of this tree, which has a mucilaginous and ſweetiſh taſte, and a diſagreeable ſmell, was firſt noticed as a vermifuge by Mr. Peter Duguid. (Eſſ. and Obſ. Phyſic. and Liter. vol. 2. page 264.) But the fulleſt information concerning this tree, in reſpect to both its medical and botanical characters, has been communicated by Dr. Wright, who reſided a long time in Jamaica. According to his account, the bark of this tree is powerfully medicinal, and its anthelmintic effects have been eſtabliſhed in Jamaica by long experience. It may be given in different forms, as in decoction, ſyrup, powder, and extract; and the manner of preparing, and exhibiting theſe, are particularly ſtated by Dr. Wright. For the *decoction*, take freſh dried or well-preſerved cabbage-bark, one ounce: boil it in a quart of water, over a ſlow fire, till the water is of an amber colour, or rather of a deep-coloured Madeira wine; ſtrain it off, ſweeten it with ſugar, and let it be uſed immediately; as it does not keep many days. In order to obtain the *ſyrup*, add a double portion of ſugar to any quantity of the above decoction. This ſyrup will retain its virtues for years. The *extract* is made by evaporating the ſtrong decoction in *balneo mariæ* to the proper conſiſtence; it muſt be continually ſtirred, as otherwiſe the reſinous part riſes to the top, and on this, probably, its efficacy depends. The *powder* of well dried bark is eaſily made, and looks like jalap, though not of equal ſpecific gravity. As this anthelmintic has alſo a narcotic effect, it is proper to begin with ſmall doſes, which may be gradually increaſed till a nauſea is excited, when the doſe for that patient is aſcertained. A ſtrong healthy grown perſon may at firſt take four table-ſpoonfuls of the decoction or ſyrup, three grains of the extract, or thirty grains of the powder for a doſe. The doſe muſt be diminiſhed for younger perſons: and children two or three years of age, may take a table-ſpoonful of the decoction or ſyrup, one grain of extract, or ten grains of the powder; and children of a year old, half the quantity. Cold water muſt not be drank during the operation of the medicine, as it is apt to occaſion ſickneſs, vomiting, fever, and delirium. In this caſe the ſtomach muſt be waſhed with warm water, caſtor oil muſt be adminiſtered, and lime juice beverage uſed plentifully for common drink. The bark purges pretty briſkly, eſpecially in powder; thirty or forty grains working as well as jalap by ſtool; but in this mode of adminiſtering it, it does not ſeem to kill worms ſo well as in decoction. The cabbage-bark is a valuable remedy when uſed with proper caution; but ſome fatal accidents have attended the imprudent uſe of it, chiefly from overdoſing the medicine. Phil. Tranſ. vol lxvii. p. 597.

GEOFFREY of Monmouth, in *Biography*, an early hiſtorian of our own country, who flouriſhed about the middle of the 12th century, was firſt archdeacon of Monmouth, and then biſhop of St. Aſaph. On account of tumults in Wales he quitted his dioceſe, and obtained the abbacy of Abingdon in commendam. His clergy applied to him to return, which he refuſed, thinking he might ſtill keep his abbacy; in this he was diſappointed, and was left without any preferment. As an hiſtorian he is known by his "Chronicon ſive Hiſtoria Britonum." This work has been cenſured for its fabulous narrations; the author is, however, entitled to much applauſe as a polite ſcholar. His Latin ſtyle riſes greatly above mediocrity. He was author of many other pieces, among which is a poem on Merlin, which is much commended by Leland. The Chronicon is ſuppoſed to be tranſlated from an ancient hiſtory in the Welſh language, and it contains a pretended genealogy of the kings of Britain, from the time of Brutus the Trojan, and enumerates upwards of ſeventy illuſtrious monarchs before the invaſion of Julius Cæſar. This work has been frequently reprinted. Bayle. Moreri. New Annual Regiſter, vol. iv.

GEOFFROY, Etienne Francois, a phyſician, was born at Paris on the 13th of February, 1672. His father was an apothecary, and had held the offices of ſheriff and conſul. While the young Geoffroy was purſuing his ſtudies under his paternal roof, his father held regular ſcientific meetings, at which Caſſini attended with his planiſpheres, Sebaſtien with his machines, and Joblot with his magnets, and at which Du Verney performed his diſſections, and Homberg his chemical experiments. After an excellent foundation of general ſcience was thus laid, his father ſent him, in 1692, to Montpellier, to ſtudy his own profeſſion of pharmacy under an experienced apothecary. Here he attended the courſes of the moſt celebrated profeſſors of the univerſity, and afterwards travelled through the ſouthern provinces before he returned to Paris. Already he had acquired conſiderable reputation; and, although not yet a phyſician, he was appointed to accompany the duke de Tallard, as his medical attendant, on his embaſſy to England, in 1698. In London he was much eſteemed by ſir Hans Sloane, and other men of ſcience, and was elected a member of the Royal Society. From England he went to Holland; and afterwards to Italy in 1700, with the abbé de Louvois. Natural hiſtory and the materia medica were among the principal objects of his enquiries; for his father intended him for his ſucceſſor in his eſtabliſhment at Paris: but he aimed at the higher walk of the profeſſion, and with the conſent of his father at length took the degree of batchelor in 1702, and that of doctor in 1704. His diſpoſition was mild and kind to his patients, who, on his outſet in practice, were alarmed by the ſolemn air which his ſympathy for their ſufferings occaſioned him to aſſume; but his reputation ſoon increaſed, and he was called in conſultation even by the moſt diſtinguiſhed members of the profeſſion. In 1709, he was appointed by Louis XIV. to the profeſſorſhip of medicine, vacant by the death of Tournefort. In his new office he undertook to deliver to his pupils a complete hiſtory of the materia medica, upon which ſubject he had been for a long time collecting information. He completed his account of the *mineral* ſubſtances employed in medicine, of which he gave a moſt correct and ample hiſtory: and was employed on the *vegetable* kingdom, which he treated alphabetically, and carried no farther than the article *Meliſſa*: on the *animal* kingdom he had not touched; but the whole of what he had delivered in his lectures was found among his papers in good order, and afterwards publiſhed. In 1712, he ſucceeded Fagou as profeſſor of chemiſtry in the king's garden. In 1726, he was elected dean of the faculty, in the exerciſe of the functions of which he was led into ſome active and anxious diſputes, which, together with the duties of his profeſſion, and of his other offices, deſtroyed his health, which was naturally very delicate. He lingered from the beginning of the year 1730 till the 6th of January, 1731, when he died. Notwithſtanding his malady, however, he had the reſolution to complete a work, which had been deemed neceſſary by preceding deans, but never accompliſhed; namely, a pharmacopeia, containing a collection of the compound medicines requiſite to be kept by apothecaries, "Le Code Medicamentaire de la Faculté de Paris," of which two editions, enlarged and corrected, were afterwards publiſhed. His papers on the materia medica were publiſhed under the following title: "Tractatus de Materia Medica, ſive, de Medicamentorum ſimplicium hiſtoria, virtute, delectu, et uſu," Paris 1741, 3 vols. 8vo. under the inſpection of Antoine de Juſſieu. Several editions have been ſubſequently publiſhed. It was tranſlated into French by Ant. Bergier, who publiſhed 7 vols. 12mo. in 1743, and the remainder in 3 vols. in 1750. Arnault de Nobleville, and Salerne, phyſicians of Orleans, publiſhed a continuation of this work, under the title of "Hiſtoire Naturelle des Animaux," Paris 1756, 1757, in 6 vols. 12mo, which is deemed not unworthy to be ranked with the production of Geoffroy. Eloy. Dict. Hiſt.

GEOGLOSSUM, in *Botany*, from *γεα*, the *earth*, and *γλωσσα*, the *tongue*, Perſoon Syn. Fung. 607. Claſs and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.—Sect. *clavæformes*.

Eſſ. Ch. *Receptacle* club-ſhaped, fleſhy, generally compreſſed, ſhort, with a prominent margin next to the ſtalk.

This genus of *Fungi* is founded by Perſoon on the *Clavaria ophioglоſſoides* of other authors, with ſome different ſpecies which reſemble it, and which have the appearance of a little tongue, growing out of the earth upon a ſtalk. He enumerates and defines ſeven ſpecies. His *G. hirſutum* is *Clavaria ophioglоſſoides* of Sowerby's Fungi, t. 83; his *G. glabrum* is a ſmaller and ſmooth fungus, very like the fructifying ſpike of the fern *Ophiogloſſum*, except in being nearly black.

GEOGNOSY. See Geology and Mineralogy.

GEOGRAPHICAL Mile is a minute, or the ſixtieth part of a degree of a great circle. See Degree and Mile.

Geographical *Table*. See Map.

GEOGRAPHY, formed of *γη*, *terra*, *earth*, and *γραφω*, *ſcribo*, *I write*, *I deſcribe*; the doctrine or knowledge of the earth, both as in itſelf and as to its affections; or a deſcription of the terreſtrial globe, and particularly of the known habitable part thereof, with all its ſubordinate diviſions. Geography conſtitutes a branch of mathematics, of a mixed kind; becauſe it conſiders the earth, and its affections, as depending on quantity; and conſequently, as meaſurable: *viz.* its figure, place, magnitude, motion, celeſtial appearances, &c. with the ſeveral circles imagined on its ſurface.

Geography is diſtinguiſhed from coſmography, as a part from the whole; this latter conſidering the whole viſible world, both heaven and earth.

From topography and chorography, it is diſtinguiſhed, as the whole from a part.

Golnitz conſiders geography as either *exterior* or *interior*: but Varenius more juſtly divides it into *general* and *ſpecial*; or *univerſal* and *particular*.

Geography, *general* or *univerſal*, is that which conſiders the earth in general, without any regard to particular countries, or the affections common to the whole globe; as its figure, magnitude, motion, land, ſea, &c. And this may be ſubdivided into *abſolute* geography, which reſpects the body of the earth itſelf, its parts and peculiar properties, &c.; *relative*, which accounts for the appearance and accidents owing to celeſtial cauſes; and *comparative*, which explains thoſe properties that ariſe from comparing different parts of the earth together.

Geography, *ſpecial* or *particular*, is that which conſiders the conſtitution of the ſeveral particular regions, or countries, their bounds, figure, &c. with the mountains, foreſts, mines, waters, plants, and animals, &c. therein; as alſo their climates, ſeaſons, heat, weather, diſtance from the equator, &c. and their inhabitants, arts, foods, commodities, cuſtoms, language, religion, policy, cities, &c.

Special geography may be ſubdivided, with regard to the ſeveral periods of its progreſs, into *ancient*, including a deſcription of the earth, conformably to the knowledge which the ancients had till the decline of the Roman empire; of this kind Cellarius's Ancient Geography is an excellent ſummary: the geography of the *mean* age, which extended from the fall of the Roman empire to the reſtoration of learning; and *modern* geography, comprehending the actual deſcription of the earth ſince that time. With regard to its objects and uſes, ſpecial geography may be divided into *natural*, which treats of the diviſions and diſtinctions which nature has made in the ſurface of the globe, and the complexion, language, &c. of its inhabitants; *hiſtorical*, comprehending the different revolutions which any country or town has undergone; *civil*, or *political*, including the government of any country; *ſacred*, deſcribing thoſe countries and places that are mentioned in ſcripture and eccleſiaſtical hiſtory; *eccleſiaſtical*, giving an account of the eccleſiaſtical juriſdiction eſtabliſhed and exerciſed in various countries; and *phyſical*, which conſiders not only the ſurface of the globe, but alſo its intrinſic nature and ſubſtance. Geography is very ancient, at leaſt the ſpecial part thereof; for the ancient writers ſcarcely went beyond the deſcription of countries. Of this kind is the geography which we find in the books of Moſes, written about the year 1452 B. C. and that of Homer, in his Iliad and Odyſſey, who flouriſhed, according to the Arundelian marbles, 907 years B. C. The geographical knowledge we derive from Herodotus, who flouriſhed about 445 years B. C., is very partial and imperfect. It chiefly relates to certain parts of Aſia, and divers others unknown, as well as the northern and weſtern parts of Europe; and alſo Africa, Egypt and Lybia excepted.

It appears (ſee Ptol. Geog. l. i. c. 9.) that the early geographers, being deſtitute of mathematical inſtruments

ſtruments and of aſtronomical obſervations, began firſt to determine the ſituation of places according to climates; and they were led to fix upon theſe climates from the form and colour of certain animals which were to be found in thoſe different countries. The appearance of negroes, or of thoſe called by them Ethiopians, and of animals of the larger ſize, ſuch as the rhinoceros and elephant, ſuggeſted to them the line of diviſion, where the limits of the Torrid Zone began towards the north, and terminated towards the ſouth. This groſſer manner of dividing their climates muſt be conſidered as the firſt rude outline of geography in the more illiterate ages of the world. However this be, the Chaldeans and Egyptians, who were diſtinguiſhed by their ſkill in geometry and aſtronomy, were of courſe the firſt perſons that paid any particular attention to geography; and it is ſaid that the firſt map was made by order of Seſoſtris I. who conquered Egypt.

This Egyptian king, ſays Euſtathius in his epiſtle, prefixed to his commentary on Dionyſius's περιηγησις, having traverſed great part of the earth, recorded his march in maps, and gave copies of his maps not only to the Egyptians, but to the Scythians, to their great aſtoniſhment. The Jews alſo ſeem to have had ſurveyors among them; and hence ſome have imagined that they had made a map of the Holy Land, when they gave the different portions to the nine tribes at Shiloh. (Joſh. xviii. 4. 8. 9.) And Joſephus tells us (l. v. c. 1.), that when Joſhua ſent out people from the different tribes to meaſure the land, he gave them as companions perſons well inſtructed in geometry, whoſe ſkill would prevent their deviating from the truth. We may therefore reaſonably preſume that a geometrical ſurvey was then made of the Holy Land.; though we cannot abſolutely determine whether their menſuration was only taken down in numbers, or regularly projected and digeſted into a map.

Beſides the method of dividing countries by climates, already mentioned, the Egyptians and Babylonians adopted another, which was that of determining the ſituation of places, or their diſtance from the equator, by obſerving the length of their longeſt and ſhorteſt days. This they performed by means of a gnomon, erected upon a horizontal plane, by which they were enabled to meaſure the length or ſhortneſs of the ſhadow in proportion to the height of the gnomon. For an account of this invention, and of the method of applying it, ſee Gnomon.

From the days of Thales,and his immediate ſucceſſors, who flouriſhed in the ſixth century before Chriſt, geography ſeems to have received little improvement for 200 years, till the eſtabliſhment of the famous ſchool of Alexandria; although Pythagoras and his diſciples were rightly informed with regard to the true ſyſtem of the world, as they placed the ſun in the centre, and aſcribed to the earth both its diurnal and annual revolutions. During this period we have an aſtronomical obſervation of conſiderable importance to geography, and the firſt Greek obſervation upon record; which is that of Meton and Euctemon, who obſerved the ſummer ſolſtice at Athens on a day correſponding to the 27th of June, 432 years B. C. This ſolſtitial obſervation muſt have given them an opportunity of determining the latitude of Athens at the ſame time, if they had known the ſimple manner of deducing the concluſion: for as the length of the ſhadow of the gnomon was attentively watched at the moment of the ſolſtice, the proportion of that to the gnomon's height was eaſily known, by which the angle of the ſun's altitude would be given; and though the ſun's greateſt declination was not then accurately known, yet ſtill the latitude of Athens might have been determined within the limitations of the error reſpecting the declination. We have reaſon to believe that Timocharis and Ariſtillus, who began to obſerve 295 years B. C, were the firſt who introduced the manner of determining the poſition of the ſtars, according to their longitudes and latitudes taken with reſpect to the equator. This we know from Ptolemy, who has preſerved many of their obſervations in his "Almageſt;" and particularly one, which gave riſe to the famous diſcovery of the *Preceſſion of the Equinoxes*: which ſee. It was after the preceſſion of the equinoxes was fully eſtabliſhed by Ptolemy, that the longitudes and latitudes of the ſtars were uniformly referred to the ecliptic inſtead of the equator. It was therefore, by an eaſy tranſition, that Hipparchus would be led to aſſort and diſpoſe the different parts of the earth according to latitude or longitude: this being only a new application or tranſpoſition of that artifice, which had been already ſo happily introduced in the arrangement of the conſtellations, and therefore equally proper to be adopted in tracing the meridians and parallels of the earth. Hipparchus muſt be univerſally allowed to have firſt fixed the ſolid foundation of geography by uniting it to aſtronomy, and thus rendering its principles ſelf-evident and invariable.

Pliny (N. H. l. ii. c. 12.) confirms this, when, after mentioning Thales and Sulpicius Gallus, who had both predicted eclipſes, he adds, "that Hipparchus had foretold the revolution (of the eclipſes) of the ſun and moon for 600 years, comprehending the months, days, and hours of different nations, and the ſituation of places," by which it would ſeem that the latitudes and longitudes of theſe places were particularly given. But the fulleſt and ſtrongeſt authority for appropriating this invention to Hipparchus, is that of Ptolemy in his "Geography," (l. i. c. 4.) who ſays, "that Hipparchus was the only author who had given *the elevations of the north pole of a few cities*, in proportion to the great number that were to be delineated, and ſuch too as lay under the ſame parallels, &c. &c." And yet it is ſomewhat remarkable that though latitudes and longitudes were in this manner introduced and pointed out by Hipparchus, yet they were ſo little attended to till the days of Ptolemy, that none of the intermediate authors, ſuch as Strabo, Vitruvius and Pliny, all of whom minutely deſcribed the geographical ſituation of places according to the length and ſhadows of the gnomon, have ever given us the leaſt hint of the latitude or longitude of any one place whatever in the language of degrees and minutes.

When the true principles of geography were thus pointed out by this new invention of latitude and longitude, it was no wonder that maps were from thence made to aſſume a new form of projection eſſentially different from thoſe in uſe prior to this period. For the hiſtory of the conſtruction of maps, ſee Map.

It was a conſtant cuſtom among the Romans, after they had conquered and ſubdued any province, to have a map, or painted repreſentation thereof, carried in triumph, and expoſed to the view of the ſpectators. Thus the Romans, as they were the conquerors, became the ſurveyors of the world. Every new war produced a new ſurvey and itinerary of the countries where the ſcenes of action occurred; ſo that the materials of geography were accumulated by every additional conqueſt. Polybius, (l. 3. p. 123. ed. Caſaub.) when he tells us, that at the beginning of the ſecond Punic war, Hannibal was preparing his expedition againſt Rome, by croſſing from Africa into Spain, and ſo through Gaul into Italy, ſays, "that all theſe places were meaſured or ſurveyed with the utmoſt care by the Romans."

Vegetius De Re Mil. (l. iii. c.6.) has well deſcribed the ſurveys of particular provinces, with which every Roman general was regularly furniſhed before his march. Æthicus, in the preface to his "Coſmographia," further informs us, that Julius Cæſar ordered a general ſurvey to be made of the whole Roman empire by a decree of the ſenate: ſelecting for this purpoſe perſons well inſtructed in every branch of philoſophy. The three ſurveyors were Zenodoxus, Theodotus, and Polyclitus, each of whom was appointed to ſurvey a different diviſion of the empire. This ſurvey commenced in the conſulſhip of Julius Cæſar and Marc Antony, in the year 44 B. C, and continued for twenty-five years one month and ten days, to the conſulſhip of Sentius Saturninus and Lucretius Cinna, in the year 19 B. C. The Roman itineraries that are ſtill extant, evidently ſhew with what accuracy their ſurveys were made in every province; and Pliny has filled the 3d, 4th, and 5th books of his Natural Hiſtory with the geographical diſtances that were thus meaſured.

Before the Romans engaged in this buſineſs, Neco, king of Egypt, ordered the Phœnicians to make a ſurvey of the whole coaſt of Africa; which they accompliſhed in three years: Darius procured the Ethiopic ſea, and the mouth of the Indus, to be ſurveyed. Thales of Miletus, Anaximander his diſciple, who is ſaid to have conſtructed the firſt map; Democritus, Eudoxus, &c. who made the uſe of maps common in Greece; Ariſtagoras of Miletus, who preſented to Cleomenes, king of Sparta, a table of braſs, on which he had deſcribed the known earth, with its ſeas and rivers; and other Greeks, availing themſelves of the aſſiſtance derived from the Chaldeans and Egyptians, proſecuted the ſtudy and enlarged the extent of this ſcience. It appears that in the time of Socrates geographical maps were uſed at Athens; for this philoſopher humbled the pride and boaſt of Alcibiades, by deſiring him to point out his territories in Attica in a map: and Pliny relates, (l. vi. c. 17.) that Alexander, in his expedition into Aſia, took two geographers, Diognetus and Bœton, to meaſure and deſcribe the roads, and that from their itineraries the writers of the following ages took many particulars. Indeed, this may be obſerved, that whereas moſt other arts are ſufferers by war, geography and fortification have been improved thereby. We alſo learn from Strabo, that a copy of Alexander's ſurvey was given by Xenocles, his treaſurer, to Patrocles the geographer, who, as Pliny informs us, was admiral of the fleets of Seleucus and Antiochus. His book on geography is often quoted both by Strabo and Pliny: and it appears that this author furniſhed Eratoſthenes with the principal materials and authorities for conſtructing the oriental part of his map of the then known world. For the voyages of Patrocles under Seleucus, upon the Caſpian ſea, and elſewhere, were a kind of ſupplement to thoſe meaſurements given by Bœton and Diognetus already mentioned, and by Nearchus and Oneſicritus, the two admirals who were employed under Alexander, and therefore Pliny quotes them immediately after. It appears likewiſe from the ſame paſſage, that Megaſthenes and Dionyſius were two ſurveyors ſent into India by Ptolemy Philadelphus, for the purpoſes of geography: and their authority was ſometimes ſet in oppoſition to Patrocles by Hipparchus, in his criticiſm upon Eratoſthenes's geography. (Strabo, lib. ii. paſſim.) From the memorable era of Alexander's expedition and conqueſt, and thoſe of his immediate ſucceſſors, geography began to aſſume a new face and form. For Eratoſthenes, who is deſervedly conſidered as the great father of chronology, diſtinguiſhed himſelf by the cultivation of the ſcience of geography. (See the article ERATOSTHENES.)

We ſhall now recite the names of ſome of the principal perſons who have contributed to the improvement of geography. Pytheas, the famous geographer of Marſeilles, flouriſhed in the time of Alexander; and Ariſtotle ſeems to have been no leſs converſant with geography than philoſophy: after Alexander, Seleucus Nicanor, Theophraſtus the diſciple of Ariſtotle, Eratoſthenes, who publiſhed three books of geographical commentaries, and corrected a chart of Anaximander, Hipparchus, who corrected the obſervations of Eratoſthenes, and thus furniſhed occaſion for a diſpute which greatly contributed to the improvement of geography, Agatharcides of Cnidus, who lived under Ptolemy Philometor, and Mneſias, who, about fifty years after him, publiſhed a deſcription of the whole world, Artemidorus of Epheſus, who gave a deſcription of the earth in eleven books, often cited by Strabo and Pliny, and many others, whoſe names it would be tedious to enumerate, diſtinguiſhed themſelves by the cultivation and improvement of this ſcience. Geography was tranſmitted, with the other arts, from Greece to Rome, as we have already mentioned. Varro's works contain many geographical remarks: Zenodoxus, Theodorus and Polyclitus were employed under the conſulſhip of Julius Cæſar and Marc Antony, in ſurveying and meaſuring the globe. (See the preceding part of this article). The commentaries of Cæſar are well known. Ptolemy encouraged Poſidonius, who made an imperfect menſuration of the earth by celeſtial obſervations, in different places under the ſame meridian. (See DEGREE). Auguſtus was a diſtinguiſhed patron and promoter of this ſcience; under whom Strabo publiſhed his geography. And the taſte for the ſtudy and advancement of geography was greatly encouraged under Tiberius, Claudius, Veſpaſian, Domitian, and Adrian. Iſidore of Charax, who lived to the commencement of the firſt century of the Chriſtian era; Pomponius Mela, who publiſhed a book entitled "De Situ Orbis;" Metius Pompoſianus, who, having depicted the earth on a parchment, fell a ſacrifice to the jealouſy of Domitian, the emperor ſuſpecting that he aimed at the empire; Pliny the naturaliſt, who has deſcribed the countries known in his time in the third, fourth, fifth and ſixth books of his Natural Hiſtory; Marinus the Tyrian, who corrected and enlarged the diſcoveries of preceding geographers; and the emperor Antoninus, deſerve particular mention. This abſtract of the hiſtory of ancient geographers, notwithſtanding whoſe ſucceſſive labours geography was ſtill in a very imperfect ſtate, brings us to a period, about the 150th year of the Chriſtian era, in which Ptolemy of Alexandria contributed greatly to the improvement of this ſcience, by a more ample and accurate deſcription of the terreſtrial globe than any had yet given of it. He availed himſelf of numerous obſervations and ancient charts; he corrected the miſtakes and ſupplied many defects of others; and by reducing the diſtances of places on the earth to degrees and minutes, after the manner of Poſidonius, making uſe of the degrees of longitude and latitude, and ſettling the ſituation of places by aſtronomical obſervations, he reduced geography into a regular ſyſtem, and laid a foundation for thoſe farther diſcoveries and improvements, which naturally reſulted from the progreſſive, and at preſent advanced ſtate of geometry, aſtronomy, navigation, and commerce.

In order to form a proper judgment of the benefits accruing to geography from the labours of Ptolemy, we ought to take into account the materials that were extant in his time, and which he had actually in his poſſeſſion. Theſe conſiſted of various particulars, ſome of greater and others of a leſs degree of authenticity. The principal were the "proportions of the gnomon" to its ſhadow, taken by different aſtronomers at the times of the equinoxes and ſolſtices; "calculations" founded upon the length of the longeſt days; "the meaſures" or computed diſtances of the principal roads contained in their ſurveys and itineraries, and the various "reports of travellers and navigators," who often determined the intervals of places by hear-ſay and gueſs-work. All of theſe were to be compared together, and digeſted into one uniform body or ſyſtem, and after this, were converted and tranſlated by him into a new mathematical language, expreſſing their different degrees and minutes of latitude and longitude, according to the invention of Hipparchus, but which Ptolemy had the merit of carrying into full practice and execution, after it had been neglected for upwards of 250 years. We have no reaſon to ſuppoſe, that Ptolemy had in his poſſeſſion real aſtronomical obſervations ſufficient to determine all the longitudes and latitudes which he has given; ſo that we ought always to remember, that their degrees of accuracy depended upon the veracity of the fact or ſuggeſtion communicated to him, from which they were afterwards deduced. We have therefore no reaſon to be aſtoniſhed at the multitude of errors that are to be found in it, when his original materials were ſo imperfect for executing ſo large a work, as that of fixing the longitudes and latitudes of all the places, coaſts, bays, and rivers of the then known world; an undertaking which, even in our days, has not hitherto been brought to any ſufficient degree of accuracy. The miſtakes of Ptolemy ought to be regarded with candour, as they aroſe from the ignorance of the age in which he lived, which could give him no better information, and not from ignorance or inattention on his own part. Nevertheleſs, Ricciolus, Cellarius, Paul Merula, and Salmaſius have been too ſevere in their criticiſm and cenſures; as if they were diſappointed in not ſeeing this ſcience in its full maturity in the writings of Ptolemy, at a time when it was evidently but juſt beginning to advance beyond the verge of its earlieſt infancy. They might with equal juſtice condemn the modern geographers for giving no better account of Nova Zembla, or New Holland, or of thoſe continents and iſlands that lie on the northern or ſouthern extremities of the great South ſea towards the two Poles; of which the knowledge which they could obtain was very imperfect. The principal miſtakes in Ptolemy took their riſe from certain aſtronomical obſervations and ſurveys, which were ſuppoſed to have been made with accuracy in a prior age, and which were adopted by this great geographer as genuine; and they have been, for want of better information, copied by ſucceeding geographers and inſerted in their maps, as being, in their opinion, of acknowledged and undoubted authority. Theſe miſtakes, thus introduced, maintained their places in all maps, by a kind of unqueſtioned preſcription, even to the commencement of the laſt century, and it unfortunately happened that theſe errors related to that part of the world which was beſt known to the ancient Greeks and Romans. Thus, Ptolemy ſtates the latitude of Byzantium to be 43° 5′ inſtead of 41° 1′, the latitude according to modern obſervations. In this particular Ptolemy was miſled by Hipparchus, who is mentioned by Strabo (l. i.) as having viſited Byzantium, and made this obſervation in perſon. The latitude of Marſeilles, which was ſuppoſed to be under the ſame parallel with Byzantium, was not, however, ſo much miſtaken, as by modern obſervations it has been found to be 43° 17′ 45″; and allowance being made for the now acknowledged diminution of the obliquity of the ecliptic, (ſee ECLIPTIC,) the reſult will be nearer the truth. Another error of Ptolemy relates to the latitude of ancient Carthage, which he has placed in 32° 20′ inſtead of 36° 52′, the true latitude according to the beſt obſervations. This erroneous latitude ſeems to have been copied or tranſlated from a paſſage in Strabo (l. ii.), in which it is ſtated that at Carthage the gnomon has the ſame proportion to the equinoctial ſhadow, which 11 has to 17, whence by plain trigonometry we ſhall have the latitude of 32° 28′, very near that of Ptolemy. The third capital miſtake of Ptolemy relates to the length of the Mediterranean, which is generally meaſured from the ſtraits of Gibraltar to the bottom of the bay of Iſſus, where Alexandretta, or Scanderoon, now ſtands, whoſe ancient name was Alexandria ad Iſſum. The difference of longitude of Alexandria ad Iſſum and Gibraltar, according to Ptolemy, is 62° 0′; whereas the difference of longitude between theſe two places, according to the lateſt obſervations, is 41° 28′, and Ptolemy's error is 20° 32′. This error, which continued in all our maps, more or leſs, till the beginning of the laſt century, took its riſe from the ſuppoſed ſurveys of perſons of reputation, recorded by Strabo. (See DEGREE, EARTH, and LONGITUDE.) But to return from this digreſſion:—many valuable geographical works appeared under Diocleſian, Conſtantius, and Maximian, &c. Under the emperor Theodoſius the provincial and itinerary chart or table, ſince known under the name of Peutinger, was digeſted and formed; and the laſt work, that ought to be claſſed with thoſe of the ancients, was the Notitia Imperii, attributed to Æthicus, who lived between the years 400 and 450 of the Chriſtian era. The ages of barbariſm ſucceeded the fall of the Roman empire; and the arts and ſciences were obliged to ſeek refuge and protection from the Arabians and Orientaliſts in Aſia; the principal of whom, diſtinguiſhed by their attention to geography, were Almamom, caliph of Babylon, and Abulfeda, a Syrian prince. (See DEGREE.) After the revival of learning in Europe, and particularly during the two laſt centuries, geography has derived very conſiderable acceſſions from travels, voyages, and a variety of nautical and aſtronomical obſervations.

The great misfortune of ancient geography, and which indeed confined it to ſuch a lingering ſtate of infancy, was, that the true method of determining with accuracy the difference of longitudes was a matter of ſuch difficulty, and remained ſo long unknown. One of the firſt attempts to rectify the length of the Mediterranean was made under the auſpices of M. de Peireſk in 1635; and he alſo, with a direct view of correcting the errors in the longitudes of different places, took particular pains to get obſervations made at Marſeilles, Aleppo, and Grand Cairo, of an eclipſe of the moon, which happened Auguſt the 27th 1635. Before that time the difference of longitude between Marſeilles and Aleppo had been ſuppoſed to be 45°, but by theſe obſervations it was found only to amount to 30° (the real difference has been ſince found to be 31° 58′); ſo that by this a very conſiderable correction was made in the length of the Mediterranean, by taking off the difference of one whole hour, or 15°, at once. About this time eclipſes of the ſun and moon were thought ſufficient to determine the longitudes of all places with a tolerable accuracy. But, in the event, the ableſt aſtronomers ſoon found that from theſe eclipſes, however carefully obſerved, no clear deduction could be made of the longitude of any one place to any ſufficient degree of exactneſs. Hence ſeveral eminent aſtronomers, ſuch as Fournier, Kircher, and even Ricciolus, who had collected the obſervations of no leſs than 56 eclipſes of the ſun and moon, between the years 1560 and 1658, gave up the correction of geography by the application of eclipſes of the ſun and moon alone, as a fruitleſs and deſperate undertaking. At length recourſe was had to the eclipſes of the ſatellites of Jupiter, and they were found effectual for the purpoſe. It was ſome time, however, before the theory of the ſecondary planets was regularly reduced to tables; and though Simon Marius firſt, and after him Baptiſta Hodierna, compoſed ephemerides of their motions, yet nothing of that ſort was found to be ſufficiently accurate for the purpoſes of longitude, till M. Caſſini publiſhed his tables of the revolutions and eclipſes of the ſatellites in 1668. The firſt opportunity of effectually applying this theory to the rectifying of geography was ſuggeſted by M. Caſſini, and taken by M. Picard in 1671 and 1672, who, at the obſervatory of Tycho Brahe at Uraniburgh, obſerved two immerſions and three emerſions of the firſt ſatellite of Jupiter, which were afterwards compared with the ſame obſerved by M. Caſſini at the obſervatory at Paris. This firſt experiment gave at once the difference of longitude in the cleareſt manner beyond the poſſibility of a doubt; and it likewiſe afforded the certain proſpect of rectifying the whole extent of geography as to longitude, upon principles that were ſelf-evident, and not liable to any miſtake whatever. In conſequence of this ſucceſs, M. Picard and M. De la Hire, were immediately employed in correcting the map of France; in doing which, they were obliged to contract it every where within leſs boundaries than it was ſuppoſed, according to their former maps, to have occupied; inſomuch that Lewis XIV. jocoſely ſaid, that he found by their journey he had ſuffered a loſs of part of his kingdom. Other academicians determined by the ſame method the longitude of the iſle of Gorée, near cape Verd, on the coaſt of Africa, and of Guadaloupe and Martinico in the Weſt Indies. And when M. Caſſini had corrected his tables of the ſatellites of Jupiter, and publiſhed a new edition of them in 1693, M. Chazelles was ſent up the Levant, to obſerve the longitudes and latitudes of Scanderoon, Alexandria, and Conſtantinople, in order to determine the length and breadth of the Mediterranean, which he executed with great ability.

Since the correction of longitudes has been introduced by means of the ſatellites of Jupiter, other methods have been alſo adopted and deviſed, which are proper and effectual for that purpoſe; ſuch as "the tranſits of Mercury and Venus" over the body of the ſun; "occultations" of the fixed ſtars by the moon; and ſince the lunar tables have been improved by M. Mayer and others, another mode, equally applicable to this important object, has occurred, by meaſuring from time to time the exact "diſtances of the moon from the ſun," and "from a fixed ſtar" of the firſt and ſecond magnitude. In this mode there is a limitation of error, which ſo far gives a degree of ſatisfaction, and prepares the way for bringing the point that is thus unſettled to a more ſpeedy and certain determination. Inſtruments of obſervation have alſo been improved; and time-pieces have been conſtructed, free in a great degree from the error and uncertainty of thoſe that were formerly in uſe. See CHRONOMETER and CLOCK. See alſo EPHEMERIS and LONGITUDE.

For a fuller account of the hiſtory of ancient geography, ſee the preface to Bertius's edition of Ptolemy's Theatrum Geographiæ Veteris, fol. For a brief hiſtory of the riſe and progreſs of geography, ſee Varenius's Geog. and the Introduction to Blair's Tables of Chronology.

The art, however, muſt needs have been exceedingly defective; as a great part of the globe was then unknown: particularly all America, the northern parts of Europe and Aſia, with the Terra Auſtralis, and Magellanica; and as they were ignorant of the earth's being capable of being ſailed round, and of the torrid zones being habitable, &c.

The principal writings on this art, among the ancients, are Ptolemy's eight books; among the moderns are, Johannes De Sacroboſco De Sphæra, with Clavius's comment; Ricciolus's Geographia and Hydrographia Reformata; Weigelius's Speculum Terræ; Dechales's Geography, in his Mundus Mathematicus; and above all, Varenius's Geographia generalis, with Jurin's additions; to which may be added, Leibnecht's Elementa Geographiæ generalis; Sturmius's Compendium Geographicum; Wolfius's Geographia, in his Elementa Matheſeos; the preface to M. Robert's Atlas; the introduction to Buſching's Geography; the works of Duval, Briet, Deliſle, D'Anville, Bonne, Birache, Mentelle, the Sanſons, Homann Morvilliers, Martiniere; Pinkerton's Geography, Gordon's, Salmon's and Guthrie's Grammars, &c. Hornii Orb. ant. delineatio, Cluverius, Cellarius, Pomp. Mela, &c. &c.

The reader will find under the appropriate terms in this Cyclopædia, ſuch information concerning the ſubjects which they expreſs, as is conſiſtent with the nature and limits of the work; and it would be, therefore, altogether ſuperfluous to detail them in this place, and, in ſo doing, to tranſcribe articles that will be found in their proper places. See ALTITUDE, AMPHISCII, ANTIPODES, ANTÆCI, CIRCLES, CLIMATE, COLURES, DEGREE, EARTH, ECLIPTIC, EQUATOR, EQUINOCTIAL, GLOBE, HETEROSCII, HORIZON, LATITUDE, LONGITUDE, MAP, MERIDIAN, MOUNTAIN, OCEAN, PARALLELS, PERIÆCI, PERISCII, POLE, SPHERE, *Sphere* OBLIQUE, PARALLEL, and RIGHT, TROPICS, ZONES, &c. &c. &c.

GEOLOGY, in a ſtrict ſenſe of the word, or GEOGNOSY, is the ſcience which illuſtrates the ſtructure, relative poſition, and mode of formation of the different mineral ſubſtances that compoſe the cruſt of the earth. This intereſting part of mineralogy principally owes the diſtinguiſhed rank it now holds among the ſciences to the celebrated profeſſor of Freyberg, who has however ſeparated geognoſy, or the ſcience to which the above-given definition applies, from geology in the ſenſe in which the word is taken by him; conſidering the latter as a merely ſpeculative branch of knowledge, and as having nearly the ſame relation to the former which aſtrology has to aſtronomy. While geognoſy, leſs intent upon enquiring into the primordial ſtate of the globe, is contented with the merit of obſerving, of collecting and arranging ſimple facts in order to aſcertain what *can* be known reſpecting the relative ſituation and ages of mineral ſubſtances.

Geology (in the ſenſe in which the word is taken by Werner) aſpires to the higher merit of recording the events of periods, when the planetary ſyſtem of which the earth forms a part was yet uncreated, and of aſſigning cauſes to effects, and explaining phenomena, before it is aſcertained whether they really have exiſtence, or are merely the offspring of fancy and ignorance. The framers of moſt of thoſe tiſſues of extravagant notions, known by the appellation of *theories of the earth* (ſee EARTH and THEORIES *of the Earth*,) have been ſatisfied with a very moderate ſhare of materials for their ſtructures, not to mention that moſt of them were utterly unacquainted with the nature of the ſubſtances, the origin of which they undertook to elucidate. Nothing is better calculated to flatter ſelf-love than to be mentioned as the creator of a theory of the earth; nothing eaſier, with a moderate ſhare of imagination and leſs knowledge of facts, than to frame a new theory ſufficiently diſtinct from all its precurſors to be noticed; and nothing ſafer than to broach opinions which, though they cannot be proved true by their authors, are certain to be left unrefuted by others. And who would be deſirous to waſte his time in refuting, or even remembering, all the theories of the earth now extant? Their number, amounting already to above half a hundred, appears to be daily increaſing, and ſtands in need of claſſification to aſſiſt the memory; which, it muſt be allowed, might be more profitably employed in retaining thoſe general obſervations which, unconnected with any theory of the earth, or with the Moſaic account, have in latter times been preſented to the world by a few unprejudiced geognoſians. Inſtead of prematurely endeavouring to accommodate the little geognoſtic knowledge we poſſeſs to the events hinted at in the ſacred hymn of creation, which was by no means intended for a ſyſtem of geology; we ſhould commence our reſearches in this field of knowledge with ſubjecting to a careful examination what nature produces as it were under our eyes, ſuch as the manifold alterations that have taken place in the phyſiognomy of tracts of country almoſt within the memory of man. How little are we acquainted with the means which nature employs to form the very ſoil on which we tread, by converting into mould the various animal and vegetable exuviæ! How ſcanty are the genuine obſervations we poſſeſs on the proceſs of alluvial depoſition! on the detritus accumulated at the foot of mountains by means of the decompoſition of the various rocks! how little do we know of the proceſs employed to produce petrifactions! and how little of the circumſtances under which the latter occur! And yet many of theſe, and other phenomena within the ſphere of human obſervation, will admit of conſiderable elucidation, and may lead to very intereſting reſults, by applying to them ſound principles of logic and induction. But reſearches of this nature require what few are inclined to beſtow upon them, the patient obſervation of many years; and, what falls to the lot of few obſervers, a facility of combining and generalizing inſulated facts. As an inſtance both of the difficulty and utility of ſuch reſearches, if properly conducted, and of the little attention that has hitherto been paid to conſiderations that ſhould precede any attempt at framing a ſyſtem of geology, we advert only to the highly intereſting diſcoveries made within the laſt twelve years, by Cuvier in the neighbourhood of Paris. It is in the confined ſpace of the well known gyps-formation of that part of France that this incomparable naturaliſt has found the oſſeous remains of no leſs than fifteen quadrupeds, unlike any ſpecies now known to exiſt. Have theſe organized beings, it may be aſked, lived in the places where their remains are found, or have they been carried thither? and are they ſtill to be met with living, or to be conſidered totally or partly deſtroyed? It is obvious that the cauſes to be aſſigned for the occurrence of thoſe petrifactions muſt be diametrically oppoſite according as theſe two ſimple queſtions are anſwered in the affirmative or negative; and yet ſomebody has thought it worth while to ſatisfy himſelf reſpecting this circumſtance; nor have any of the authors of the ten or twelve hypotheſes that profeſs to explain the formation of the baſin of Paris, been aware that in a ſolitary ſmall corner of that baſin, namely, at Grignon, there have been diſcovered by Lamarck, in the courſe of ſeveral years, about ſix hundred unknown ſpecies of ſhells, beſides forty or fifty, of which the prototypes are ſuppoſed to be ſtill exiſting.

We ſhall not attempt in this article to give a hiſtory of geology, which would be nothing more than a chronological expoſition of the different theories of the earth (ſee EARTH, and THEORIES *of the Earth*): nor is it to naturaliſts of earlier periods than the latter end of the laſt century, that we are indebted for genuine obſervations in this department of ſcience. But much as we owe to the exertions of a Lehmann, Deluc, Dolomieu, and particularly Sauſſure, who, in his celebrated *agenda*, has proved how well he knew the deſiderata of geology, and what remained to be done to give this branch of knowledge all the perfection it is ſuſceptible of; yet the merit of arranging, into a harmonious whole, a multiplicity of materials furniſhed by an intimate acquaintance with the internal ſtructure of a conſiderable and highly intereſting tract of country, is entirely due to Werner; who, being aſſiſted by the moſt profound knowledge of the various mineral ſubſtances, and gifted with a happy facility of generalizing facts, has produced a ſyſtem of geognoſy, at once ſimple and practical, and much more free from gratuitous aſſumption than all the reſt. Profeſſor Jameſon is the firſt in this country who has given an expoſition of the Wernerian geognoſy, conſtituting the third volume of his "Mineralogy." The following is intended only as a brief ſketch of that ſyſtem, fuller details of which will be found under the various articles referred to.

The ſurface of the globe, conſidered relative to its inequalities, is divided into highland, lowland, and the bottom of the ſea. The *highland* comprizes, 1. Alpine land, compoſed of mountain groups or ſeries of mountain chains; 2. Mountain chains, formed by a ſeries of thoſe ſtill more ſimple inequalities, called 3. Mountains: in the former we conſider their length, height, form, and connection; the parts of the latter are the foot, the acclivity, and the ſummit. See MOUNTAINS, and MOUNTAIN GROUPS.

Lowland we call thoſe extenſive flat tracts which are almoſt entirely deſtitute of ſmall mountain groups, which latter, if they occur in them, generally occupy the middle part of the lowland. The principal lowland in Europe is the eaſtern part of Great Britain, the north of France, the cidevant Netherlands, the northern part of Germany and Sileſia, the whole of Poland, the N. W. part of Ruſſia, towards the Ural mountains, a very ſmall part of Sweden, namely, Gothland. The ſecond extenſive lowland plain is in the centre of Aſia; it is known by the name of the Steppes, and includes almoſt the whole N. E. part of Ruſſia; ſome ſmaller ones are in Arabia. The extent of the lowland of Africa is not known. America has two conſiderable lowland plains: the one, in its northern half, is traverſed by the Miſſiſippi and Miſouri, and borders towards the eaſt by the Apalachian mountains, and the Weſt India iſlands; the ſecond, in South America, borders on the Andes. With theſe plains of the lowland are connected the *river-courſes*, or river valleys, in which we have to conſider the bed of the river and the holm or haugh land, the high and low bank of the river. (See RIVER-*courſe*.) The inconſiderably riſing ground with which the lowland plains are frequently marked, is, by German geognoſians, called *Land-höhen* when they are nearly of equal length and breadth, and *Land-rücken* when they have an elongated form.

The bottom of the ſea, or that part of the globe which is ſtill covered by water, may equally be conſidered with a view to its depreſſions and elevations; to the latter belong the flat, the rocky bottom, the ſhoals, reefs, and iſlands. See SEA and ISLAND.

It is only after a diligent ſtudy of the inequalities juſt pointed out, that we can with advantage undertake to explore the means employed by nature to produce them; and the firſt ſtep is to proceed to the examination of the phyſical cauſes of the ſlow, but unceaſing changes of the globe. Obſervation teaches us, that moſt of the elevations and hollows we meet with on the ſurface of the earth owe their origin to the action of the atmoſphere, to that of the ocean, and to volcanic fire. Theſe powerful agents may be conſidered with regard to their *deſtroying*, and, in conſequence of this deſtruction, with regard to their *forming* effects. The waters of the ocean poſſeſs the former of theſe powers in a ſuperior degree; whole maritime diſtricts are known to have been overwhelmed by their irregular action upon the land; but alſo the regular motion of the ſea, ebb and flood tide, currents, &c. conſiderably contribute to gradually changing the face of the bottom of the ſea, and of the ſhores on which they act. The deſtroying effects of the atmoſpheric waters are both mechanical and chemical; the former are produced by long continued rain, water-ſpouts, ice, ſnow, thaws, and conſequent floods, by which conſiderable portions of rocks are detached and carried, together with other looſe materials they meet, to more or leſs diſtant places, according as the bulk of theſe materials or the nature of the country, either favours or impedes their progreſs. The chemically deſtroying effects of water are leſs rapid, and depend on the ſolubility of the different rocks over which they flow. The forming effects of water, both mechanical and chemical, are the natural conſequence of its deſtructive effects; examples of the former are ſandbanks, changes of coaſts, &c. Of the latter, beds of ſalt, calcareous, and other depoſitions, &c. See Waters, *Atmoſpheric*, and Ocean.

The effects of volcanic fire are deſtroying by means of the conſumption of the inflammable materials, by deſiccation and fuſion; and forming by ſublimation, and by the production of lavas and other volcanic ejections, by ſublimation, &c. See Volcano.

From the deſcription of the inequalities of the ſurface of the earth, and of the means employed in forming them, the Wernerian ſchool proceeds to the conſideration of the internal ſtructure of the earth, the knowledge of which we derive from a careful examination of the order which nature has followed in the depoſition of the mountain maſſes, and which is principally laid open to view in the chaſms and ſections produced by floods, &c. in natural caverns and in the interior of mines. By theſe means we may become acquainted with four different ſtructures, beſides that of the ſimple foſſil, which is the object of Oryctognoſy; 1. The ſtructure of *rocks* or *mountain rocks*; theſe are either ſimple (ſuch as limeſtone, clay-ſlate, ſerpentine), or aggregated, in which caſe the principal kinds of texture of the component parts are granular, ſlaty, porphyritic, and amygdaloidal. (See Rocks.) 2. A more general ſtructure is that of *mountain maſſes*; theſe have either a ſimply ſtratified ſtructure, *viz.* when a mountain, or mountain maſſes are compoſed of one ſpecies of rock divided into parallel tabular maſſes or ſtrata; or they conſiſt of alternating ſtrata of different rocks, which in this caſe are called *beds*. Mountain maſſes alſo diſplay what is termed *ſeamed* ſtructure, in which diſtinct concretions on a large ſcale are obſervable, ſuch as the columnar, the large globular, and the club-ſhaped ſtructure, ſeveral modifications of which are obſerved in baſalt. Another variety of this ſtructure is called *tabular ſeamed* ſtructure, which is not unlike ſtratification. (See Mountain Masses, and Strata.) A ſtill more general ſtructure is 3. The *ſtructure of formations*, which term Werner applies to a determinate aſſemblage of ſeveral ſimilar and diſſimilar rock maſſes which conſtitute an independent whole. If the maſs is uniform throughout; if, for inſtance, it conſiſts entirely of ſandſtone, granite, &c. it is termed *ſimple*, whereas it is a *compound* formation, if it exhibits diſſimilar maſſes, ſuch as black coal with fletz-trap, &c. Some formations conſtitute the principal maſs of a mountain in which they occur, (gneiſs, clay-ſlate, porphyry, &c.) while others occur only imbedded (porphyry, lime-ſtone, &c.); and theſe beds, if they occur in different principal formations, and always under the ſame circumſtances, notwithſtanding the difference of the rocks in which they are found, and if, moreover, they form members of a ſeries of formations, are conſidered as, and denominated *independent formations*. If the reverſe of all this is obſerved in ſingle beds, they are called *ſubordinate* to the formation in which they are imbedded, as is the caſe with the beds of roe-ſtone, in the ſecond ſand-ſtone, &c. For ſome further diſtinctions, ſee Repositories, *mineral*. The moſt general of the ſtructures we know is, 4. That of the *cruſt of the earth*, compoſed of rock formations, which cover each other in certain directions, and in a regular manner. As to the original extent of formations in general, Werner terms *univerſal* formations thoſe which, without great interruption, ſurround the whole globe, and thus conſtitute the greater part of its cruſt; to it belong almoſt the whole of the primitive, tranſition, and fletz-formation. *Partial* formations, on the other hand, are thoſe that appear only in detached ſpots, and exhibit characters diſtinct from thoſe of the univerſal formation: thus the depoſition at Wehrau in Luſatia (which Werner ſuſpects to be the reſult of a ſmall and partial flood) is compoſed of ſand-ſtone, lime-ſtone, bituminous ſhale and iron-clay, which all reſt on looſe ſand. The preſent extent and continuity of formations are ſo far different from the original, that thoſe called *univerſal* often appear broken into ſmall detached portions, frequently reſembling partial formations, and they receive different names according to their different ſhapes, and the ſituations in which they are found. Other conſiderations relative to the ſtructure of the cruſt of the globe are derived from the poſition and direction of the ſtrata in regard to the fundamental or ſubjacent rock, from the direction of the ſtrata without reference to the fundamental rock, and from the relation of the *outgoings* (*i. e.* the upper extremities of the different ſtrata as they appear at the ſurface of the earth), to the exterior of the mountain; for which ſee Strata.

A compariſon of the different claſſes of rocks, and their ſucceſſion and ſtratification, points out the following diſtinctions. The claſs of rocks on which all others reſt, and which, on that account, is conſidered as the oldeſt, is the claſs of the *primitive rocks*, whoſe texture is often more or leſs cryſtalline, a quality denoting previous chemical ſolution. They comprehend granite, gneiſs, mica-ſlate, talc-ſlate, hornblende ſlate, ſyenite, porphyry, ſerpentine, and lime-ſtone. Theſe rocks are moſtly diſpoſed in conformable and unbroken ſtratification, each newer ſtratum with lower level, as is the caſe with gneiſs, mica-ſlate, and clay-ſlate, while the granite beneath will ſometimes appear to riſe up through them, encompaſſed, in various manners, by the other rocks. (See Rocks, *Primitive*.) The rocks next in ſucceſſion are ſuch as are likewiſe principally compoſed of chemical productions, but in which mechanical depoſition is obſerved more abundantly the nearer they approach the following claſs; the rocks conſtituting this intermediate claſs are called tranſition-rocks. Lime-ſtone occurs more frequently in this than in the preceding claſs: the other rocks it contains are principally grey-wacke, grey-wacke ſlate, and clay-ſlate. (See Transition-*Rocks*). To this ſucceeds, as of ſtill later origin, the claſs of fletz-rocks, in which the mechanical depoſits occur in greater abundance, at the ſame time that the chemical precipitation diſappears. (See Fletz-*Rocks*.) The next claſs which bears the character of ſtill more recent formation, is entirely compoſed of mechanical depoſits, ſuch as ſand, clay, &c. (See Rocks, *Alluvial*.) But, beſides theſe formations, the outgoings of which ſhow gradually diminiſhing levels from the older to the newer, there are two others, the ſtrata of which, inſtead of having paralleliſm with, are ſuperincumbent on, the outgoings of the other ſtrata: they are called the *neweſt fletz-trap*, and the *newer porphyry formation*, and are ſeen to reſt both on fletz-ſtrata of very recent formation, and on elevated primitive mountains. The former of theſe formations is particularly intereſting, as including rocks, whoſe origin has been, and continues to be, a ſubject of controverſy between the Neptuniſts and Volcaniſts, ſuch as baſalt, wacke, &c. all of which, according to Werner, are the reſults of a deluge, or ſudden riſe of the water at a more recent period than that in which the fletz-mountains were formed. (See FLETZ-*Rocks* and TRAP-*Formation.*) The ſecond of theſe great formations, occurring in the ſame unconformable ſtratification, conſiſts of porphyry, ſyenite, and pitch-ſtone, and is ſuppoſed of much older origin than the neweſt fletz-trap-formation, with which, however, it agrees in many reſpects. See PORPHYRY.

No geologiſt before Werner has pointed out the ſucceſſion in which the different ſuites of formations have been depoſited from the water at different periods; a ſucceſſion which ſhows the alterations that fluid has undergone with regard to the ſubſtances it held, at different times, either chemically diſſolved, or mechanically floating. Thus the oldeſt of the primitive rocks contain metals almoſt peculiar to them, and which, therefore, were not again depoſited in ſucceeding periods, ſuch as tin, molybdena, and tungſteen; and in ſeveral caſes, one and the ſame ſubſtance, (ſuch as lime-ſtone,) though it be repeated at conſiderable intervals, ſtill adopts in each of them a peculiar character. Theſe ſuites are, 1. That of the *lime-ſtone formation*, beginning with the primitive cryſtalline granular lime-ſtone, and paſſing, by inſenſible gradations, through the tranſition, and fletz-lime ſtones, into the lowermoſt links of the ſeries, *viz.* chalk and calcareous tuf. 2. That of the *ſlate formation:* its central point is clay-ſlate (from which this formation derives its name), paſſing, on one hand, through mica-ſlate into gneiſs, when the ſlaty ſtructure gradually diſappears, and a paſſage is formed into the oldeſt member, namely granite; and, on the other hand, through tranſition-ſlate, grey-wacke ſlate, and grey-wacke, into the ſeries of fletz ſand-ſtones, and from thence into the alluvial ſeries, conſiſting of ſlate clay, loam, ſand, and gravel. 3. The *trap-formation ſuite* paſſes from the primitive hornblende-ſlate, characterized by its cryſtalline nature, and from the primitive green-ſtone, and green-ſtone ſlate, through the tranſition green-ſtone, into the fletz-trap, formed chiefly of amygdaloid, and from thence into the neweſt fletz-trap formation, conſiſting principally of baſalt and wacke, unconformably ſuperincumbent on rocks of various antiquity. 4. The *porphyry formation ſuite* is equally characteriſtic in its different members, from old primitive porphyry down to that mentioned above, as of ſimilar origin with the neweſt fletz-trap formation: the nature of the different members of this formation ſtands, however, in need of further examination. (See PORPHYRY.) 5. The *gyps-formation* comprises three principal members, the oldeſt of which, or the primitive gypſum, [illegible] in mica-ſlate and clay-ſlate; the ſecond and third are fletz-gypſum, the former of them accompanying the following, or 6. *Salt-formation*, which conſtitutes two ſeries, one of which occurs only with fletz-gypſum, (ſee FLETZ-*Rocks*), while the other is ſtill forming on the bottom of lakes, &c. (See ROCK-*ſalt*.) 7. The *coal-formation-ſuite*, [illegible] the independent coal formation, various [illegible] of coal belonging to the fletz-trap formation, and [illegible]; the members of this ſuite require farther inveſtigation. (See FLETZ-*Rocks*, and COAL.) 8. The *ſerpentine-formation ſuite* is compoſed, as far as we know, of two members, the firſt or older occurring with primitive rocks, eſpecially primitive lime-ſtone, in conformable ſtratification; and the ſecond or newer, found in an unconformable and overlying poſition on the older rocks. See SERPENTINE.

For further particulars relating to the Wernerian ſyſtem of geognoſy, we refer to the articles STRATA, VEIN, and WATERS, *Diminution of.*

GEOMANCY, GEOMANTIA, a kind of divination, performed by means of a number of little points, or dots, made on paper at random: and conſidering the various lines and figures which thoſe points preſent: and thence forming a pretended judgment of futurity, and deciding any queſtion propoſed.

The word is formed of the Greek γη, *terra*, *earth;* and μαντεια, *divination;* it being the ancient cuſtom to caſt little pebbles on the ground, and thence to form their conjectures; inſtead of the points afterwards made uſe of.

Polydore Virgil defines geomancy a kind of divination performed by means of clefts, or chinks made in the ground; and takes the Perſian Magi to have been the inventors thereof.

GEOMETRICAL, ſomething that has a relation to *geometry*.

Thus we ſay, a geometrical method, a geometrical genius, geometrical ſtrictneſs, geometrical conſtruction, geometrical demonſtration.

Geometry itſelf ſeems to lead us into errors; after once reducing a thing to geometrical conſideration, and finding that it anſwers pretty exactly, we purſue the view, are pleaſed with the certainty and agreeableneſs of the demonſtrations, and apply the geometry farther and farther, till we often outrun nature.

Hence it is, that all machines do not ſucceed: that all compoſitions of muſic, wherein the concords are the moſt rigidly obſerved, are not agreeable: that the moſt exact aſtronomical computations do not always foretell the preciſe time and quality of an eclipſe, &c.

The reaſon is, that nature is not a mere abſtract; mechanical levers and wheels are not geometrical lines and circles; as they are often ſuppoſed to be: the taſte for tunes is not the ſame in all men; nor at all times in the ſame man: and as to aſtronomy, as there is no perfect regularity in the motions of the planets, their orbits hardly ſeem reducible to any fixed, known figure.

The errors, therefore, we fall into in aſtronomy, muſic, mechanics, and the other ſciences to which geometry is applied, do not properly ariſe from geometry, which is an infallible ſcience, but from the falſe uſe, or the miſapplication of it.

GEOMETRICAL *Conſtruction* of an equation, is the contriving and drawing of lines and figures, whereby to demonſtrate the equation, theorem, or canon, to be geometrically true. See CONSTRUCTION *of Equations*.

GEOMETRICAL *Line* or *Curve*, called alſo *algebraic line* or *curve*, is that wherein the relations of the abſciſſas to the ſemi-ordinates may be expreſſed by an algebraic equation. See CURVE.

Geometrical lines are diſtinguiſhed into claſſes, orders, or genera, according to the number of the dimenſions of the equation that expreſſes the relation between the ordinates and the abſciſſas: or, which amounts to the ſame, according to the number of points in which they may be cut by a right line.

Thus a line of the firſt order will be only a right line: thoſe of the ſecond, or quadratic order, will be the circle, and the conic ſections; and thoſe of the third, or cubic order, will be the cubical and Nelian parabolas, the ciſſoid of the ancients, &c.

But the curve of the firſt gender (becauſe a right line cannot be reckoned among the curves) is the ſame with a line of the ſecond order; and a curve of the ſecond gender, the ſame with a line of the third order; and a line of an infiniteſimal order is that which a right line may cut in infinite points; as the ſpiral, cycloid, the quadratrix, and every line generated by the infinite revolutions of a radius.

However, it is not the equation, but the deſcription, that makes the curve a geometrical one; the circle is a geometrical line, not becauſe it may be expreſſed by an equation, but becauſe its deſcription is a poſtulate: and it is not the ſimplicity of the equation, but the eaſineſs of the deſcription, which is to determine the choice of the lines for the conſtruction of a problem. The equation that expreſſes a parabola is more ſimple than that which expreſſes a circle; and yet the circle, by reaſon of its more ſimple conſtruction, is admitted before it.

The circle and the conic ſections, if you regard the dimenſions of the equations, are of the ſame order; and yet the circle is not numbered with them in the conſtruction of problems; but by reaſon of its ſimple deſcription is depreſſed to a lower order; *viz.* that of a right line; ſo that it is not improper to expreſs that by a circle, which may be expreſſed by a right line, but it is a fault to conſtruct that by the conic ſections, which may be conſtructed by a circle.

Either, therefore, the law muſt be taken from the dimenſions of equations, as obſerved in a circle, and ſo the diſtinction be taken away between plane and ſolid problems: or the law muſt be allowed not to be ſtrictly obſerved in lines of ſuperior kinds; but that ſome, by reaſon of their more ſimple deſcription may be preferred to others of the ſame order, and be numbered with lines of inferior orders.

In conſtructions that are equally geometrical, the moſt ſimple are always to be preferred: this law is ſo univerſal as to be without exception. But algebraic expreſſions add nothing to the ſimplicity of the conſtruction; the bare deſcriptions of the lines here are only to be conſidered; and theſe alone were conſidered by thoſe geometricians, who joined a circle with a right line. And as theſe are eaſy or hard, the conſtruction becomes eaſy or hard: and therefore it is foreign to the nature of the thing, from any thing elſe to eſtabliſh laws about conſtructions.

Either, therefore, with the ancients, we muſt exclude all lines beſide the circle, and perhaps the conic ſections, out of geometry; or admit all according to the ſimplicity of the deſcription: if the trochoid were admitted into geometry, we might, by its means, divide an angle in any given ratio: would you therefore blame thoſe who would make uſe of this line to divide an angle in the ratio of one number to another; and contend, that this line was not defined by an equation, but that you muſt make uſe of ſuch lines as are defined by equations?

If, when an angle were to be divided, for inſtance, into 1001 parts, we ſhould be obliged to bring a curve defined by an equation of above a hundred dimenſions to do the buſineſs; which nobody could deſcribe, much leſs underſtand; and ſhould prefer this to the trochoid, which is a line well known, and deſcribed eaſily by the motion of a wheel, or circle: who would not ſee the abſurdity?

Either, therefore, the trochoid is not to be admitted at all in geometry; or elſe, in the conſtruction of problems, it is to be preferred to all lines of a more difficult deſcription; and the reaſon is the ſame for other curves. Hence, the triſections of an angle by a conchoid, which Archimedes, in his Lemmas, and Pappus, in his Collections, have preferred to the invention of all others in this caſe, muſt be allowed to be good; ſince we muſt either exclude all lines, beſide the circle and right line, out of geometry, or admit them according to the ſimplicity of their deſcriptions; in which caſe the conchoid yields to none except the circle. Equations are expreſſions of arithmetical computation, and properly have no place in geometry, except ſo far as quantities truly geometrical (that is, lines, ſurfaces, ſolids, and proportions) may be ſaid to be ſome equal to others: multiplications, diviſions, and ſuch ſort of computations, are newly received into geometry, and that apparently contrary to the firſt deſign of this ſcience: for whoever conſiders the conſtruction of problems by a right line and a circle, found by the firſt geometricians, will eaſily perceive that geometry was introduced that we might expeditiouſly avoid, by drawing lines, the tedioufneſs of computation

It ſhould ſeem, therefore, that the two ſciences ought not to be confounded together: the ancients ſo induſtriouſly diſtinguiſhed them, that they never introduced arithmetical terms into geometry; and the moderns, by confounding both, have loſt a great deal of that ſimplicity, in which the elegance of geometry principally conſiſts. Upon the whole, that is arithmetically more ſimple, which is determined by more ſimple equations; but that is geometrically more ſimple which is determined by the more ſimple drawing of lines; and in geometry, that ought to be reckoned beſt which is geometrically moſt ſimple.

GEOMETRICAL *Locus*, or *Place*, called alſo ſimply *locus*. See LOCUS.

GEOMETRICAL *Medium*. See MEDIUM.

GEOMETRICAL *Method of the Ancients*. It is to be obſerved that the ancients eſtabliſhed the higher parts of their geometry on the ſame principles as the elements of that ſcience, by demonſtrations of the ſame kind; and that they ſeem to have been careful not to ſuppoſe any thing done, till by a previous problem they had ſhewn how it was to be performed. Far leſs did they ſuppoſe any thing to be done that cannot be conceived, as a line or ſeries to be actually continued to infinity, or a magnitude to be diminiſhed till it becomes infinitely leſs than what it was. The elements into which they reſolved magnitudes were finite, and ſuch as might be conceived to be real. Unbounded liberties have been introduced of late, by which geometry, which ought to be perfectly clear, is filled with myſteries. See Maclaurin's Fluxions, Intr. p. 39, ſeq.

GEOMETRICAL *Oſculum*. See CURVE, EVOLUTE, and OSCULUM.

GEOMETRICAL *Pace*, is a meaſure conſiſting of five feet. See PACE, and FOOT.

GEOMETRICAL *Plan*, in *Architecture*. See PLAN.

GEOMETRICAL *Plane*. See PLANE.

GEOMETRICAL *Progreſſion*. See *Geometrical* PROGRESSION.

GEOMETRICAL *Proportion*, called alſo abſolutely, and ſimply, *proportion*, is a ſimilitude or identity of ratios. See RATIO.

Thus, if A be to B, as C to D, they are in geometrical proportion: ſo 8, 4, 30, and 15, are geometrical proportionals. See PROPORTION.

GEOMETRICAL *Solution* of a problem, is when the problem is directly ſolved according to the ſtrict principles and rules of geometry, and by lines that are truly geometrical.

In this ſenſe we ſay, geometrical ſolution in contradiſtinction to a mechanical, or inſtrumental ſolution, where the problem is only ſolved by ruler and compaſſes.

The ſame term is likewiſe uſed in oppoſition to all indirect and inadequate kinds of ſolutions, as by infinite ſerieſes, &c.

We have no geometrical way of finding the quadrature of the circle, the duplicature of the cube, or two mean proportionals; but mechanical ways, and others, by infinite ſerieſes, we have.

The ancients, Pappus informs us, in vain endeavoured at the triſection of an angle, and the finding out of two mean proportionals by a right line, and a circle. Afterwards they began to conſider the properties of ſeveral other lines; as the conchoid, the ciſſoid, and the conic ſections; and by ſome of theſe endeavoured to ſolve thoſe problems. At length, having more thoroughly examined the matter, and the conic ſections being received into geometry, they diſtinguiſhed geometrical problems into three kinds; *viz.*

1. *Plane* ones, which, deriving their original from lines on a plane, may be regularly ſolved by a right line, and a circle.

2. *Solid* ones, which are ſolved by lines deriving their original from the conſideration of a ſolid; that is, of a cone.

3. *Linear* ones, to the ſolution of which are required lines more compounded.

According to this diſtinction we are not to ſolve ſolid problems by other lines than the conic ſections; eſpecially if no other lines but right ones, a circle, and the conic ſections, muſt be received into geometry.

But the moderns, advancing much farther, have received into geometry all lines that can be expreſſed by equations; and have diſtinguiſhed, according to the dimenſions of the equations, thoſe lines into kinds; and have made it a law, not to conſtruct a problem by a line of ſuperior kind, that may be conſtructed by one of an inferior kind.

GEOMETRICAL *Square.* See SQUARE.

GEOMETRICAL *Table.* See PLAIN *Table.*

GEOMETRICALLY PROPORTIONALS, are quantities in continual proportion; or which proceed in the ſame conſtant ratio: as 6, 12, 24, 48, 96, 192, &c.

They are thus called, in contradiſtinction to equi-different quantities; which are called, though ſomewhat improperly, *arithmetically proportionals.*

GEOMETRY, the ſcience, or doctrine of extenſion, or extended things; that is, of lines, ſurfaces, or ſolids.

The word is Greek *γεωμετρια*, formed of *γεα* or *γη*, *earth*, and *μετρεω*, *meaſure;* it being the neceſſity of meaſuring the earth, and the parts and places thereof, that gave the firſt occaſion to the invention of the principles and rules of this art; which has ſince been extended and applied to numerous other things; inſomuch that geometry, with arithmetic, is now the general foundation of all mathematics.

Herodotus, lib. ii. p. 102. edit. Weſſelingii, Diodorus, lib. i. § 81, or vol. i. p. 91. edit. Amſt. 1746. and Strabo, lib. xvii. vol. ii. p. 1139. edit. Amſt. 1707. aſſert, that the Egyptians were the firſt inventors of geometry; and that the annual inundations of the Nile were the occaſion of it; for that river bearing away all the bounds and landmarks of men's eſtates, and covering the whole face of the country, the people, ſay they, were obliged to diſtinguiſh their lands by the conſideration of their figure and quantity; and thus, by experience and habit, formed themſelves a method, or art, which was the origin of geometry. A farther contemplation of the draughts of figures, of fields thus laid down, and plotted in proportion, might naturally enough lead them to the diſcovery of ſome of their excellent and wonderful properties; which ſpeculation continually improving, the art became gradually improved, as it continues to do to this day. Joſephus, however, ſeems to attribute the invention to the Hebrews: and others, among the ancients, make Mercury the inventor. Polyd. Virgil, De Invent. Rer. lib. i. cap. 18.

From Egypt geometry paſſed into Greece, being carried thither, as ſome ſay, by Thales; where it was much cultivated and improved by himſelf, Pythagoras, Anaxagoras of Clazomene, Hippocrates of Chios, and Plato, who teſtified his conviction of the neceſſity and importance of geometry in order to the ſucceſsful ſtudy of philoſophy by the following inſcription on the door of his academy, *ουδεις αγεωμετρητος εισιτω*, *let no one ignorant of geometry enter here.* Plato, conceiving that geometry was too mean and reſtricted an appellation for this ſcience, ſubſtituted for it the more extenſive name of "Menſuration;" and others have denominated it "Pantometry." Other more general and comprehenſive appellations are more ſuitable to its extent, more eſpecially in the preſent advanced ſtate of the ſcience; and accordingly ſome have defined it as the ſcience of inquiring, inventing, and demonſtrating all the affections of magnitude. Proclus calls it the knowledge of magnitudes and figures, with their limitations; as alſo of their ratios, affections, poſitions, and motions of every kind. About fifty years after Plato, lived Euclid, who collected together all thoſe theorems which had been invented by his predeceſſors in Egypt and Greece, and digeſted them into fifteen books, entitled the Elements of Geometry; and thoſe propoſitions which were not ſatisfactorily proved, he more accurately demonſtrated. (See EUCLID.) The next to Euclid of thoſe ancient writers, whoſe works are extant, is Apollonius Pergæus, who flouriſhed in the time of Ptolemy Euergetes, about two hundred and thirty years before Chriſt, and about a hundred years after Euclid. (See his biographical article.) The third ancient geometer, whoſe writings remain, is Archimedes of Syracuſe, who was famous about the ſame time with Apollonius. (See ARCHIMEDES.) We can only mention Eudoxus of Cnidus, Archytas of Tarentum, Philolaus, Eratoſthenes, Ariſtarchus of Samos, Dinoſtratus, the inventor of the quadratrix, Menechmus, his brother and the diſciple of Plato, the two Ariſteuſes, Conon, Thraſideus, Nicoteles, Leon, Theudius, Hermotimus, and Nicomedes, the inventor of the conchoid; beſides whom, there are many other ancient geometers, to whom this ſcience is indebted.

The Greeks continued their attention to geometry even after they were ſubdued by the Romans. Whereas the Romans themſelves were ſo little acquainted with this ſcience, even in the moſt flouriſhing time of their republic, that they gave the name of mathematicians, as Tacitus informs us, to thoſe who purſued the chimeras of divination and judiciary aſtrology. Nor were they more diſpoſed to cultivate geometry, as we may reaſonably imagine, during the decline, and after the fall of the Roman empire. The caſe was different with the Greeks; among whom we find many excellent geometers ſince the commencement of the Chriſtian era, and after the tranſlation of the Roman empire. Ptolemy lived under Marcus Aurelius; and we have extant the works of Pappus of Alexandria, who lived in the time of Theodoſius; the commentary of Eutocius, the Aſcalonite, who lived about the year of Chriſt 540, on

Archimedes's menſuration of a circle; and the commentary on Euclid, by Proclus, who lived under the empire of Anaſtaſius.

The conſequent inundation of ignorance and barbariſm was unfavourable to geometry as well as to the other ſciences; and thoſe few who applied themſelves to this ſcience, &c. were calumniated as magicians. However, in thoſe times of European darkneſs, the Arabians were diſtinguiſhed as the guardians and promoters of ſcience; and from the ninth to the fourteenth century they produced many aſtronomers, geometers, geographers, &c. from whom the mathematical ſciences were again received into Spain, Italy, and other parts of Europe, ſomewhat before the beginning of the 15th century. Some of the earlieſt writers after this period are Leonardus Piſenus, Lucas Paciolus or de Burgo, and others between 1400 and 1500. After this period appeared many editions of Euclid, or commentaries upon his Elements; *e. g.* Orontius Fineus, in 1530, publiſhed a commentary on the ſix firſt books; as did James Peletarius in 1557; and about the ſame time Nicholas Tartaglia publiſhed a commentary on the whole 15 books. We might here mention other editions or commentaries; ſuch are thoſe of Commandine, Clavius, Billingſly, Schéubelius, Harlinus, Daſypodius, Ramus, Herigon, Stevinus, Saville, Barrow, Tucquet, Dechales, Furnier, Scarborough, Keill, Cann, Stone, and many others. (See ELEMENTS.)

At the revival of letters, there were few Europeans capable of tranſlating and commenting on the works of the ancient geometers; and geometry made little progreſs till the time of Des Cartes, who publiſhed his Geometry in 1637. However, not to mention all thoſe who extended geometry beyond its elementary parts, ſuch as Theodoſius in his Spherics, Serenus in his ſections of the cone and cylinder, Kepler in his Nova Stereometria, &c.; in 1635, Bonaventure Cavalerius, an Italian of the order of Jeſuits, publiſhed his "Geometry of Indiviſibles;" Torricelli his "Opera Geometrica;" Viviani, his "Divinationes Geometricæ," "Exercitatio Mathematica," "De Locis Solidis," "De Maximis et Minimis," &c.; Vieta, his "Effectio Geometrica," &c.; Gregory St. Vincent, in 1647, publiſhed his treatiſe, entitled "Quadratura Circuli & Hyperbolæ," a work abounding with excellent theorems and paralogiſms; and Paſcal, about the ſame time, publiſhed his treatiſe of the cycloid. Geometry, as far as it was capable of deriving aid and improvement from the arithmetic of infinites, was indebted to the labours of Fermat, Barrow, Wallis, Mercator, Brounker, J. Gregory, Huygens, and others, to whom we may add Newton and Leibnitz. (See FLUXIONS.) But ſir Iſaac Newton contributed to the progreſs of pure geometry by his two treatiſes, "De Quadratura Curvarum," and "Enumeratio Linearum Tertii Ordinis" (ſee CURVE): and ſtill farther by his incomparable and immortal work, entitled "Philoſophiæ Naturalis Principia Mathematica," which will always be conſidered as the moſt extenſive and ſucceſsful application of geometry to phyſics. We cannot forbear tranſcribing in this place the compliment paid to this author by the editors of the Encyclopedie, who, conſidering the various monuments of the author's genius, and that he had made his principal diſcovery before the age of twenty-four, are tempted, they ſay, to ſubſcribe to the words of Pope, that the ſagacity of Newton aſtoniſhes even celeſtial intelligences, and that they contemplate him as a being occupying a kind of middle ſtation between man and themſelves; or at leaſt they cannot forbear exclaiming, *homo homini quid præſtat!* what a diſtance does there ſubſiſt between one man and another!

The modern geometers are innumerable; and the names of Cotes, Maclaurin, R. Simſon, T. Stewart, T. Simpſon, &c. not to mention living writers, will always be held in eſteem and veneration by thoſe that are devoted to the ſtudy of geometry and mathematics. See ELEMENTS.

The province of geometry is almoſt infinite: few of our ideas but may be repreſented to the imagination by lines, upon which they become of geometrical conſideration: it being geometry alone that makes compariſons, and finds the relations of lines.

Aſtronomy, muſic, mechanics, and, in a word, all the ſciences which conſider things ſuſceptible of more and leſs, *i. e.* all the preciſe and accurate ſciences, may be referred to geometry; for all ſpeculative truths conſiſting only in the relations of things, and in the relations between thoſe relations, they may be all referred to lines. Conſequences may be drawn from them; and theſe conſequences, again, being rendered ſenſible by lines, they become permanent objects, which may be conſtantly expoſed to a rigorous attention and examination: and thus we have infinite opportunities both of enquiring into their certainty, and purſuing them farther.

The reaſon, for inſtance, why we know ſo diſtinctly, and mark ſo preciſely, the concords called *octave, fifth, fourth,* &c. is that we have learnt to expreſs ſounds by lines, *i. e.* by chords accurately divided; and that we know, that the chord, which ſounds octave, is double of that with which it makes octave; that the fifth is the ſeſquialterate ratio, or as three to two; and ſo of the reſt. The ear itſelf cannot judge of ſounds with ſuch a nice preciſion; its judgments are too faint, vague, and variable, to form a ſcience. The fineſt beſt-tuned ear cannot diſtinguiſh many of the differences of ſounds; whence many muſicians deny any ſuch differences; as making this ſenſe their judge. Some, for inſtance, admit no difference between an octave and three ditones: and others, none between the greater and leſſer tone; the comma, which is the real difference, is inſenſible to them; and much more the ſchiſma, which is only half the comma.

It is only by reaſon, then, that we learn, that the length of the chord which makes the difference between certain ſounds being diviſible into ſeveral parts, there may be a great number of different ſounds contained therein, uſeful in muſic, which yet the ear cannot diſtinguiſh. Whence it follows, that had it not been for arithmetic and geometry, we ſhould have had no ſuch thing as regular fixed muſic; and that we could only have ſucceeded in that art by good luck, or force of imagination; *i. e.* muſic would not have been any ſcience founded on inconteſtible demonſtrations: though we allow, that the tunes compoſed by force of genius and imagination, are uſually more agreeable to the ear than thoſe compoſed by rule. So, in mechanics, the heavineſs of a weight, and the diſtance of the centre of that weight from the fulcrum, or point by which it is ſuſtained, being ſuſceptible of plus and minus, they may both be expreſſed by lines: whence geometry becomes applicable to this ſcience; in virtue of which, infinite diſcoveries have been made, of the utmoſt uſe in life.

Geometrical lines and figures are not only proper to repreſent to the imagination the relations between magnitudes, or between things ſuſceptible of more and leſs; as ſpaces, times, weights, motions, &c. but they may even repreſent things which the mind can no otherwiſe conceive, *e. gr.* the relations of incommenſurable magnitudes.

It muſt be obſerved, that this uſe of geometry among the ancients was not ſtrictly ſcientifical, as among us; but rather ſymbolical: they did not argue, or deduce things and properties unknown, from lines; but repreſented or delineated by them things that were known. In effect, they were not uſed as means or inſtruments of diſcovering, but as images or characters, to preſerve, or communicate, the diſcoveries that were already made.

"The Egyptians," Gale obſerves, "uſed geometrical figures, not only to expreſs the generations, mutations, and deſtructions of bodies; but the manner, attributes, &c. of the ſpirit of the univerſe, who, diffuſing himſelf from the centre of his unity, through infinite concentric circles, pervades all bodies, and fills all ſpace. But of all other figures they moſt affected the circle and triangle; the firſt, as being the moſt perfect, ſimple, capacious, &c. of all figures: whence Hermes borrowed it to repreſent the divine nature; defining God to be an intellectual circle or ſphere, whoſe centre is everywhere, and circumference nowhere." See Kirch. Œdip. Ægyptiac. and Gale Phil. General. lib. ii. cap. 2.

The ancient geometry was confined to very narrow bounds, in compariſon of the modern. It only extended to right lines and curves of the firſt order, or conic ſections; whereas into the modern geometry new lines of infinitely more and higher orders are introduced.

Geometry is commonly divided into four parts, or branches; planimetry, altimetry, longimetry, and ſtereometry; which ſee reſpectively.

Geometry, again, is diſtinguiſhed into *theoretical* or *ſpeculative*, and *practical.*

The firſt contemplates the properties of continuity; and demonſtrates the truth of general propoſitions, called *theorems.*

The ſecond applies thoſe ſpeculations and theorems to particular uſes in the ſolution of *problems.*

Geometry, *ſpeculative*, again may be diſtinguiſhed into *elementary* and *ſublime.*

Geometry, *elementary* or *common*, is that employed in the conſideration of right lines, and plane ſurfaces, and ſolids generated from them.

Geometry, *higher*, or *ſublime*, is that employed in the conſideration of curve lines, conic ſections, and bodies formed of them.

The writers who have cultivated and improved geometry may be diſtinguiſhed into elementary, practical, and thoſe of the ſublimer geometry.

The principal writers of elements, ſee enumerated under Elements.

Thoſe of the higher geometry are Archimedes, in his books De Sphæra, Cylindro, and Circuli Dimenſione; as alſo De Spiralibus, Conoidibus, Sphæroidibus, De Quadratura Parabolæ, and Arenarius: Kepler, in his Stereometria Nova; Cavalerius, in his Geometria Indiviſibilium; and Torricellius, De Solidis Sphæralibus; Pappus Alexandrinus, in Collectionibus Mathematicis; Paulus Guldinus, in his Mechanics and Statics; Barrow, in his Lectiones Geometricæ; Huygens, De Circuli Magnitudine; Bullialdus, De Lineis Spiralibus; Schooten, in his Exercitationes Mathematicæ; De Billy, De Proportione Harmonica; Lalovera, De Cycloide, For. Erneſt. Com. ab Harbenſtein, in Diatome Circulorum; Viviani, in Exercit. Mathemat. de Formatione & Menſura Fornicum; Bap. Palma, in Geomet. Exercitation. and Apoll. Pergæus, De Sectione Rationis.

For practical geometry, the fulleſt and completeſt treatiſes are thoſe of Mallet, written in French, but without the demonſtrations; and thoſe of Schwenter and Cantzlerus, both in High Dutch. In this claſs are likewiſe to be ranked Clavius's, Tacquet's, and Ozanam's Practical Geometries; De la Hire's Ecole des Arpenteurs; Reinholdus's Geodæſia; Hartman Beyers's Stereometria; Voigtel's Geometria Subterranea; all in High Dutch: Hulſius, Galileus, Goldmannus, Scheffelt, and Ozanam, on the Sector. &c. &c. &c.

The ſcience of geometry is founded on certain axioms, or ſelf-evident truths (ſee Axiom); it is introduced by definitions of the various objects which it contemplates, and the properties of which it inveſtigates and demonſtrates, ſuch as points, lines, angles, figures, ſurfaces, and ſolids:—lines again are conſidered as ſtraight or curved; and in their relation to one another, either as inclined or parallel, or as perpendicular:—angles as right, oblique, acute, obtuſe, external, vertical, &c.:—figures, with regard to their various boundaries, as triangles, which are, in reſpect of their ſides, equilateral, iſoſceles, and ſcalene, and in reference to their angles, right-angled, obtuſe-angled, and acute-angled; as quadrilaterals, which comprehend the parallelogram, including the rectangle and ſquare, the rhombus and rhomboid, and the trapezium and trapezoid; as multilaterals or polygons, comprehending the pentagon, hexagon, heptagon, &c.; and as circles:—and as ſolids, including a priſm, parallelepipedon, cube, pyramid, cylinder, cone, ſphere, and the fruſtum of either of the latter. We ſhall not here attempt to compile a complete ſyſtem of geometry, as it would occupy too many of our pages, in a work from its nature protracted and enlarged to a very great extent; and this is the leſs neceſſary, becauſe the reader will find under the titles above enumerated, and others naturally connected with and derived from them, the moſt eſſential and important principles of geometry, together with the operations that are founded upon them; and becauſe any perſon who is deſirous of acquainting himſelf with the ſcience of geometry, in its whole extent and application, will have recourſe to one or other of thoſe numerous treatiſes, in a more enlarged or more compendious form, which may be eaſily procured. The Elements of Euclid by Dr. R. Simpſon occur firſt to our recollection, and deſerve particular recommendation; but the object of the geometrical ſtudent may be ſatisfactorily attained by T. Simpſon's Geometry, or by the treatiſes of Emerſon, Hutton, Bonnycaſtle, Leſlie, &c. &c.

But as the analytic method of treating geometrical queſtions is leſs generally known, and as complete treatiſes on this ſubject are only to be found in foreign works, we have been induced to devote a conſiderable ſpace to this part of the ſcience; the following treatiſe is chiefly compiled from the "Feuilles d'Analyſe" by Monge, which were publiſhed in ſeparate portions for the uſe of the polytechnic ſchool, and afterwards collected in a quarto volume. A more elementary work has lately been publiſhed by Garnier in octavo, to which the reader is referred.

Geometry, *Analytic.*—Method of defining the poſition of a point in a plane.

A point M (*Analyſis*, *Plate* VIII. *fig.* 1.) is defined by referring its poſition to two lines, as A Y, A X, generally at right angles to each other, but they may be inclined at any given angle.

If M Q be drawn perpendicular to A Y, and M P perpendicular to A X, then Q M, M P, are called the co-ordinates of the point M; the diſtance of the point from A Y is uſually denoted by x, and its diſtance from A X by y.

The point of interſection of the two lines A Y, A X is called the origin of the co-ordinates, and the lines A Y, A X, produced each way to Y′ and X′, are called axes.

If the diſtance of the point M from theſe axes is given, *viz.* $MQ = a$, $MP = b$, then $x = a$, $y = b$ is the equation to the point M.

But if the point M be ſituated in any other of the angles, the ſign of a and b will vary, and theſe variations are governed by the ſame rules, as the ſines and coſines in trigonometry.

For inſtance, if the point M is ſituated in the angle

Y A X,

Y A X, then $x = +a,\ y = +b$
The equation of M' is $x = -a,\ y = +b$
M'' is $x = -a,\ y = -b$
M''' is $x = +a,\ y = -b$

If the point M is ſituated on the line A X, then $y = 0$, $x = a$.

If it is ſituated on A Y, then $x = 0$; $y = b$, and at the point A, $x = 0$; $y = 0$.

The point M may likewiſe be defined by the length of the line A M, and by the angle ϕ, which it makes with the axis A X. If this length be expreſſed by z, and the angle by ϕ,

$$z = c\,;\ \phi = A$$

A° being the number of degrees contained in the angle ϕ, and c the value of z.

The poſition of a ſtraight line is determined in a plane by the co-ordinates of two of its points, or by the co-ordinates of a ſingle point, and the angle which it makes with one of its axes: the latter is the method moſt uſually employed.

If the line paſſes through the origin of the axes, its poſition is determined by the angle which it makes with the axis.

We ſhall firſt conſider this caſe as being the moſt ſimple. Let it be propoſed to determine the relation between the co-ordinates of any point in ſuch a ſtraight line.

Let us take, for example, a point M′ (*fig.* 2.) whoſe abſciſſa is A $P' = x'$. $P'M' = y'$: theſe co-ordinates, like thoſe of the other points, making an angle β with each other, which is that of the axes, we ſhall have this equation;

$$\frac{y'}{x'} = \frac{\text{ſin. }\alpha}{\text{ſin. }(\beta - \alpha)}\,;$$

and for the points M″, M‴, &c. whoſe co-ordinates would be x'', y''; x''', y''', &c. we have

$$\frac{y''}{x''} = \frac{\text{ſin. }\alpha}{\text{ſin. }(\beta - \alpha)},\ \frac{y'''}{x'''} = \frac{\text{ſin. }\alpha}{\text{ſin. }(\beta - \alpha)},\ \&c.$$

If x, y repreſent the co-ordinates of any point in A L, the general equation will be

$$\frac{y}{x} = \frac{\text{ſin. }\alpha}{\text{ſin. }(\beta - \alpha)} \text{ .... } (1)$$

thus x becoming ſucceſſively x', x'', &c. y changes to the correſponding ordinates y', y'', &c. The formula (1) is called the equation of a ſtraight line; it is the algebraic enunciation of a property common to all its points, and is thus written;

$$y = \frac{\text{ſin. }\alpha}{\text{ſin. }(\beta - \alpha)}\,x \text{ .... } (2)$$

The abſciſſa x being given, the ordinate y may be deduced.

When the angle α varies, the line changes its poſition, turning round the point A; thus another ordinate y correſponds to the ſame abſciſſa x, which alſo happens if β varies, but it is eſſential to obſerve that for all the values both of α and β, the equation (2) retains the ſame form.

If it ſhould be required to find the relation between the co-ordinates of the point of a ſtraight line R′ L′, ſituated in any manner whatever, then if A L be drawn parallel to R′ L′, paſſing through the point A, we ſhall obſerve that for the ſame abſciſſa x every ordinate of A L, for example; P′ M′ will be augmented by the ſame quantity A $R = b$; let $y + b$ be repreſented by y, equation of R′ L′ will be according to (2);

$$y = \frac{\text{ſin. }\alpha}{\text{ſin. }(\beta - \alpha)}\,x + b \text{ .... } (3)$$

Here α and b give the poſition of the ſtraight line R′ L′; when theſe quantities are known it may be conſtructed, but if the line is ſubject to any particular conditions, as, to paſs through a given point; to be either parallel or perpendicular to a given line; to paſs through two points, &c. α and b become unknown quantities, as we ſhall ſee immediately.

Let us ſuppoſe the quantities a, β, and b given, and that it is required to conſtruct the ſtraight line $y = \frac{\text{ſin. }\alpha}{\text{ſin. }(\beta - \alpha)}\,x + b$; the problem is reduced to finding two of theſe points; we endeavour to find the points in which the line cuts the two axes A X, A Y, (*fig.* 3.) the interſection R being the only point of the line in which $x = 0$, and R′ the only point of the ſame line in which $y = 0$; we ſuppoſe, ſucceſſively, $x = 0$, $y = 0$, and we ſhall find $y = b =$ A R, $x = -\frac{\text{ſin. }(\beta - \alpha)}{\text{ſin. }\alpha}\,b =$ A R′; taking, then, A R′ on the other ſide of the point A, if it is negative, and A R on A Y if it is poſitive, the line drawn through theſe two points will be that belonging to the equation.

If the equation to a ſtraight line $y = x + 1$ be ſuppoſed to refer to two axes, making an angle of 45° with each other, and the inclination, α, which the line makes with the axis X be required; ſince $\frac{\text{ſin. }\alpha}{\text{ſin. }45^\circ - \alpha} = 1$, ſin. $\alpha = \frac{1}{\sqrt{2}}$ coſ. $\alpha - \frac{1}{\sqrt{2}}$ ſin. α; conſequently, tang. $\alpha = \frac{1}{1 + \sqrt{2}}$.

The value of b remaining conſtant, the line takes every poſſible poſition round the point R (*fig.* 2.) for every poſſible angle from 0 to 360°; for every angular value of α, taken with every ordinate b, poſitive and negative, the line will paſs through every point of the axis Y Y′. There exiſts, therefore, no line in the ſame plane that cannot be defined by equation (3), provided b and α are taken of a proper value.

The angle β has no influence on the poſition of the line; the variations of this angle only affect the inclination of the ordinate upon the axis of the abſciſſæ; ſo that for the ſame abſciſſæ, the ordinate correſponds with another point in the line.

But, in general, the co-ordinates are ſuppoſed rectangular; in which caſe, ſin. $\beta =$ ſin. $90^\circ = 1$, and ſin. $(\beta - \alpha) =$ coſ. α; and equation (3) becomes $y = x$ tang. $\alpha + b = ax + b$, a being ſuppoſed the tang. α.

When the ſtraight line paſſes through the origin of the co-ordinates, its equation becomes $y = ax$.

This equation is conſtructed by taking A $P = 1 =$ radius, and then ſetting off from a ſcale of equal parts the value of a on the perpendicular P M (*fig.* 4.); PM being equal to α, M will be a point in the required line.

We may now conſtruct the equation $y = x + 1$, $y = -x - 1$.

Theſe two lines cut the axis A X in the ſame point, and are ſituated ſimilarly to it, one above, the other below; they are moreover perpendicular to each other.

The ſtraight lines $y = -x - 1$, $y = -x + 1$, are parallel, becauſe they make the ſame angle with the axis, having the ſame tangent, -1.

The ſtraight line expreſſed by the equation $y = x\sqrt{-1} - 1$ is reduced to a point on the axis Y below the origin, and diſtant from it by a quantity equal to unity, ſince, for every other value than zero, the ordinate is imaginary.

The problems relating to a ſtraight line, in general, require the unknown quantities a and b to be determined, ſo that the required line $y = ax + b$ (1) may have the required poſition.

Problem I.

To make a ſtraight line paſs through two given points. Let the co-ordinates of one point be x', y', and of the other x'', y''; which ſignifies that when the ordinate generally expreſſed by y becomes y', the ordinate x becomes x'; and when $x = x''$, $y = y''$, we have therefore two equations of condition:

$$(2) \ldots\ldots\ldots\ldots y' = ax' + b, \quad y'' = ax'' + b \ldots\ldots\ldots\ldots (3)$$

from whence we obtain

$$a = \frac{y'' - y'}{x'' - x'} = \frac{y' - y''}{x' - x'}:$$

and by ſubſtituting for a its value,

$$b = \frac{y'x'' - y''x'}{x'' - x'}$$

Or equation (2) may be ſubtracted from equation (1), then $y - y' = a\,(x - x')$; and ſubſtituting for a in this equation its value, as found above, the equation of the line required is

$$y - y' = \frac{y' - y''}{x' - x''}\,(x - x') \ldots\ldots\ldots\ldots (4)$$

in which equation we may obſerve that when x becomes x', the ſecond term becomes equal to zero, and $y = y'$.

If $y' = y''$, then $y = y'$, or $y = y''$, which denotes that the line is parallel to the axis A X.

If $x' = x''$, $a = \dfrac{y' - y''}{0} = \infty$, the angle which the line makes with the axis is in this caſe a right one.

Problem II.

To determine the diſtance between two given points in a plane.

The diſtance M′ M″ (*fig.* 5.) is the hypothenuſe of the right-angled triangle M′ M″ m'': if it be repreſented by D, then $D = \sqrt{\overline{M''m''}^2 + \overline{M'm''}^2} = \sqrt{(y'' - y')^2 + (x'' - x')^2}$. If the point M is at the origin, the co-ordinates $x'\,y'$ become nothing, and the preceding expreſſion is reduced to $D^2 = \sqrt{y''^2 + x''^2} = x''\sqrt{1 + a^2}$, becauſe then the equation to the ſtraight line is $y = ax$; and as this alſo takes place when $x = x''$, $y = y''$, it gives $y'' = ax''$.

Problem III.

To determine the equation of a ſtraight line that ſhall paſs through a given point, and be parallel to a given ſtraight line.

Theſe two conditions are ſufficient to determine the two elements of poſition for the required ſtraight line.

Let the equation of the given ſtraight line be $y = ax + b$ ……… (1), and that of the line required $y = a'x + b'$ ……… (2): a and b are, in this caſe, given, and a' and b' required. Let x', y' denote the co-ordinates of the given point; and ſince this point is in the required line, we have $y' = a'x' + b'$ ……… (3).

From equation (1) take equation (3), and $y - y' = a'$ $(x - x')$ ……… (4).

The ſame reſult may be obtained by taking the value of b' in equation (3), and ſubſtituting it in equation (2). Moreover, the two ſtraight lines being parallel, their trigonometric tangents are the ſame, that is, $a = a'$: introducing this condition in equation (4), that of the line required will be $y - y' = a\,(x - x')$ ……… (5).

If the given point be taken on the given line, then y' is the value of y, which correſponds to $x = x'$; and equation (1) becomes

$$y' = ax' + b.$$

Subſtituting this value of y' in equation (5), we obtain

$$y = ax + b$$

which ſhews that the required line and the given line are identical, which is, indeed, ſelf-evident.

Problem IV.

The equation of two ſtraight lines being given to determine the angle which they make with each other, (*fig.* 6.) The angles C A X, C B X, are given, the angle to be found is A C B. Put C A X $= \alpha$, C B X $= \alpha'$; A C B $=$ V, tang. $\alpha = a$, tang. $\alpha' = a'$; then $\alpha' = \alpha +$ V, and tang. V $=$ tang. $(\alpha' - \alpha) = \dfrac{a' - a}{1 + aa'}$. If the ſtraight lines are parallel, tang. V $= 0$, and $a' = a$; if they are perpendicular, tang. V $= \infty$, or $\dfrac{1}{\text{tang. V}} = 0$; therefore $1 + aa' = 0$.

Problem V.

To determine the equation of a ſtraight line that ſhall paſs through a given point, and make a given angle with a given ſtraight line. Let the equation of the given line be - - $y = ax + b$ ……… (1)
and that required - $y = a'x + b'$ ……… (2)
a and b are given; from whence a' and b' are to be determined by the conditions of the problem. Since the required line is to paſs through a point whoſe co-ordinates are x', y', its equation muſt ſubſiſt when $x = x'$, and $y = y'$; hence

$$y' = a'x' + b' \ldots\ldots\ldots (3), \text{ and conſequently}$$

$$y - y' = a'\,(x - x') \ldots\ldots\ldots (4);$$

b' being determined from one of the conditions, it remains to determine a' from the other. Now, m being the trigonometric tangent of the angle which the two lines make with each other (by Problem IV.), $m = \dfrac{a' - a}{1 + aa'}$; hence $a' = \dfrac{a + m}{1 - ma}$. Subſtituting this value of a' in equation (4), we have the equation required,

$$y - y' = \frac{a + m}{1 - ma}\,(x - x') \ldots\ldots\ldots (5).$$

Problem VI

To determine the condition under which three lines, drawn from the angles of a triangle, will meet in a ſingle point. Let x', y'; x'', y''; x''', y''' be the co-ordinates of the angles D, B, C (*fig.* 7.); the equations to the three ſtraight lines drawn from theſe angles will be $y - y' = a'$ $(x - x')$; $y - y'' = a''\,(x - x'')$; $y - y''' = a'''\,(x - x''')$; a', a'', a''' being the trigonometrical tangents of the angles which they make with the axis A X. For theſe lines to meet in a point, it is requiſite that the ſame ſyſtem of values of x, y, ſhould ſubſiſt for the three equations, which is equivalent to finding the value of x and y by means of any two of them, and making the reſult of their ſubſtitution in the third equal to zero; we thus find the equation of condition

$$a'(y'' - y''') + a''(y''' - y') + a'''(y' - y'') + a'a''(x' - x'') = 0 \quad (1)$$
$$+ a''a'''(x'' - x''')$$
$$+ a'''a'(x''' - x')$$

Let us ſuppoſe the required ſtraight lines to be perpendicular to the ſides of the triangle, and then examine if, upon this ſuppoſition, the equation (1) ſubſiſts.

The equation to B C is $y - y'' = \frac{y'' - y'''}{x'' - x'''}(x - x'')$; and that of the ſtraight line drawn through D is $y - y' = a'(x - x')$.

Now as this latter ſtraight line ſhould be perpendicular to the other, the equation $aa' + 1 = 0$, from whence $a' = -\frac{1}{a}$, ought to exiſt between the trigonometrical tangents; but here $a = \frac{y'' - y'''}{x'' - x'''}$, therefore $a' = \frac{x'' - x'''}{y'' - y'''}$.

The ſtraight line drawn through B being perpendicular to D C, we conclude

$$y - y' = \frac{y' - y'''}{x' - x'''}(x - x'),\; y - y'' = a''(x - x'')$$

and the ſtraight line drawn through C being perpendicular to D B, we have likewiſe

$$y - y' = \frac{y' - y''}{x' - x''}(x - x'),\; y - y''' = a'''(x - x''')$$

Hence the values of a'', a''', are

$$a'' = -\frac{x''' - x'}{y''' - y'};\quad a''' = -\frac{x' - x''}{y' - y''};$$

and likewiſe

$$\left.\begin{aligned} a'a''(x' - x'') &= \frac{(x' - x'')(x'' - x''')(x''' - x')}{(y' - y'')(y'' - y''')(y''' - y')}(y' - y'') \\ a''a'''(x'' - x''') &= \frac{\text{N}}{\text{D}}(y'' - y''') \\ a'''a'(x''' - x') &= \frac{\text{N}}{\text{D}}(y''' - y') \end{aligned}\right\}\ldots(2)$$

N and D being the numerator and denominator of the fraction which multiplies $y' - y''$. By the ſubſtitution of all theſe values the equation of condition is ſatisfied, for it becomes

$$-(x'' - x''' + x''' - x' + x' - x'') + \frac{\text{N}}{\text{D}}(y' - y'' + y'' - y''' + y''' - y') = 0$$

(*fig.* 8). If the ſide B C be placed on the axis of the abſciſſæ, which does not alter the general nature of the reſults, and alſo the point B be placed at A, then $y'' = 0$, $x'' = 0$, $y''' = 0$, and the equation of condition is ſimplified, and becomes $-a''y' + a'''y' + a'a''x' - a''a'''x''' + a'''a'(x''' - x') = 0 \ldots\ldots (3)$. In this poſition of the triangle, $a' = -\frac{x'' - x'''}{y'' - y'''} = \infty$, and in fact the line D R is perpendicular to A X. If in equation (3) the terms which do not include a' be ſuppreſſed, to expreſs that the tangent is infinite, the equation (3) will be ſimplified, and expreſſed, thus, $a'a''x' + a'''a'(x''' - x') = 0$; and dividing by a', $a''x' + a'''(x''' - x') = 0$; but in this poſition of the triangle, we have $a'' = \frac{x''' - x'}{y'}$; $a''' = -\frac{x'}{y'}$; and by theſe values the preceding equation is ſatisfied.

If from the points A and C lines be drawn to the middle of the oppoſite ſides, the trigonometrical tangent will be $a'' = \frac{y'}{x''' - x'}$, $a''' = \frac{y'}{x' - 2x'''}$. The ſubſtitution of theſe values in equation (3) will give, after dividing by y,

$$a'\left\{\frac{x'}{x''' + x'} + \frac{x''' - x'}{x' - 2x'''}\right\}$$
$$= \frac{y'}{x''' + x} - \frac{y'}{x' + 2x'''} + \frac{y'x'''}{(x''' + x')(x' - 2x''')};$$

from which we deduce $a' = \frac{-2y'}{x''' - 2x'}$; and as this is found to be the value of a', that is, of the trigonometrical tangent of the angle which the line D M makes with A X, it may be concluded that this third line paſſes through the point of interſection of the two firſt.

Let us conſider the perpendiculars drawn from the centres of the ſides of the triangle A D C (*fig.* 9.), the equation

of A D is $y = \frac{y'}{x'}x$

of D C, $y - y' = \frac{y'}{x' - x'''}(x - x')$

of A C, $y = 0$

The equations of the perpendiculars to theſe ſides are,

$$y - \tfrac{1}{2}y' = -\frac{x'}{y'}(x - \tfrac{1}{2}x')$$
$$y - \tfrac{1}{2}y' = -\frac{x' - x'''}{y'}\left(x - \frac{x' + x'''}{2}\right)$$
$$x = \frac{x'''}{2}.$$

The equation of condition may be immediately formed by determining x from the two firſt equations, and employing this value in the third; which ought to be ſatisfied by this ſubſtitution if there exiſts a point of interſection; now x is found $= \frac{x'''}{2}$; therefore theſe three lines interſect in a point.

Method of determining the Poſition of a Point in Space.—Let A X, A Y, A Z, be three ſtraight lines reciprocally perpendicular to each other (*fig.* 10.) at the point A; each of them will be perpendicular to the two others, becauſe it is perpendicular to two ſtraight lines which interſect at its extremity in this plane. Therefore each of theſe planes will be at the ſame time perpendicular to the two others. Theſe three planes form then the three faces of a rectangular parallelopipedon, and the ſolid trihedral angle A. Let us ſuppoſe the planes Z A X and Z A Y vertical, and the plane Y A X horizontal. Let a point in ſpace be repreſented by M, ſituated out of the planes Z A X, Z A Y, Y A X in real poſition, for example, before the firſt plane, to the right of the ſecond, and above the third; and let us ſuppoſe perpendiculars M M′, M M″, M M‴, from the point M to theſe three planes; theſe perpendiculars will meaſure the ſhorteſt diſtances from the point to each of theſe planes. The planes drawn through the perpendicular M M′ and M M″, M M′ and M M‴, M M″ and M M‴ will encloſe the parallelopipedon, and the point M will be the ſummit of the ſolid trihedral angle M oppoſite to the angle A.

The diſtance M M′ from the point M, to the plane Z A X is in real length equal to M″ *m*′ or A *m*″; the diſtance M M″ from the ſame point to the plane Z A Y is M‴ *m*″ or A *m*, and the diſtance from this point to the horizontal plane Y A X is M M''' or M' *m* or A *m'*. Thus theſe diſtances may be found on the fixed lines A Y, A X, A Z.

The points M', M'', M''', of the perpendiculars let fall from the point M on the planes to which we refer the poſition of this point, are called the *vertical* and *horizontal projections* of the point M, *vertical* in conſidering M' and M'', and *horizontal* when conſidering M'''.

Two of theſe projections are ſufficient to determine the point; for if from each of them perpendiculars be drawn to the plane which contains it, they will interſect in the point M.

The third projection evidently reſults from each of the two others, as may be ſeen in the figure.

Since the poſition of a point is completely defined by its diſtance from three rectangular planes of projection, if we denote the diſtance of the point from the plane Y A Z by x, the diſtance of the ſame point from the plane Z A X by y, and its diſtance from the plane Y A X by z, and the linear values of theſe diſtances be denoted by a, b, c, its poſition will be indicated by $x = a$, $y = b$, $z = c$: the formulæ $x = a$, $z = c$, denote the poſition of the projection M': the formulæ $y = b$, $z = c$, denote the projection M''; and theſe two projections are ſufficient, as we have ſeen, to find the poſition of the point; and theſe two ſyſtems of formulæ compriſe the data of the three diſtances. When the point is in the horizontal plane, $z = 0$, and its poſition is fixed by $x = a$, $y = b$: when it is in the plane Z A X, $y = 0$, and its poſition is determined by $x = a$, $z = c$; and if in the plane Z A Y we have $x = 0$, and it is defined by $y = b$, $z = c$.

For a point ſituated on the axis A X, we have $z = 0$, $y = 0$, $x = a$.

If on the axis A Y, $z = 0$, $x = 0$, $y = b$; and if on A Z, $x = 0$, $y = 0$, $z = c$.

At A, the origin of theſe diſtances, we have $x = 0$, $y = 0$, $z = 0$.

Every point in the plane, M M' *m* M''', and conſequently the plane itſelf, is denoted by $x = a$, becauſe a is the common diſtance of each of its points from the plane Y A Z.

The plane M M'' *m''* M''' is denoted by $y = b$, and the plane M M' *m'* M' is deſcribed by $z = c$.

The poſition of theſe three planes gives that of the point M, and conſequently this point will be defined, as we have already ſaid, by the formulæ $x = a$, $y - b$, $z = c$.

Of the Equations to a ſtraight Line.—The equations of a ſtraight line, ſituated in ſpace, expreſs the relation which exiſts between the co-ordinates x, y, z, of any point whatever of the ſtraight line: let us ſuppoſe it projected on the planes $x z$, and $y z$; theſe projections will be other ſtraight lines, which have for their equations

$$x = a z + \alpha \quad . \quad . \quad . \quad . \quad y = b z + \beta:$$

eliminating z from theſe equations, the reſulting equation is $b x - a y = b a - \alpha \beta$, which belongs to the plane $x y$.

The equations of theſe three projections, of which any two imply the third, are the equations of the ſtraight line, whoſe poſition in ſpace depends on the conſtant quantities $a b$, $\alpha \beta$.

To obtain the co-ordinates of the points in which this ſtraight line cuts the three planes, we muſt make ſucceſſively the three values $x = 0$, $y = 0$, $z = 0$, which gives $x = \alpha$, $y = \beta$, for the point where the ſtraight line interſects the plane $x y$; $z = -\frac{\beta}{b}$ $x = -\frac{\alpha \beta}{b} + \alpha$ for the point where it interſects $x z$; $z = -\frac{\alpha}{a}$, $y = \frac{b a}{a} + \beta$ for the point where it meets the plane $y z$.

The ſtraight line, whoſe equation is $x = a z + \alpha$; makes, with the axis z, an angle, whoſe tangent is a: it cuts the axis x in a point, whoſe diſtance from the origin of the co-ordinates is equal α, ſince, if in this equation $z = 0$, $x = \alpha$.

If two ſtraight lines are ſituated in the ſame plane; ſuppoſe that of x, z, then let the equation to the firſt be $x = a z + \alpha$, and to the ſecond $x = a' z + \alpha'$; for theſe ſtraight lines to be parallel, a' muſt $= a$, and, if perpendicular, $1 + a a' = 0$, or $a' = -\frac{1}{a}$.

The equation of two ſtraight lines, ſituated in ſpace being, for the firſt,

$$x = a z + \alpha,\ y = b z + \beta$$
$$x = a' z + \alpha',\ y = b' z + \beta';$$

the equation, which expreſſes that theſe lines meet each other, is $(\alpha' - \alpha)(b' - b) - (\beta' - \beta)(a' - a) = 0$, which reſults from the elimination of x, y, z, from the four equations of the two ſtraight lines.

Problems relating to a ſtraight Line.—PROB. I. To draw a ſtraight line through a point given in ſpace parallel to a given ſtraight line. Let the three rectangular co-ordinates be x, y, z; z being ſuppoſed vertical; and let the equations of the projections of the ſtraight line on the vertical planes be $x = a z + b$, $y = a' z + b'$; then the equation of the horizontal projection will be $a y - a' x = a b' - a' b$.

If x', y', z', repreſent the co-ordinates of the given point, the equations of the required line will be

$$x - x' = a\,(z - z')$$
$$y - y' = a'\,(z - z')$$
$$a\,(x - x) = a\,(y - y')$$

of which any two imply the third.

PROB. II.

To determine the equation of a ſtraight line drawn through two points given in ſpace. Let x', y', z', be the co-ordinates of the firſt point; x'', y'', z'', thoſe of the ſecond, the ſtraight line paſſing through the firſt point, its equations will be of the form

$$x - x' = a\,(z - z')$$
$$y - y' = b\,(z - z')$$

(See Prob. I. of the plane)

And ſince it muſt paſs through the ſecond, its equations muſt alſo be

$$x - x'' = \alpha\,(z - z'')$$
$$y - y'' = b\,(z - z'')$$

a and b being eliminated from their four equations, the equations of the required ſtraight line will be

$$x\,(z' - z'') = z\,(x' - x'') + x'' z' - x' z''$$
$$y\,(z' - z'') = z\,(y' - y'') + y'' z' - y' z''.$$

The co-ordinates of the two extremities of a right line being x', y', z'', for the firſt, and x'', y'', z'', for the ſecond, the diſtance between the exremities, or length of the line joining them, will be

$$\sqrt{(x' - x'')^2 + (y' - y'')^2\,(z' - z'')}.$$

PROB. III.

To determine the conditions requiſite for two ſtraight lines to meet in ſpace. Let the equations of one ſtraight line be

$$x = a z + \alpha$$
$$y = b z + \beta$$

and of the other

$$x = a' z + \alpha'$$
$$y = b' z + \beta$$

To determine the relation between the elements of poſition $a, b, a', b'; \alpha, \beta, \alpha', \beta'$, eliminate x, y, z, from the four equations, and $(a' - a)\ (b' - b) - (\beta' - \beta)\ (\alpha' - \alpha) = 0$.

Of the Equation to a Plane.—A plane being given by its interſection with two co-ordinate planes, it may be conceived as generated by one of theſe lines moving parallel to itſelf in the direction of the other.

Let $z = ax + c$, and $z = by + e$, be the equations to the two given interſecting lines, the generating line being parallel to itſelf, and to the interſecting line on the plane xz, its equations in any one poſition will be

$$z = ax + y,\ y = \beta.$$

But if it ſhould meet the ſecond line, whoſe equations are

$$x = 0$$
$$z = by + e;$$

hence this equation of condition

$$b\beta + c = \gamma;$$

from which it follows, that the equation of the generating line of the plane, in any given poſition, depending on β, are

$$z = ax + b\beta + c$$
$$y = \beta.$$

Eliminating β from theſe two equations, that of the plane is obtained,

$$z = ax + by + c,$$

in which a and b are the tangents of the angles which the interſections of the plane make with the axes x and y; c is the co-ordinate z, correſponding to the origin of the ordinates; ſince, if in the equation of the plane, x and y are made $= 0$, $z = c$. This equation may be more commodiouſly expreſſed by the following form:

$$Ax + By + Cz + D = 0,$$

in which, of the four conſtant quantities A, B, C, D, three only are neceſſary; hence $\begin{cases} -\dfrac{A}{C} = a \\ -\dfrac{B}{C} = b \\ -\dfrac{D}{C} = c. \end{cases}$

The equation of a plane has been determined from its interſections with the planes of the co-ordinates. Theſe interſections may likewiſe be determined by the equation to the plane.

Let $ax + by + c = z$, make ſucceſſively $x = 0$, $y = 0$, $z = 0$, and there reſult $\begin{cases} z = 0 \\ ax + by + c = 0 \end{cases} \begin{cases} y = 0 \\ z = ax + c \end{cases}$ $\begin{cases} x = 0 \\ z = by + c, \end{cases}$ which equations belong to the interſections of the given plane with the three planes xy, xz, and xy.

The equation of a ſtraight line, ſituated in one of the co-ordinate planes, is likewiſe that of a plane paſſing through this line, and perpendicular to the plane of the co-ordinates which contains it. When the plane is perpendicular to one of the axes, as x, its equation is $x = c$ (conſtant): $y = \beta$, $z = \gamma$, are the equations of two other planes, one perpendicular to the axis y, and the other perpendicular to the axis z.

In the equation to the plane make ſucceſſively $\begin{Bmatrix} z = 0 \\ y = 0 \end{Bmatrix}$, $\begin{Bmatrix} x = 0 \\ z = 0 \end{Bmatrix}$, $\begin{Bmatrix} y = 0 \\ x = 0 \end{Bmatrix}$; values will then be obtained for x, y, z; which are the diſtances of the origin of the co-ordinates from the points of interſection of the plane with the axes of the co-ordinates: let the equation to the planes be $z = az + by + c$, theſe diſtances will be $-\frac{c}{a}, -\frac{e}{b}, c$.

Two planes which are parallel have parallel interſections; therefore, if the equation to the firſt plane be

$$z = ax + by + c$$

the ſecond, $z = a'x + b'y + c'$

the condition of paralleliſm will be expreſſed by the equations $a = a'$, $b = b'$.

PROBLEM I.

Problems relating to a ſtraight Line and a Plane.—To draw a plane parallel to a given plane, let the equation to the given plane be

$$z = ax + by + d$$

and that of the plane required

$$z = a'x + b'y + d$$

then the condition of paralleliſm will be

$$a' = a,\ b = b.$$

PROBLEM II.

To determine the equation of a plane which ſhall paſs through three given points, let the co-ordinates of the given points be

1 . . . . x', y', z',
2 . . . . x'', y', z'',
3 . . . . x''', y''', z''',

The equation of the plane required being ſuppoſed

$$Ax + By + Cz + D = 0$$

the three following conditions are obtained;

$$Ax' + By' + Cz' + D = 0$$
$$Ax'' + By'' + Cz'' + D = 0$$
$$Ax''' + By''' + Cz''' + D = 0$$

from which are deduced the following equations;

$$A = y'(z'' - z''') + y''(z''' - z') + y'''(z' - z'')$$
$$B = z'(x'' - x''') + z''(x''' - x') + z'''(x' - x'')$$
$$C = x'(y'' - y''') + x'''(y''' - y') + x'''(y' - y')$$
$$D = x'(y''z''' - y'''z'') + x'(y'''z' - y'z''') + x'''(y'z'' - y''z')$$

The three co-efficients to determine are $\frac{A}{C}, \frac{B}{C}, \frac{D}{C}$ from the ſame number of equations. If the triangle formed by the ſtraight lines joining the given points be projected on the three planes zy, xz, yx, the areas of theſe reſpective projections will be $\frac{A}{2}, \frac{B}{2}, \frac{C}{2}$, and it will be ſhewn that D is ſix times the ſolidity of a pyramid whoſe baſe is the triangle in ſpace, and whoſe vertex is the origin of the co-ordinates.

Let a triangle, as $z' z'' z'''$, repreſent the projections of the above three points on the plane of xz, the area of the trapezium $z'' x'' x''' z'''$ will be $\frac{(x'' - x'')}{2} + \frac{z(x''' - x'')}{2}$

the area of the trapezium $x' z' z'' x''$ will be

$$\frac{z''(x'' - x')}{2} + \frac{z'(x''' - x'')}{2}$$

and that of the trapezium $x' z' z''' x'''$ will be

$$\frac{z'''(x''' - x')}{2} + \frac{(z' x''' - x')}{2}$$

From the ſum of the two firſt ſurfaces, take the laſt, the difference will be the area of the triangle projected on the plane xz, which will be $t' = \frac{B}{2}$. In the ſame manner, t and t'' repreſenting the projections of the ſame triangle on the planes yz, xy, we have

$$t = \tfrac{1}{2}A,\ t'' = \tfrac{1}{2}C.$$

PROBLEM III.

Given the co-ordinates of a point, and the equations of a ſtraight line, to find the equation of the plane which paſſes through the ſtraight line and the given point, let x', y', z' be the co-ordinates to the point;

$$\left.\begin{aligned} x &= az + \alpha \\ y &= bz + \beta \\ b &= (x - a) = a(y - \beta) \end{aligned}\right\} \text{be the equations of the line}$$

Then ſince the plane, whoſe equation is required, paſſes through the given point, and likewiſe through the point where the given line interſects the plane $x y$, the co-ordinates to which points are $z = 0$, $x = \alpha$, $y = \beta$. If the equation to the plane be ſuppoſed

$$z = A x + B y + D,$$

in which A, B, D, are co-efficients to be determined, then

$$z' = A x' + B y' + D \ldots\ldots (1)$$
$$0 = A \alpha + B \beta + D \ldots\ldots (2)$$

Now the right lines being in the plane, ſuppoſe them both moved parallel to themſelves till the plane paſſes through the origin of the co-ordinates, the equations there will be, for the ſtraight line,

$$x = a x,\ y = b z,\ a y = b x$$

and for the plane $x = A x + B y$.

In this poſition the line is ſtill in the plane, ſo that their co-ordinates are ſtill the ſame; therefore,

$$z = A a z + B b z, \text{and } 1 = A a + B b \ldots\ldots (3)$$

The equations 1, 2, 3, will give A, B, D in terms of a, b, α, β, and the equation of the plane will be

$$(x - x')(y' - b z' - \beta) - (y - y')(x' - a z - \alpha)$$
$$+ (z - z') \left\{ (b x' - \alpha) - a (y' - \beta) \right\} = 0.$$

Problem IV.

Given the equations of a ſtraight line, and of a plane to determine the conditions; 1ſt, that the plane and ſtraight line may be rectangular; 2d. The co-ordinates of the points where they meet; 3d. The diſtance of this point from a given point, either in the *given line* or given plane.

When a plane is perpendicular to a ſtraight line, the interſection of the plane with the co-ordinate planes and the projection of the line with theſe ſame planes are perpendicular to each other.

Let $x = a z + \alpha$, $y = b z + \beta$, be the equations to the line; $z = A x + B y + C$ the equation to the plane; the equations to the interſections of this plane with the rectangular planes of $x z$, and $x y$, are $z = A x + C \ldots\ldots z = B y + C$, but the plane being perpendicular to the line is $A = -a$, $B = -b$; therefore the equation of a plane perpendicular to the line, is $a x + b y + z = C$: combining this equation with thoſe of the ſtraight line $x = a z + \alpha$, $y = b z + \beta$ we may deduce the values of x, y, z, the co-ordinates of the point in which the ſtraight line interſects the plane. If the plane is given by the equation $a x + b y + z = C$, and the perpendicular to it be required to be drawn through a point whoſe co-ordinates are x, y, z, the equation to this perpendicular will be $x - x' = a (z - z') \ldots\ldots\ldots y - y' = b (z - z')$ and the equation to the plane may be expreſſed in this form

$$a (x - x') + b (y - y') + z - z' = C - a x' - b y' - z'$$

Let X, Y, Z, be the co-ordinates of the point of interſection of the plane and perpendicular, then

$$Z = z' + \frac{C - a x' - b y - z'}{1 + a^2 + b^2}$$

$$Y = y' + \frac{b (C - a x - b y' - z'}{1 + a^2 + b^2}$$

$$X = \frac{a (C - a x' - b y' - z'}{1 + a^2 + b^2}$$

The length of the perpendicular comprehended between the points X, Y. Z and the points x', y', z' is =

$$\sqrt{(X - x')^2 + (Y - y')^2 + (Z - z')^2}$$

$$[illegible] = \frac{C - a x' - b y' - z'}{\sqrt{[illegible]}}$$

Hence it follows that the perpendicular drawn from the origin of the co-ordinates upon a plane whoſe equation is $a x + b y + z = C$ is expreſſed by $\frac{C}{\sqrt{1 + a^2 + b^2}}$

Having the equations of a ſtraight line $\left\{ \begin{matrix} x = a z + \alpha \\ y = b z + \beta \end{matrix} \right\}$ the equation of a plane perpendicular to this line drawn through the point x', y', z', is $a (x - x') + b (y - y') + z - z' = 0$.

To find the co-ordinates of the point of interſection of the plane, the equations of the ſtraight line may be put under the following form;

$$x - x' = a z + \alpha - x'$$
$$y - y' = b z + \beta - y'$$

Let X′, Y′, Z′, be the co-ordinates of the points of interſection; then

$$Z = \frac{a (x' - \alpha) + b (y' - \beta) + z'}{1 + a^2 + b}$$

$$Y = \frac{b (a (x' - \alpha) + b (y' - \beta) + z'}{1 + a + b^2}$$

$$X = \frac{a (a (x' - \alpha) + b (y' - \beta) + z'}{1 + a + b^2}$$

Subſtituting for X′, Y′, Z′, their values in the radical

$$\sqrt{(X' - x)^2 + (Y - y')^2 + (Z - z')^2}$$

an expreſſion is obtained for the perpendicular contained between the given point of the ſtraight line, of which the co-ordinates are X′, Y′, Z′. When the ſtraight line paſſes through the origin of the co-ordinates, its equations become $x = a z$, $y = b z$ and the radical $\sqrt{X'^2 + Y'^2 + Z'^2}$ expreſſes tle length of the ſtraight line, drawn from the origin of the co-ordinates to its interſection with the perpendicular let fall from the point x', y', z', upon it: on this ſuppoſition, $\alpha = 0$, $\beta = 0$

$$Z' = \frac{a x' + b y' + z}{1 + a^2 + b^2};\ Y' = b z';\ X' = a z';$$ therefore $$\sqrt{X'^2 + Y'^2 + Z'^2} = \frac{a x' + b y' + z'}{\sqrt{1 + a^2 + b^2}}.$$

This expreſſion is uſed in finding the angle which two ſtraight lines make with each other.

4. The equation of two ſtraight lines being given to find the angle which they make with each other, and if they do not interſect each other to determine the angle which their projections form on a plane that is parallel to them, let the equations of the given lines be

$$1ſt \left\{ \begin{matrix} x = a z + \alpha \\ y = b z + \beta \end{matrix} \right.$$
$$2d \left\{ \begin{matrix} x = a' z + \alpha' \\ y = b' z + \beta' \end{matrix} \right.$$

If they interſect, the angle which they make is equal to the angle formed by their parallels which paſs through the origin of the co-ordinates; the equations to their parallels being $\left\{ \begin{matrix} x = a z,\ y = b z \\ x = a' z,\ y = b' z \end{matrix} \right\}$. If a point be taken on the ſecond parallel, whoſe co-ordinates are x', y', z', and a perpendicular be let fall from this point to the firſt parallel; then in the right-angled triangle formed by this perpendicular, and by the ſtraight lines drawn from the origin of the co-ordinates to the two extremities of this perpendicular, there are given the two ſides which contain the required angle; the expreſſion for one of theſe ſides is

$\sqrt{x'^2 + y'^2 + z'^2}$, the other, as found in the preceding problem, is $\frac{a x' + b y' + z'}{\sqrt{1 + a^2 + b^2}}$.

Therefore the coſine of the required angle is equal

$$\frac{a x' + b y' + z'}{\sqrt{1 + a^2 + b^2} \times \sqrt{x'^2 + y'^2 + z'^2}}.$$

But $x' = a' z'$, $y = b' z'$; therefore the coſine of the angle formed by the two given ſtraight lines

$$\frac{1 + a a' + b b'}{\sqrt{1 + a^2 + b^2} \times \sqrt{1 + a'^2 + b'^2}}.$$

It appears from this expreſſion, that when two ſtraight lines have for their equations

$$\begin{cases} 1 \ldots\ldots\ldots\ldots\ldots x = a z, \; y = b z \\ 2 \ldots\ldots\ldots\ldots\ldots x = a' z, \; y = b z \end{cases}$$

if they are perpendicular to each other, the following equation of condition will be obtained, $1 + a a' + b b' = 0$, which equation may be likewiſe obtained directly as follows: the plane perpendicular to the firſt line drawn through the origin of the co-ordinates has for its equation $a x + b y + z = 0$. But the perpendicular to the firſt ſtraight line muſt be contained in the plane perpendicular to it; therefore the equations to the perpendicular $x = a' z'$, $y = b' z$, and the equation of the plane muſt ſubſiſt at the ſame time; therefore $1 + a a' + b b' = 0$. The angle of the two planes may be thus determined. Let $a x + b y + z = C$, $a' x + b' y + z = C$ be the equations of the planes; theſe make with each other the ſame angle as the ſtraight lines which are perpendicular to them, and which are drawn from the origin of the co-ordinates; therefore the coſine of the angle formed by the two given planes, is

$$\frac{1 + a a' + b b'}{\sqrt{1 + a^2 + b^2} \times \sqrt{1 + a'^2 + b'^2}}.$$

If the angle be required between one ſtraight line and one plane, then ſuppoſe a parallel drawn to the given lines through the origin of the ordinates, and a perpendicular to the plane, the angle contained between theſe two ſtraight lines will be the complement of the required angle; and conſequently, the coſine of the angle of the two lines is the ſine of the angle required.

The ſtraight line, whoſe equations are $x = a z$, $y = b z$, makes with the axes x, y, z, angles whoſe coſines are

$$\frac{x}{\sqrt{x^2 + y^2 + z^2}}, \quad \frac{y}{\sqrt{x^2 + y^2 + z^2}}, \quad \frac{z}{\sqrt{x^2 + y^2 + z^2}}$$

$$\frac{a}{\sqrt{1 + a^2 + b^2}}, \quad \frac{b}{\sqrt{1 + a^2 + b^2}}, \quad \frac{1}{\sqrt{1 + a^2 + b^2}}$$

The ſame expreſſions are the values of the coſines of the angles which a plane perpendicular to the ſtraight line, and whoſe equation is $a x + b y + z = 0$, makes with the co-ordinate planes $x y$, $z y$, $x z$. If the equation of the plane is $A x + B y + C z + D = C$, the coſines of the angles which it makes with the co-ordinate planes are

$$\frac{A}{\sqrt{A^2 + B^2 + C^2}}, \quad \frac{B}{\sqrt{A^2 + B^2 + C^2}}, \quad \frac{C}{\sqrt{A^2 + B^2 + C^2}}$$

and the expreſſion found above for the perpendicular, let fall from the origin of the co-ordinates on the plane, becomes

$$\frac{D}{\sqrt{A^2 + B^2 + C^2}}.$$

It has been already remarked, that if T be the triangle formed by the three lines which join, two and two, the three given points, and t, t', t'' its projections on the co-ordinate planes, then $t = \frac{1}{2} A$, $t' = \frac{1}{2} B$, $t'' = \frac{1}{2} C$; $\frac{D}{6}$ being the ſolidity of a pyramid which has for its baſe the triangle T, and whoſe vertex is the origin of the co-ordinates. Now the ſolidity of this pyramid is the product of the baſe T, by one third of its height $\frac{D}{\sqrt{A^2 + B'' + C^2}}$; therefore $\frac{D}{6} = T \times \frac{D}{3 \sqrt{A^2 + B^2 + C^2}}$, or ſubſtituting for A, B, C their values $2 t$, $2 t'$, $2 t''$, $T^2 = t'^2 + t + t''^2$.

If S be the area of another triangle whoſe projections are s, s', s'', and ſituated in the ſame plane as the triangle T; then

$$S^2 = S^2 + S'^2 + S''^2$$

Since $T = \frac{1}{2} \sqrt{A^2 + B^2 + C^2}$, $\frac{T}{t} = \frac{1}{\left(\frac{A}{\sqrt{A^2 + B^2 + C^2}}\right)}$ in like manner $\frac{T}{t'} = \frac{1}{\left(\frac{B}{\sqrt{A^2 + B^2 + C^2}}\right)}$; $\frac{T}{t''} = \frac{1}{\left(\frac{C}{\sqrt{A^2 + B^2 + C^2}}\right)}$ which ſignifies that any triangle is to its projection on one of the co-ordinate planes, as radius is to the coſine of the angle which the plane of the triangle makes with the plane on which it is projected.

But the triangle S being in the ſame plane with the triangle T

$$\frac{t}{T} = \frac{s}{S}, \quad \frac{t'}{T} = \frac{s'}{S}, \quad \frac{t''}{T} = \frac{s''}{S};$$

therefore if the equation $T^2 = t^2 + t'^2 + t''^2$ be put under this form, $T = \frac{t}{T} t + \frac{t'}{T} t' + \frac{t''}{T} t''$, it will become $T S = t s + t' s' + t'' s''$; but $(T^2 + S)^2 = T^2 + 2 T S + S^2 = t^2 + t'^2 + t''^2 + 2 t s + 2 t' s' + 2 t'' s'' + s^2 + s'^2 + s''^2$; therefore $(T + S)^2 = (t + s)^2 + (t' + s')^2 + (t'' + s'')^2$.

Taking in the ſame manner in the ſame plane a third triangle R, whoſe projections on the rectangular planes are r, r', r'', it may be ſhewn that $(R + S + T)^2 = (r + s + t)^2 + (r' + s' + t')^2 + (r'' + s'' + t'')^2$; hence if any plane figure whatever be projected on three rectangular planes, the ſquare of the area of this figure will be equal to the ſum of the ſquares of the areas of its three projections.

Problem V.

Two ſtraight lines being given, 1ſt, to determine the equations to a ſtraight line perpendicular to each of them on which their ſhorteſt diſtance is meaſured; 2d, to find an expreſſion for this ſhorteſt diſtance.

The direction of a plane parallel to two ſtraight lines given in poſition may be determined: this plane being drawn through any point in ſpace, we may conceive a plane to paſs through each of the ſtraight lines perpendicular to it: the interſection of theſe two planes is evidently the line required, therefore the equations to theſe planes will be thoſe of the line required.

Let $x = a z + \alpha$, $y = b z + \beta$, be the equations to the firſt line, it will meet the plane $x y$ in a point P, of which the co-ordinates $z = 0$, $y = \beta$, $x = a$.

The ſecond ſtraight line having for its equations $x = a' z + \alpha'$, $y = b' z + \beta$, it meets the plane $x y$ in a point P′, whoſe co-ordinates are $z = 0$, $y = \beta$, $x = \alpha$.

The equations of the planes drawn through the points P and P′ parallel to the two given ſtraight lines are of the form

$$A\ (x - \alpha) + B\ (y - \beta) + z = 0 \ \ldots\ldots\ (c)$$
$$A\ (x - \alpha') + B\ (y - \beta') + z = 0 \ \ldots\ldots\ (c')$$

A and B being two conſtant quantities determinable by the following equations

$$\left.\begin{array}{l} 1 + A\,a + B\,b = 0 \\ 1 + A\,a' + B\,b' = 0 \end{array}\right\}\ \text{hence}$$

$$A = \frac{b - b'}{a\,b' - a'\,b}\ (1)$$

$$B = \frac{a' - a}{a\,b' - a'\,b}\ (2)$$

The perpendiculars to theſe parallel planes drawn through the points P, P' have their equations

1ſt - - - $x = A\,z + \alpha;\ y = B\,z + \beta$
2d - - - $x = A\,z + \alpha';\ y = B\,z + \beta'$

The plane drawn through the firſt of theſe perpendiculars, and the firſt given line, has for its equation

$$L\ (x - \alpha) + M\ (y - \beta) + z = 0\ (E)$$

L and M being given by the two equations

$$1 + L\,A + M\,B = 0\ (3)$$
$$1 + L\,a + M\,b = 0\ (4)$$

The equation of the plane drawn through the ſecond perpendicular, and the ſecond ſtraight line is

$$L'\ (x - \alpha') + M'\ (y - \beta') + z = 0\ (E')$$

L' and M' being determinable by theſe equations

$$1 + L'\,A + M\,B = 0$$
$$1 + L'\,a' + M'\,b' = 0$$

Now each of theſe laſt planes contains the required line, therefore the equations of their line of interſection will be thoſe required.

The equations (1) (2) give the values of A and B, and combining them with equations (3) (4) the following values are obtained for L M, L' M';

$$L = \frac{a - a' + b\,(a\,b' - a'b)}{a\,(a' - a) + b'\,(b' - b)}$$

$$L' = \frac{a - a' + b'\,(a\,b' - a'b)}{a\,(a' - a) + b'\,(b' - b)}$$

$$M = \frac{b - b' - a\,(a\,b' - a'b)}{a\,(a' - a) + b\,(b' - b)}$$

$$M' = \frac{b - b' - a'\,(a\,b' - a'b)}{a\,(a' - a) + b\,(b' - b)}$$

Subſtituting theſe values in equations (E) (E') we have

$$(x - \alpha)\ \left\{a - a' + b\ (a\,b' - a'\,b)\right\} + (y - \beta)\left\{b - b' - a\ (a\,b' - a'\,b)\right\} + z'\ \left\{a\ (a' - a) + b\ (b' - b)\right\} = 0;$$

$$(x - a')\ \left\{a - a' + b'\,(a\,b' - a'\,b)\right\} + (y - \beta')\left\{b - b' - a'\,(a\,b' - a'\,b)\right\} + z\left\{a'\ (a' - a) + b'\ (b' - b')\right\} = 0;$$

where the ſecond equation may be deduced from the firſt by changing a, b, α, β into a', b', α', β', and a', b' into a, b.

From theſe two equations which repreſent the required line, its projections on the planes $y\,z$, $x\,z$, may be found by ſucceſſively eliminating x and y.

It remains now to determine the abſolute length of the ſhorteſt diſtance between the two lines.

If from the origin of the co-ordinates a perpendicular be let fall on each of the parallel planes, theſe, having the ſame direction, will become one and the ſame ſtraight line: their difference, or the diſtance between the two planes, will be the ſhorteſt diſtance required. The length of theſe perpendiculars will, by the laſt problem, be

$$P = \frac{A\,\alpha + B\,\beta}{\sqrt{(1 + A^2 + B^2}},\ \text{for the plane}$$

$A\ (x - \alpha) + B\ (y - \beta) + z = 0$; D being $= A\,\alpha + B\,\beta$;

$$\text{and } P' = \frac{A\,\alpha' + B\,\beta'}{\sqrt{1 + A^2 + B^2}},\ \text{for the plane}$$

$A\ (x - \alpha') + B\ (y - \beta') + z = 0$, where $D' = A\,\alpha + B\,\beta'$.

$$\text{The difference } P' - P = \frac{A\,(\alpha' - \alpha) + B\,(\beta' - \beta)}{\sqrt{(1 + A^2 + B^2)}}$$

ſubſtituting for A and B their values

$$P' - P = \frac{(\alpha' - \alpha)\ (b' - b) - (\beta' - \beta)\ (a' - a)}{\sqrt{\left\{(a' - a)^2 + (b' - b)^2 + (a'b - a\,b')\right\}}}$$

When the ſtraight lines meet each other, this diſtance being nothing, $(\alpha' - \alpha)\ (b' - b) - (\beta' - \beta)\ (a' - a) = 0$; the ſame equation, as has been already found, expreſſing two right lines which interſect each other.

On the transformation of the Co-ordinates.—Given the co-ordinates of a point in relation to three rectangular planes, to determine the co-ordinates of this point, in reſpect to three other planes.

Theſe three new planes being given in poſition in reſpect to three primitive planes, their equations are given.

Let theſe be, for the

1ſt, $A\,x + B\,y + C\,z + D = 0$
2d, $A'\,x + B'\,y + C'\,z + D' = 0$
3d, $A''\,x + B''\,y + C''\,z + D'' = 0$

Theſe three planes interſect each other two by two in three ſtraight lines which are the new axes. The new co-ordinates of the point are meaſured on the lines drawn through this point parallel to the new axis. The length of any one of theſe co-ordinates is the part of one of theſe lines contained between the point, and the plane of the co-ordinates to which this line is parallel.

Let x, y, z, be the co-ordinates of the point in relation to the primitive planes, and u, v, w, its co-ordinates in relation to the three new planes. For conciſeneſs let

$$L^2 = \frac{(A\,(C'B'' - C'B') + B\,(A'C'' - A''C') + C\,(B'A'' - B''A')^2}{(C'B'' - C''B')^2 + (A'C'' - A''C')^2 + (B'A'' - B''A')^2}$$

$$L'^2 = \frac{(A'\,(C\,B'' - C''\,B) + B'\,(A\,C'' - A''\,C) + C'\,(B'\,A'' - B''\,A)^2}{(C\,B'' - C'B)^2 + (A\,C'' - A''C)^2 + (B\,A'' - B''A)^2}$$

$$L''^2 = \frac{A''\,(C\,B' - C'B) + B''\,(A\,C' - A'C)^2 + C''\,(B\,A' - B'\,A)^2}{(C\,B' - C'B)^2 + (A\,C' - A'C)^2 + (B\,A' - B'A)^2}$$

The values of the new co-ordinates will be

$$u = \frac{A\,x + B\,y + C\,z + D}{L}$$

$$v = \frac{A'\,x + B'\,y + C'z + D'}{L'}$$

$$w = \frac{A''\,x + B''\,y + C''\,z + D''}{L''}$$

If the three new planes be ſuppoſed perpendicular to each other, then $A\,A' + B\,B' + C\,C' = 0'$; $A\,A'' + B\,B'' + C\,C'' = 0$; $A'\,A'' + B'\,B'' + C'\,C'' = 0$.

Multiplying the firſt of theſe three equations by B'', the ſecond by B', and ſubtracting, we have $C\ (C\,B'' - C''\,B) - A\ (B'\,A'' - B''\,A) = 0$. Multiplying the firſt by A'', the ſecond by A', and ſubtracting, we have,

$$B\ (B'\,A'' - B''\,A') - C\ (A'\,C'' - A''\,C') = 0.$$

Multiplying the firſt by C'', the ſecond by C', and ſubtracting, we have

A (A'

$$A\,(A'C'' - A''C') - B\,(C'B'' - C''B') = 0.$$

By means of theſe three equations the expreſſion for L is reduced to $\sqrt{A^2 + B^2 + C^2}$.

By a ſimilar calculation,

$$L' = \sqrt{A'^2 + B'^2 + C'^2};\ L'' = \sqrt{A''^2 + B''^2 + C''^2};$$

which gives for the new co-ordinates u, v, w,

$$u = A\ x + B\ y + C\ z + D\ \div \sqrt{A^2 + B^2 + C^2}$$
$$v = A'\,x + B'\,y + C'\,z + D' \div \sqrt{A'^2 + B'^2 + C'^2}$$
$$w = A''\,x + B''\,y + C''\,z + D'' \div \sqrt{A''^2 + B''^2 + C''^2}$$

The values of u, v, w, might have been determined directly, ſince they are the perpendiculars drawn from the points x, y, z, upon three planes, whoſe equations are known.

If it be required to transform one ſyſtem of rectangular co-ordinates into another ſyſtem likewiſe rectangular, and having the ſame origin as the firſt, the three new axes may be given by the equations of the three new rectangular planes. Of the ſix conſtant quantities which enter theſe equations, three are determined by the condition that the planes are perpendicular to each other, and their values are to be calculated from that which is aſſigned to the three others; but this calculation may be avoided by determining the poſition of the new axes by means of any three angles ψ, θ, ϕ. This transformation is uſeful in the application of analyſis to mechanics. The following method is that uſed by La Place in the "Mechanique celeſte."

Let the primitive planes be deſignated by two of the three co-ordinates x, y, z, which they contain, and the new planes by two of the co-ordinates x''', y''', z'''.

Let θ be the angle of the two planes $x\,y$ and $x'''\,y'''$.

ψ the angle which the axis x makes with the line of interſection of the plane $x'''\,y'''$ with the plane $x\,y$.

ϕ the angle which this line makes with the axis x'''.

It is now required to find the values of x''', y''', z''', in terms of x, y, z, and of the three angles ψ, θ, ϕ.

Let x', y', z', be the co-ordinates of a point referred to the rectangular axes, reckoned upon the three following lines. 1. The interſecting line of the plane $x'''\,y'''$ with the plane $x\,y$. 2. The projection of the axis z''' on the plane $x\,y$. 3. The axis z;

$$\begin{aligned} \text{then}\quad x &= x' \text{ coſ. } \psi + y' \text{ ſin. } \psi \\ y &= y' \text{ coſ. } \psi = x' \text{ ſin. } \psi \\ z &= z'. \end{aligned}$$

Let x'', y'', z'', be the co-ordinates of a point referred to the rectangular axes, reckoned upon the three following lines; 1. The interſecting line of the plane $x'''\,y'''$ with that of $x\,y$. 2. The perpendicular to this line on the plane $x'''\,y'''$. 3. The axis z'''; then

$$\begin{aligned} x' &= x'' \\ y' &= y'' \text{ coſ. } \theta + z'' \text{ ſin. } \theta \\ z' &= z'' \text{ coſ. } \theta - y'' \text{ ſin. } \theta: \end{aligned}$$

z''', y''', z''' being the co-ordinates of the point relative to the three axes x''', y''', z''', we have

$$\begin{aligned} x'' &= x''' \text{ coſ. } \phi - y''' \text{ ſin. } \phi \\ y'' &= y''' \text{ coſ. } \phi + x''' \text{ ſin. } \phi \\ z'' &= z'''. \end{aligned}$$

$$\text{Hence } x = \begin{cases} \quad x''' (\text{coſ. } \theta \text{ ſin. } \psi \text{ ſin. } \phi + \text{coſ. } \psi \text{ coſ. } \phi) \\ + y''' (\text{coſ. } \theta \text{ ſin. } \psi \text{ coſ. } \phi - \text{coſ. } \psi \text{ ſin. } \phi) \\ + z''' \text{ ſin. } \theta \text{ ſin. } \psi \end{cases}$$

$$y = \begin{cases} \quad x''' (\text{coſ. } \theta \text{ coſ. } \psi \text{ ſin. } \phi - \text{ſin. } \psi \text{ coſ. } \phi) \\ + y''' (\text{coſ. } \theta \text{ coſ. } \psi \text{ coſ. } \phi + \text{ſin. } \psi \text{ ſin. } \phi) \\ + z''' \text{ ſin. } \theta \text{ coſ. } \psi \end{cases}$$

$$z = z''' \text{ coſ. } \theta - y''' \text{ ſin. } \theta \text{ coſ. } \phi - x''' \text{ ſin. } \theta \text{ ſin. } \phi.$$

Multiplying theſe values of x, y, z reſpectively by the co-efficients of x''' in theſe values, we have

$$x''' = \begin{cases} \quad x\ (\text{coſ. } \theta \text{ ſin. } \psi \text{ ſin. } \phi + \text{coſ. } \psi \text{ coſ. } \phi) \\ + y\ (\text{coſ. } \theta \text{ coſ. } \psi \text{ ſin. } \phi - \text{ſin. } \psi \text{ coſ. } \phi) \\ - z\ \text{ ſin. } \theta \text{ ſin. } \phi. \end{cases}$$

And by multiplying theſe values of x, y, z reſpectively by the co-efficients of y''' in theſe values, and afterwards by the co-efficients of z''', we have

$$y''' = \begin{cases} \quad x\ (\text{coſ. } \theta \text{ ſin. } \psi \text{ coſ. } \phi - \text{coſ. } \psi \text{ ſin. } \phi) \\ + y\ (\text{coſ. } \theta \text{ coſ. } \psi \text{ coſ. } \phi + \text{ſin. } \psi \text{ ſin. } \phi) \\ - z \text{ ſin. } \theta \text{ coſ. } \phi. \end{cases}$$

$$z''' = x \text{ ſin. } \theta \text{ ſin. } \psi + y \text{ ſin. } \theta \text{ coſ. } \psi + z \text{ coſ. } \theta.$$

Another transformation is ſometimes uſed; a point being referred to three rectangular planes by the co-ordinates x, y, z, a ſtraight line is drawn from this point to the origin of the co-ordinates; the length of this line is given, as likewiſe the angles which it makes with the three rectangular axes. If r repreſent this line, and α, β, γ, the three angles, then $x = r \text{ coſ. } \alpha$, $y = r \text{ coſ. } \beta$, $z = r \text{ coſ. } \gamma$ (1).

Of theſe three angles two only are neceſſary; becauſe

$$\text{coſ. } \alpha^2 + \text{coſ. } \beta^2 + \text{coſ. } \gamma^2 = 1.$$

When the poſition of a point is thus determined by a line r and two angles, r is called the *radius vector*, and the origin of the co-ordinates becomes a pole, from which proceeds the *radii vectores* of different points in ſpace.

Sometimes the radius vector is projected upon one of the rectangular planes, ſuppoſe on $x\,y$: the angle of the radius, with its projection, is given, as likewiſe the angle of the projection with the axis of x, or y, if ϕ repreſent the firſt, and ψ the ſecond of theſe angles,

$$z = r \text{ ſin. } \phi\,;\ y = r \text{ ſin. } \phi \text{ ſin. } \psi\,;\ x = r \text{ ſin. } \phi \text{ coſ. } \psi.\ (1)$$

If the point, referred to three rectangular planes by the co-ordinates x, y, z, belongs to a ſurface, we have between theſe three co-ordinates an equation, $F(x, y, z,) = 0$. If the co-ordinates are transformed, and the new ones become u, v, w, we muſt ſubſtitute in $F = 0$ for x, y, z, their values in terms of u, v, w, and the reſulting equation will belong to the new ſurface referred to the new planes.

If in the equation $F = 0$, for x, y, z, we ſubſtitute the values given in equations (1) and (2), it will become what is termed the polar equation to this ſurface.

When a curve is given by two equations $f\,(x, y, z) = 0$, $f\,(x, y, z) = 0$, in ſubſtituting in theſe equations the values given by equation $F\,(x, y, z) = 0$, we obtain an equation to the curve, relating either to three new planes by the co-ordinates u, v, w, or to a pole, by the *radii vectores*, and their angles.

Of the centres of ſurfaces, and of their diametral planes.—The centre of a ſurface is defined to be a point, in which all the chords paſſing through this point are divided into two equal parts.

A diametral plane is that which divides a ſyſtem of parallel chords, each into equal parts.

Hence, if a ſurface has a centre, all the diametral planes which it can have, neceſſarily paſs through this centre.

Having given the algebraic equation of a ſurface, to determine, 1ſt, if it has a centre; 2d. if it has a diametral plane.

If the propoſed ſurface has a centre, let it be referred to three planes, the origin of whoſe co-ordinates is the centre itſelf.

Any ſtraight line drawn through the origin of theſe co-ordinates will be a diameter, and will cut the ſurface in two points, the co-ordinates of the firſt being x, y, z, and of the ſecond $-x, -y, -z$. Therefore, the equation to the ſurface muſt ſubſiſt in taking x, y, z, poſitive or negative; to ſatisfy this condition, the ſum of the exponents of the three co-ordinates in every form muſt be the ſame in every parity as the number which expreſſes the degree of the equation propoſed, that is; if even, even, if odd, odd. Thus, if $\varphi(r, s, t,) = 0$ be the equation to the ſurface referred to, any three planes, then, in this equation make

$$r = x + a, s = y + b, t = z + e;$$

and an equation of the ſurface will be obtained in terms of x, y, z referred to three new planes parallel to the firſt, and paſſing through the point ſuppoſed to be the centre of the ſurface: if, by the three particular values aſſigned to a, b, c, the terms can be made to diſappear, in which the ſum of the exponents of the three co-ordinates are of a different denomination as to even or odd, then the degree or dimenſion of the equation $\varphi(r, s, t) = 0$, the propoſed ſurface will have a centre.

Of diametral Planes—When, in all the terms of an equation of a ſurface, the exponent of one of the co-ordinates is an even number, the plane of each of the other co-ordinates divides the ſurface into two equal and ſimilar parts.

The equation being $\varphi(x, y, z,)$ if in all its terms the exponent of z is an even number, the plane of x and y will be a diametral, for it will give for z a value α, function of x, y, and conſtant quantities, and $z = \alpha$ will ſatisfy this equation; therefore, to the ſame values of x and y, two values of z will correſpond, differing only in the ſign; therefore the plane of x, y will be diametral, and for the ſame reaſon the two other planes of the co-ordinates will be diametral; when in each term the exponents of x, y are even numbers.

Let $\varphi(r, s, t,) = 0$ be the equation of the propoſed ſurface; by the transformation of the ordinate, the ſurface may be referred to three new planes, then $Ar + Bs + Ct + D = 0$; $A'r + B's + C't + D' = 0$; $A''r + B''s + C''t + D''' = 0$; in which equation there are nine conſtant quantities.

The ſurface propoſed has diametral planes, when, by aſſigning real and particular values to theſe conſtant quantities, the terms in which the exponents of the co-ordinates which are odd numbers, may be made to diſappear. The real root of the equation, obtained by making the co-efficients of theſe terms equal zero, determine the number of diametral planes.

In conſidering ſurfaces of the ſecond degree, great uſe may be made of theſe principles, in determining the centres and diametral planes of theſe ſurfaces.

Of Surfaces of the ſecond Degree.—Let the general equation of the ſecond degree, between three variable quantities x, y, z, be $ax^2 + by^2 + cz^2 + dxy + eyx + fxz + gx + hy + kz + 1 = 0$. To determine if the ſurface to which this equation belongs has a centre.

Making $x = x' + \alpha, y = y' + \beta, z = z' + \gamma, \alpha, \beta, \gamma$ being ſuppoſed the co-ordinates of the center, the equation becomes $a'x'^2 + b'y'^2 + c'z'^2 + d'x'y' + e'y'z' + f'x'z' + g'x' + h'y' + k'z' + 1 = 0$.

In this equation, which is likewiſe of the ſecond degree, there are only three terms in which the ſum of the exponents of the co-ordinates is an odd number; theſe terms may be made to diſappear, by making their co-efficients equal to zero, which gives $g' = 0$; $h' = 0$; $k' = 0$, making this ſubſtitution and taking only the terms multiplied by x', y', z', $2a\alpha + d\beta + fy + g = 0$, $2b\beta + d\alpha + e\gamma + h = 0$, $2c\gamma + e\beta + f\alpha + k = 0$.

Theſe equations being linear in α, β, γ, theſe quantities have real values; therefore, ſurfaces of the ſecond degree have a centre.

If a certain relation be eſtabliſhed between the conſtant quantities a, b, c, d, &c. this centre may be placed at an infinite diſtance from the origin of the co-ordinates. In effect, the value of α, β, γ are fractions whoſe common denominator is $ac^2 + bf^2 + cd^2 - 4abc - def$, therefore, when the following equation ſubſiſts between the conſtant quantities of the general equation of a ſurface of the ſecond degree, *viz.* $ae^2 + bf^2 + cd^2 + 4abc + def$; the co-ordinates of the centre of this ſurface are infinite. The ſurface of the ſecond degree has likewiſe diametral planes, for by tranſpoſing the ordinates it may be referred to three new planes, containing nine conſtant quantities; taking u, v, w for the new co-ordinates, the general equation becomes $Au^2 + Bv^2 + Cw^2 + Duv + Evw + Fuw + Gu + Hv + Kw + 1 = 0$; exterminating thoſe terms in which the exponent of any one of the co-ordinates is odd, the ſix following equations are obtained; $D = 0, E = 0, F = 0, G = 0, H = 0, K = 0$; (A). Of nine conſtant quantities, ſix only are determined by theſe equations; hence it follows, that three planes may cut a ſurface of the ſecond degree in four equal and ſimilar parts in an infinite number of ways; it has therefore an infinity of diametral and conjugate planes, and of theſe three perpendicular ones, which interſect each other on the three ſtraight lines on which are reckoned the axes of the ſurface. This property is analogous to that of curves of the ſecond degree, which have an infinity of conjugate diameters, and in theſe curves there are two conjugate diameters perpendicular to each other, called *axes*. The three equations which expreſs that the new planes of the co-ordinates are rectangular joined to the ſix equations (A), determine the nine conſtant quantities which enter into the equations of theſe planes.

Taking for granted what however may be demonſtrated, that theſe conſtant quantities have always real values, we may ſuppoſe, that referring the ſurface of the ſecond degree to its rectangular co-ordinates, its general equation will always be of this form, $Lx^2 + My^2 + Nz^2 - 1 = 0$. We ſhall firſt conſider the ſurfaces comprehended under the general equation, and next the caſe where the centre is removed to an infinite diſtance from the origin of the co-ordinates.

Every ſurface of the ſecond degree interſected by a plane, has for its ſection a curve of the ſecond degree; for whatever be the planes, it may become, by the tranſformation of its co-ordinates, one of the planes to which the ſurface is referred, ſo that after this tranſformation, the equation to the ſurface is ſtill of the ſecond degree; moreover, the equations of the ſections made on a ſurface by the planes of the co-ordinates cannot be of a higher dimenſion than the equation of the ſurface, therefore every ſurface of the ſecond degree cut by a plane has for its ſection a curve of the ſecond degree likewiſe.

If the interſecting plane moves parallel to itſelf, the ſection remains always ſimilar to itſelf: its axes remain always parallel, and its centre is always on the ſame diameter of the ſurface, which may be thus demonſtrated.

The equation of a curve of the ſecond degree may always be reduced to this form,

$$lx^2 + my^2 + nxy + p = 0.$$

If in this equation fx and fy be ſubſtituted for x and y, f being a conſtant quantity, the new equation which reſults from this ſubſtitution belongs evidently to a curve ſimilar to the firſt, and ſimilarly ſituated; it only differs from the firſt in the conſtant term, for after having divided all the terms by f^2, it becomes

$$lx^2 + my^2 + nxy + \frac{p}{f^2} = 0.$$

Therefore all curves of the ſecond degree, whoſe equations are of this form, differing only in the conſtant term, will be ſimilar and ſimilarly ſituated.

The general equation to a ſurface of the ſecond degree being

$$Lx^2 + My^2 + Nz^2 - 1 = 0,$$

Let the equation of any interſecting plane be

$$z = \mathrm{A}x + \mathrm{B}y + \mathrm{C}.$$

The projection of the interſection of the curve with the ſurface on the plane xy will have this equation,

$$\left.\begin{array}{l} x^2(\mathrm{L} + \mathrm{N}\mathrm{A}^2) + y^2(\mathrm{M} + \mathrm{N}\mathrm{B}^2) + 2\mathrm{A}\mathrm{B}\mathrm{N}xy \\ + 2\mathrm{A}\mathrm{C}\mathrm{N}x + 2\mathrm{B}\mathrm{C}\mathrm{N}y + \mathrm{N}\mathrm{C}^2 - 1 \end{array}\right\} = 0 \, (1)$$

If the interſecting plane be ſuppoſed to change its poſition by moving parallel to itſelf, A and B will remain conſtant, and C only will change its value; hence it follows that the co-efficients of x^2, y^2, xy, in the equation of projection, will remain the ſame, whatever be the value of C. But by the transformation of the co-ordinates this equation may be reduced to this form;

$$l u^2 + m' v^2 + n' u v + p' = 0;$$

in which equation the co-efficients $l\ m'\ n'$ only contain A and B; p' alone being ſome function of C. If C be made to vary, the value of p' may be ſuppoſed to become p'', and the preceding equation to become

$$l u^2 + m' v^2 + n' u v + p'' = 0$$

which as it only differs from the former in the conſtant quantity, evidently belongs to a ſimilar curve; hence it may be demonſtrated that all parallel ſections are ſimilar, and ſimilarly ſituated. Moreover, the locus of the centres of theſe ſections is in a diameter of the ſurface.

If in the equation $\mathrm{L}x^2 + \mathrm{M}y^2 + \mathrm{N}z^2 - 1 = 0$ we ſubſtitute for the co-efficients L, M, N, the conſtant quantities $\frac{1}{a^2}, \frac{1}{b^2}, \frac{1}{c^2}$, a being greater than b, and $b > c$; it becomes

$$b^2c^2x^2 + c^2a^2y^2 + a^2b^2z^2 = a^2b^2c^2 \ (\mathrm{E})$$

The advantage of this ſubſtitution is to render the ſign of each term of the equation independent of the particular values of the co-efficients, and to introduce as conſtant quantities (in the equations of the ſections of the ſurface by the planes of the co-ordinates) only the principal axes of theſe ſections.

From the different combinations of the ſigns three diſtinct caſes ariſe from equation E; for a full inveſtigation of which we muſt refer our reader to the original work from which this article was principally extracted. (Vide Application de l'Analyſe a la Geometric, par M. Monge.)

The three equations are

$$b^2c^2x^2 + c^2a^2y^2 + a^2b^2z^2 = a^2b^2c^2, \text{or } \mathrm{L}x^2 + \mathrm{M}y^2 - \mathrm{N}z^2 = 1$$
$$b^2c^2x^2 + c^2a^2y^2 - a^2b^2z^2 = a^2b^2c^2, \text{or } \mathrm{L}x^2 + \mathrm{M}y^2 - \mathrm{N}z^2 = 1$$
$$b^2c^2x^2 - c^2a^2y^2 - a^2b^2z^2 = a^2b^2c^2, \text{or } \mathrm{L}x^2 - \mathrm{M}y^2 - \mathrm{N}z^2 = 1$$

The former belongs to the ellipſoid and the two others to two different ſpecies of hyperboloids.

GEOMETRY, *Characters in.* See CHARACTER.

GEOMETRY, *Spherical.* See SPHERICAL.

GEOMORI, Γεωμοροι, in *Antiquity*, the diviſion or claſs of the ancient Athenians employed in agriculture.

GEONOMA, in *Botany*, from γεωνομος, a *ſetter out*, or *diſtributor of land*, alluding to the mode of growth of the firſt ſpecies of the genus in queſtion, as hereafter deſcribed.—Willd. Sp. Pl. v. 4. 593.—Claſs and order, *Monoecia Monadelphia.* Nat. Ord. *Palmæ.*

Gen. Ch. . . . .

Eſſ. Ch. General Spatha double, of two valves. Male, Calyx in three deep ſegments. Petals three. Filaments ſix, united into a cylinder.

Female, Calyx and Corolla like the male. Style one, lateral. Stigma of two lobes. Drupa dry, with one ſeed.

1. G. *pinnatifrons.* "Fronds pinnate; the pinnæ abruptly jagged."—Native of the Caracas, in ſhady woods on the lofty mountain of Buenaviſta. *Bredemeyer.*—The *trunk* is ſimple and ſlender, an inch in diameter, ſmooth, riſing to the height of fifteen feet, when, by the power of the wind on its ample foliage, it is blown down, but ſoon produces new ſhoots and roots from the top, whence a new trunk ſprings up to the ſame height of about fifteen feet, and in its turn is quickly laid proſtrate like the former. The *fronds* (rather *leaves*) are pinnate, their pinnæ irregular, ſomewhat folded, jagged abruptly at the ſummit. *Spatha* double, of two valves, wedge-ſhaped, ſomewhat compreſſed, acute, three inches long. *Spadix* fifteen inches in length, branched at the top, the branches round, bearing each from ſeven to nine alternate, cylindrical ſpikes, of the length of three inches each. *Flowers* conſtantly three, ſunk in a little hollow of the ſpike, two of which are male, one female. *Drupa* dry and fibrous, the ſize of a pea. *Nut* globoſe, black.

2. G. *ſimplicifrons.* "Fronds ſimple, wedge-ſhaped, cloven."—Found at the Caracas with the former. *Bredemeyer.*—The *trunk* of this is permanently upright, ten feet high, an inch thick. *Fronds* (or *leaves*) a foot long, ſimple, wedge-ſhaped, taper at the baſe, cloven, and divaricated at the ſummit, ſupported on very long ſtalks. *Spatha* double, of two valves. *Spadix* bearing at its extremity three or four cylindrical ſpikes. *Flowers* immerſed in little cavities, like the former. *Willdenow.*

GEOPONIC, ſomething deſcribing or relating to agriculture. Cato, Varro, Columella, Palladius, and Pliny, are ſometimes called geoponic writers.

GEORG, St., in *Geography*, a town of Germany, at the conflux of the rivers Teya and March, formerly a royal city, but now much reduced; 24 miles N.N.E. of Preſburg.—Alſo, a town of Hungary; 7 miles N.N.E. of Preſburg.

GEORGE, in *Biography*, ſurnamed the Cappadocian, was made biſhop of Alexandria when Athanaſius was driven from that ſee by the perſecutions of the emperor Conſtantius, about the year 355. (See ATHANASIUS.) He was a native of Epiphania, in Cilicia, where his father purſued the buſineſs of a fuller. From this obſcure ſituation the ſon raiſed himſelf, it is ſaid, not by the moſt honourable means, to the ſtation of a prelate in the church. At firſt he obtained a lucrative appointment as purveyor of bacon to the army: not contented with the regular profits of his office, he made uſe of every art, however baſe and corrupt, in the accumulation of wealth; ſo as to render a mean employment truly infamous. His depredations on the public purſe became ſo notorious, that he felt it extremely dangerous to wait the iſſue of a ſuit commenced againſt him. He fled from the purſuit of juſtice, and contrived to take with him his ill-gotten wealth. The place of his retreat was Alexandria, where he profeſſed great zeal for the Arian ſyſtem of theology, and being a man of ſuperior talents, he acquired conſiderable influence with his diſciples in that city. Here he collected a large and very valuable collection of books, which the emperor Julian afterwards made the foundation of the noble library eſtabliſhed by him in the temple erected in honour of the emperor Trajan, but which was burnt by the connivance of the emperor Jovian. When Athanaſius was driven from Alexandria, George was elected biſhop by the prevailing party. In this ſtation his conduct was in the higheſt degree cruel and oppreſſive. He perſecuted the Catholics with an unrelenting hand, and the other inhabitants of this vaſt dioceſe were objects of his tyranny and avarice. The merchants he impoveriſhed by unjuſt monopolies and cruel taxes; the Pagans, who had been excited with the hopes of freedom and toleration, did not eſcape his rapacity, and the rich temples of Alexandria were either pillaged or inſulted by him, who exclaimed, in a haughty and threatening tone of voice, "How long will theſe ſepulchres be permitted to ſtand." The people endured all theſe acts of oppreſſion till their patience was exhauſted; they then roſe as one man, and expelled him the city. With much difficulty he regained his authority, which he held till the year 362, when the acceſſion of Julian to the empire was the ſignal for the downfal of the biſhop. He, and two other perſons, who had been miniſters of his atrocities, were ignominiouſly dragged in chains to the public priſon. Here, after a confinement of a few days only, they were attacked by the Pagan populace, who forced open the doors of the dungeons, and with cruel inſults maſſacred the vile wretches. Their lifeleſs bodies were carried in triumph through the ſtreets on the back of a camel, and after having ſuffered every indignity, they were thrown into the ſea, with the avowed intention of diſappointing the devotion of Chriſtians, who, they foreſaw, would gladly canonize the tyrant as a martyr and ſaint. The fears of the Pagans were juſt, but their precautions ineffectual. The meritorious death, as it was denominated, of the prelate, obliterated the memory of his life, and the infamous George of Cappadocia has been transformed into the renowned St George of England, the patron of arms, of chivalry, and of the garter. The ſaints of Cappadocia, Baſil, and the Gregories, did not acknowledge their companion, and pope Gelaſius, about the year 494, is the firſt Catholic who acknowledges St. George, and who placed him among the martyrs of the churches. He rejects his acts as ſpurious, and as the compoſition of heretics. His fame and popularity in Europe, and eſpecially in England, proceeded from the cruſades. Gibbon, vols. iii. and iv. Moreri.

GEORGE *of Trebiſond*, a learned modern Greek, was born, in 1395, in the iſle of Crete. of a family originally from Trebiſond, from which he derives his name. He came to Italy about 1420, and obtained the patronage of Francis Barbaro, a noble of Venice, through whoſe means he was invited to a profeſſorſhip of Greek at Vicenza. Thence he removed to Venice, where he acquired great reputation as a grammarian and inſtructor in Grecian eloquence. After this he obtained an invitation from pope Eugenius IV. to ſettle at Rome, and, during the life of the pontiff, he was occupied in teaching rhetoric and philoſophy, and in tranſlating ſeveral ancient Greek authors into Latin. He was engaged in a ſimilar manner by pope Nicholas V., under whoſe patronage George might have lived happily, had not his own temper involved him in many diſputes with the learned men about the papal court. With Poggio he came to blows, and it was neceſſary to reſort to the authority of the apoſtolic ſecretaries to part them. His own conduct at length forced him from Rome, and he took refuge, in 1452, at Naples, where he was graciouſly received by king Alphonſo, but he did not partake of his liberality, and had great difficulty, at this period, in maintaining his family. It is ſuppoſed, that by the interference of his friend Filelfo, he was reconciled to the pope, and that he returned to the papal city: but in 1459 he was at Venice, where he preſented to the doge his verſion of Plato's book on laws, and was then engaged as a profeſſor of belles lettres. In 1464 he went to Crete, and paſſed thence to Conſtantinople. On his return he found his own ſcholar Paul II. on the papal throne, which led him to viſit Rome, but his treatment there did not, probably, correſpond with his expectations; he was, for ſome offence not known, caſt into priſon, where he was kept during a ſpace of four months. He died about the year 1480. He lived to a good old age, and was author of many works on rhetoric and ſubjects connected with polite literature; and he tranſlated many others, particularly of the fathers, from the Greek into the Latin. He is eſteemed very highly for the ſhare which he had in introducing Greek literature into the Weſt. His Latin ſtyle was far from pure; and in controverſy he dealt much in invective. The compariſon which he inſtituted between Ariſtotle and Plato gave great offence to the adherents of the latter, particularly to cardinal Beſſarion, who wrote an anſwer to him. Gen. Biog.

GEORGE, called alſo *Amira*, flouriſhed about the cloſe of the 16th century, and was at Rome under the pontificate of Clement VIII. He publiſhed "A Syriac and Chaldee Grammar" in 4to. in 1596. He was, after this, elected patriarch of the Maronites, among whom he introduced the uſe, and explained the principles, of the Gregorian calendar. He died about the year 1641. Moreri.

GEORGE LEWIS I., king of Great Britain, and elector of Hanover, the ſon of the elector Erneſt-Auguſtus, by Sophia, daughter of Frederick elector-palatine, and granddaughter of James I., king of England, was born in 1660, and trained to the profeſſion of arms under his father. When he had arrived to the ſtate of manhood, he engaged in the ſervice of the emperor againſt the Turks, and became illuſtrious as a warrior in three campaigns in Hungary. He next diſtinguiſhed himſelf in the war between the empire and France, and in the year 1700 he ſucceeded, on the death of his father, to the electorate. In the following year he marched to the aſſiſtance of the duke of Holſtein, who was attacked by the king of Denmark, and obliged the Danes to raiſe the ſiege of Tonningen. He joined the alliance againſt France in the ſucceſſion war, and forced the princes of the houſe of Wolfenbuttle to quit their alliance with the French. The command of the army of the empire was conferred upon him in 1707, but after the duties of three campaigns, in which he had been able to act only on the defenſive, he reſigned his command, and left his own troops in the ſervice of the allies. At the peace of Raſtadt, Lewis XIV. recognized the electoral dignity in the houſe of Lunenburg, as he had before, at the peace of Utrecht, the ſucceſſion of the ſame houſe to the crown of Great Britain. This event happened on the death of queen Anne in 1714, when the prince, now George I., was in the fifty-fourth year of his age. He was already celebrated for the wiſdom and juſtice of his government, and his perſonal qualities, though limited in his views by the intereſts of a German prince, and but little acquainted with the character of the nation he was about to rule. "It is evident," ſays an hiſtorian, "that the title of this prince was founded ſolely on the choice of the parliament, that is, of the people, and that the uſual order of ſucceſſion was entirely ſuperſeded. For, admitting the male line of the houſe of Stuart to have been extinguiſhed in the perſon of James II., the right of blood reſted in the houſe of Savoy, deſcended from Henrietta, ducheſs of Orleans, daughter of Charles I." Thus the rights of the people were fully exerciſed, and the family on the throne is in truth an elected family, though the general law of ſucceſſion remains unaltered. The king threw himſelf into the arms of the Whig party, who, indeed, alone openly maintained thoſe principles upon which the right of his crown was founded. Of theſe the fundamental one was the ſuperiority of the national will, in appointing a chief governor, to any claim derived from hereditary right. Such a principle had been already aſſumed, and was the only one that could juſtify the nation in ſetting aſide the more immediate heirs to the crown, on the plea of difference of religion. (See WHIGS.) As ſoon as this prince was ſettled on his throne, the late Tory miniſtry were called to account for their conduct, particularly with reſpect to the treaty of Utrecht, and ſeveral of the heads of it were impeached, and either impriſoned,

priſoned, or driven into exile. Theſe meaſures were the cauſe of great diſſatisfaction; tumults were excited in various parts of the kingdom, and at length, in September 1715, the earl of Marr ſet up the ſtandard of rebellion, and proclaimed, with due honours, the pretender. The plan was ill concerted, and very weakly ſupported, and early in the following year it was entirely quelled, but ſeveral of the leaders loſt their lives on the ſcaffold. Still a large body of the people were diſaffected to the new family, and the power of the Tory party was ſo formidable, that the miniſtry, to eſtabliſh their authority, had recourſe to ſeptennial parliaments, inſtead of triennial ones, according to the law of the land. It was agreed by men of all parties, who were not perſonally intereſted in the change, that this innovation was a moſt groſs violation of the principles of the conſtitution, which no temporary neceſſity could juſtify. The king had, about this period, acquired by purchaſe the duchies of Bremen and Verden, in order to extend his power as elector of Hanover. By the acquiſition he was involved in a quarrel with Charles XII. of Sweden, who threatened to invade Scotland in favour of the claims of the pretender. The czar Peter alſo concurred in the ſcheme. To obviate the danger, the king entered into a triple alliance with Holland and France, a fleet was ſent up the Baltic to awe the Swedes, and all commercial intercourſe with that nation was ſuſpended: but the death of Charles XII. in 1717, and the ſubſequent changes in the politics of Sweden, put an end to the alarm in that quarter, and ſecured George in the quiet poſſeſſion of his newly acquired continental acquiſitions. The ambition of the court of Spain, governed by cardinal Alberoni, diſturbed the peace of Europe, and occaſioned a quadruple alliance between the three powers above-mentioned, with the acceſſion of the emperor. The ſeizure of Sardinia, and invaſion of Sicily by the Spaniards, gave a pretext for ſending a powerful Engliſh fleet into the Mediterranean under ſir George Byng, who fell in with, and almoſt totally deſtroyed the Spaniſh fleet. This ſucceſs was followed by the recovery of Sicily and Sardinia, and Spain was under the neceſſity of acceding to a peace dictated by the allied powers. A pacification of the north of Europe was alſo effected by the mediation of England. The national deluſion and calamity in the year 1720, (ſee Bubble,) recalled the king from a viſit to his German dominions, and the prudent meaſures of parliament produced the reſtoration of public credit. In 1722 a new conſpiracy againſt the government was diſcovered, and ſeveral perſons were apprehended in conſequence of it, among whom was Dr. Atterbury, biſhop of Rocheſter, who was puniſhed with perpetual baniſhment. The miniſters of France and England, Fleury and Walpole, being friendly to peace, preſerved a good underſtanding between the two countries for many years. Several treaties were negociated under the pretence of maintaining the balance of power, but uſually other private ends were to be anſwered by them. The leading principle of George I. was the ſafety and proſperity of his German dominions, to the intereſts of which, thoſe of Great Britain were, on various occaſions, ſaid to be ſacrificed. In 1725, a treaty between the emperor and the king of Spain excited the jealouſy of king George ſo much, that he counteracted it by another at Hanover, compriſing moſt of the other European powers, and he ſent a fleet to the Weſt Indies under admiral Hoſier, in order to block up the Spaniſh galleons at Portobello. The death of the admiral and moſt of his crew from diſeaſe, was conſidered as one of the moſt inglorious diſaſters of the reign. The Spaniards then beſieged Gibraltar, but all differences were finally ſettled by a negociation. The king of England ſeemed at length to have ſurmounted all his political difficulties, and a proſpect of permanent peace and tranquillity appeared to open upon him. The toils, and dangers, and anxieties which he had felt during his whole reign ſeemed at laſt to be rewarded with glory, happineſs, and repoſe. He thought every circumſtance was favourable to his viſiting his electoral dominions, and embarked for that purpoſe at Greenwich, June 3, 1727. He landed in Holland on the 7th, but in his journey from thence to Hanover he ſuffered a paralytic ſeizure, and feeling that he was near the end of his long journey, he exclaimed to his attendant, "C'eſt fait de moi." He reached the palace of his brother, the biſhop of Oſnaburg, but could not advance farther. He died June 11, 1727, in the ſixty-eighth year of his age, and the 13th of his reign. He has been characterized as plain and ſimple in his appearance, grave and ſedate in his manner, but eaſy and familiar among his intimates, in whoſe ſociety he was fond of relaxing from the cares of the ſtate. He poſſeſſed much natural prudence and good ſenſe, and well underſtood his intereſts, at leaſt as far as the objects neareſt his heart were concerned. Acceding to the crown of Great Britain when far advanced in life, he ſeemed ever to conſider himſelf rather as elector than as king, and the influence and power of Great Britain were of little eſtimation in his eyes when directed to any other end than the aggrandizement of his native country. In the view of Europe at large, he ſuſtained the character of a prudent, able, and fortunate prince. His government was not without defects in the adminiſtration, but he was unqueſtionably a zealous friend to civil and religious liberty. He had female favourites, but was not governed by them. He had little or no taſte for literature and ſcience, and was unable to appreciate their value, yet he founded in each univerſity a profeſſorſhip of modern hiſtory. He was, however, a lover of muſic; and ſoon after his acceſſion eſtabliſhed regulations for the conduct of this part of the ſervice in the royal chapel. He had married in 1681, his couſin Sophia Dorothea, daughter of the duke of Zell, a match that was attended with little domeſtic happineſs. He left behind him one ſon, who ſucceeded him in his crown.

George Augustus II. king of Great Britain, ſon of the preceding, was born in 1683, and came to England with his father in 1714, where he received the rank and title of Prince of Wales. In 1716, he was appointed regent during the king's abſence. After this, on account of ſome private difference between father and ſon, the latter lived for ſome time in a ſtate of eſtrangement from the court. He ſucceeded to the throne in 1727, and adopted the ſame miniſters and meaſures which had governed the nation during the life of George I. He inherited alſo, in full force, the attachment which his father ſhewed to his German intereſts, which ſwayed the councils of his cabinet, though it was frequently obliged to give way to other conſiderations. Europe, for ſome time, was in a ſtate of peace, through the influence of the treaties of Seville and Vienna, the latter of which guaranteed the Pragmatic ſanction, or the law by which the female heirs of the emperor Charles VI. were to ſucceed to the hereditary dominions of Auſtria. In 1732 Walpole introduced into parliament the financial ſcheme of a great extenſion of the exciſe; but the violent oppoſition it met with from the nation obliged him to relinquiſh the object. What the people refuſed to ſubmit to at that period has been ſince adopted almoſt without a murmur. In the year 1737, complaints were made againſt the government for abridging liberty, by a bill for limiting the number of playhouſes, and ſubmitting dramatic writings to the inſpection of the lord chamberlain. Diſputes had long prevailed between Spain and England, on account of the trade carried on in the Weſt Indies by their reſpective ſubjects. In 1739, the matters in debate were compromiſed by a convention ſettled by the reſpective courts, but its terms were ſo little ſatisfactory to the traders, that Walpole found himſelf obliged by their clamours to prepare for hoſtilities. War was declared, and Portobello taken by admiral Vernon. The war, however, did not turn out ſo ſucceſsful as the people expected, ſo that a clamour was raiſed againſt the miniſter, and ſir R. Walpole was obliged to reſign in the year 1742. At the ſame period France, and the other powers in league with her, ſeemed determined, on the death of the emperor Charles VI., to ſtrip his daughter Maria Thereſa of her inheritance, which had been guaranteed to her by the Pragmatic ſanction. In defence of her juſt rights, George ſent an Engliſh army to the continent, and alſo a large body of forces from his electorate, who were taken into Britiſh pay. The king himſelf joined the army, which was under the command of the earl of Stair, and diſplayed great bravery. Victory declared itſelf in favour of the Britiſh, but they were forced to leave their wounded to the care of the enemy. Soon after, the command of the allied army devolved on the king's ſecond ſon, the duke of Cumberland, who was reckoned very deficient in talents as general of a great army. Under him was loſt the bloody battle of Fontenoi in 1744, and the French maintained an undoubted ſuperiority in Flanders during the remainder of the war. In the following year the adherents of the pretender encouraged him to try his fortune by a deſcent, in the northern part of the kingdom, where he might expect an immediate and deciſive declaration to be made in his favour. His ſon, accordingly, under the protection of the court of France, landed on the coaſt of Scotland, in the month of July. He was received with much reſpect and affection, and was immediately joined by ſeveral of the clans, with whom he proceeded to the ſouth, enlarging his ſmall army with all thoſe who would join in his cauſe. At Perth he proclaimed his father king, and immediately after took poſſeſſion of Edinburgh, defeated a body of the royal troops at Preſton Pans, and marched into England, where he had the ſtrongeſt aſſurances of being powerfully reinforced. He proceeded to Derby, but found the people no where zealouſly inclined to ſupport his cauſe; at length the duke of Cumberland arrived from Flanders, with ſeveral Engliſh regiments, engaged and defeated the rebels, and thus put an end to the hopes of the pretender, who could no longer be conſidered as an object of terror or alarm. The government of the houſe of Brunſwick was from this period more firmly eſtabliſhed; and it appeared that the greater part of the nation had indiſſolubly connected the intereſts of religion and liberty with the ſupport of thoſe principles which called the family of the reigning prince to the throne. In 1748, peace was negociated, and eſtabliſhed by the treaty of Aix-la-Chapelle; this treaty did not correſpond with the expectations of the people, but it was welcomed as a relief from the burthens neceſſarily impoſed by a ſtate of warfare. In 1751, the king loſt his eldeſt ſon Frederic, who had lived a conſiderable time at variance with his father, but who had made his peace with the court after the diſmiſſion of Walpole. This prince, the father of our preſent ſovereign, was amiable and well diſpoſed, and the fondeſt hopes had been entertained of the patriotiſm which he would have exhibited on the throne to which he was heir, and of which he was deprived by an early death. In 1755, a war broke out between Great Britain and France, the events of which, though truly important to the kingdom, are in no great degree connected with the character of the king. To his apprehenſions for the ſafety of his German dominions, was imputed the alliance formed with the king of Pruſſia, and the employment of a large force in continental warfare. This was the leaſt glorious part of the public tranſactions: and during the early years of the conteſt events were very unfavourable to England; but when, at the demand of the people, the king ſummoned to his councils the great William Pitt, afterwards earl of Chatham, the tide of ſucceſs ſet full in upon the meaſures of government. The French power in the Eaſt Indies was annihilated; and in America the reduction of Louiſburg was followed by that of Canada. The iſland of Guadaloupe, and the Britiſh ſettlement of Senegal, fell under the Britiſh dominion, and the famous battle of Minden exalted the reputation of the Britiſh ſoldiery. The navy of England reigned triumphant over the ſeas, while that of France was reduced to inſignificance, from which it never after completely recovered. Notwithſtanding all this ſucceſs the German war was unpopular, and miniſters were reproached for the ſacrifices which they had made, or were ſuppoſed to have made, to the perſonal wiſhes of the king. In this ſtate of affairs George II. ſuddenly died from a rupture of the right ventricle of the heart, which, without any previous illneſs or ſuffering, terminated his life on the 25th of October 1760, in his ſeventy-third year, and in the thirty-third of his reign. During this long period he had experienced many viciſſitudes of fortune, but he lived to ſee himſelf the moſt ſucceſsful of all the Engliſh monarchs. He was endowed by nature with an underſtanding by no means comprehenſive, and he had taken little pains to improve and expand his original powers by intellectual cultivation. Equally a ſtranger to learning and the arts, he ſaw the rapid increaſe of both under his reign, without contributing in the remoteſt degree to accelerate the progreſs by any mode of encouragement. He was haſty and obſtinate in his temper, yet a natural goodneſs of heart, a love of juſtice, and an honeſt openneſs of diſpoſition, conciliated the affection of his people, and have inſpired reſpect and veneration for his memory. He was a firm friend to the eſtabliſhed laws and liberties of the kingdom, and it muſt be admitted, highly to his honour, that the general principles of his adminiſtration, both civil and religious, were liberal and juſt. Many of the penal ſtatutes, which ſtill remain unrepealed, were in the reign of this prince meliorated, and virtually ſuſpended, by the mildneſs and equity of the executive government. And he will long be remembered for his declaration, "that during his reign, there ſhould be no perſecution for conſcience ſake." On various occaſions he had given ſignal demonſtrations of perſonal bravery, nor did the general tenour of his conduct afford proofs leſs ſtriking of his rectitude and integrity. If he cannot be ranked among the greateſt, he is certainly entitled to be claſſed with the moſt reſpectable princes of the age in which he lived.

George, *St.* a name whereby ſeveral orders, both military and religious, are denominated. It took its riſe from a ſaint famous throughout all the Eaſt, called by the Greeks Μεγαλομαρτυς, q. d. *great martyr.*

On ſome medals of the emperors John and Manuel Comneni, we have the figure of St. George armed, holding a ſword or javelin in one hand, and in the other a buckler, with this inſcription; an O, and therein a little
P
A, and ΓΕ—ΓΙΟΣ, making Ο ΑΓΙΟΣ ΓΕΟΡΓΙΟΣ, *O Holy*
O
George. He is generally repreſented on horſeback, as being ſuppoſed to have frequently engaged in combats in that manner.

He is highly venerated throughout Armenia, Muſcovy, and all the countries which adhere to the Greek rite: from the Greek, his worſhip has long ago been received into the Latin church; and England and Portugal have both choſen him for their patron ſaint. See GEORGE of *Cappadocia*.

GEORGE, *St.* is particularly uſed for an Engliſh order of knights, more commonly now called the *order of the Garter*. See GARTER.

GEORGE, *knights of St.* There have been various orders under this denomination, moſt of which are now extinct.

The order of *St. George*, at firſt called the order of the "Golden Angel," is ſaid to have been inſtituted by Conſtantine the Great, in the year 312. The collar is compoſed of fifteen oval plates of gold, richly chaſed on their edges, and enamelled blue. On 14 of theſe plates is the cypher of the name of Chriſt, compoſed of the Greek capital letters X and P between the two capitals A and Ω, ſignifying that Jeſus Chriſt is the beginning and end; but on the centre oval, which is edged with laurel leaves, the cypher X P is placed on a croſs patence gules, edged or, and having on its points the letters I. H. S. V.; and pendent from the bottom was the figure of St. George killing the dragon. The habit of the knights was a long cloak of ſky blue velvet, lined with white ſilk, tied at the neck with a cord of crimſon ſilk and gold intermixed, terminating at each extremity in a large taſſel; on the left breaſt of the cloak was embroidered the croſs of the order.

The order of *St. George* in Auſtria and Carinthia was inſtituted, as ſome ſay, by Rodolph, count of Habſburg, the firſt emperor of the houſe of Auſtria, about the year 1273 or 1290; or, as others ſay, by the emperor Frederic III. in order to guard the frontiers of Germany, Hungary, Auſtria, Carinthia, and Styria, from the inroads of the Turks. The badge of the order was a plain purple croſs edged with green.

The order of *St. George* in Burgundy was founded, in the year 1400, by Philbert de Miolans, a gentleman of Burgundy, on account of his having brought from the Eaſt ſome relics of St. George, which he depoſited in a chapel erected for the purpoſe, near to the pariſh church of Rougamont. The badge of the order is a St. George on horſeback, overthrowing a dragon, ſimilar to that on the collar of the order of the garter. It was worn pendent to a blue ribband tied to a button-hole. Women were admitted into this order.

The order of *St. George* in Auſtria was refounded by the laſt emperor Maximilian, who directed that the badge of the order ſhould be a croſs croſlet botonnée gules, encircled on the upper part with a ducal coronet or, and worn pendent from three chains of gold.

The order of *St. George* at Genoa was inſtituted in 1472. The doge of Venice is perpetual grand maſter of the order. The enſign of the order is a plain red croſs, worn round the neck, pendent to a ribband.

The order of *St. George* in Rome was founded by pope Alexander VI. in the year 1492. The collar of the order was a gold chain, to which was pendent, in enamel, the figure of St. George on horſeback, throwing down a dragon, and piercing it with a lance. The badge was a gold croſs within a circle of gold, like an open crown.

The order of *St. George* at Ravenna is ſuppoſed to have been inſtituted by pope Paul III. in 1534. It was aboliſhed by pope Gregory in 1572.

The order of *St. George*, defender of the immaculate conception of the bleſſed Virgin Mary, was inſtituted at Munich by Albert, elector of Bavaria, in the year 1729, and confirmed by the pope. The perſon admitted into this order muſt prove his gentility for five generations both on his mother's and father's ſide. The badge of the order is a ſtar of eight points; on the centre is enamelled the image of St. George on horſeback, ſlaying a dragon; the croſs is enamelled blue, and edged with white, and cantoned with a ſmaller croſs, enamelled blue and white; which, pendent to a ſky-blue watered ribband, edged with white, is worn ſcarfwiſe. On the left breaſt the knights alſo wear the ſame ſtar embroidered, having on the centre a red croſs. On feſtivals they wear a collar compoſed of oblong plates with crowns at each end, and columns ſurmounted with globes; each column ſupported by two lions, holding in their anterior paws ſcymitars, joined together with lozenge-chains enamelled blue and white: on the oblong plates is the following motto:—"In fide, juſtitia, et fortitudine."

The military order of *St. George* in Ruſſia, called alſo the order of "Merit," was inſtituted by the empreſs Catharine II. in 1769, has the precedence over that of St. Anne of Holſtein, and was divided into four claſſes.—The badge is a croſs of gold, enamelled white, on the centre of which is a medallion, with the figure of St. George ſlaying a dragon. This is worn pendent to a black ribband edged with orange colour, and two ſtripes of orange on the black. Thoſe of the firſt claſs wear it under their coat, paſſing from right to left; and on the left breaſt of their coat is a ſtar wrought in gold, in the ſhape of a lozenge: on the centre of the ſtar are embroidered the figure of St. George and the dragon. Thoſe of the ſecond claſs wear the badge pendent to a ribband paſſing round their neck, and a ſtar on their left breaſt. Thoſe of the third claſs wear the badge pendent to a narrow ribband which paſſes round their neck; but they have no ſtar. Thoſe of the fourth claſs wear the badge pendent at the button-hole of their coats. Each knight of the firſt claſs receives an annual ſalary of 700 roubles = 140*l*: each of the ſecond claſs has 400 roubles = 80*l.* per annum: each of the third claſs 200 roubles or 40*l.* per annum; and each of the fourth claſs 100 roubles or 20*l.* per annum. The fund of this order, aſſigned by the empreſs for the payment of their ſalaries, and other expences, is 40,000 roubles = 8000*l.* per annum. Of this 1,680 is deſtined for the firſt claſs; and 2000 for each of the remaining three. The number of knights is unlimited. In 1778, the firſt claſs, which is confined to commanders in chief, contained only four; the ſecond claſs comprized only eight knights; the third, forty-eight; and the fourth two hundred and thirty-four. No perſon can obtain this order without having performed ſome gallant exploit, or having ſerved in the rank of an officer 25 years by land, or 18 by ſea.

The order of *St. George* of Alfama, or the order of *Monteſa*, an order of knighthood in Spain. When the order of knights-templars became extinct in Spain, an order was inſtituted, about the year 1317, to ſupply their places, in conſequence of a permiſſion for that purpoſe obtained from pope John XXII. at which time Monteſa in Valencia was ſelected as a proper place for the reſidence of the knights. In the following year, James, king of Arragon and Valencia, built at Monteſa a noble college for their habitation, and dedicated it to St. George: and hence the order aſſumed its appellation of the order of St. George of Monteſa. The habit of this order is a white mantle, on the left breaſt of which is embroidered a plain red croſs. The badge of the order is a plain red croſs, enamelled on gold, which is worn ſcarfwiſe, pendent to a broad red watered ribband. The order of St. George of Alfama, was inſtituted about the year 1201, at a town of that name in the dioceſe of Tortoſa. In 1399 this order was united to that of Monteſa, by pope Benedict XIII. and that union was confirmed in the council of Conſtance.

GEORGE, *Religious of the order of St.* Of theſe there are divers orders and congregations; particularly canons regular of St. George in Alga, at Venice, eſtabliſhed by authority of pope Boniface IX. in the year 1404. The foundation of this order was laid by Bartholomew Colonna, who preached, in 1396, at Padua, and ſome other villages in the ſtate of Venice. Pope Pius V. in 1570, gave theſe canons precedence of all other religious. Another congregation of the ſame inſtitute in Sicily, &c.

St. GEORGE's *Croſs.* See CROSS.

GEORGE *noble*, a piece of gold, current at ſix ſhillings and eight-pence in the reign of king Henry VIII.

GEORGE *Bank*, in *Geography*, a rocky ſhoal, near the weſt coaſt of Sumatra. N. lat. 3° 48′. E. long. 96° 12′.

GEORGE, *Cape*, a cape on the S. coaſt of Kerguelen's Land. N. lat. 49° 54′. E. long. 70° 13′.—Alſo, a cape on the W. coaſt of Newfoundland. N. lat. 48° 28′. W. long. 59° 17′.—Alſo, a cape on the N. coaſt of the iſland of South Georgia. S. lat. 54° 17′. W. long. 36° 32′.—Alſo, a cape on the coaſt of Peru. S. lat. 23° 50′.—Alſo, a cape on the coaſt of New Holland, diſcovered on St. George's day by lieutenant Cook, and ſo called by him. S. lat. 35° 10′. W. long. 208° 51′.

GEORGE, *St.*, *Cape*, a cape on the W. coaſt of Newfoundland. N. lat. 49° 30′. W. long. 59°.—Alſo, the ſouthern extremity of New Ireland. S. lat. 5°. E. long. 152° 15′.

GEORGE *Creek*, a town of America, in Alleghany county, Maryland; 152 miles from Waſhington.—Alſo, a river of America, which runs into the Potowmack; 12 miles S.W. of Fort Cumberland.

GEORGE *Iſland*, an iſland of America, lying between lake Superior and lake Huron. N. lat. 46° 15′. W. long. 84° 20′.

GEORGE's *Iſlands*, two iſlands in the South Pacific occean, diſcovered by Commodore Byron in 1765, and ſo called by him in honour of his majeſty. They were again obſerved by captain Cook in 1774, in the paſſage from the Marqueſas to Otaheite. One of theſe iſlands, called by the inhabitants "Tiookea" was of an oval ſhape, and about 10 leagues in circuit, lying in the direction of E.S.E. and W.N.W., and ſituated in S. lat. 14° 27′ 30″, and W. long. 144° 56′. The inhabitants of this, and probably of the other low iſles, are of a much darker colour than thoſe of the higher iſlands, and ſeem to be of a much more ferine diſpoſition; which captain Cook attributes to their ſituation. Nature not having beſtowed her favours on theſe low iſlands with that profuſion ſhe has done to ſome others, the inhabitants are chiefly indebted to the ſea for their ſubſiſtence; conſequently they are much expoſed to the ſun and weather, and thus become more dark in colour, and more hardy and robuſt; for without doubt they are of the ſame nation. They were obſerved to be ſtout, well-made men, and on their bodies was marked the figure of a fiſh;—a very good emblem of their profeſſion. The other iſland was ſimilar to the former, extending N.E. and S.W. near four leagues, and from five to three miles broad. It lies S.W. by W. two leagues diſtant from the weſt end of Tiookea; and the middle is ſituated in S. lat. 14° 37′. W. long. 145° 10′. The natives of theſe iſlands appeared to be armed with long ſpears and clubs; their aſpect and movements were hoſtile: ſome of them, however, appeared to captain Cook to manifeſt a friendly diſpoſition; but they ſeemed to have no inclination to maintain any intercourſe with him. They ſupplied him with dogs, which were plentiful, and cocoa-nuts, which were the only fruit they ſaw. Theſe furniſhed them with almoſt all the neceſſaries of life, particularly food, ſails, cordage, timber, and veſſels to hold water; and with a view to this uſe of them, their habitations, which were mean low hovels, thatched with cocoa-nut branches, were ſelected near groves of theſe trees. Scurvy-graſs was obtained in great abundance. Their canoes, which they are dextrous in navigating, are large and curiouſly conſtructed. Commodore Byron obſerved the ſhore to be covered with coral, and the ſhells of very large pearl-oyſters; and he conceived that a very profitable pearl-fiſhery might be eſtabliſhed on theſe iſlands. The women had a piece of cloth, appearing to be fabricated of the ſame ſtuff with their ſails, which hung from the waiſt as low as the knee; but the men were ſtark naked. Near the huts of theſe people were buildings, that appeared to be burying-places, from the ſtructure of which it was inferred that they had great veneration for the dead. Freſh water is ſcarce. Each of theſe iſlands has in it a lagoon, or large ſalt-water lake. The people are much addicted to theft.

GEORGE *Lake*, a lake of Eaſt Florida, which is an enlargement of the river St. Juan, or St. John. It is alſo called "Great Lake," being about 15 miles wide, and generally about 15 or 20 feet deep, except at the entrance, which has a bar with 8 or 9 feet of water. This lake is beautified with two or three fertile iſlands, the largeſt of which is about two miles broad, commanding an extenſive proſpect, bearing evident marks of a large town of the Aborigines, and appearing to have been the choſen reſidence of an Indian prince.—Alſo, a lake that lies to the ſouthward of lake Champlain. The portage between the two lakes is one mile and a half. The water of this lake is very clear, and was formerly uſed by the French in Canada for ſacramental purpoſes, whence the lake was denominated lake "Sacrament." This lake is about 36 miles long, and from one to ſeven wide. It emboſoms more than two hundred iſlands; or, as ſome ſay, three hundred and ſixty-five; moſt of which are barren rocks, covered only with heath and a few cedar, ſpruce, and hemlock trees and ſhrubs, and abounding with rattle-ſnakes. The remains of Fort George ſtand at the ſouth end of the lake, about 14 miles N. by W. of Fort Edward, on Hudſon river. The famous fort of Ticonderoga, which ſtood on the north ſide of the outlet of the lake, where it diſcharges its water into lake Champlain, is now in ruins.—Alſo, a lake in Upper Canada, ſituated below the Falls of St. Mary, and N. of Muddy lake; it is about 25 miles long, with very ſhallow water.

GEORGE's *Sound.* See NOOTKA.

GEORGE, *St.*, the largeſt of the Bermudas iſlands, about 15 miles in length and three in breadth, containing about 500 houſes, ſurrounded and defended by a chain of rocks, which extend ſome way into the ſea, ſo that ſhips can approach it only in two places, and not without the aſſiſtance of an experienced pilot. It is divided into nine pariſhes or diſtricts. It has a town of the ſame name, containing a town-houſe, where the governor, council and magiſtrates aſſemble, a handſome church, and a library. N. lat. 32° 40′. W. long. 64° 32′. (See BERMUDAS).—Alſo, a town, or rather village, nearly in the centre of Newcaſtle county, in the ſtate of Delaware, N. America; ſituated on a creek of the ſame name, which falls into the Delaware river four miles below it, and a little above Reedy iſland; 45 miles S.W. of Philadelphia.—Alſo, a town and capital of the iſland of Grenada, and alſo one of its ſix pariſhes, formerly called by the French "Fort Royale." It is ſituated in a ſpacious bay, on the weſt ſide of the iſland, not far from the ſouth end, and poſſeſſes one of the ſafeſt and moſt commodious harbours in the Engliſh Weſt Indies, which has been lately fortified at a great expence, and being one of the ports of entry belonging to the iſland was made a ſea-port by 27 Geo. III. c. 27. The town of St. George is built chiefly of brick, and makes a handſome appearance. It is divided by a ridge, which, running into the ſea, forms on one ſide the carenage, and on the other the bay.—Accordingly here is the "Bay-town," which has a handſome ſquare and market-place, and the "Carenage-town," in which the principal merchants reſide; the ſhips lying land-locked, and in deep water cloſe to the wharfs. On the ridge between the two towns ſtands the church, and on the promontory above it is a large old fort, which was probably conſtructed by the firſt French inhabitants. It is built of ſtone, and is large enough to accommodate an entire regiment. N. lat. 12° 4'. W. long. 61° 31'. Edwards's Weſt Indies, vol. ii.—Alſo, one of the Azores iſlands, about 10 leagues in length, and two in breadth. The ſoil is generally level, except towards the north, where it is rocky and barren; it is elſewhere fertile in corn, and the other neceſſaries of life. It is chiefly remarkable for a great number of lofty and full-grown cedars, with which the natives carry on a conſiderable trade. N. lat. 38° 39'. W. long. 28°.—Alſo, a town of Hindooſtan, on the coaſt of Malabar; eight miles S. of Cochin.—Alſo, a ſea-port on the iſland of Sciro. N. lat. 38° 58'. E. long. 24° 37'.—Alſo, a ſmall iſland in the Grecian Archipelago, three miles E. of Milo.—Alſo, a ſmall iſland in the Grecian Archipelago, at the entrance of the gulf of Sandarlick. N. lat. 38° 48'. E. long. 26° 42'.—Alſo, a ſmall iſland in the Eaſt Indian ſea, near the coaſt of Hindooſtan; four miles from Goa.—Alſo, a town of France, in the department of the Mayne and Loire; 20 miles S.S.W. of Angers.—Alſo, a large and deep bay on the W. ſide of Newfoundland. N. lat. 48° 12'—Alſo, a river of America, or rather an arm of the ſea, in Lincoln county and ſtate of Maine, lying about two leagues S.W. of Penobſcot bay. This river is navigable for brigs and ſhips of a large burden up to the narrows; and from thence about four miles higher, to nearly the head of the tide, for ſloops and ſchooners of 80 or 90 tons. It is about half a league wide up to the narrows. The navigation is in winter. This river abounds with all kinds of fiſh.—Alſo, a river of St. Mary's county, in Maryland, which is a broad but ſhort creek, having its mouth between Piney point and St. Mary's river on the north bank of the Potowmack; oppoſite to the iſland of the ſame name.

St. GEORGE'*s Bank*, a fiſhing bank in the Atlantic ocean, in the Maſſachuſetts, E. of cape Cod. It extends from north to ſouth between 41° 15' and 42° 22' N. lat., and between 67° 50' and 68° 40' W. long.

St. GEORGE'*s Bay*, a bay of the Pacific ocean, on the S.E. coaſt of New Ireland, between cape St. George and cape Orford.

St. GEORGE'*s Channel*, that part of the Atlantic ocean which is ſituated between Ireland and Wales.—Alſo, a ſtrait of the Pacific ocean between New Britain and New Ireland, 300 miles in length.—Alſo, a ſtrait between the little Nicobar and Sambelong iſles, in the Eaſt Indian ſea.

St. GEORGE'*s Iſland*, a ſmall iſland in the mouth of the river Potowmack. N. lat. 38° 13'. W. long. 76° 34'.

St. GEORGE'*s Iſlands*, a cluſter of ſmall iſlands near the coaſt of Eaſt Florida, oppoſite to the mouth of the Apalachicola.—Alſo, ſmall iſlands in the Atlantic, near the coaſt of Maine in America. N. lat. 43° 50'. W. long. 68° 10'.

St. GEORGE'*s Key*, was one of the principal Britiſh ſettlements in the bay of Honduras, taken by the Spaniards during the American war, but retaken by the Britiſh ſoon after. The Britiſh ſettlements on the Moſquito ſhore, and in the bay of Honduras, were ſurrendered to the crown of Spain at the Spaniſh convention, ſigned at London on the 14th of July, 1786. N. lat. 17° 35'. W. long. 88° 43'.

St. GEORGE *d'Albora*, an iſland in the Grecian Archipelago, about ſeven miles in circumference. N. lat. 37° 28'. E. long. 23° 20'.

St. GEORGE *de Comiers*, a town of France, in the department of the Iſere; nine miles S. of Grenoble.

St. GEORGE *d'Elmina*. See ELMINA.

St. GEORGES-*en-Couſans*, a town of France, in the department of the Loire, and chief place of a canton in the diſtrict of Montbriſon, 9 miles N.W. of Montbriſon. The place contains 1020, and the canton 7271 inhabitants, on a territory of 207½ kiliometres, in 8 communes.

St. GEORGE *d'Eſperanche*, a town of France, in the department of the Iſere; 18 miles S.E. of Lyons.

St. GEORGES *de Lévéſac*, a town of France, in the department of the Lozére, and chief place of a canton in the diſtrict of Florac, 18 miles S.W. of Mende. The place contains 1000, and the canton 2600 inhabitants, on a territory of 137½ kiliometres, in 5 communes.

St. GEORGES *ſur Loire*, a town of France, in the department of the Mayne and Loire, and chief place of a canton in the diſtrict of Angers; 9 miles S.W. of Angers. The place contains 2,320, and the canton 9951 inhabitants, on a territory of 205 kiliometres, in 9 communes.

St. GEORGES-*les-Baillargeaux*, a town of France, in the department of the Vienne, and chief place of a canton in the diſtrict of Poitiers. The place contains 1119, and the canton 6027 inhabitants, on a territory of 190 kiliometres, in 7 communes.

St. GEORGE *d'Orque*, a town of France, in the department of the Herault; 4 miles W. of Montpellier.

St. GEORGE *de Rantambaut*, a town of France, in the department of the Ille and Vilaine; 9 miles N. of Fougeres.

St. GEORGE *in Reith*, a town of Auſtria, 6 miles S.E. of Waidhoven.

St. GEORGE *am Sec*, a town of Germany, in the principality of Culmbach, ſeated on a lake, called the pond of Brandenburg; 24 miles N.N.E. of Bayreuth.

St. GEORGES *des Sept Voies*, a town of France, in the department of the Maine and Loire; 12 miles N.W. of Saumur.

St. GEORGES-*du-Viévre*, a town of France, in the department of the Eure, and chief place of a canton in the diſtrict of Pontaudemer; 25 miles N.W. of Evreux. The place contains 830, and the canton 11,733 inhabitants, on a territory of 95½ kiliometres, in 14 communes.

GEORGENBERG, a town of Sileſia, in the principality of Oppeln; 40 miles E. of Oppeln. N. lat. 50° 30'. E. long. 18° 52'.

GEORGENFELD, ST., a town of Saxony, in the circle of Erzgebirg; 18 miles S. of Pirna. N. lat. 50° 40'. E. long. 13° 44'.

GEORGENTHAL, a town of Saxony, in the principality of Gotha; 6 miles S of Gotha.

GEORGENZELLS, a town of Germany, in the county of Henneberg; 5 miles S.S.E. of Salzungen.

GEORGE-TOWN, a town of America, being the chief and poſt-town of Suſſex county, in the ſtate of Delaware, ſituated 103 miles S. of Philadelphia, containing about 30 houſes, and lately made the ſeat of the county-courts.—Alſo, a poſt-town in Maryland, in Kent county, on the eaſt ſide of Cheſapeak bay, containing about 30 houſes; 9 miles from the mouth of the river Saſſafras, 65 miles S.W. of Philadelphia.—Alſo, a poſt-town of Beaver county, Pennſylvania, on the S.E. ſide of Monongahela river, at the mouth of George's creek; 16 miles S.W. of Union. In this place are annually built many boats, for the trade and emigration to the weſtern country.—Alſo, a poſt-town and port of entry in Montgomery county, Maryland, and in the territory of Columbia, pleaſantly ſituated on a number of ſmall hills, on the northern bank of Potowmack river, ſeparated eaſtward by Rock creek from Waſhington city, and diſtant 4 miles from the capital, and 8 N. from Alexandria. The houſes, which are about 250, are elegant and commodious. The Roman Catholics have eſtabliſhed a college in this place, which is in a flouriſhing ſtate. The town carries on a ſmall trade with Europe and the Weſt Indies; 46 miles S.W. by W. from Baltimore, and 148 S.W. from Philadelphia. N. lat. 38° 55'.—Alſo, a town and townſhip of Lincoln county, in the ſtate of Maine, ſituated on both ſides of Kennebeck river; incorporated in 1716, and containing 1534 inhabitants. It is entirely ſurrounded by navigable waters, excepting about two miles of land, which divides the waters of Winnagance creek, a part of the Kennebeck, from an arm or influx of Caſco bay, called Stephen's river. This townſhip contains about 28,000 acres of land, and ſalt-marſh. Upon this ſpot the Europeans firſt attempted in 1607 to colonize New England. It is a part of what was called "Sagadahock;" and the patentees of the Plymouth company began here to lay the foundation of a great ſtate. They ſent over for this purpoſe a number of civil and military officers, and about 100 people. Several misfortunes obliged them to give up the ſettlement, and in 1608 the whole number who ſurvived the winter returned to England. George-town is 15 miles S. of Pownalborough, and 170 N. by E. from Boſton.—Alſo, a poſt-town of Georgia, in the county of Oglethorpe, 50 miles S.W of Auguſta, in the midſt of a poor country, but indicating proſperity.—Alſo, a large maritime diſtrict in the lower country of South Carolina, ſituated in the N.E. corner of the State. Horry and Marion diſtricts have lately been taken from this territory, leaving 20,332 inhabitants, of whom 16,860 are ſlaves.—Alſo, a poſt-town, and port of entry, and capital of the laſt-mentioned diſtrict, ſituated on a ſpot near which ſeveral ſtreams unite their waters, and form a broad water called "Winyaw" bay, 13 miles from the ſea. It contains 3 or 400 dwelling-houſes, built chiefly of wood. The public buildings are a court-houſe, gaol, and academy; four churches for epiſcopalians, baptiſts, preſbyterians, and methodiſts reſpectively. The place carries on a ſmall trade with the Weſt Indies; 60 miles N.E. by N. from Charleſtown, and 681 from Philadelphia. N. lat. 33° 24'. W. long. 79° 35'.—Alſo, a town of Kentucky, on the Eikhorn; 20 miles E. of Francfort. N. lat. 38° 7'. W. long. 84° 50'.—Alſo, a town of New Brunſwick, on the river St. John. N. lat. 45° 48'. W. long. 66° 12'.—Alſo, a town on the eaſt coaſt of the iſland of St. John, on the gulf of St. Laurence.—Alſo, a town of the ſtate of Georgia; 20 miles N. of Wayneſborough.—Alſo, a town of Scotland, in Perthſhire, with ſome barracks, at the end of Loch Rannock; 31 miles N.W. of Perth. N. lat. 56° 41'. W. long. 4° 25'.

GEORGIA, in *Botany*, Ehrhart Beitr. v. 1. 176, ſo named by that author after his majeſty George III. king of Great Britain, when he eſtabliſhed, as a new genus, the moſs called by Linnæus *Mnium pellucidum*. All botaniſts, nevertheleſs, have preferred the name *Tetraphis*, given by Hedwig. See Fringe *of* Moſses, n. 1. It ſeems, however, that there ought to be a *Georgia* after Georgi the Ruſſian traveller and botaniſt. See Georgina.

Georgia, in *Geography*, a country of Aſia, between the Caſpian and Black ſeas, and particularly appropriated to the territory that lies between the Caſpian ſea and Mingrelia, anciently known by the name of "Iberia." The ancient Iberia, which lies to the weſt, is now chiefly the "Immeretia" of European Turkey, on the other ſide of a branch of the Caucaſus. Georgia, or more properly "Gurguſtan," including Dagheſtan and Schirvan, may be conſidered as conſtituting the Albania of the ancients; a name, however, that has been applied in different quarters to mountainous regions.

The whole country, which is known by the name of Georgia or Gruſinia, is divided into two conſiderable Chriſtian ſtates. One of theſe, bounded by the Black ſea, conſiſts of the kingdom of "Immeretia," and the principalities of "Mingrelia" and "Guriel," (which ſee reſpectively,) and is now governed by a common prince, who bears the title of tzar or czar. Each of theſe countries had formerly its own ruler, all acknowledging the ſupremacy of the Grand Sultan, till czar Solomon united them under his authority, and freed them from the paramount Ottomans. Solomon, having upon his acceſſion forbidden the ſcandalous traffic practiſed by the nobles of ſelling their peaſants, greatly offended the Turks, who gained by that ſpecies of commerce. Being by their intrigues driven from his throne, and compelled to find an aſylum in the woods and mountains, he lived like a wild man for ſixteen years, in caverns and holes, and frequently, by his perſonal courage, eſcaped aſſaſſination, until he was re-inſtated in his dominions by the Ruſſians. This prince, on ordinary occaſions, was diſtinguiſhed from his ſubjects by riding on an aſs, perhaps the only one in Immeretia, and by wearing boots. He had no regular troops, but collected a deſultory army of 6000 men, without artillery. Theſe troops were drawn together by the ſound of the trumpet; in other reſpects the prince's orders were iſſued at the markets, which are held every Friday. One of his ſervants aſcended a tree near the place of meeting, and proclaimed the edict with a loud voice. His ſubjects were of the Greek religion. Solomon died of the plague in 1784, and was ſucceeded by his nephew David, who threw himſelf under the protection of Ruſſia. In 1784 his embaſſadors were introduced to the empreſs at Peterſburg, and, in the eaſtern ſtyle of homage, threw themſelves on the ground at her feet.

The ſecond Georgian ſtate conſiſts of the principalities of "Karduelia" or "Carduelia," (Kartalinia) and "Kakhetty," which have been long governed by Chriſtian princes, in ſubmiſſion to the Perſian empire, but, ſince the ſhock ſuſtained by the throne of the Sophis, have rendered themſelves independent. Each of theſe two provinces formerly compoſed a diſtinct ſtate; but they have both lately been reduced under the ſole ſovereignty of prince Heraclius of the Kakhettian dynaſty. The ſtate of Karduelia and Kakhetty borders northwards on the Kabarda, eaſtwards on Dagheſtan and Schirvan, (which ſee reſpectively,) ſouthwards on the Perſian Armenia, and weſtwards on Immeretia. The capital is *Teflis* (which ſee). The czar, or prince Heraclius, who is celebrated for his bravery and other great qualities, as well as by the important part which he acted during the diſturbances that agitated Perſia after the death of Tamas Kuli-Khan, ſubmitted in the year 1783 to the Ruſſian empire, thus voluntarily ſacrificing an independence which he ſeemed to have ſecured by his exploits; but the advantages of which were richly compenſated in the protection he procured by this ſubmiſſion. However, notwithſtanding his cloſe alliance with Ruſſia, he was compelled in 1787 to renounce his connection with it, and to acknowledge himſelf tributary to the Porte; but he died ſoon afterwards. Within a few years paſt the Ruſſian intereſt revived, and prevailed; and in February 1801, Georgia was by a public ukaſe united to that empire. The Georgians or Gruſinians, as they are ſometimes called, avoided all commixture with the Tartars, and have diſtinguiſhed themſelves as the moſt numerous and powerful body of the mountaineers of Caucaſus, now for the greateſt part ſubject to the protecting authority of Ruſſia. The inhabitants of Georgia, when it was one kingdom, were Chriſtians, but ſince the year 1639, they were blended with Mahometans; the king of Perſia having conquered and divided the country into two provinces or kingdoms, and having obliged the people to embrace the Mahometan religion. But ſince they have been under the protection of Ruſſia, they have again avowed themſelves Chriſtians, following in part the rights of the Armenian, and in part thoſe of the Greek church. They are repreſented as the moſt tractable Chriſtians of the Eaſt. The Georgians excel in the uſe of the bow, and are reputed to be the beſt ſoldiers in Aſia. The women are celebrated for their beauty, but though they are very handſome they love to adorn themſelves with paint, and are not in high eſtimation for their modeſty. As the country produces ſtrong wine, the Georgians are addicted to intoxication, and the women, as well as the men, indulge freely in the uſe of brandy. The men, it is ſaid, have no virtue but courage; fathers ſell their children, and ſometimes their wives. According to the laws of war in Turkey, any province which revolts is given up to pillage, and the inhabitants are reduced to ſlavery. In conſequence of this cuſtom, which prevails throughout Aſia, Georgia and Circaſſia ſupply the market of Conſtantinople with ſlaves; though it is ſaid, that the Circaſſians alone have the honour of being admitted into the bed of the ſultan. This ſupply of female ſlaves is continually furniſhed by the Leſgues Tartars, who, ſituated between the Caſpian and Black ſeas, between Georgia and Circaſſia, are perpetually at war with theſe two provinces. They carry over to the eaſtern coaſt of the Black ſea the ſlaves they have taken, and ſell them to the Turkiſh merchants, who come thither at ſtated times for this traffic. The inhabitants of this ſame coaſt, likewiſe, ſeize on their countrymen in the neighbouring villages, and ſell them; and children have been ſometimes ſold by their parents. See Circassia.

The air of Georgia is dry, very warm in ſummer, and very cold in winter. Fine weather commences in the month of May, and continues till the end of November. The ſoil is extremely fertile, provided the ground be watered. The bread and fruits are excellent; and the paſtures feed a great number of cattle, fat and lean. The game is of excellent flavour, and the wild hogs are delicate. The inhabitants make wine, which they ſell into Armenia and Perſia, eſpecially to Iſpahan, for the king's table. Silk forms a conſiderable branch of trade to Erzerum; though the inhabitants are unacquainted with the beſt method of winding it. In this province there are only four conſiderable towns; *viz.* Tefflis, Gori, Suren and Ali. See Persia.

Georgia, one of the United States of America, ſituated between 31° and 35° N. lat. and between 5° and 16 W. long.; extending in length about 600 miles, and in breadth 250; and bounded on the eaſt by the Atlantic ocean; S. by Eaſt and Weſt Floridas; W. by the river Miſſiſippi; N.E. and N. by South Carolina, the Tenneſſee ſtate, or by lands ceded to the United States by South Carolina. Its population is eſtimated, by the cenſus of 1790, at 82,548 perſons; of whom 29,264 were ſlaves; but the number has ſince been much augmented. The ſettlement of a colony between the rivers Savannah and Alatamaha became the ſubject of contemplation in England in the year 1732, with a view to the accommodation of poor people in Great Britain and Ireland, and for the farther ſecurity of Carolina. The benevolent and humane propoſed to raiſe a fund for conveying indigent emigrants to this part of America, free of expence. Their generous project was encouraged by letters patent obtained from his majeſty George II. in June 1732; and, in honour of the king, the new province was called "Georgia." A corporation was eſtabliſhed for ſettling the colony, which was to be ſeparated from Carolina by the Savannah; and a large ſum of money was raiſed for the purpoſe of carrying the liberal and humane deſign into execution. General Oglethorpe was ſelected for conducting the emigrants, about 116 in number, to their new abode; and ſoon after their arrival, in the commencement of the year 1733, they marked the ſpot, on which Savannah now ſtands, as the moſt proper for the foundation of their ſettlement. Accordingly they proceeded to erect a fort, and a number of ſmall huts, for their defence and accommodation. A treaty of amity was concluded between the ſettlers and their neighbours, the Creek Indians; and various regulations were framed, for their future government. The number of new ſettlers from the Highlands of Scotland and from Germany gradually increaſed; ſo that in the courſe of three years, Georgia received above 400 Britiſh ſubjects, and about 170 foreigners. Afterwards ſeveral adventurers from Scotland, Germany, and Switzerland followed their countrymen, and contributed to encourage the hopes of the truſtees as to the permanence and proſperity of the colony. Several towns were built, and, in 1739, more than 600 people were employed in trading with the Indians for furs and ſkins. Nevertheleſs, in 1741, the Engliſh government received information that ſcarcely a ſixth part remained of the number of perſons who had migrated to Georgia; and thoſe that continued were ſo much diſcouraged, that they ſeemed to be deſirous of fixing in a more favourable ſituation. It was thus found that the ſyſtem of government, which had been formed for this colony, was highly injudicious and altogether inconſiſtent with its proſperity. The firſt uſe which the proprietors of Georgia made of the unlimited powers with which they were inveſted, was to eſtabliſh a ſyſtem of legiſlation that made them abſolute maſters, not only of the police, juſtice, and finances of the country, but even of the lives and eſtates of the inhabitants. As great inconveniences had been found to ariſe in other colonies from large poſſeſſions, it was thought proper in Georgia to allow each family only 50 acres of land; which they were not permitted to mortgage, or to diſpoſe of by will to their female iſſue. This laſt regulation, however, which made the males only capable of inheritance, was ſoon aboliſhed; but other reſtrictions of a diſcouraging nature ſtill remained. No man was permitted to leave the province without a licence. If any of the lands granted by the truſtees were not cultivated, cleared, and fenced round with a wooden fence, or pales ſix feet high, within 18 years from the date of the grant, ſuch part was to revert to the truſtees for the benefit of the colony. It was forbidden to uſe negroes, to import rum, and to trade with the Indians without a ſpecial licence obtained for this purpoſe. Under theſe reſtraints the province languiſhed, and the people complained; till at length the truſtees, in the year 1752, ſurrendered their charter to the king, and it was made a royal government. From this time, till the peace of Paris in 1763, the province ſtruggled under many difficulties; ariſing from the want of credit with friends, and from the frequent moleſtations of enemies. The good effects of this peace were ſenſibly felt, and its annual exports, which in 1752 amounted to no more than about 10,000*l.* ſterling, were very much augmented; and its population and agriculture proportionally increaſed; though under ſome checks and interruptions from diſputes and wars with the Creek Indians. But ſince a treaty of peace and friendſhip with the Creek nation was concluded in 1790, the ſtate of Georgia has been rapidly advancing in every kind of improvement.

Since the revolution, Georgia has been divided into counties, comprehended under two diſtricts, *viz.* the Upper and the Lower; the former includes 15 counties, *viz.* Montgomery, Waſhington, Hancock, Greene, Franklin, Oglethorpe, Elbert, Wilkes, Lincoln, Warren, Jefferſon, Jackſon, Bullock, Columbia, and Richmond; the latter contains nine counties, *viz.* Camden, Glynn, Liberty, Chatham, Bryan, M'Intoſh, Effingham, Scriven, and Burke. The principal towns are Auguſta, formerly the ſeat of government, Savannah, the former capital of the ſtate, Sunbury, Brunſwick, Frederica, Waſhington, and Louiſville, which is the metropolis of the ſtate, and where its records are depoſited. The principal rivers which water Georgia, are Savannah, which ſeparates it from South Carolina, Ogeechee, which runs parallel with the former, and Alatamaha, which runs parallel with the others. Beſides theſe and their numerous branches, we might mention Turtle river, Little Sitilla, Great Sitilla, Crooked river, and St. Mary's, which forms a part of the ſouthern boundary of the United States. The rivers in the middle and weſtern parts, belonging to the "Georgia Weſtern territory," will be noticed in another place. All theſe rivers contain a plentiful ſupply of various ſorts of fiſh, as rock, mullet, whiting, ſhad, trout, drum, baſs, cat fiſh, whiting, brim and ſturgeon; and the bays and lagoons afford oyſters, and other ſhell fiſh. The chief lake, or marſh, in this ſtate, is Ekanfanoka, called by ſome Ouaquaphenogaw, which is 300 miles in circumference. The eaſtern part of the ſtate, between the mountains and the ocean, and the rivers Savannah and St. Mary's, comprehending a tract of country more than 120 miles from N. to S., and from 50 to 80 E. and W., is level without a hill or ſtone. At the diſtance of about 40 or 50 miles from the ſea-board, or ſalt-marſh, the land gradually riſes to mountains. The vaſt chain of the Alleghany or Appalachian mountains terminates in Georgia, 60 miles S. of its northern boundary. From the baſe of this mountain ſpreads a widely extended plain, of the richeſt ſoil, and in a latitude and climate well adapted to the culture of moſt productions either of the ſouth of Europe or of the Eaſt Indies. In the low country, near the rice ſwamps, bilious complaints and fevers are very general during the months of July, Auguſt, and September; and at the approach of this ſickly ſeaſon, the rich planters, with their families, remove either to the ſea-iſlands or to a more elevated ſituation, for the benefit of the air. In the winter and ſpring, pleuriſies, peripneumonies, and other inflammatory diſorders, produced by colds, are common, and frequently fatal. The winters in Georgia, however, are mild and pleaſant; ſnow is ſeldom ſeen, nor is vegetation interrupted by ſevere froſts. In the hilly country, commencing about 50 miles in ſome parts, and in others about 100 miles from the ſea, the air is pure and ſalubrious, and the water good and abundant. From June to September the mercury in Fahrenheit's thermometer fluctuates from 76° to 90°; and in winter from 40° to 60°. The moſt prevailing winds are S.W. and E.; and in winter N.W. The E. wind is warmeſt in winter and cooleſt in ſummer; the S. wind in ſummer and autumn is damp, ſultry, and inſalubrious. In the S.E. parts of the ſtate, the trade winds impart their agitation to the atmoſphere, and ſerve to purify and meliorate it. In the lowlands rice is cultivated; and in the interior and hilly parts, wheat and Indian corn, and the other productions common to the northern ſtates, are the objects of agricultural attention. Rice is at preſent the ſtaple commodity of this ſtate; and the other chief articles of produce are tobacco, wheat and indigo. Georgia alſo yields cotton, ſilk, corn, potatoes, oranges, figs, olives, pomegranates, &c. The foreſts conſiſt of oak, hickory, mulberry, pine, cedar, &c. The whole coaſt is bordered with iſlands, of which the principal are Skidaway, Waſſaw, Oſſabaw, St. Catherines, Sapelo, Frederica, Jekyl, Cumberland, &c. Theſe iſlands are ſurrounded by navigable creeks, between which and the main land is a large extent of ſalt-marſh at a medium four or five miles broad, fronting the whole ſtate, and interſected with creeks, which admit a general inland navigation, between the iſlands and the main land, from the N.E. to the S.E. corners of the ſtate. The entrances of rivers flowing between theſe iſlands, form capacious harbours from three to eight miles broad; communicating with each other by parallel ſalt creeks. The iſlands in their natural ſtate are covered with pine, oak, hickory, live oak, and red cedar. The ſoil is grey, formed by a mixture of ſand and black mould; and a conſiderable part of it is very rich, and yields, by cultivation, good crops of indigo, corn, cotton, and potatoes. The ſoil of the main land, adjoining the marſhes and creeks, reſembles that of the iſlands; except that, which borders on the creeks and river that penetrate far into the interior of the country, and which furniſhes the valuable rice ſwamps. The ſoil between the rivers, at a greater diſtance, changes from a grey to red colour; and ſtill more remotely, into the mulatto kind, conſiſting of a black and red earth. This ſort of land is generally ſtrong, and yields large crops of wheat, tobacco, corn, &c. This ſoil is ſucceeded by another, nearly black, and very rich. This ſucceſſion of different ſoils is uniform and regular, intermixed with occaſional veins of different ſorts; and ſtretches, in the order above-mentioned, acroſs this ſtate nearly parallel with the ſea-coaſt, and extends through the ſeveral ſtates, nearly in the ſame direction, to the banks of Hudſon river. The culture of cotton is now ſo much an object of attention in this ſtate as to afford a reaſonable expectation, that the ſtates of South Carolina and Georgia may, in a few years, be able to raiſe more than 10 millions of pounds annually for exportation. With proper attention, moſt of the tropical fruits would flouriſh in this ſtate. The ſouth-weſtern part of this ſtate, and the adjoining parts of E. and W. Florida, will, it is conjectured, at ſome future period, become the vineyard of America. The chief articles of export are rice, tobacco, indigo, ſago, lumber, naval ſtores, leather, deer ſkins, ſnake root, myrtle and bees wax, corn, and live ſtock. The value, in ſterling money, of the exports of Georgia, in the year 1755, was 15,744*l.*; in 1772, 121,677*l.*; in 1791, value in dollars, 491,472; in 1792, 458,973; in 1793, 501,383; in 1794, 676,154; in 1796, 950,158; and in 1801, 1,854,951. In 1790, the tonnage employed in this ſtate was 28,540, and the number of American ſeamen was 11,225. In return for her exports, Georgia receives Weſt India goods, teas, wines, clothing, and dry goods of all kinds: from the northern ſtates, cheeſe, fiſh, potatoes, apples, cyder, and ſhoes. The imports and exports are principally to and from Savannah, which has a fine harbour, and is the chief emporium of the ſtate.

The diſpoſition and character of the inhabitants, collected from various parts of the world, are very much diverſified; they are charged with indolence, which is attributed partly to the relaxing heat of the climate, and partly to the want of motives, neceſſary for exerting induſtry; they are praiſed for their friendlineſs and hoſpitality to ſtrangers. Their diverſions are dancing, horſe-racing, cock-fighting, and chiefly hunting. They are reproached with an addictedneſs to gaming.

The different religious ſects of this ſtate are Baptiſts, Methodiſts, Preſbyterians, Epiſcopalians, Roman Catholics, Quakers, and Jews. The two firſt are the moſt numerous, and inhabit the upper part of the ſtate. The Epiſcopalians and Preſbyterians are about equal in number; and the Catholics and Jews have each of them one church. The civil conſtitution of Georgia was adopted and ratified by a convention of delegates from the people, on the 6th of May, 1789, and is formed upon a plan ſimilar to the federal conſtitution of the United States. All legiſlative power is veſted in two diſtinct branches, a ſenate and houſe of repreſentatives, both choſen by the people at large, and ſtyled the General Aſſembly. The members of the ſenate are choſen for the term of three years, and thoſe of the houſe of repreſentatives are choſen annually. The ſenate conſiſts of one member from each county, and the houſe of repreſentatives of thirty-four members. The executive power is veſted in the hands of a governor, who holds his office during two years. Freedom of the preſs and trial by jury ſhall remain inviolate, and all perſons ſhall be entitled to the writ of "habeas corpus." All perſons ſhall have the free exerciſe of their religion, without being obliged to contribute to the ſupport of any religious profeſſion but their own. In each county a ſuperior court is holden twice in every year, in which all cauſes, civil and criminal, ſhall be tried, thoſe excepted, which may be ſubject to the federal court, or ſuch as may by law be referred to inferior juriſdictions. The judges of the ſupreme court, and the attorney-general, ſhall have a ſalary eſtabliſhed by law; and hold their commiſſion for three years. In the adminiſtration of juſtice, this ſtate is divided into two diſtricts, called the upper and lower circuit; and there are only two judges appointed to ſit in the ſuperior court; each of theſe judges being appointed to try cauſes in each circuit. Beſides the ſuperior court, there is an inferior court, a court of common pleas eſtabliſhed in each county, which ſits twice in a year, with five judges, appointed by the legiſlators. The county courts have a juriſdiction of criminal cauſes, which can be tried only in the ſuperior court. Beſides theſe there are the ſheriff's court, and courts held by the juſtices of the peace, in every part of the ſtate. The literature of this ſtate, which is yet in its infancy, is gradually advancing towards higher degrees of improvement. For this purpoſe a college is inſtituted at Louiſville, with liberal endowments; and in ſubordination to this it is propopoſed to found academies in every county of the ſtate. This inſtitution is denominated the "Univerſity of Georgia." The funds for its ſupport conſiſt of about 50,000 acres of valuable land, together with nearly 6000*l.* ſterling in bonds, houſes, and town lots in Auguſta. Other property alſo, to the amount of 1000*l.*, has been ſet apart in each county for erecting and furniſhing their reſpective academies. The fund originally deſigned to ſupport the literary orphan ſchool, founded by the Rev. George Whitfield, a few miles S. of Savannah, conſiſt chiefly of rice plantations and negroes. On the death of the counteſs of Huntingdon, to whom Mr. Whitfield bequeathed this property as truſtee, the legiſlature, in the year 1792, paſſed a law, veſting it in thirteen commiſſioners, with power to carry Mr. Whitfield's original deſign into execution; and in compliment to the counteſs, the ſeminary is denominated "Huntingdon college."

The middle parts of this ſtate are inhabited by the Muſkogee or Creek Indians, the moſt numerous tribe of Indians within the United States. See Creeks.

The "Georgia Weſtern Territory" conſiſts of an extenſive tract of land, a principal part of which belongs to, and is inhabited by the Creek, Chactaw, Chickaſaw, and Cherokee nations of Indians. It is waſhed by the Miſſiſippi river on the weſt, and may be conſidered as extending eaſtward as far as the Appalachicola and Flint rivers. It is interſected by a great number of ſtreams, which run in every direction; the principal are the Yazoo, and Looſa Chitto, which diſcharge themſelves into the Miſſiſippi, Pearl, Paſcagoula, Mobille, Alibama, Tombeekkee, Eſcambia, and Chatta Hatcha, which fall into the gulf of Mexico; and the Tenneſſee Bend, with Chuccamaga river, which falls into it from the ſouth-eaſt, water its northern part. Twenty millions of acres of this territory was ſold in conſequence of an act of the legiſlature, paſſed in 1795, to certain companies; and the purchaſe money, amounting to 500,000 dollars, was paid into the ſtate treaſury. This land was afterwards ſold at an advanced price, by the original purchaſers, to various perſons, principally of the middle and eaſtern ſtates. This tranſaction produced a great degree of diſcontent; but the ferment has ſince ſubſided; and the termination of the diſpute has been a general ſatisfaction on the part of the purchaſers, that the diſcordant proceedings of the legiſlature cannot affect their title, which they conceive to be good againſt all claims on the part of Georgia. Morſe.

Georgia, *New*, or *South* Georgia, an iſland in the South Atlantic ocean, diſcovered by La Roche in 1675, ſeen by Mr. Guyot, in the ſhip Lion, in 1756, and more particularly deſcribed by captain Cook, who explored it with attention in 1775, deſcribed its extent and true poſition, and named it Georgia, in honour of his majeſty. It is ſituated between 53° 57′ and 54° 57′ S. lat., and between 38° 13′ and 35° 34′ W. long. It extends S. E. by E. and N. W. by W., and in that direction is 31 leagues long, and its greateſt breadth is about 10 leagues. It ſeems to abound with bays and harbours, eſpecially on the N.E. coaſt; but they are rendered inacceſſible for the greateſt part of the year by the vaſt quantity of ice; or, at leaſt, it muſt be dangerous lying in them, on account of the breaking up of the ice-cliffs, by which the coaſt is bounded, and which riſe up perpendicularly in maſſes of very conſiderable elevation. When theſe fall they float about in the ſea like detached iſlands, and in falling make a noiſe like that of a diſcharged cannon. The inner parts of the country exhibit an appearance no leſs ſavage and horrible than the coaſt. The rocks raiſed their lofty ſummits, till they were loſt in the clouds, and the vallies lay covered with everlaſting ſnow. The lands, or rather rocks, bordering on the ſea coaſt, were not covered with ſnow like the inland parts. The rocks ſeemed to contain iron. They are of blackiſh horizontal ſlate, probably approaching to hornblende. Not a tree was to be ſeen, nor a ſhrub even big enough to make a tooth-pick. The only vegetation that could be ſeen was that of a coarſe ſtrong-bladed graſs growing in tufts, wild burnet, and a plant like moſs, which ſprung from the rocks. Seals or ſea-bears were numerous, but ſmaller than thoſe at Staten Land. Several flocks of penguins of a large ſize were obſerved, and beſides theſe, the oceanic birds were albatroſſes, common gulls, and that ſort called by Cook Port Egmont hens, terns, ſhags, divers, the new white bird, and a ſmall bird like thoſe of the Cape of Good Hope, called yellow birds, which were found to be moſt delicious food. All the land birds that were ſeen conſiſted of a few ſmall larks; but our navigators found no quadrupeds. The dung of one was ſeen, ſuppoſed to have belonged to a fox or an animal of that kind. On the whole coaſt our voyagers obſerved neither a river nor a ſtream of freſh water. They thought it highly probable, that the country has no perennial ſprings; and that the interior parts, as being much elevated, never enjoy heat enough to melt the ſnow in ſuch quantities as to produce a river or ſtream of water. The coaſt alone receives warmth ſufficient to melt the ſnow, and this only on the N. E. ſide; for the other, beſides being expoſed to the cold ſouth winds, is in a great degree deprived of the ſun's rays by the uncommon height of the mountains. On the approach of our navigators to Georgia, they firſt diſcovered an iſland in S. lat. 54° and W. long. 38° 23′, which was called "Willis's iſland," which was a high rock of no great extent: eaſt of this, between it and the main, they obſerved another iſland, to which, on account of the number of birds they ſaw upon it, they gave the name of "Bird Iſland." This iſland is of larger extent than the former, lies cloſe to the N. E. point of the main land, which was called "Cape North." After having cleared the paſſage between theſe two iſlands, they purſued their coaſting voyage to "Cape Buller," and at length arrived at a bay, which they denominated "Poſſeſſion bay," ſituated in S. lat. 54° 5′. W. long. 37° 18′, 11 leagues E. of Cape North. The land in which this bay lies, was at firſt judged to be part of a great continent; but upon coaſting round the whole country, it was found to be an iſland, about 70 leagues in circuit. Between this bay and Cape Buller lies the "Bay of Iſles," ſo named on account of ſeveral ſmall iſles lying in and before it. The next projecting point was called "Cape Saunders," and beyond this is a large bay, which was named "Cumberland Bay." The next projecting land, which was an iſland appearing to be the extremity of the coaſt to the eaſt, was called "Cape Charlotte," and on the weſt ſide of it lay a bay, which was named the "Royal Bay," the W. point of it being called "Cape George." Theſe two capes are diſtant from each other ſix leagues. The iſland above mentioned, diſtant in the direction of S. by E. eight leagues from Cape Charlotte, was denominated "Cooper's Iſle," which is a rock of conſiderable height, about five miles in circuit, and one mile from the main. The coaſt between them forms a large bay, named "Sandwich Bay." At Cooper's Iſle the main coaſt takes a S. W. direction for the ſpace of four or five leagues to a point which Capt. Cook called Cape Diſappointment. Off this are three ſmall iſles, the ſouthernmoſt of which is green, low, and flat, and lying one league from the Cape. Advancing towards the S. W., land opened beyond the Cape, which proved to be an iſland, and was called "Pickerſgill iſland." In ſailing round this iſland, our navigators were almoſt continually involved in a thick miſt, which led them to apprehend that they might be ſurrounded with dangerous rocks.—Cook's Second Voyage, vol. ii.

Georgia, a townſhip of America, in the ſtate of Vermont and county of Franklin, containing 1068 inhabitants. It is ſituated on lake Champlain, oppoſite to the north end of South Hero iſland, and joins Milton on the ſouth and St. Albán's on the north. The river La Moille traverſes the S. E. corner of this townſhip.

Georgia, *Gulf of*, a large gulf of the North Pacific ocean, between the continent of North America and Quadra and Vancouver's iſland; about 120 miles in length from north to ſouth; the breadth varying from 6 to 20 miles. It contains ſeveral cluſters of iſlands, and branches off into a great number of canals, moſt or all which were examined by Capt. Vancouver and his officers.

GEORGIAN Planet, or Georgium *Sidus*, in *Aſtronomy*, the name given by Dr. Herſchel, the diſcoverer, to the ſeventh primary planet of the ſolar ſyſtem. It is now generally known, particularly on the continent, by the name of Uranus.

This planet was diſcovered by Dr. Herſchel on the 13th March, 1781. It is ſuppoſed that other aſtronomers have obſerved it, and inſerted it in their catalogues as a fixed ſtar. But Dr. Herſchel, when he firſt ſaw it, was ſtruck with its appearance, which ſeemed to differ from that of the neighbouring ſmall ſtars. He happened to be accidentally engaged in examining the ſmall ſtars near the feet of Gemini, and he obſerved one conſiderably larger than the reſt, but it not being quite ſo brilliant, he ſuſpected that it might be a comet; in conſequence of which he obſerved it with different magnifying powers, from 227, with which he diſcovered it, to 2010, and found that its apparent magnitude increaſed in proportion, contrary to what takes place in the fixed ſtars. He therefore meaſured its diſtance from ſome of the neighbouring fixed ſtars, and comparing its diſtance for ſeveral nights he found that it moved at the rate of about $2\frac{1}{4}''$ in an hour. Dr. Herſchel wrote immediately to the Royal Society, that other aſtronomers might join in obſerving it; upon which it was found and obſerved by Dr. Maſkelyne, who almoſt immediately declared that he ſuſpected it to be a planet; and on April 1, he wrote an account of this diſcovery to the aſtronomers at Paris, ſo that it was ſoon obſerved by all the aſtronomers in Europe. Mr. Lexell was then in England, and applied himſelf to compute the orbit upon the ſuppoſition that it was a comet; he therefore, according to the uſual manner in ſuch a caſe, ſuppoſed the orbit to be a parabola, and aſſumed ſeveral perihelion diſtances, 6, 8, 10, 11, 12, 14, 16, and 18 times the earth's diſtance from the ſun, and found that any perihelion diſtance between 14 and 18, would anſwer very well to the obſervations. Boſcovich printed a memoir on the ſubject, in which he ſhewed that there were four different parabolas in which a body might move, and yet the computed places would agree with the obſervations which had then been made. Other aſtronomers, however, found that a circular orbit, whoſe radius was about 18 times the diſtance of the ſun from the earth, would agree better with the obſervations; and confirmed Dr. Maſkelyne's opinion that it was a planet. Upon the ſuppoſition, therefore, of a circular orbit, M. de la Lande proceeded to inveſtigate its magnitude from the following obſervations. Mem. de l'Acad. Roy. des Sci. 1779.

Time of obſervation	April 25, 1781, at $9^h\ 47'$	July 31, 1781, at $15^h\ 33'$	Dec. 12, 1781, at $10^h\ 10'$
Right aſcenſion obſerved	$2^s\ 25^\circ\ 15'\ 27''$	$3^s\ 1^\circ\ 7'\ 49'$	$3^s\ 1^\circ\ 23'\ 31''$
North declination obſerved	23 35 34	23 40 25	23 42 47
Longitude	2 25 39 17	3 1 2 7	3 1 16 28
Latitude, north	11 36	12 24	14 54
Nutation in longitude	+ 10	+ 8	+ 7
Aberration in longitude	+ 19	+ 21	− 18
Sun's longitude from the mean equinox	1 5 58 53	4 9 7 13	8 21 21 50
Log. of the ſun's diſtance	0.003196	0.006272	9.992993

From theſe data, M. de la Lande calculated the elements of a circular orbit; but it having been found that the motion did not agree with any poſſible circle, it became neceſſary to calculate the elements of an elliptic orbit. When a ſufficient number of oppoſitions had been obſerved for this purpoſe, profeſſor Robiſon of Edinburgh undertook this inveſtigation, a full account of which is given in Edinb. Tranſ. vol. i. 1788. The obſervations on which this inveſtigation is founded are as follows:

True Time at Edinburgh.		Longitude.	N. lat.
Dec. 21, 1781,	17′ 44′ 33′	3ˢ 0° 52′ 11″	15′ 7″
26, 1782,	8 56 56	3 5 20 29	18 56
31, 1783,	0 46 24	3 9 50 52	22 10
Jan. 3, 1785,	17 28 56	3 14 23 2	25 40
8, 1786,	10 39 31	3 18 57 5	28 52

From which the following elements were obtained:

Mean diſtance		19.08247
Eccentricity		0.9006
Periodic time		83.359 years
Mean anomaly at the 5th oppoſition		4ˢ 0° 32′ 51″
Long. of aphelion	for epoch Dec. 31, 1783.	11 23 9 51
Long. of the node		2 12 46 14
Inclination of the orbit		0 46 25
Equation of the centre		5 26 56 6

The elements, as given by La Place, are as follows:

	Years.	Days.	Hours.	Min.	Seconds.
Sidereal revol.	84	29	0	0	0.0

Semi maj. axis or mean diſtance	19.183620
Proportion of eccentricity of ſemi maj. axis for beginning of 1750	0.046683
Secular variation (—indicates diminution)	—0.000026228

	Deg.	Min.	Sec.
Mean longitude at beginning of 1750	228	33	53.6
Long. of perihelion 1750	166	36	48.8
Sidereal and ſecular motion of perihelion	0	4	6.1
Inclination of orbit to ecliptic 1750	0	46	26.0
Secular variation of inclination of orbit to true ecliptic	0	0	3.0
Long. of aſcending node on ecliptic 1750	72	37	52.8
Sidereal and ſecular motion of node on true ecliptic	0	57	16.2

The diameter of this planet is about 4½ times that of the earth, or 35,112 Engliſh miles nearly. When ſeen from the earth, its apparent diameter, or the angle which it ſubtends at the eye, is 3″.5, and its mean diameter, as ſeen from the ſun, is 4″. As the diſtance of the Georgian from the ſun is twice as great as that of Saturn, it can ſcarcely be diſtinguiſhed by the naked eye. When the ſky however is ſerene, it appears like a fixed ſtar of the ſixth magnitude with a blueiſh white light, and a brilliancy between that of Venus and the Moon; but with a power of 200 or 300, its diſc is viſible and well defined. Its arc of retrogradation is 3° 36′, and the duration of its retrograde motion 151 days.

This planet is accompanied by ſix ſatellites, all of them diſcovered likewiſe by Dr. Herſchel. The two firſt, which he ſaw for the firſt time in the month of Jan. 1787, proved afterwards to be the ſecond and fourth, the others were diſcovered ſome few years later.

The moſt remarkable circumſtance attending theſe ſatellites is, that they move in a retrograde direction, and revolve in orbits nearly perpendicular to the ecliptic, contrary to the analogy of the other ſatellites, which phenomenon is extremely diſcouraging when we attempt to form any hypotheſes relative to the original cauſe of the planetary motions.

According to La Place, if we take for unity the ſemidiameter of the planet, equal to 1″.9, ſuppoſed ſeen at the mean diſtance of the planet from the ſun, the diſtance of its ſatellites will be as follows:

I.	13.120
II.	17.022
III.	19.845
IV.	22.752
V.	45.507
VI.	91.008

And the duration of their ſidereal revolutions

	D.	Days.	hrs.	min.	ſec.
I.	5.8926	5	21	25	20
II.	8.7068	8	16	57	47
III.	10.9611	10	23	2	47
IV.	13.4559	13	10	56	29
V.	38.0750	38	1	48	0
VI.	107.6944	107	16	39	56

La Place conceives that the firſt five ſatellites of the Georgian may be retained in their orbits by the action of its equator, and the ſixth by the action of the interior ſatellites; hence he concludes that the planet revolves about an axis very little inclined to the ecliptic, and that the time of its diurnal rotation cannot be much leſs than that of Jupiter and Saturn.

Uſe of the Tables.—The general conſtruction of this kind of tables will be explained under Planet. The manner of calculating the mean longitude of the planet is as follows. Vince's Aſtronomy, vol. iii.

From Table I. take out the mean longitude, the aphelion, and node, together with the arguments II., III., IV., V., VI., VII., VIII., and place them in an horizontal line. But if the given year be not found in that table, take the neareſt year preceding the given year as an epoch, and take out as before.

Under which, from Table II. place the mean motion in longitude of the aphelion and node, with the arguments anſwering to the number of years elapſed ſince the epoch, to the given year.

Under theſe write down (Table III.) the mean motions of the ſame, for the given month.

Under theſe write down (Table IV.) the mean motions of the ſame, for the given day of the month.

Under theſe write down (Table V.) the mean motions of the ſame, for hours and minutes.

Add together the numbers in the ſeveral columns, rejecting twelve ſigns, or any multiples thereof, if they occur; and in the arguments, rejecting 10,000 in the arguments IV., VI., and 1000 in the arguments II., III., V., VII., VIII., or any multiples thereof, and you get the mean longitude, the aphelion, and node, and the arguments for the given time.

From the mean longitude of the Georgian ſubtract the longitude of the aphelion, and you have argument I., or mean anomaly.

With argument I. take out the equation of the orbit in Table VI., together with the ſecular variation, with their proper ſigns, except the time be *before* 1780, in which caſe the ſecular variation is to be taken out with a contrary ſign, making a proportion for the minutes and ſeconds of the argument, and you firſt get the equation; and doing the ſame for the ſecular variation, you get the ſecular variation; then ſay, 100 : the number of years from 1780 to the given time

: : ſecular variation above found : ſecular variation required. *Before* 1780 the ſecular variation muſt be taken with a ſign contrary to that found in the table. With argument II. take out the equation in Table VII., making a proportion in this and in the following equations, for the intermediate numbers of the arguments. With argument III., take out the equation in Table VIII. With argument IV. take out the equation in Table IX. With argument V. take out the equation in Table X. With argument VI. take out the equation in Table XI. With argument VII. take out the equation in Table XII. With argument VIII. take out the equation in Table XIII. Take the ſum of all theſe equations, regard being had to the ſigns of the firſt equation, and of the ſecular variation, the ſigns of the others being poſitive; and from it ſubtract 7′ 20″, and you get the value of theſe eight equations; and this applied with its proper ſign to the mean longitude already found gives the longitude of the Georgian in his orbit.

From the longitude thus found, ſubtract the longitude of the node, and you have argument IX.

With argument IX. enter Table XVII. and take out the reduction to the ecliptic, with its proper ſign, making a proportion for the minutes and ſeconds of the argument: and this applied to the longitude of the Georgian in his orbit, gives his true heliocentric longitude on the ecliptic, reckoned from the mean equinox.

With argument IX. enter Table XVI., and take out the latitude, making a proportion for the minutes and ſeconds of the argument, and you have the true heliocentric latitude of the planet.

With the mean anomaly enter Table XIV., and take out the radius vector, and correct it by the following Table XV. and you have the true diſtance of the planet from the ſun, that of the earth being unity.

Example.—To find the heliocentric Latitude and Longitude of the Georgian, on Nov. 26, 1789, at 16^h 14′, mean Time at Greenwich.

Sum of equations	—	3	21	45.5

This is the true heliocentric longitude from the *mean* equinox; and if we want it from the *true* equinox, we muſt apply the equation of the equinoxes.

In this operation the firſt five lines are taken out immediately from the tables, and the ſums of all the columns give the mean longitude of the aphelion, the node, and the arguments for the given time. Argument I. is immediately found according to the rule, the equation to which is thus found. The equation (Table VI.) for $4^s 22°$ is $-3° 26' 59''.6$, and the variation or 60′ is 4′ 31″.1; hence 60′ : 54′ 15″ : : 4′ 31″.1 : 4′ 5″.1, which (as the equation is decreaſing) ſubtracted from $-3° 26' 59''.6$ gives $-3° 22' 54''.5$, the equation required. And to find the ſecular variation, that variation is + 7″.44 for 4^s 22°, and it decreaſes 0″.16 for 60′; hence 60′ : 54′ 15″ : : 0″.16 : 0″.15, which taken from + 7″.44 leaves + 7″.29, the ſecular variation correſponding to the given argument. Now this ſecular variation is reckoned from 1780, and from thence to November 26, 1789, there has elapſed 9.9 years; hence, 100 : 9.9 : : + 7″.29 : + 0″.7 the ſecular variation for 9.9 years. With argument II, 638, take the equation from Table VII. Now the equation for 630 is 4″.7, and it changes 0″.7 for 10; hence 10 : 8 : : 0″.7 : 0″.6, which as the equation

tion decreaſes, ſubtracted from $4''.7$ leaves $4''.1$, the equation required. By proceeding thus to argument VIII. we get all the equations, and by taking the difference of the poſitive and negative parts, we get $3^\circ\,21'\,45''.5$ for the value of the firſt eight equations; which applied to $4^s\,10^\circ\,6'\,11''.4$ gives $4^s\,6^\circ\,47'\,25''.9$ the longitude of the Georgian in his orbit. From this longitude ſubtract $2^s\,12'\,48'\,19''$ the longitude of the node, and we get $1^s\,23^\circ\,56'\,7''$, which is argument IX.; with which enter Table XVII. and take out the reduction, which is $-\,8''.9$, and this applied to $4^s\,6^\circ\,44'\,25''.9$ gives $4^s\,6^\circ\,44'\,17''$, the heliocentric longitude of the Georgian on the ecliptic from the mean equinox. Alſo with argument IX. enter Table XVI. and take out the latitude. Now for $1^s\,23^\circ$ the latitude is $36'\,57''$, and it increaſes $28''.8$ for $60'$; hence $60' : 56''.7 :: 28''.8 : 26''.9$, which added to $36'\,57''$ gives $37'\,23''.9$, the heliocentric latitude of the Georgian.

Georgian *Bible*. See Bible.

Georgian *Monks* and *Nuns*, are religious of Georgia, in Aſia, who follow the rule of St. Baſil.

GEORGIANA, in *Geography*, a name originally given to a tract of country in the province of Maine, in North America.

GEORGIC, ſomething that relates to the culture or tilling of the ground.

The word is borrowed from the Latin *georgicus*; and that of the Greek γεωργικος, of γη, *terra*, *earth*; and εργαζομαι, *opero*, *I work*, *labour*, of εργον, *opus*, *work*.

The Georgics of Virgil are four books compoſed by that poet on the ſubject of agriculture.

GEORGIEV, in *Geography*, a town of Ruſſia, in the government of Caucaſus; 32 miles W.N.W. of Ekaterinograd.

GEORGINA, in *Botany*, ſo named by Willdenow in honour of Profeſſor Georgi; ſee Georgia and Dahlia. We have retained the latter name, given by Cavanilles, for this fine genus, becauſe it has been univerſally adopted in this country, where the various ſpecies ſeem likely to come into general cultivation. A change in ſuch a caſe not only ſhocks vulgar prejudices and illiterate indolence, but is materially inconvenient.

GEORGITZ, in *Geography*, a town of Walachia; 18 miles N.N.E. of Buchareſt.

GEOSCOPY, a kind of knowledge of the nature and qualities of the ground or ſoil, gained by viewing and conſidering it.

The word is formed of the Greek γη, *earth*, and σκοπεω, *I ſee*, *view*.

Geoſcopy is only conjectural; but its conjectures are very well grounded.

GEOSTATICS. See Statics.

GEPHRUS, in *Ancient Geography*, a town of Syria, according to Polybius, which ſurrendered to Antiochus.

GEPHYRA, a town of Syria, in the Seleucide territory, according to Ptolemy; 22 miles from Antioch.—Alſo, a town of Africa, according to Polybius, in the vicinity of Carthage, ſituated on the bank of the river Macros.

GEPHYRÆI, a people mentioned by Herodotus, who were probably natives of Gephyra in Syria; they migrated with Cadmus into Bœotia, where they occupied the territory of Tanagra; but on being driven from thence by the Bœotians, they took refuge in Attica.

GEPIDÆ, a people of Scandinavian origin, of whoſe Gothic extraction Jornandes gives the following account: the Goths, leaving Scandinavia under the conduct of king Barith, put to ſea with only three ſhips. One of theſe, ſailing ſlower than the other two, was thence called "Gepanta," ſignifying in the Gothic tongue ſlow: and hence the name of Gepantæ and Gepidæ, which was at firſt given them as an appellation of reproach. Procopius likewiſe expreſsly affirms, that the Goths, the Vandals, the Viſigoths, and the Gepidæ, were originally the ſame nation; that they had the ſame cuſtoms, manners, religion, and language; and that they only differed in names, borrowed, perhaps, he ſays, from their different leaders. They entered Scythia with the other Goths, and ſettled in the neighbourhood of the Tanais and Palus Mæotis. There they continued till the reign of Arcadius and Honorius, when, their number being greatly increaſed, they approached the Danube, and having afterwards croſſed that river, dwelt in the neighbourhood of Singidunum and Sirmium, about the year 400, where they ſtill were when Procopius wrote his hiſtory. They had kings of their own, and formed a diſtinct nation, ſeparate from both the Oſtrogoths and Viſigoths; but perhaps not one from the Lombards, who were afterwards maſters of Italy. Under their king Faſtida, they gained a complete victory over the Burgundians about the year 245; and Faſtida, elated with this victory, laid waſte the territories of the Goths, whoſe ſovereign Oſtrogotha refuſed to grant them land for their accommodation. Being defeated by the Goths, they afterwards joined them, and other northern nations, in the irruption which they made with their united forces into the empire in the ſecond year of the reign of Claudius; but they were defeated by that prince with great ſlaughter. In the year 279 Probus granted them lands in Thrace, upon promiſe of their quiet ſubmiſſion; but whilſt the emperor was engaged in war in the Eaſt, they ſeized the neighbouring provinces, and were cut off in great numbers by Probus after his return. St. Jerom mentions the Gepidæ among the other nations of Barbarians, who, in 407, invaded Gaul, and overran its provinces. Attila afterwards ſubdued them, and in 451 they ſerved under him in his famous expedition into Gaul. Upon the death of Attila, the Gepidæ ſhook off the yoke under the conduct of their king Ardaric, who obtained a complete victory over the Hunns; in conſequence of which the Gepidæ not only recovered their ancient liberty, but gained poſſeſſion of ancient Dacia, N. of the Danube, from which they had been driven by Attila. They then entered into an alliance with the Romans, who agreed to pay them an annual penſion. Having obtained poſſeſſion of part of Illyricum, with the city of Sirmium, they continued quiet till the year 537, when, on account of their joining the Heruli, and plundering the neighbouring provinces, they were compelled by Juſtinian, after ſeveral encounters, to abandon Illyricum, and to content themſelves with Dacia beyond the Danube. In the year 550, a quarrel aroſe between the Gepidæ and the Lombards; but the latter, having obtained a reinforcement from Juſtinian, attacked the former, and gave them a total overthrow. This defeat was followed by a peace between the two nations, which was brought about by the mediation of Juſtinian. The peace, however, was of ſhort duration. Under their reſpective ſovereigns, *viz.* Cunimandus, king of the Gepidæ, and Alboinus, king of the Lombards, they commenced mutual hoſtilities; and determined to abide by the iſſue of a ſingle battle. The conteſt was very ſevere, and remained for ſome time very doubtful; but at laſt, the Gepidæ were put to flight, and purſued by the victorious Lombards with ſuch ſlaughter, that ſcarcely one was left alive of the numerous multitude that had engaged. After this victory the Lombards ſeized the whole of Dacia, and obliged the Gepidæ either to ſubmit, or to retire. Henceforth they had no king of their own, but lived in ſubjection either to the Lombards, who were maſters of their country, or to the princes of the neighbouring nations, eſpecially the Hunns, ſettled in Pannonia. Thus their kingdom terminated in the year 572, Juſtin, the ſucceſſor of Juſtinian, being then emperor.

GEPPE, in *Geography*, a river of Germany, which riſes near Neuſtat in the county of Mark, and runs into the Bigge, two miles N. of Olpe, in Weſtphalia.

GER, Cape. See Aguer.

GERA, a town of Saxony, in the Vogtland, on the Elſter; 30 miles S.S.W. of Leipſic. N. lat. 50° 49′. E. long. 12° 6′.—Alſo, a town of Italy, in the department of the Upper Po.—Alſo, a river of Germany, which runs into the Unſtrull, ſix miles N. of Erfurt.

Gera, in *Ancient Geography*, a town of Arabia. Ptolemy.

GERÆA, a town of Luſitania. Ptolemy.

GERÆSTIUM, a country of the Peloponneſus, in Arcadia.

GERÆSTUS, a town and port of the iſland of Eubœa, upon the S.W. coaſt, about 15 miles from Caryſtus; now Gereſto.

GERALFINGEN, in *Geography*, a town of Switzerland; four miles S.E. of Soleure.

GERANDRUM, in *Ancient Geography*, a town of the iſland of Cyprus.

GERANGER, in *Geography*, a town of Norway, in the dioceſe of Drontheim; 22 miles S.S.W. of Romſdal.

GERANIA, in *Botany*, the 73d natural order in Juſſieu's ſyſtem, or the 13th of his 13th claſs. The following is his definition of this, one of his moſt important and extenſive claſſes. Cotyledons two. Petals many. Stamens inſerted below the germen.—The Calyx is of one or many leaves, very rarely deficient. Petals hypogynous, or inſerted below the piſtil, definite in number, very rarely indefinite, for the moſt part diſtinct, but ſometimes connected at the baſe, into a ſort of falſe monopetalous corolla; they are rarely wanting. Stamens inſerted below the piſtil, definite or indefinite, the filaments often diſtinct, ſometimes united all together into one tube, more rarely collected into ſeveral bundles; anthers diſtinct, or united only in *Viola* and *Impatiens* (called *Balſamina* by Juſſieu). Germen ſuperior, in many ſimple, in ſome multiplied; ſtyle ſingle, or multiplied, or deficient; ſtigma one, or ſeveral. Fruit ſuperior, ſometimes ſimple, of one or many cells; ſometimes, but more rarely, multiplied, each pericarp of one cell.

The order of *Gerania* is thus defined by Juſſieu. *Calyx* ſimple, either of five leaves, or of one deeply five-cleft, permanent. *Petals* five. *Stamens* definite, their filaments united at the baſe, ſometimes all fertile, ſometimes part of them abortive. *Germen* ſimple; ſtyle one; ſtigmas five, oblong. *Fruit* either of five cells, or of five capſules, each cell or capſule containing one or two ſeeds. *Corculum* without a periſperm, (or albumen). *Stem* either ſomewhat ſhrubby, or herbaceous. *Leaves* with ſtipulas, oppoſite or alternate. *Flowers*, in the former caſe, oppoſite to each leaf; in the latter, axillary.

Juſſieu enumerates only two genera as properly belonging to this order, *Geranium*, which includes *Erodium* and *Pelargonium* juſtly ſeparated from that genus by the late M. L'Heritier; ſee Erodium: and *Monſonia*, which is but too nearly akin to *Geranium*. He ſubjoins three genera as related to this order; *Tropæolum*, whoſe affinity is very obſcure; *Impatiens* (his *Balſamina*), which is perhaps ſtill leſs akin to it; and *Oxalis*, which laſt we would rather refer to the *Rutaceæ*, an order which Juſſieu ſeems but imperfectly to have ſtudied. He indeed, like Linnæus, hints ſome relationſhip between *Oxalis* and *Tribulus* or *Zygophyllum*, both which laſt he ſtations in the firſt ſection of his *Rutaceæ*; but we preſume to think they are there miſplaced, and that *Oxalis* is not ſo much allied to them as to the real *Rutaceæ*, ſo many of which are found in New Holland. In all ſuch doubtful caſes however, which form the difficulty and the pedantry of the ſtudy of natural orders, and in which our chief guide being conjecture, humility and candour are moſt becoming, we merely aim at collecting obſervations. The unnatural combinations complained of in a ſyſtem profeſſedly artificial, cannot be half ſo hurtful as error maſked in authority in the details of a pretended natural one. The doubts and hints of the excellent Juſſieu are in themſelves inſtructive, but how few are content like him to confeſs their doubts! He has at length acquired a pupil worthy of himſelf in this country, Mr. R. Brown, whoſe opportunities of obſervation, among the paradoxical novelties of New Holland, have given ample ſcope to his intelligence and aſſiduity.

Gerania, in *Ancient Geography*, a town of Thrace.—Alſo, a town of Phrygia.—Alſo, an ancient town of the Peloponneſus, in Laconia, on the confines of Meſſenia.—Alſo, a mountain of Greece, in the territory of Megaris, towards the iſthmus of the Peloponneſus.

GERA'NIS, or Geranium, in *Surgery*, a bandage formerly applied to fractured collar-bones, and diſlocated ſhoulders. The word is derived from γερανος, a *crane*, becauſe the ſhape of the bandage was thought to reſemble an extended crane.

GERANITES, γερανος, *a crane*, in *Natural Hiſtory*, a name given by ſome authors to ſuch pieces of agate, or any other of the ſemi-pellucid gems, as have round ſpots in them, reſembling in colour the eye of a crane.

GERANIUM, in *Botany*, γερανιον of the ancient Greeks, admirably named from γερανος, a *crane*, the germen and ſtyle reſembling the head and beak of that bird. Crane's-bill.—Linn. Gen. 350. Schreb. 458. Willd. Sp. Pl. v. 3. 696. L'Herit. in Ait. Hort. Kew. v. 2. 432. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 729. Juſſ. 268. Lamarck Illuſtr. t. 573. f. 1. Gærtn. t. 79, pratenſe. Claſs and order, *Monadelphia Decandria*. Nat. Ord. *Gruinales*, Linn. *Gerania*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of five ovate, acute, concave, permanent leaves. *Cor.* regular, of five large, obovate or obcordate, equal, ſpreading petals. Nectary five glands at the baſe of the germen, alternate with the petals. *Stam.* Filaments 10, awl-ſhaped, recurved, united at the baſe into a ſmall cup, five alternate ones longeſt, all ſhorter than the petals; anthers oblong, verſatile, five of them occaſionally abortive. *Piſt.* Germen ſuperior, with five furrows, beaked; ſtyle central, awl-ſhaped, longer than the ſtamens, permanent; ſtigmas five, oblong, reflexed. *Peric.* Capſules five, aggregate, membranous, globoſe, lateral, ſeparating at their inſide, each attached upwards to a long, linear, flat, pointed, rigid, ſmooth awn, at length elaſtically recurved, adhering by its point to the ſummit of the ſtyle. *Seeds* ſolitary, lateral, roundiſh, their ſurface ſmooth or dotted.

Eſſ. Ch. Calyx of five leaves. Petals five. Nectariferous glands five. Fruit beaked, of five aggregate capſules, each tipped with a long, recurved, naked awn.

Obſ. This genus, as above defined, contains only the *Gerania columbina* of Linnæus, or what are commonly called European Geraniums, or Crane's-bills, bearing but one or two flowers on a ſtalk. (See Erodium.) Thus it is adopted by Willdenow, who has 39 ſpecies, 13 of which are natives of Britain. They are tolerably naturally diſtributed into three ſections.

* Flower-ſtalks ſingle-flowered; 4 ſpecies.

G. *ſanguineum*, Engl. Bot. t. 272, a handſome inhabitant of rocky woods and abrupt gravelly ground, is an example of this ſection, though the late Mr. Davall once found in Switzerland an occaſionally two-flowered variety. See Fl. Brit. 739. A variety found on the Lancaſhire coaſt, of humble depreſſed growth, with white red-veined petals, is frequent in gardens.

G. *ſibiricum*, Jacq. Hort. Vind. v. 1. t. 19, an inconſpicuous ſpecies, is, we believe, conſtantly ſingle-flowered.

** Flower-ſtalks two-flowered. Root perennial, 24 ſpecies. Moſt of the Crane's-bills uſually cultivated for ornament are of this diviſion, as

G. *anemonifolium* of L'Heritier. Curt. Mag. t. 206. This ſhowy ſpecies, diſcovered by Mr. Maſſon in Madeira, was, as Mr. Curtis records, long known in our gardens by the name *lævigatum*, admirably expreſſive of its ſmoothneſs, and the French botaniſt changed it for the worſe. We could have no redreſs, as the original name had not been printed. It is a hardy greenhouſe plant, throwing out, from its ſhort knotty *ſtem*, a profuſion of ſpreading, long-ſtalked, ſhining, palmate, prinnatifid *leaves*, and many ſpreading, leafy *branches*, forked upwards. The *flowers* are large, of a fine crimſon, broader than a half-crown.

G. *macrorrhizum*, Linn. Sp. Pl. 953. Jacq. Ic. Rar. t. 134, native of Italy, is a very common hardy perennial in our gardens, remarkable for the roundneſs of its red petals, and the ſtrong, but aromatic, cedar-like, ſcent of its herbage. The plant is of humble growth, with a ſhort knotty *ſtem*, like the laſt. *Leaves* ſoft and downy.

G. *phæum*, Linn. Sp. Pl. 953. Engl. Bot. t. 322; and

G. *fuſcum*, Linn. Mant. 97, two ſpecies very nearly akin, are remarkable for the dark brown colour of their *flowers*; as G. *reflexum*, ibid. 257. Cavan Diſſ. t. 81. f. 1, is for its reflexed *petals*, and G. *lividum*, L'Herit. Geran. t. 39, firſt well determined by Haller at his No. 935, though he was not for ſome time attended to, for its flat, round, ſerrated *petals*, of a pale livid dove-colour. Theſe four laſt are often ſeen in gardens about London.

G. *nodoſum*, Linn. Sp. Pl. 953. Engl. Bot. t. 1091, is the moſt rare Britiſh ſpecies, and ſcarcely found elſewhere but on the mountains of Provence and Dauphiny, in ſhady places.

G. *ſtriatum*, Linn. Sp. Pl. 953. Curt. Mag. t. 55, a native of Italy, very hardy with us, is generally admired for its delicately pencilled bloſſoms.

G. *angulatum*, Curt. Mag. t. 203, now frequent in gardens about London, but from what country imported is not known, was firſt aſcertained as a diſtinct ſpecies by the late Mr. Curtis. Its *flowers* are prettily veined with reddiſh purple on a pale ground.

G. *pratenſe*, Linn. Sp. Pl. 954. Engl. Bot. t. 404, a very handſome blue-flowered ſpecies, common in paſtures in the north, is extremely remarkable, and almoſt ſingular in this natural order, for having ſometimes double flowers, in which ſtate it was found near Athol houſe, Scotland, by lady Charlotte Murray in 1793. It is often ſeen with white petals.

G. *argenteum*, Linn. Sp. Pl. 954. Curt. Mag. t. 504, a native of Mount Baldus, was introduced into England by the indefatigable and intelligent Mr. Lodlige, whoſe zeal and liberality as a cultivator are above all praiſe. Its *leaves* are beautifully ſilvery, the plant dwarf, but the *flowers* peculiarly large, bluſh-coloured, veined with red.

G. *pyrenaicum*, Linn. Mant. 97. Sm. Fl. Brit. 735. Engl. Bot. t. 405. Curt. Lond. faſc. 3. t. 42, common about London and Edinburgh, has not been well underſtood, even by Mr. Curtis, who undertook to illuſtrate it. Linnæus originally confounded it with *molle* hereafter mentioned, from which its even capſules, perennial root, and greater magnitude, keep it very diſtinct.

*** Flower-ſtalks two-flowered. Root annual; 11 ſpecies.

G. *bohemicum*, Linn. Sp. Pl. 955, placed firſt in this ſection, well drawn in Dillenius's Hort. Elth. t. 133. f. 160, is remarkable for its very black hairy ſeed-veſſels, and viſcid herbage.

G. *molle*, Engl. Bot. t. 778, ought to follow immediately; with *diſſectum*, t. 753; *rotundifolium*, t. 157; and *puſillum*, t. 385. Theſe four, long confounded, and ſcarcely underſtood by any botaniſt, are beautifully diſtinguiſhed, in every degree of luxuriance, by their *capſules*, which are corrugated and naked in the firſt; more ſlightly corrugated, but hairy, with reticulated ſeeds, in the ſecond; carinated, even and hairy, with reticulated ſeeds in the third, with much more entire leaves; even and hairy, with ſmooth ſeeds, in the laſt, whoſe hairs on the part in queſtion are, moreover, cloſe-preſſed, not ſpreading as in the preceding. We were obliged to the late Mr. Davall for firſt calling our attention to this part, and thus leading to one of the moſt ſatisfactory diſcoveries in European botany.

G. *carolinianum*, Linn. Sp. Pl. 956. Jacq. Hort. Schonbr. v. 2. t. 140, where it is miſtaken for a new plant, and called *lanuginoſum*! follows theſe; with *columbinum*, Engl. Bot. t. 259. To which ſhould ſucceed *lucidum*, t. 75; then, if it be a diſtinct ſpecies, which we much doubt, *purpureum* of Willdenow, n. 39, and Villars Dauph. t. 40; and finally *robertianum*, Engl. Bot. t. 1486. Curt. Lond. faſc. 1. t. 52. This *purpureum* has been a weed in Chelſea garden ever ſince the time of Miller, but though Ray mentions it as a native, ſee Fl. Brit. 732, G. *robertianum* β, we never gathered it elſewhere.

Geranium, in *Gardening*, comprehends plants of the herbaceous perennial kind, of which the ſpecies cultivated are, the dark flowered crane's-bill (G. phœum); the knotty crane's-bill (G. nodoſum); the ſtreaked crane's-bill (G. ſtriatum); the Siberian crane's-bill (G. ſibiricum); the bloody crane's-bill (G. ſanguineum); and the long-rooted crane's-bill (G. macrorhizum); but there are other ſorts that may be cultivated with propriety.

The fifth ſpecies has ſeveral varieties, as with ſhort ſpreading ſtems and ſmall leaves and flowers; with large leaves deeply divided, and with variegated or ſtriped flowers.

Method of Culture.—Each of theſe ſpecies of plants is capable of being increaſed in two ways, either by ſowing the ſeeds or parting the roots. Where the firſt method is adopted, the ſeeds ſhould be ſown in the autumn as ſoon as they have become perfectly ripened, either in pots or a ſhady border in the garden ground where the mould is light and fine. As ſoon as the plants have acquired a few inches in growth, they ſhould be pricked out into other pots, or beds of ſimilar earth, at the diſtance of five or ſix inches in the latter caſe; but where this cannot be done, they may be permitted to remain until the following autumn or ſpring, and be then put out into other pots or borders, where they are to continue, being occaſionally watered in a moderate manner.

In caſes where the parting of the roots is practiſed, care ſhould be taken not to divide them too much; planting them out in the early part of the autumn, either in pots or where they are to continue.

Moſt of theſe ſorts of plants are of rather hardy growth, and ſucceed in moſt kinds of ground, demanding but little attention in their cultivation, beſide that of their being kept clear from all ſorts of weeds and rubbiſh.

All of them are capable of affording variety in the borders, clumps, and other parts of pleaſure gardens, and the potted kinds produce a fine effect in ſituations about the houſes in mixture with thoſe of other ſorts.

GERANOS, Γερανος, in *Antiquity*, a remarkable dance performed in the feſtival called *Delia*.

GERANZAGO, in *Geography*, a town of Italy; nine miles E.N.E. of Pavia.

GERAR, or Gerasar, or *Gezarah*, in *Scripture Geography*, a city of the Philiſtines, S. of Judah. The Abimelechs were kings of this city in the time of Abraham and Iſaac. At this time it was the boundary of the Canaanites, ſituated on the river Bezor, about ſeven miles S.W. of Debir, and ſix E. of Beerſheba. It afterwards belonged to the tribe of Simeon. Gerar extended far into Arabia Petræa, being 25 miles from Eleutheropolis, beyond Daroma, the ſouth of Gudah. Moſes ſays, that it lay between Kadeſh and Shur; and he mentions the brook or valley of Gerar. (Gen. xxvi. 26.) Sozomen ſpeaks of a little town, called *Gera*, 50 furlongs from Peluſium.

Gerar is confounded with Beerſheba, Aſhkelon, Alluſh, and Arad.

GERARD, Herb. in *Botany*. See Ægopodium.

Gerard, in *Biography*, who flouriſhed about the end of the eleventh, and commencement of the twelfth centuries, founder and firſt grand-maſter of the order of St. John of Jeruſalem, was a native of the iſle of Martigues, on the coaſt of Provence. While Jeruſalem was in the hands of the Saracens, ſome Neapolitan merchants obtained permiſſion from the ſultan of Egypt and Syria, in the year 1050, to erect a Benedictine monaſtery, near the holy ſepulchre, for the convenience of the pilgrims who came to viſit it. Among others Gerard came to pay his devotions at the holy city, where he obtained a high character for piety and prudence. The monaſtery ſoon became rich, and in conformity with the ſpirit of the times the abbot built, with the wealth poured in by the rich devotees, an hoſpital for the reception of the poorer claſs, and with proper accommodation for the aged and the ſick. The management of this he gave to Gerard. A part of the building was ſeparated for a chapel dedicated to St. John, becauſe it was ſaid that Zacharias, the father of St. John, had lived on the ſpot where it was built. Gerard, after the conqueſt of Jeruſalem, by Godfrey of Bouillon, projected the foundation of a new religious order, in which the eccleſiaſtical and military character ſhould be blended. He began, about the year 1100, to carry his deſign into execution, when numbers of perſons aſſociated with him under the denomination of the "Hoſpitalers of St. John of Jeruſalem," who, beſides the three uſual vows of chaſtity, poverty, and obedience, took a particular vow to devote themſelves to the relief of all Chriſtians in diſtreſs. The order was recognized, and privileges granted to it by pope Paſcal II. Gerard was the firſt grand-maſter, and ſuch was the commencement of that order which has been ſo frequently and ſo long celebrated in hiſtory: the members of it were firſt denominated knights of Rhodes, and afterwards knights of Malta. Moreri.

Gerard, John, a learned German Lutheran divine, was born at Jena in the year 1621, where he was educated, but at the age of nineteen he went to Altdorf for the ſake of greater progreſs in the oriental languages, and in 1643 the univerſity conferred on him the degree of M.A. He was appointed profeſſor of philoſophy at Wittemberg in 1646, and in 1652 he was nominated profeſſor of hiſtory at Jena. After this he was created doctor of divinity, and made profeſſor in that faculty, having devoted much of his time to biblical and theological learning. He was likewiſe appointed rector of the univerſity of Jena. He died in the year 1688, and left behind him, as memorials of his great learning, many works of very deep erudition: among theſe were "Harmonia Linguarum Orientalium;" "Diſputationum theologicarum Faſciculus;" "De Eccleſiæ Copticæ Ortu, Progreſſu, et Doctrina."

Gerard, Alexander, was born at Garioch, in the county of Aberdeen, in the year 1728: he was educated at the grammar-ſchool at Aberdeen, and ſo great was his progreſs, that he was entered a ſtudent in Mariſchal college when he was but twelve years of age. Here he devoted his firſt four years to the ſtudy of Greek, Latin, the mathematics, and philoſophy, and was, at the cloſe of the courſe, admitted to the degree of M.A. He now commenced his theological ſtudies, which he proſecuted at the univerſities of Aberdeen and Edinburgh. Immediately on the completion of his twentieth year, he was licenſed to preach in the church of Scotland, and in the year 1750 was choſen aſſiſtant to Mr. David Fordyce, profeſſor of philoſophy in the Mariſchal college at Aberdeen, and in two years afterwards, upon the death of the profeſſor, Gerard was appointed to ſucceed him. Here, after a ſhort time, the department aſſigned to Mr. Gerard was confined to moral philoſophy and logic, the duties of which he diſcharged with conſcientious and unwearied diligence, and with equal ſucceſs and reputation. He was a member of a literary ſociety at Aberdeen, which met very regularly every fortnight during the winter, when the members communicated their ſentiments with the utmoſt freedom, and received mutual improvement from their literary diſcuſſions. In 1759 Mr. Gerard was ordained a miniſter of the church of Scotland, and in the following year he was appointed profeſſor of divinity in the Mariſchal college, and about the ſame period he took his degree of doctor of divinity. He continued to perform the ſeveral duties attached to his offices till 1771, when he reſigned the profeſſorſhip, together with the church living, and was preferred to the theological chair in the univerſity of King's college, a ſituation which he held till his death in 1795. Dr. Gerard's attainments were ſolid rather than brilliant, the effect of cloſe and almoſt inceſſant ſtudy, and a fine judgment. He had improved his memory to ſuch a degree, that he could, in little more than an hour, get by heart a ſermon of ordinary length. He was author of "An Eſſay on Taſte," which was publiſhed in 1759, and which obtained for him the prize of a gold medal, from the Society of Edinburgh. This work was afterwards much enlarged and reprinted in 1780. His "Diſſertations on the Genius and evidences of Chriſtianity," publiſhed in 1766, are well known and highly appreciated: ſo alſo are his "Eſſay on Genius," and his ſermons in two volumes. In the year 1799 his ſons gave the world a poſthumous work of much merit, which had been left among the papers of his father, entitled "The Paſtor's Care," which made a part of his theological courſe of lectures. As a clergyman the conduct of Dr. Gerard was marked with prudence, exemplary manners, and the moſt punctual and diligent diſcharge of his miniſterial duties: his ſermons were ſimple and plain, adapted to the common claſs of hearers, but ſo accurate as to ſecure the approbation of the ableſt judges. As a profeſſor of divinity, his great aim was not to impoſe by his authority upon his pupils any favourite ſyſtem of opinions; but to impreſs them with a ſenſe of the importance of the miniſterial office; to teach them the proper manner of diſcharging all its duties; and to enable them, by the knowledge of the ſcriptures, to form a juſt and impartial judgment on controverted ſubjects. Poſſeſſing large ſtores of theological knowledge, he was judicious in ſelecting his ſubjects, happy and ſucceſsful in his manner of communicating inſtruction. He had the merit of introducing a new, and in many reſpects a better, plan of theological education, than thoſe on which it had formerly been conducted. Having a conſtant regard to whatever was practically uſeful, rather than to unedifying ſpeculations, he enjoined no duty which he was unwilling to exemplify in his own conduct. In domeſtic life he was amiable and exemplary: in his friendſhips ſteady and diſintereſted, and in his intercourſe with ſociety hoſpitable, benevolent, and unaſſuming; uniting to the decorum of the Chriſtian paſtor, the good breeding of a gentleman, and the cheerfulneſs, affability, and eaſe of an agreeable companion.

GERARDE, John, a ſurgeon and famous herbaliſt of the time of queen Elizabeth, was born at Namptwich, Cheſhire, in 1545. He practiſed ſurgery in London, and roſe to eminence in that profeſſion. Mr. Granger ſays "he was many years retained as chief gardener to lord Burleigh, who was himſelf a great lover of plants, and had the beſt collection of any nobleman in the kingdom: among theſe were many exotics, introduced by Gerarde." This is confirmed by the dedication of the firſt edition of his Herbal, in 1597, to that illuſtrious nobleman, in which he ſays he had "that way employed his principal ſtudy, and almoſt all his time" then for 20 years. It appears therefore that he had given up his original profeſſion. Johnſon, the editor of his ſecond edition, ſays "he lived ſome ten years after the publiſhing of this work, and died about 1607;" ſo that he ſurvived his noble patron nine years. See CECIL, WILLIAM.

Gerarde lived in Holborn, and had there a large botanic garden of his own, of which he publiſhed a catalogue in 1596 and again in 1599. Of this work ſcarcely an impreſſion is known to exiſt, except one in the Britiſh Muſeum, which proved of great uſe in preparing the *Hortus Kewenſis* of Mr. Aiton, as ſerving to aſcertain the time when many old plants were firſt cultivated. Holborn was then in the outſkirts of the town on that ſide. The reader of Engliſh hiſtory will recollect that the hypocritical Richard III. aſked the biſhop of Ely to ſend for "ſome of the good ſtrawberries which he heard the biſhop had in his garden in Holbourn," by way of ſhewing himſelf in good humour at the council, while he was in fact meditating the ſeizure of lord Haſtings. The catalogue of Gerarde's garden contains, according to Dr. Pulteney, 1033 ſpecies, or at leaſt ſuppoſed ſuch, though many doubtleſs were varieties, and there is an atteſtation of Lobel ſubjoined, aſſerting his having ſeen nearly all of them growing and flowering. This was one of the earlieſt botanic gardens in Europe.

The great work of our author is his Herbal, or General Hiſtory of Plants, printed in folio in 1597, by John Norton, who procured the wooden cuts from Frankfort, originally done for the German herbal of Tabernæmontanus. The baſis of the text was the work of Dodonæus entitled *Pemptades*, for which alſo we believe the ſame cuts had been uſed; ſee DODONÆUS. Lobel aſſerts that a tranſlation of the Pemptades had been made by a Dr. Prieſt, at the expence of Mr. Norton, but the tranſlator dying ſoon after, the manuſcript was uſed by Gerarde, indeed without acknowledgment. The intelligent reader of the Herbal will obſerve that moſt of the remarks relative to the places in which certain plants are found, their common uſes, &c., belong to the original work, and refer to the country in which Dodonæus wrote, not to England. Gerarde is alſo accuſed of having been no Latin ſcholar, and of having made many miſtakes in the additional matter which he tranſlated from the works of Cluſius, Lobel, &c. He alſo certainly miſapplied many of the cuts. Notwithſtanding ſuch faults, Gerarde had the great merit of a practical knowledge of plants, with unbounded zeal, and indefatigable perſeverance. Dr. Pulteney juſtly obſerves that notwithſtanding his manifeſt inferiority to Lobel in point of learning, it muſt yet be owned that Gerarde contributed greatly to bring forward the knowledge of plants in England. His connection with the great, and his ſituation in London, favoured an extenſive correſpondence, both with foreigners and his own countrymen; and his ſucceſs in procuring new exotics, as well as ſcarce indigenous plants, was equal to his diligence and aſſiduity. In fact, we owe to Gerarde and his friends the diſcovery of many new Engliſh plants; and his name will be remembered by botaniſts with eſteem, when the utility of his Herbal is ſuperſeded." Among the perſons to whom he was indebted for the communication of exotic plants and ſeeds, are recorded ſir Walter Raleigh, Edward lord Zouch, and lord Hunſdon, with many of leſs elevated rank.

A ſecond edition of Gerarde's Herbal was publiſhed by Dr. Thomas Johnſon in 1636, which has ever ſince been a very popular book, and indeed, as Haller remarks, Gerarde was the claſſical author of the Engliſh, almoſt to the time of Ray. Johnſon, like many other editors, cenſured his author with great freedom, and undoubtedly made many eſſential corrections. He has prefixed a liſt of his additions, which are very numerous, and a learned hiſtorical preface. He was a man of far more learning than Gerarde, but by no means ſo good a botaniſt. Among the moſt valuable of his additions are the communications of Mr. John Goodyer of Maple-Durham, Hampſhire, a man of ſingular penetration and accuracy in practical botany. Johnſon added many excellent figures, either of new plants, or in the place of ſuch as were badly executed in the firſt edition. Among the latter is *Gratiola latifolia*, which Haller complains he could make nothing of. It proves to be *Scutellaria minor*, and is well repreſented in Johnſon's edition, p. 581.

Mr. Granger, in his Biographical Hiſtory of England, ed. 4. v. 1. 275, mentions only two engraved portraits of Gerarde.

"JOHN GERARDE; engraved by William Rogers, for the firſt edition of his Herbal.

Ditto engraved by Paine, for Johnſon's edition of the ſame book."

The latter, dated 1636, is a ſmall copy of the former. There is a ſprig of the potatoe plant in the left hand.

The writer of the preſent article is poſſeſſed of the copper-plate itſelf, very much worn, of an octavo portrait of Gerarde, without age or date, holding a ſprig of *Ciſtus*, with his arms and the Italian motto, *D'aſſenti, buone.* In one corner below is a branch of Jaſmine, in the other the Bugloſs. The name of the engraver ſeems to be Hall. Pulteney's Sketches of the Progreſs of Botany in England. Granger's Biographical Hiſtory of England. Haller's Bibl. Bot. S.

GERARDIA, in *Botany*, named by Plumier in memory of the Engliſh herbaliſt John Gerarde; ſee that article. (It may alſo ſerve to commemorate a botaniſt of our own time, Louis Gerard, M. D. author of the excellent Flora Galloprovincialis, publiſhed in 1761, with a few exquiſitely engraved plates, and who, we believe, is ſtill living, at a very advanced age, at Cottignac in Provence, where the writer of this viſited him in 1786. (See Tour on the Continent, ed. 2. v. 1. 204.) – Plum. Nov. Gen. 30. t. 12. Linn. Gen. 307. Schreb. 403. Willd. Sp. Pl. v. 3. 221. Mart. Mill. Dict. v. 2. Juſſ. 119. Lamarck. Illuſtr. t. 529. (Nigrina; Linn. Mant. 42 and 512. Melaſma; Berg. Cap. 162. Gærtn. t. 55.)—Claſs and order, *Didynamia Angioſpermia*. Nat. Ord. *Perſonatæ*, Linn. *Scrophulariæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, permanent, with five upright, ſharp ſegments. *Cor.* of one petal, ringent, tube round, longer than the calyx; upper lip erect, obtuſe, flat, broadeſt, emarginate; lower reflexed, deeply three-cleft, its lateral ſegments emarginate, the middle one ſhorter, deeply divided. *Stam.* Filaments four, ſcarcely ſo long as the tube, two of them rather ſhorter than the reſt; anthers ſmall. *Piſt.* Germen ſuperior, ovate, ſmall; ſtyle ſimple, ſhort; ſtigma obtuſe. *Peric.* Capſule ovate, of two cells and two valves, opening at the baſe, the partition contrary to the valves. *Seeds* ovate; according to Linnæus ſolitary, which does not appear from Plumier's works.

Eſſ. Ch. Calyx five-cleft. Corolla two-lipped; the lower lip in three deep emarginate lobes, the middlemoſt deeply divided. Capſule of two cells, opening at the baſe.

This genus, as founded by Plumier and adopted by Linnæus, entirely depends on the firſt ſpecies.

1. G *tuberoſa*. Linn. Sp. Pl. 848. (G. humilis, bugulæ foliis, aſphodeli radice; Plum. Ic. 64. t. 75. f. 2.), found by Plumier in South America, and never ſeen by Linnæus. We have a very bad ſpecimen from that country, which agrees with Plumier's figure, as to the leaves and habit, but nothing can be made out of the fructification. The above characters are taken from Plumier's works. Willdenow, by miſtake, we preſume, ſays the capſule is of three cells. Dr. Swartz appears not to have found this, or any other ſuppoſed *Gerardia*, in the Weſt Indies. Linnæus, well aware that the various plants he ſubſequently referred hither might probably not well accord with the above, has given a hint that "the fructification requires examination." Whatever might be the reſult of ſuch examination, this plant muſt be the true, though it were the only *Gerardia*, and the reſt in that caſe muſt have a new generic appellation and character.

2. G. *delphinifolia*. Linn Sp. Pl. 848. Roxb. Coromand. v. 1 .t. 40. is totally diſtinct in habit and character. Its anthers have a remarkable creſt, indicated but miſrepreſented in Roxburgh's figure, for what there appears the anther is the creſt, and the apparent point of the filament is the true anther, at leaſt in our ſpecimen.

3. G. *purpurea*, a North American ſpecies, cloſely agreeing with the laſt in habit, has no ſuch creſt or appendage, but their flowers are otherwiſe very ſimilar. G. *flava* and *pedicularia* are undoubtedly of the ſame genus with theſe; but *glutinoſa*, figured in Lamarck t. 529. f. 1, has a very different appearance. It was gathered in China by Oſbeck, who likewiſe has given a plate of this ſpecies in his Travels, t. 9. Lamarck's f. 2. is G. *pedicularia*.

Willdenow has 12 ſpecies in all. None of them ſeem now to be known in the Engliſh gardens, though highly deſerving of culture for the beauty and ſize of their flowers. G. *purpurea* indeed is mentioned in the *Hortus Kewenſis*, as a hardy annual, introduced in 1772, by Samuel Martin, M. D., but it probably did not long remain, or at leaſt has not been diſperſed among collectors in general.

GERARDMER, in *Geography*, a town of France, in the department of the Voſges, and chief place of a canton, in the diſtrict of St. Dié, 10 miles E. of Remiremont. The place contains 4,285, and the canton 4,285 inhabitants, on a territory of 122½ kiliometres, in one commune.

GERARDS, Mark, in *Biography*, a painter, born at Bruges in 1561; who came into England not long after the year 1580, and remained till his death in 1635. He was made painter to queen Elizabeth, as he was alſo to Anne of Denmark. His works are very numerous here, though, as he uſed no mark, they are not eaſily known. He painted very thin and neat; ornamenting the dreſſes of his figures with jewels and pearls in a profuſe manner. The fleſh he generally painted of a greyiſh teint, and theſe are the beſt tokens of his hands by which his pictures may be diſcovered.

He painted a proceſſion of queen Elizabeth to Hunſdown houſe, which is engraved by Vertue; and he drew the queen and the knights of the garter in proceſſion; from which deſign Aſhmole's print is engraved in his hiſtory of that order. He alſo wrote an introduction to the art of drawing, which was tranſlated and publiſhed in Engliſh in 1674.

GERARDSTOWN, in *Geography*, a ſmall town of America, in Berkeley county, Virginia, containing about 30 or 40 houſes; 10 miles from Martinſburg.

GERASA, or Gergésa, in *Scripture Geography*, a city beyond and eaſt of the Dead ſea, included by ſome in Cœleſyria, by others in Arabia; placed among the cities of the Decapolis, Matt. vii. 28. The Greek editions of Matthew, for Gereſenians, read Gergeſenes, and ſome, Gadarens. Luke and Mark have the ſame reading. Origen thinks that the true reading is neither Geraſa nor Gadara; but that the city of Gergeſa is meant, which lies on the lake of Tiberias, where, in his time, the people ſhewed the rocks and precipices from which the ſwine ran down. It is alſo called Giraſa and Girgeſha, and was one of the cities that belonged to the half-tribe of Manaſſeh.

GERASDORFF, in *Geography*, a town of Auſtria; 7 miles E. of Korn Neuburg.

GERAU, a ſmall country of Germany, ſituated near the conflux of the Maine and the Rhine, in the circle of the Upper Rhine: its capital is Darmſtadt.

Gerau, *Groſs*, a town of Germany, in the principality of Heſſe-Darmſtadt; 8 miles W. N. W. of Darmſtadt.

GERBA, or Jerba, a ſmall iſland in the Mediterranean, near the coaſt of Tripoli. Its principal produce is barley and fruit. Its ancient name was "Lotophagitis." N. lat. 33° 56′. E. long. 11° 20′.

GERBEL, Nicholas, in *Biography*, a native of Pfortzheim, was known and highly celebrated in the fifteenth century as a moſt learned juriſt. He was profeſſor of the law at Vienna, and afterwards at Straſburg. He attained likewiſe to a high reputation for his deep knowledge in hiſtory and antiquities. He is characterized by De Thou as one equally eſtimable for his erudition and humanity. His works are "Iſagoge in Tabulam Graciæ Nicolai Sophiani;" "De Anabaptiſtarum ortu et progreſſu;" "Vita Joannis Caſpiniani." The firſt of theſe was publiſhed in 1545, and afterwards augmented into ſeven books, comprehending a complete deſcription of all Greece, and printed at Baſil in 1550. Gerbel corrected Caſpinian's "Chronicle of the Cæſars," and Arrian's "Hiſt. of Alexander."

GERBERA, in *Botany*. See Arnica.

GERBERAY, in *Geography*, a town of France, in the department of the Oiſe, fortified in the 9th century, to ſtop the incurſion of the Normans; 12 miles N. W. of Beauvais. N. lat. 49° 32′. E. long. 1° 57′.

GERBERT, or Girbert, *Pope*, in *Biography*, was a native of Auvergne, and born of obſcure parents in the neighbourhood of Aurillac, where he was a monk; and may be juſtly conſidered as one of the principal ornaments of the tenth century. His talents were ſo various, and his aſſiduity in acquiring knowledge ſo great, that it is difficult to ſay what were thoſe branches of literature and ſcience in which he chiefly excelled. He was a divine, a mathematician, and a philoſopher, and he wrote upon geometry, particularly the quadrature of the circle, aſtronomy, logic and rhetoric. He was eminently diſtinguiſhed by his knowledge of muſic, on which he compoſed, in Latin monkiſh rhyme, a didactic poem, entitled "Ars Muſica," preſerved in the Rawlinſon collection of MSS. at Oxford; and in this little work is a ſeparate treatiſe, under the title of "Rhythmomachia," or the battle of numbers or figures, which Gerbert compoſed as a kind of game, ſoon after the arrival of the Arabian figures or cyphers in Europe, for which the author gives rules reſembling thoſe for cheſs. Having cultivated muſic very aſſiduouſly, regarding it as the ſecond in rank among the liberal arts, he muſt have acquired a conſiderable reputation in it, as the authors of the twelfth century gave him the title of Gerbert the "Muſician." He is ſaid to have been as well ſkilled in the conſtruction of muſical inſtruments as in the uſe of them, particularly the hydraulic organ. William of Malmeſbury ſpeaks with wonder of the perfection to which he had brought this inſtrument by means of blowing it with warm water. His extraordinary talents and attainments eſtabliſhed his claim on thoſe high eccleſiaſtical preferments to which he was advanced. Before his exaltation to the papal chair as the ſucceſſor of Gregory V., in the year 999, he was, firſt, archbiſhop of Rheims, and afterwards of Ravenna. As pope, he aſſumed the name of Silveſter II.; but he died in 1003, after having filled the papal throne four years. The day of his death is marked in his epitaph, which was compoſed by pope Sergius IV., who ſucceeded him in 1009, and is ſtill to be ſeen in the Lateran church. This pope contributed very much to the reſtoration of letters in Europe. His genius, ſays Moſheim, (E.H. vol. ii.) was extenſive and ſublime, embracing all the different branches of literature; but its more particular bent was towards mathematical ſtudies. Mechanics, geometry, aſtronomy, arithmetic, and every kind of knowledge that had the leaſt affinity to theſe important ſciences, were cultivated by Gerbert with the moſt ardent zeal, as his various writings teſtify; and he had the merit of employing every method that was proper to animate others in the culture of the liberal arts and ſciences. The effects of this noble zeal were viſible in Germany, France, and Italy, both in the tenth and following century. Gerbert was, in a great meaſure, indebted for his extraordinary acquirements, more eſpecially in phyſics, mathematics and philoſophy, to the writings and inſtructions of the Arabians, who were ſettled in Spain. It was in this century that the plan of the holy war was formed; and towards the concluſion of it, the bloody ſignal was given by our learned pontiff, in the firſt year of his pontificate. This ſignal was an epiſtle, written in the name of the church of Jeruſalem, to the church univerſal throughout the world, in which the European powers are ſolemnly exhorted and intreated to ſuccour and deliver the Chriſtians in Paleſtine. The pontiff's exhortations, however, were only regarded by the inhabitants of Piſa. We ſhall here add that Gerbert's great learning induced the vulgar to ſuſpect that he was addicted to magic, and Platina has adopted this abſurd notion; for he ſays that he obtained the papacy by ill arts, and that he left his monaſtery to follow the devil. He allows him, indeed, the merit of a ſincere repentance; but mentions ſome prodigies at his death, which will claim little regard on the teſtimony of ſuch a writer. The moſt complete collection of Gerbert's letters is that of Ducheſne.

GERBERT, *Father Martin*, a German muſical writer, who belonged to the congregation of Benedictines, at the abbey of St. Blaiſe, in the Black Foreſt, near Friburg, in Briſgaw, about 30 miles from Straſburg, and has been elevated to the head of his ſociety under the denomination of "Prince-Abbot" of St. Blaiſe. In 1763 the learned abbot publiſhed the plan of a "Hiſtory of Church Muſic," from the firſt century to the preſent time, under the title of "De Cantu et Muſica Eccleſiaſtica à prima eccleſiæ Ætate, uſque ad præſens tempus." After this publication he travelled through Germany, and a great part of France and Italy, in order to collect materials in the ſeveral convents and public libraries of thoſe countries, and in 1765 he publiſhed his "Itinerary," informing the public of the ſucceſs of his reſearches. A great part of the author's materials for the hiſtory of ſacred muſic were unfortunately deſtroyed by fire; but availing himſelf of his remaining ſtock, he reſumed the work.

Though the indefatigable and pious abbot was in ſearch of the muſic uſed in the Romiſh maſs and liturgy, he candidly mentions the muſic of the Proteſtant churches. He had procured from England Dr. Boyce's magnificent publication of our cathedral muſic from the time of the reformation till the middle of the laſt century, and allows the compoſition to be excellent; but wiſhes for more plainneſs and ſimplicity in favour of the words; and thinks that fugues and learned counterpoint, though ingenious productions, render the words unintelligible. The author has inſerted at the end of the ſecond vol. the whole maſs, "In cœna Domini," in eight parts, in ſcore, to be ſung antiphonally as in our choirs, from ſide to ſide.

The harmony is very pure; but we have been ſo long accuſtomed to more varied, expreſſive, and elaborate compoſitions in our cathedral ſervice, that ſuch muſic would be thought very inſipid and unintereſting, if adopted in our choirs. After this, the "Gloria in excelſis" is given in the ſame ſimple counterpoint; where nothing is varied. Theſe two choirs are accompanied by two organs on a ground. Then the *gradual*, the *credo*, the *offertorium*, the *ſanctus*, and the *benedictus*, all in plain counterpoint.

The communion ſervice is in figurate harmony, but very dry, ancient, and common.

The plates given of the primitive notation of the chants and hymns, before the invention of lines and ſpaces, or a time-table; and indeed, even before counterpoint was attempted, in dots over the words are innumerable, from the Lexicon Diplomaticum of Walther, and from ancient miſſals. But theſe ever remain more curious than uſeful. For to acquire a clear conception of their import would lead to no uſeful or amuſing knowledge; as the chant or plainſong is generally ſo rude, uncouth, and unamuſing, that it would furniſh a very inadequate reward for the labour of deciphering it.

GERBEVILLER, in *Geography*, a town of France, in the department of the Meurthe, and chief place of a canton, in the diſtrict of Luneville; 5 miles S. of Luneville. The place contains 2,070, and the canton 9,169 inhabitants; on a territory of 232½ kiliometres, in 23 communes.

GERBIER, *Sir* BALTHASAR, in *Biography*, a painter in miniature, born at Antwerp in 1592. He was employed by Charles I. but is far more conſpicuous as having been engaged, in conjunction with Rubens, to negociate a treaty with Spain; and for having been for a time Britiſh reſident at Bruſſels. His being in the ſuite of Buckingham in Spain was the means of this elevation; for which he does not appear to have been duly qualified. He was ſomewhat acquainted with architecture, and was employed by lord Craven to give deſigns for Hempſted-hall, which has ſince been burnt.

Being neglected by the court, he, in 1648, appears as an author, and founder of an academy at Bethnal Green; and, in 1649, publiſhed his firſt lecture on geography. He afterwards went to Cayenne, and ſettled with his family at Surinam; where, by order of the Dutch, he was ſeized and ſent back to Holland, from the jealouſy of that government, which regarded him ſince his naturalization in England as an agent of the king. On the reſtoration of Charles II. he returned to England, and prepared triumphal arches for his honour. Here he practiſed various means of living for ſome years, with no great reſpect or profit, and at laſt died in 1667, having paſſed his latter days in all the expedients of quackery.

GERBILLON, JOHN FRANCIS, a diſtinguiſhed Jeſuit miſſionary, was born at Verdun in 1654. He entered into the ſociety of Jeſuits when he was ſixteen years of age, and having conſtantly the miſſion to China in view, he qualified himſelf for it by the ſtudy of the mathematics, and thoſe ſciences that might be moſt uſeful to him in his great work. He had the good fortune to ſee his wiſhes accompliſhed in 1685, when he was allowed to embark for China, in company with ſix other perſons, members of the ſame ſociety. On his arrival he remained at Pekin, ſtudying the language, and during this period, being admitted frequently into the preſence of the emperor, he ſo ingratiated himſelf with him, as to obtain an appointment to join an embaſſy ſent to regulate the boundaries with the court of Muſcovy. He contributed much to the ſucceſs of this buſineſs, and on his return to China was treated with great honour by the emperor, who choſe him his inſtructor in mathematics and philoſophy. Gerbillon is ſuppoſed to have enjoyed more advantages than almoſt any other perſon, for ſtudying the manners of the Chineſe court, and for making obſervations on the neighbouring country. He obtained permiſſion to preach the Chriſtian religion in China, and had the direction of the French college in Pekin, and was in the end made ſuperior-general of all the miſſionaries ſent from France. He died at Pekin in the year 1707, leaving behind him curious accounts of his eight journeys into Tartary, which have been printed in Du Halde's Deſcription de la Chine. He was the author of the "Elements of Geometry," and of a work on Perſpective, both printed in a very handſome manner at Pekin. Moreri.

GERBOA, in *Zoology*. See Dipus.

GERBSTADT, in *Geography*, a town of Germany, in the county of Mansfeld; 30 miles S.W. of Deſſau. N. lat. 51° 40'. E. long. 11° 47'.

GERDAU, a river of Luneberg, which runs into the Ilmenau, at Oldenſtadt.

GERDAVEN, a town of Pruſſia, in the province of Natangen, ſituated on the Omet, near a conſiderable lake, which is called the "Calendar of Gerdaven," from its prognoſticating the weather; 30 miles S.E. of Konigſberg. N. lat. 54° 16'. E. long. 21° 27'.

GERDEN, a town of Germany, in the biſhopric of Paderborn; 14 miles E. of Paderborn.

GERDES, Daniel, in *Biography*, was born at Bremen in 1698, where his father was engaged in a commercial life. Great care was taken of the education of Daniel, who made a rapid progreſs in the claſſics. At firſt it was intended he ſhould purſue the law as a profeſſion, but the plan was changed, and he devoted himſelf to the ſtudy of theology. In 1722 he was admitted into holy orders, and immediately afterwards made a tour on the continent, and formed an acquaintance with the moſt learned men of that period. In 1726 he was admitted to the degree of doctor, and in 1735 he was choſen profeſſor of theology at Groningen, and upon his entrance on the office he delivered an oration "De unctione quæ Fideles omnia docet." The ſame year he was elected a member of the royal academy of ſciences at Berlin. He died in the year 1765, leaving behind him many works that bear ample teſtimony to his learning and zeal in the cauſe of literature. His writings are moſtly theological, and tend to the elucidation of the difficult parts of the Old and New Teſtament. Gen. Biog.

GERDIN, in *Geography*, a town of Ruſſia, in the government of Perm, ſituated on the Colva; 152 miles N. of Perm. N. lat. 59 40'. E. long. 56° 14'.

GERDOBA, a mountain of Africa; 80 miles E. of Angela.

GEREEK, a town of Hindooſtan, in Bahar; 12 miles S. of Bahar.

GEREM, a town of Grand Bucharia; 15 miles S.S.W. of Badakſhan.

GEREMSCHANGKAIA, a town of Ruſſia, in the government of Upha; 36 miles W.N.W. of Bugulma.

GEREN, a town of Pruſſia, in Pomerelia, on the Viſtula; 9 miles W.S.W. of Marienburg.

GERENIA, or Gerunium, in *Ancient Geography*, a town of Italy.—Alſo, a town of the Peloponneſus, in Laconia. Ptolemy.—Alſo, a town of Meſſenia, on an eminence, S.W. of Alagonia. Pauſanias ſays that this town was the ſame with the "Enope" of Homer. It was conſecrated to Machaon, an ingenious phyſician, ſlain by Eryphilus, whoſe bones were collected by Neſtor, and depoſited at Rhodon, near this town. It had a temple dedicated to Machaon. Eaſt of it was a mountain called "Calathéon," on which was a temple conſecrated to Calathea, with a grotto, having a ſtrait entrance, and containing in its interior many curioſities.

GERENNA, or Jerenna, in *Geography*, a town of Spain, in the province of Seville, ſurrounded by large ſtones, ſuppoſed to have been the effect of an earthquake; 12 miles N.N.W. of Seville.

GERENSCHANSKOI, a fortreſs of Ruſſian Siberia, in the government of Kolivan; 240 miles S.S.W. of Kolivan. N. lat. 50° 45'. E. long. 79° 14'.

GERESHEIM, a town of the duchy of Berg; 5 miles E. of Duſſeldorf.

GE RE SOL, in *Muſic*, one of the clefs.

GERESPA, in *Ancient Geography*, a town of Aſia, in the interior of Media, ſometimes called *Gerepa*, and *Geresa*.

GERESTADT, in *Geography*, a town of Norway, in the biſhopric of Aggerhuus; 32 miles S.W. of Tonſberg.

GERESTO, a town of the iſland of Negropont; 15 miles S. of Cariſto.

GEREUTH, a town of the principality of Wurzburg; 5 miles N. of Ebern.

GERFALCON, Gyrfalcon, or *Jerfalcon*, (ſee **Falco**). This is naturally a very bold, wild and fierce bird, and is therefore very difficult to be reclaimed; but when that is done it proves one of the very beſt kinds, and will fly at almoſt any thing. The beak of the gerfalcon is always blue, and the claws are remarkably long and ſtrong.

In going up to the gate, as the ſportſmen expreſs it, theſe birds do not hold the ſame ſort of courſe that others do, but immediately climb up upon the train on ſight of the bird, and as ſoon as they have reached her, they immediately make the attack, and generally pull her down at the firſt encounter; but if not, always at the ſecond or third.

This ſort of hawk is to be fed and rewarded like the others. It is of a very ſly and crafty nature, and is ſo ſlothful, that it loves to keep the caſting a long time; therefore, inſtead of cotton, it is proper to give them ſometimes a caſting of tow, and to keep them ſharp ſet. As to the reclaiming this ſort of hawk, it is only to be done by gentleneſs and kindneſs; and when ſhe has been taught to be turned looſe, ſhe is not to be taught to come to the pelts of hens or other fowl. But ſhe muſt never be ſuffered to taſte any living fleſh, for that will be apt to draw away her love from the hand and voice. Whenever ſhe eats, the falconer muſt be cloſe to her, and muſt make her eat the choiceſt pieces out of his hand. There is great care to be taken in the making of theſe birds, for as they are made at firſt, ſo they are for ever; and it is a neceſſary caution, with birds of this bold and fierce nature, not to hurry over the buſineſs, but to repeat the ſame thing very often till it is perfectly fixed. See Falconry.

GERGAR, in *Geography*, a town of Spain, in the province of Grenada; 10 miles S.W. of Purchena.

GERGEFALVA, a town of Tranſilvania; 16 miles W.N.W. of Hermenſtadt.

GERGESA. See Gerasa.

GERGESENES, or Girgashites, in *Ancient Geography*, an ancient people, who inhabited the land of Canaan, before the Iſraelites took poſſeſſion of it. Their territory lay next above that of the Amorites, on the eaſt ſide of the ſea of Tiberias; and it was afterwards poſſeſſed by the half-tribe of Manaſſeh. See Geresa.

GERGETHA, or Gergitha, a town ſituated in the Troade, E. of Rhætium, Ophrynium, and Dardanus, in the vicinity of the ſcite of Troy or Ilium, near mount Ida. This town appears to have been inland at ſome diſtance from the ſea.

GERGINA, a town of Aſia, in Phrygia, at the foot of mount Ida, ſeeming to be the ſame with Gergetha.

GERGIS, the name given by Steph. Byz. to the *Gergetha* of Strabo.

Gergis, in *Geography*, a town of Africa; 80 miles W. of Tripoli.

GERGOVIA, in *Ancient Geography*, a ſtrongly fortified place of Gaul, belonging to the Arverni. According to Cæſar (l. vii. 36.) it was ſituated on a very high mountain, and every acceſs to it was extremely difficult. At length it was obliged to ſubmit to the victorious arms of Rome, and it was probably ſo completely deſtroyed, that no trace remains from which we may aſcertain its ſituation. It has been conjectured, however, that its ſituation was in the vicinity of Clermont.

GERHARDSBRON, in *Geography*, a town of Germany, in the principality of Anſpach; 28 miles W. of Anſpach. N. lat. 49°. 17'. E. long. 10°.—Alſo, a town of Wurtemberg; 28 miles E. of Hailbron.

GERINES, a ſea-port of the iſland of Cyprus, anciently called "Cerynia." The walls, which are about half a mile in circumference, appear to be erected on the foundation of the ancient walls. This place has one entire church, and two or three in ruins. Its chief trade is with Caramania, whither it exports rice and coffee brought from Egypt, and whence it brings back ſtorax, and a great number of paſſengers. Gerines is the reſidence of an Aga and Cadi: 16 miles N.N.W. of Nicoſia.

GERINGSWALDA, a town of Saxony, in the circle of Leipſic; 20 miles S.S.E. of Leipſic. N. lat. 51° 5'. E. long. 12° 46'.

GERIS, a town of Egypt, on the left bank of the Nile; 8 miles N. of Aſhmunein.

GERISA, in *Ancient Geography*, a town of Africa Propria, ſituated between the two Syrtes. Ptolemy.

GERISAU. See Gersau.

GERKOW, Jorkow, or *Borek*, a town of Bohemia, in the circle of Saatz; 22 miles N. E. of Saatz.

GERLACH, Stephen, in *Biography*, was born at a village in Swabia in the year 1546. He laid the foundation of a learned education at Stutgard, and became diſtinguiſhed for his diligence at the univerſity of Tubingen, where, in 1566, he took his degree of B. A. with great applauſe. Shortly after this he withdrew from the univerſity on account of the plague. He was admitted to the degree of doctor in philoſophy in 1567 at Eſlingen, and in 1573 he accompanied an embaſſy from the emperor Maximilian II. to the Turkiſh court. He continued at Conſtantinople about five years, acquainting himſelf with the manners and religion of the Turks and Greeks, and cultivating an acquaintance with the moſt eminent men in the latter communion. Upon his return to Tubingen he obtained other preferment, and engaged in the duties of his profeſſion with ſo much zeal and aſſiduity, as to injure his health. He died in 1612 in the 66th year of his age. He was author of "An Epitome of Eccleſiaſtical Hiſtory;" of "A Journal of the embaſſy ſent to the Porte by the emperors Maximilian II. and Rodolf II." abounding in curious and intereſting particulars, hiſtorical, eccleſiaſtical, and theological: and numerous theological "Diſſertations," &c. Moreri.

GERLATZKOI, in *Geography*, a fortreſs of Ruſſia, on the E. ſide of the Irtiſch, in the government of Kolyvan; 212 miles W. of Kolyvan. N. lat. 54°. 20'. E. long. 75° 24'.

GERM, in *Vegetable Philoſophy*. See Embryo.

Germ, in *Navigation and Commerce*, the name given in Egypt to ſmall veſſels which ſerve to carry European merchandiſe from Alexandria to Roſetta, and to bring back to Alexandria the commodities of Egypt and Arabia. Theſe veſſels are a kind of ſtrong barks, tolerably conſtructed; without decks, drawing little water; and, according to their ſize, having two or three maſts with very large latine ſails, the yards of which are fixed to the heads of the maſts, and cannot be lowered, ſo that, however bad the weather may be, the ſailors are obliged to climb up the whole length of them, in order to furl the ſails. They are, in general, of about five or ſix tons burden. Goods are often damaged in theſe uncovered veſſels, and the navigation of them is dangerous in a rough ſea. Although the diſtance which they have to ſail is ſcarcely more than 12 leagues, and though the bay of Aboukir, which is in the middle of their paſſage, affords them ſafe ſhelter, this coaſting trade is not free from danger, eſpecially at the mouth of the weſtern branch of the Nile, formerly called the "Bolbitic," now "the branch of Roſetta;" where is a bar formed by the ſand, upon which the waves, driven by the wind from the offing, and oppoſed by the ſtream of the river, break with great fury. A ſmall iſland, dividing the entrance of this branch, leaves on each hand a narrow paſſage, called in the language of the country "Boghaſs," a canal or ſtrait. But there is only a narrow channel of this paſſage which is ſecurely navigable; for it is continually ſhifting, on account of the inſtability of the bottom and the agitation of the ſea. A pilot, "Reis," or maſter of the "Boghaſs," is continually employed in ſounding this changeable paſſage, and indicating it to the "germs." In ſpite of all theſe precautions, they often get on ſhore; and, being ſoon overwhelmed with water and ſand, periſh with their crews and cargoes.

GERMA, or Germe, in *Ancient Geography*, a town of Aſia, upon the Helleſpont; which, according to Ptolemy, was a colony founded by the Gauls, named Toliſtoboians, in Galatia.

GERMAIN, Count St., in *Biography*, a conſpicuous perſon of a myſterious character, who reſided in England a conſiderable time, and of whom nothing was certainly known, but that he was a fine performer on the violin, and an elegant, though not a learned or original, compoſer. Being here at the ſame time as prince Lobkowitz, they were inſeparable. He printed a book of violin ſolos to preſent to his friends and admirers, which he called "La Muſique raiſonnée," in which there were elegant paſſages, ſingular movements, and amuſing *concetti*. In his ſongs, the melody was Italian, and in good taſte; but the accompaniments were thin, and without carrying on any ingenious deſign. It was reported, that when examined before the privy council, during the rebellion, he was obliged to diſcloſe, "ſub ſigillo confeſſionis," that he was originally a muſician by profeſſion; but that by play, and his *bonnes fortunes*, he had realized an independent fortune; but this, like newſpaper reports, *merits confirmation*.

Germain, *St.* in *Geography*. See *St.* Germans.

Germain, *St.* a town of France, in the department of the Creuſe, 15 miles N. W. of Gueret.—Alſo, a town of France, in the department of the Aube; three miles S. W. of Troyes.

—Alſo, a town of France, in the department of the Orne; ſix miles S. of Belleſme.—Alſo, a river of America, which runs into the Wabaſh, N. lat. 39° 20'. W. long. 87° 58'.

Germain *d'Arce, St.* a town of France, in the department of the Sarthe; ſix miles S. E. of Le Lude.

Germain *de Belair, St.* a town of France, in the department of the Lot, and chief place of a canton, in the diſtrict of Gourdon; ſix miles S. of Gourdon. The place contains 1711, and the canton 7478 inhabitants, on a territory of 155 kiliometres, in 12 communes.

Germain-*les-Belles-Filles, St.* a town of France, in the department of the Upper Vienne, and chief place of a canton, in the diſtrict of St. Yriuix; 16 miles S. S. E. of Limoges. The place contains 2015, and the canton 12,541 inhabitants, on a territory of 312½ kiliometres, in 8 communes.

Germain-*du-Bois, St.* a town of France, in the department of the Saone and Loire, and chief place of a canton, in the diſtrict of Louhans. The place contains 1684, and the canton 11,316 inhabitants, on a territory of 227½ kiliometres, in 13 communes.

Germain-*de-Calberte, St* a town of France, in the department of the Lozére, and chief place of a canton, in the diſtrict of Florac; 12 miles S.E. of Florac. The place contains 1720, and the canton 12,273, inhabitants, on a territory of 332½ kiliometres, in 14 communes.

Germain *des Foſſes, St.* a town of France, in the department of the Allier; 12 miles N. E. of Gannat.

Germain-*l'Herm, St.* a town of France, in the department of the Puy-de-Dôme, and chief place of a canton, in the diſtrict of Ambert; 10 miles S.W. of Ambert. The place contains 1725, and the canton 10,510 inhabitants, on a territory of 232½ kiliometres, in 10 communes.

Germain-*Lambron, St.* a town of France, in the department of the Puy-de-Dôme, and chief place of a canton, in the diſtrict of Iſſoire; ſix miles S. of Iſſoire. The place contains 1706, and the canton 8348 inhabitants, on a territory of 130 kiliometres, in 16 communes.

Germain-*Laval, St.* a town of France, in the department of the Loire, and chief place of a canton, in the diſtrict of Roanne; 12 miles S. of Roanne. The place contains 1125, and the canton 8443 inhabitants, on a territory of 220 kiliometres, in 16 communes.

Germain-*en-Laye, St.* a town of France, in the department of the Seine and Oiſe, and chief place of a canton, in the diſtrict of Verſailles, ſeated on the Seine. A palace was built here by Robert, king of France, which was deſtroyed by the Engliſh in the year 1346; and another palace was erected by Francis I., which has been enlarged by ſeveral ſucceeding kings, and particularly by Louis XIV.; 2½ poſts W. of Paris. The place contains 9000, and the canton 14,355 inhabitants, on a territory of 107½ kiliometres, in 11 communes. N. lat. 48° 54'. E. long. 2° 10'.

Germain-*du-Plain, St.* a town of France, in the department of the Saone and Loire, and chief place of a canton, in the diſtrict of Chalons-ſur-Saone; ſix miles S. E. of it. The place contains 1229, and the canton 6676 inhabitants, on a territory of 130 kiliometres, in 7 communes.

Germain-*de-Pringay, St.* a town of France, in the department of the Vendée, 18 miles S.S.W. of Mortagne.

Germain-*de-Tail, St.* a town of France, in the department of the Lozère; 13 miles W. of Mende.

Germain-*en-Very, St.* a town of France, in the department of the Niévre; 15 miles S. S. E. of Nevers.

Germain-*ſur-Vienne, St.* a town of France, in the department of the Charente; four miles N. of Confolens.

GERMAINMONT, St., a town of France, in the department of the Ardennes; five miles S. W. of Rethel.

GERMAN, in *Matters of Genealogy*, ſignifies whole, entire, or own.

"Germani, quaſi eadem ſtirpe geniti." Feſt. Hence,

German, *Brother*, denotes a brother both by the father's and mother's ſide, in contradiſtinction to uterine brothers, &c. who are only ſo by the mother's ſide.

German, *Couſins*, are thoſe in the firſt or neareſt degree, being the children of brothers or ſiſters.

Among the Romans we have no inſtance of marriage between couſins german before the time of the emperor Claudius, when they were very frequent.

Theodoſius prohibited them under very ſevere penalties, even fine and proſcription. See Consanguinity.

German *acacia, bezoar, bible, black, coins, compaſſes, emperor, empire, flute, language, meaſures, monies.* See the ſeveral ſubſtantives.

German *School of Engraving.* Germany was probably the birth-place, and Italy the cradle, of that art of engraving which is performed with a view to its being afterward printed on paper. Engraving itſelf, as performed on metals, and with the inſtrument which is ſtill in uſe for that purpoſe, which in the Engliſh language is termed a graver, and in French la burin, is of very remote antiquity; the Greeks of the early ages having employed it in the decorations of their ſhields, pateras, and other implements of war and ſacrifice; and the Hebrews, and perhaps the Chaldeans and Egyptians, at a ſtill earlier period; but unleſs we ſuppoſe (which is by no means improbable) that the art of engraving and printing from tablets of wood travelled from China to Europe, it was reſerved for the artiſts of Germany or Italy, and moſt probably the former, firſt to perceive that ink might be delivered, and impreſſions thus multiplied to an undefineable amount, both from the inciſions and ſurfaces, of engraved plates of metal, and blocks of wood.

The preciſe time of the diſcovery has not been aſcertained. The baron Heinnekin, who had excellent opportunities of acquiring information, and purſued his enquiries with zeal and accuracy, has clearly ſhewn that the fabrication of cards for games of chance was firſt practiſed in Germany, by means of the art of engraving, and was in uſe ſo early as the year 1376. Not long afterward, the ſame art that had been ſubſervient to amuſement, was employed to gratify and diſſeminate ſuperſtition, and extremely rude outlines of ſaints and legendary tales, which were cut on tablets of wood, and were printed in the cities of Mentz, Straſbourg, and Haerlem, toward the cloſe of the fourteenth, and beginning of the fifteenth, centuries, are not uncommon in the port-folios and bibliographical collections of the curious.

Of theſe engravings, the earlieſt that is known, whoſe inſcription contains a *date*, and which may therefore be eſteemed a great curioſity, is now in the library of earl Spencer. It was diſcovered by Heinnekin in the library of a convent at Buxheim, near Memmingen: its ſubject is the legendary tale of St. Chriſtopher carrying the infant Jeſus acroſs the ſea; it bears the date of 1423, and is inſcribed "Chriſtoferi faciam, die quacunque tueris. Illa nempe die morte mala non morieris." This rude but curious engraving is of the folio ſize, and was found carefully paſted withinſide the cover of an old book, with a view, no doubt, to its preſervation.

The ſame magnificent collection of earl Spencer contains alſo one of the original engraved blocks which were uſed in the very infancy of printing, before moveable types were invented. It appears to be of the wood of the pear tree, and in the courſe of the three centuries and a half ſince it was engraven, is here and there perforated by worms. It may be neceſſary to obſerve, that the earlieſt printed books were impreſſed from engraved blocks or tablets of this kind. To the rude repreſentations of ſaints and miracles, their names and legends, cut in the Gothic character, or German text, on a ſcroll or label, were added, for the better information of the unlearned ſpectator, and in aid of the labours of the artiſt, if ſuch he might be termed; and from theſe explanatory ſcrolls, the idea was firſt caught of printing books, to which the works of imitative art became in their turn merely illuſtrative. Some of theſe prints are ſimply outlines, and in others, which were produced ſomewhat later, ſhadowing, with a ſingle courſe of lines, is feebly attempted. The tablet in the collection of earl Spencer, is of the former kind, and originally conſtituted the ſecond leaf of the ſecond edition (of which there is a complete copy in his majeſty's library) of the hiſtory and viſions of St. John the Divine. It is, probably, therefore, one of the earlieſt engravings on wood that was ever performed, excepting the prototypes for the playing cards, which have been before-mentioned, and perhaps the oldeſt of which the original tablet itſelf is ſtill extant. Hence it appears that the art of engraving is the parent of that of printing, and that at leaſt that branch of printing which delivers the ink from the ſurface of the engraving, and which is now termed letter-preſs printing, originated in Germany.

The preſent writer conceives that a great deal too much of ſpurious importance has been attached to the invention, as it has been termed, of printing; that the traffickers in its productions, by diverting the attention of thoſe who might elſe have become men of taſte, from its true mark, have ſtifled or intercepted much of the pleaſure which the engravers' art is capable of imparting; and that the philoſophy of engraving lies buried alive under a heap of rarity and early rubbiſh which has been piled, and is ſtill piling, on it without mercy, from the ſhovels of dealers, collectors, and thoſe who have, unfortunately for ſociety, nothing better to do than to labour under them.

A knowledge of the era, and of the author of a *great* work, or an uſeful invention, is certainly deſirable. Beſide that it is neceſſary to the truth of hiſtory, it ſeems to aſſiſt us in indulging the amiable ſentiment of gratitude. It would call forth our ſincere regret, if the name of the author of Paradiſe Loſt, or the Cartoons, or Principia, had ſunk in oblivion. But at the time which we are conſidering, paper and ink were in conſtant and daily uſe; and impreſſions from dies and from ſeals had for ages been taken, and were under hourly obſervation; it therefore required no protracted train of thought; no long connected chain of cauſes and effects; no mighty genius, like that of Homer, Michael Angelo, or Newton, to perceive that impreſſions might alſo be taken either from the ſurfaces or inciſions of engraved blocks or plates. The art of printing, as I conceive, originated in a concurrence of circumſtances entirely independent of the minds or ſtudies of its reputed inventors. We have ſeen that at firſt, when it was coarſely performed, and (like the tops of ballads, and the dying ſpeeches of criminals at preſent) groſsly addreſſed itſelf to the lower claſſes of the community, it was regarded as of very little conſequence; and though Koſter, Guttemburg, and Fauſt, cannot be ranked in the claſs of inventors, the inferior merit of perceiving that the arts of engraving and printing might be applied to purpoſes of greater magnitude and importance than had hitherto been obſerved, may be juſtly claimed for them. It is the important conſequences gradually reſulting from the diſcovery, that have made us attach a degree of credit to the name, and entertain an unmerited reſpect for the ſuppoſed reſearches, of the diſcoverer, to which, in point of real ingenuity, the maker of the firſt pair of ſpectacles or ſtockings, or the firſt ſheet of paper, would be far more juſtly entitled.

In tracing effects to their true cauſes, it ought not to be forgotten that the great benefits we have derived, and continue to derive, from engraving and printing, ought, in fairneſs, to be partly aſcribed to the diſcovery of the means of converting rags into paper: this probably helped to ſuggeſt the idea of printing, and perhaps two centuries and a half had ſcarcely more than brought this invention to the degree of perfection neceſſary for the reception of impreſſions from printing types and engravings. Had the modern art of making paper been known to the ancients, we had probably never heard the names of Fauſt and Finiguerra, for with the ſame kind of ſtamps which the Roman tradeſmen uſed for their pottery and packages, books might alſo have been printed; and the ſame engraving which adorned the ſhields and pateras of the remote ages, with the addition of paper, might have ſpread the rays of Greek and Etrurian intelligence over the world of antiquity. The proceſs of printing is indeed ſo ſimple in itſelf, and was ſo nearly obvious in the ſtate of things we have juſt attended to, that a child at play, who wanted to multiply a given form, might almoſt be aſhamed not to have perceived it: and we ought rather to wonder it was not diſcovered ſooner, than that it was diſcovered ſo ſoon.

The art of engraving and printing from tablets of wood, then, may be ſaid to have been rather diſcovered than invented in Germany, and rather ſeen than diſcovered. That it was little thought of at the time, may be inferred from the number of wood cuts, the production of this period, which appear without either dates or the names of their authors, who were at once the deſigners, engravers, and printers of their own works, but who deemed thoſe works of too little importance to claim for themſelves diſtinction on account of having performed them.

For the accommodation of thoſe perſons who could not afford to purchaſe manuſcript copies of the Old and New Teſtaments, beſide the apocalyptical viſions of St. John the Divine, which has been already mentioned, a ſmall folio volume, entitled "Hiſtoriæ Veteris et Novi Teſtamenti," (commonly known by the name of "The Poor Man's Bible,") was publiſhed about this time, or ſoon after. In the ſame manner as the former, each leaf, printed from a ſingle engraved block of wood, conſiſted of a mixture of reading with pictorial repreſentation, ſuch as it was; to which colour was in ſome inſtances afterwards added with the hair pencil, or ſome ſuch implement. The printing was performed only on one ſide the paper, and two of theſe leaves being paſted together have the appearance of a ſingle leaf printed on both ſides. Copies of theſe early wood cuts, ſufficiently faithful, may be ſeen in Strutt's Biographical Dictionary of Engravers. As the title of this anonymous and undated book (the *Poor* Man's Bible) imports, its publication was regarded merely as a cheap contrivance for diſſeminating the knowledge of holy ſcripture. Other books of engravings, printed in the ſame manner, were ſoon afterward produced, among which are "Hiſtoria beatæ Mariæ Virginis," "Ars Memorandi," "Ars Moriendi," and "Speculum Humanæ Salvationis;" but we paſs over, as of minor importance, all particular mention of theſe and various other engravings on wood by unknown workmen, which were apparently executed in Germany, about the time now under our obſervation. The next work which bears a date after the print of St. Chriſtopher and the infant Jeſus, and the firſt engraved book which bears date at all, is called "the Chiromancy of Doctor Hartlieb." It conſiſts of twenty-four ſmall folio leaves, printed on *both* ſides. "At the beginning of this curious book," ſays Strutt, "is a large vignette, repreſenting Dr. Hartleib kneeling and preſenting it to the princeſs Anne, who is ſeated upon her throne; and the names of theſe two perſonages are engraven at the bottom of their portraits. The prints in this book are exceedingly rude; but have not, as far as one can judge from the copy of one of them, given in the "Ideé generale d'une Collection complete d'eſtampes," the appearance of being ſo ancient as thoſe in the Apocalypſe, or Poor Man's Bible. This curious compilation is dated 1448, and the name of Jorg Schapff, the artiſt, who is ſuppoſed to have performed the engravings, appears upon the fourth page."

Of Hans Sporer and Johan von Paderborn, who are mentioned among the earlieſt German engravers on wood, we know nothing more than their names. They may perhaps be the authors of ſome of the works we have enumerated.

Johan Schnitzer executed the geographical charts for the edition of Ptolemy, printed at Ulm in 1486. His map of the world is ornamented with *ten* rude heads, which are intended to repreſent the winds, and is inſcribed, "Inſculptum eſt per Johannem Schnitzer de Arnſheim."

Sandrart indeed mentions and copies a print, which he believes to bear the date of 1455, and which is marked with a cypher, ſuch as the reader will find in our firſt plate of the monograms, &c. of the German ſchool of engravers. As this cypher is compoſed of the initials of Hans Sporer, it may poſſibly be from his graver; yet neither Sandrart, nor the author of "The little chronological Series of Engravers," which was printed at Cambridge, aſcribe it to him; the latter aſſerts in his preface, that the two fives in the date, or what Sandrart ſuppoſes to be ſuch, are intended for ſevens; which makes a difference of twenty-two years in the age of the print, and brings it down to the time when the elder Schauflein is believed to have flouriſhed.

The ſubject of the above print is a young woman careſſing an elderly man while ſhe ſteals his purſe; a ſubject which has been often repeated by other maſters, both on copper and on wood.

In what part of Germany, Hans or John Schauflein was born does not appear. Strutt ſays, "his prints are executed in a bold ſpirited ſtyle, and the compoſitions ſhew him to have been a man of genius, though the ſtiff manner which characterized the early German maſters obſcures much of their merit. Beſides which they are incorrectly drawn; the extremities of the figures, in particular, are very defective. Schauflein uſually marked his prints with an H and an S; or an I and an S joined together in various ways." To theſe he ſometimes added a baker's peel, which formed a pun upon his name, a peel, in the German language, being called *Schauſel*, and the word *Schaeuflein* ſignifying a little peel. At other times we find prints of this early period, marked with two little peels croſſing each other, which perhaps may mean the two Schaufleins, if they ever worked in conjunction.

The works of the elder Schauflein are chiefly very ſmall, and he is therefore claſſed among "the little maſters." The moſt remarkable of them are, "A Crucifixion, with St John, the Virgin, and two Soldiers;" "The Virgin and Child;" "St Chriſtopher," and "St. Laurence in Converſation with St. Auguſtin:" theſe are all of the circular form, and each about two inches and a quarter in diameter.

The principal wood cuts by the younger Schauflein are as follow, "Adam and Eve," a ſmall upright; "Lot and his Daughters," a middling-ſized print, length-ways; "Chriſt preaching to the Multitude from the Ship;" a middling-ſized print, length-ways, marked with an I and an S joined together, without the peel; "The Life of Chriſt;" a ſet of middling-ſized upright prints, in quarto; another ſet of "The Life of Chriſt;" in an octavo volume, conſiſting of 37 prints, entitled "Vite et paſſo Jeſu Chriſti," &c. publiſhed at Francfort by Chriſtian Egolophus, A. D. 1537. To theſe are added, "Hiſtoriæ-Evangelio;" containing the miracles, parables, &c. of Chriſt, in thirty-ſix prints, the ſame ſize as the above, and printed on both ſides. Theſe are marked with the I and S joined together upon the peel.

This artiſt is preſumed by Strutt to have alſo engraved on copper: but perhaps "the very free etching of a landſcape," if not the plate executed with the graver, of "Soldiers converſing," of which this author treats, may be the work of a third engraver of the ſame ſirname. The date of the latter is 1551, and Strutt has previouſly recorded of the third Schauflein, that he has ſeen by him a print of two men fighting, cut on wood, in a coarſe but ſpirited manner, and a very fine maſterly etching in the ſtyle of a painter, repreſenting a large company at an entertainment in a garden; which prints prove him to have been a man of great abilities. He was probably of the ſame family with the former two.

In the year 1493, appeared the celebrated Chronicle of Nuremberg, which was compiled by Hermann Schedel, a folio work, ornamented with a conſiderable number of engravings on wood by Wilhelm Pleydenwerff and Michael Wolgemut. Theſe engravings are greatly ſuperior to all that had previouſly appeared in Europe, and conſiſt, for the moſt part, of figures of various kinds, and landſcapes which, though profeſſedly views of certain cities, towns, &c. bear ſo little reſemblance to thoſe places reſpectively, that they are probably altogether the work of fancy. They are, however, cut in a bold and ſpirited ſtyle, and the characters of the heads are in ſome inſtances far from being badly delineated, though that meagre ſtiffneſs is every where prevalent, which ſo ſtrongly marks the early art of Germany.

Pleydenwerff was a native of Germany, and perhaps of Nuremberg, but it does not appear that he ever engraved on copper, or uſed any monogram or other mark by which to diſtinguiſh his engravings from thoſe of his aſſociate.

Michael Wolgemut, or Wolgemuth, was born at Nuremberg in the year 1434. He is ſaid to have been inſtructed in engraving by a certain Jacob Walch, but both Strutt and Huber doubt this fact, grounding their doubt on the want of reſemblance between the ſtyles of deſign and engraving of theſe two maſters. Walch does not appear to have engraved at all upon wood, whereas Wolgemut did little elſe. The engravings on copper attributed to Wolgemut do not bear even a diſtant reſemblance to thoſe of Walch. The latter was a tame artiſt, or rather workman, and his work characterized by labour and care, which is generally ill beſtowed; whereas Wolgemut may even be termed an artiſt of genius, a word, by the bye, which ſeems to batter down the argument of Strutt and Huber, ſince if a man of genius ſtudy under a mere manual workman, as by chance he may, he will certainly emerge from the ſtyle, or want of ſtyle of his maſter.

Wolgemut did occaſionally engrave on copper, but his works on wood are far more numerous, and more generally known. In Strutt's account of this artiſt, he ſays, "we have ſome few excellent engravings on copper, executed about this time: theſe have much of that ſpirited ſtyle in them which appears in the wooden cuts of Wolgemut; they are marked with a W ſurmounted by a ſmall o, and theſe prints, I verily believe, are the production of his graver."

He proceeds to deſcribe one of the rareſt and beſt of theſe prints which he found in the collection of the late Dr. Monro. It is ten inches and a half high, by ſeven and a half in width, and repreſents an old man ſeated in a praying poſture. He has a ſtandard reſting upon his left ſhoulder, and a book before him. Behind him is an armorial ſhield, with three different bearings; and, at the bottom, a cave with a gate before it. Above the figure is a ſcroll, upon which is written, "ſce Wilhelme Dvx Aqvitaine et Comes Pictavienſis." The head of this figure is well drawn; the hands are marked in a ſpirited manner, the folds of the drapery are broad, and boldly expreſſed, and the whole is compoſed in a ſtyle which does much honour to the artiſt. With reſpect to the mechanical part, it is executed with the graver only, in a dark, clear ſtyle, yet without formality, ſo as to have the effect of a neat etching.

It is no ſmall addition to the honour of Wolgemut, that he was the tutor of Albert Durer, a name ſo greatly celebrated in the annals of engraving.

Arrived at the period when engraving both on wood and on copper began to ſhine forth with ſuperior luſtre in Germany, it is neceſſary to look back a few years in order to note the introduction of the latter branch of the art, into that part of Europe.

The reader will find under the article ITALIAN *ſchool of Engraving*, the popular and perhaps the true account of the diſcovery of the mode of printing from the inciſions of the graver, which, ſoon after the middle of the fifteenth century, was introduced into Germany. As the firſt engravers on wood were the manufacturers of playing-cards, (called *Formſchneiders* and *Briefmalers* in Germany and in France,) ſo the earlieſt modern engravers on metal, both in Germany and Italy, were goldſmiths, and the firſt artiſt who eminently diſtinguiſhed himſelf in the former country was Martin Schöen.

Yet having already mentioned Jacob Walch of doubtful chronology, it may not be improper in this place to add, that this engraver was particularly fond of introducing Gothic architecture into his prints, in the delineation of which he took no ſmall pains; but, from a want of knowledge in perſpective, his deſigns of this kind are ſadly confuſed. He drew very incorrectly, and his compoſitions are in the extreme of that ſtiff and meagre taſte which characterizes the early productions of the German ſchool. His mark, conſiſting of the initial letter of his ſirname and a kind of lozenge croſs, may be ſeen in our firſt plate of monograms, &c. of the German ſchool of engravers; but it is to be obſerved, that there are ſome few prints marked with the croſs only, which have the appearance of being more ancient than thoſe which are marked with the W and croſs.

Of the former kind are, "a hairy, wild, Man fighting with a Bear," and "a Woman ſeated, careſſing a Unicorn," both ſmall, and of the upright form.

Of the latter kind (marked with the W and croſs,) a Gothic ornament for a crozier, a large upright; "The inſide of a Gothic Edifice," a middling-ſized circular plate, "A Ship ſtriking againſt a Rock," with the inſcription, "Haerdze" in German text, a ſmall plate; a ſet of military ſubjects, ſmall, and another of ſaints ſtanding in Gothic niches, ſmall uprights; "Three Skulls in an Arch, ornamented with Gothic work;" and "The Genealogy of Jeſus Chriſt," wherein ſaint Elizabeth appears on a throne, reading, with the Virgin Mary and infant Chriſt below. On the right hand is David with his harp, and on the left Aaron. Behind the throne ariſes a genealogical ſtem of the lineage of Chriſt from David to Joſeph, repreſented (as uſual) by half figures. This laſt is a large upright print.

Martin Schöen, or Schön, or Schöengauer, called by the foreign writers on art, Le Beau Martin, or Hübſe Martin, and miſtakenly called by Vaſari Martin of Antwerp, was born at Culmbach, a ſmall city in the circle of Franconia, in the year 1420. He was educated a goldſmith, and a certain Luprecht Ruſt, and Francis Van Stoſs, or Stohlzirs, have been mentioned as his tutors. At the age of forty, and probably before, he diſtinguiſhed himſelf by his extraordinary powers in the arts of painting and engraving, particularly the latter, and died at Colmar in 1486. His prints are without dates, but he, rather than any other man, may claim the honour of having been the firſt to practiſe the art of engraving on plates of metal, with a view to their being afterward printed on paper.

Schöen engraved from his own compoſitions; his plates are numerous, and ſhew that his mind was fertile and vigorous. If it was not ſufficiently vigorous to burſt the Gothic fetters which at that time manacled the taſte of Germany, his admirers may ſolace themſelves by doubting whether the unaſſiſted powers of any individual whatever would have been found adequate to ſo difficult an occaſion. The tyranny of eſtabliſhed cuſtom is probably not leſs ſtern and unrelenting in the arts of deſign than in thoſe of education.

How the ſtiff and meagre manner,—the angular draperies and emaciated forms which characterize the early productions of the Germans, came to prevail among the Gothic and Celtic nations, from whom they derived them, is a curious, and perhaps not an unimportant, queſtion. By comparing the early efforts in art of all nations of which we have any memorials, we may be led to infer, that man has gradually learned to ſee objects as they really exiſt in nature; the images pictured on the retina of the eye appear to be refracted in their tranſmiſſion to the intellectual retina, and in every country continue be ſo refracted, until, as the ſun of ſcience ſlowly aſcends, the morning denſity of the mental medium is gradually rarefied; it is not leſs obſervable, nor a leſs curious fact, that a ſimilar haggard lankneſs in the attempts of man in an uncivilized ſtate, to imitate the human form, has almoſt univerſally prevailed, even in ages and climates the moſt diſtant from each other. The early art of Egypt, Perſia, and Hindooſtan, agrees in meagreneſs with the rude efforts of the Mexicans and South-ſea iſlanders, and with the German art, derived from the Gothic and Celtic nations, which is now under our obſervation.

In the time of Martin Schöen, and Albert Durer, German art was much in the ſame ſtate with European ethics: theory was ſeparated from practice; and both art and philoſophy remained perplexed with falſe analogies, metaphyſical jargon, and occult nonſenſe; till Bacon, and the reſurrection of the antique, referred them to the reſults of experience, as a criterion of principle.

Neither lord Orford then, nor any other man, ſhould have diſpraiſed either Schöen or Durer, for not having done, what no artiſt of any other ſchool has of himſelf been able to perform: for, not only neither of theſe founders of the German ſchool, but none of the early Italian maſters, has ſhewn that he poſſeſſed the penetration to ſee beyond this gloomy exhalation from the barbaric ages, till the great examples of claſſic art began to re-appear, and reflect back on Nature the light they had received from her.

The works of Schöen evince a ſtrong mind operating on the co-exiſting ſtate of things, brooding over the abyſs from whence the future elements of his art were to be created; and uſing with conſiderable ſucceſs the materials by which it was ſurrounded; and it may be regarded as fortunate for his claims, that in the inſtance of his St. Anthony he has adopted a ſubject that in its nature ſet him free, or nearly ſo, from the Gothic bondage with which, on other occaſions, his genius was ſhackled: he has been the firſt boldly to venture into the regions of Chimera, and by the potency of his art has compelled thence the dæmons that Callot and Teniers were afterward ſolicitous to invoke and proud to employ; while the expreſſion of undiſturbed faith and pious reſignation in the countenance of the holy man whom they are hurrying into the air, ſhews that he ſaw and copied that portion of Nature which ſhe did vouchſafe to unveil to him, with a clear viſion, and delicate, though determined, hand. If his dæmons are more fantaſtic and leſs terrible than modern art would deem it proper to introduce, we ſhould recollect that the age of Schöen was that of Arioſto, and that two centuries elapſed between the groteſque monſters of Arioſto, and the ſublime dæmonology of Milton.

It is conſonant to the progreſſive improvement of critical obſervation, that more ſhould be known of the human countenance at an early period, (or indeed at any period,) than of the reſt of the figure, becauſe it is the kind of ſtudy and obſervation in which men are moſt intereſted. Accordingly, Schöen's heads are in general by far the beſt parts of his performances. Thoſe of his ſingle figures of St. Martin and St. John have conſiderable merit; the divine character and expreſſion of that of his Chriſt bearing his croſs, as it appears in the good impreſſions, have rarely been ſurpaſſed; and ſeveral other heads in this extenſive compoſition poſſeſs a proportional ſhare of excellence.

In this, as well as in ſeveral other of Schöen's prints, may be traced a latent feeling exiſting in the mind of their author, that the engraver's art might be rendered ſubſervient to the expreſſion of the various textures of ſubſtances. Nay more; this elementary principle ſtrongly diſcovers itſelf in the manner in which he has treated the grain of the wooden croſs; in the various modes he has invented of deſcribing the different materials of dreſs in which the figures are habited, and in the ſterility of the ground; perhaps the latter is as much the reſult of the neceſſary operation of the uneducated graver, as of ſtudy. Yet, is it in ſuch full concord with the barrenneſs of the ſcene, and the barbariſm of the ſubject, as to be not unworthy of favourable notice; while the whole together ſeems to ſhew that a ſentiment has ſubſiſted from the very commencement of engraving, that it was ſuſceptible of this particular merit, and which may therefore be fairly preſumed to be not founded in the fallacious refinements of modern faſhion, (though perhaps ſometimes run after with too much of faſhionable avidity,) but one of the primary elements of the art.

The mark which Martin Schöen affixed to his works may be ſeen in our firſt plate of the monograms, &c. of the German ſchool of engravers. Heinneken has enumerated an hundred and fifty of his engravings, moſt of which are much and deſervedly ſought after by connoiſſeurs. We ſhall begin our ſelect liſt with the mention of thoſe of which the ſubjects are taken from ſacred hiſtory.

A Nativity, where the Virgin Mary is in the act of adoring the infant Saviour, who is lying on a ſtraw pallet; behind the Virgin appears a bull and an aſs; and in the diſtance St. Joſeph. Three angels appear in the air, holding a ſcroll.

Another Nativity, where Joſeph is ſeen in profile, holding a lantern. The bull and aſs are here looking at the infant Chriſt; the ſcene in a vaulted ſtable, where, through an opening, are ſeen three ſhepherds in converſation, and three angels hymning hallelujahs above.

On the ſame plate of copper, which is ſtill kept as a curioſity, and may be ſeen in the chapel of the hoſpital at Colmar, is likewiſe engraven “The Adoration of the eaſtern Kings.” The ſcene here is alſo in a ſtable, where the kings are kneeling and offering preſents to the infant Saviour, who is held by the Virgin Mary. This plate is very ſkilfully executed, and is of a ſmall folio ſize.

“The Flight into Egypt,” in which angels are repreſented aſſiſting St. Joſeph to gather dates, and lizards are introduced with both local and allegorical propriety, one on the ground, and two others climbing up a tree. This alſo is in ſmall folio.

A ſet of ten plates of “The wiſe Virgins,” and “The fooliſh Virgins,” ſmall uprights. The former bear their lighted lamps in their hands, and are crowned with garlands of flowers; the latter are trampling on their garlands, while their lamps alſo are on the ground.

A ſet of twelve ſmall quartos from the life of Chriſt. In the firſt he is repreſented in prayer on the mount of Olives; in the ſecond, arreſted by the government; in the third, before the high prieſt; in the fourth, ſoldiers are ſcourging him; in the fifth, he is crowned with thorns; in the ſixth, Pilate is waſhing his hands; in the ſeventh, he is exhibited to the multitude; in the eighth, bearing the croſs; the ninth is the crucifixion; the tenth the holy ſepulchre; the eleventh the deſcent into hell, and the twelfth the Reſurrection.

A large folio of “Chriſt bearing his Croſs,” one of the moſt celebrated of the engravings of Schöen, and on which we have commented above.

A Crucifixion, alſo in folio, and which has been copied by Iſrael von Mecheln. The Virgin Mary and St. John are in this print repreſented at the foot of the croſs, and angels in great affliction; “The laſt Judgment;” a ſet of twelve middle-ſized uprights, of which the ſubjects are taken from the life of the Virgin; “The Death of the Virgin,” ditto, which has alſo been copied by Von Mecheln and other contemporary artiſts, and is a compoſition of conſiderable merit, and one of the moſt carefully finiſhed engravings of the maſter; “St. Anthony hurried into the Air by Dæmons,” a very capital work, of which we have already ſpoken, an upright folio, but not very large. A ſet of the apoſtles, very ſmall.

Of miſcellaneous ſubjects, Schöen has engraved “The Alchemiſts fighting;” “A Biſhop's Crozier,” in folio, in the ſpiral volute of which is the Virgin Mary with the infant Chriſt, and an angel playing on a lute; an incenſe-cup or cenſer with a chain, ditto. Twelve ſmall plates of goldſmiths' ornaments, conſiſting of armorial bearings with their appropriate ſupporters, &c. cloſing with an eſcutcheon, bearing the cypher of the artiſt himſelf, ſupported by a female; and “The Battle againſt the Saracens,” in which St. James appears on the part of the Chriſtians; a large folio plate, preſumed to have been the laſt of Schöen's engravings, from the circumſtance of certain diſtant figures toward the left hand corner being left in an unfiniſhed ſtate.

Bartholomew Schöen is ſaid, by profeſſor Chriſt, to have been the brother of Martin, but of the dates of his birth and death we find no account. His apparently very ancient engravings are known by his initials, having between them a mark of ſeparation exactly reſembling that which ſeparates the initials of Martin Schöen, which confirms the probability of their having been brothers.

The engravings of Bartholomew bear that ſort of reſemblance to thoſe of Martin, that a bad copy does to a good original, and in neatneſs and feeling are exceedingly defective. They are partly original, but the greater number are copies from the very ſuperior prints of his brother.

His original works conſiſt chiefly of groteſque figures, of which ſome are by no means deſtitute of humour. It may ſuffice to mention the few following, which are all engraved on ſmall plates.

A beggar man, with an old woman in a wheelbarrow ; a man playing on a lute, with an old woman holding a ladle and jar ; two groteſque heads of an old man and woman, marked in a better ſtyle than the former ; and a lover and his miſtreſs, a ſmall circle.

He copied the ſet from the life of Chriſt, the large folio of Chriſt bearing the croſs, and various other of the prints of Martin, but the copies may be known from the originals, by their inferiority as well as by the difference between the two ſignatures.

When a man of original genius, or one who may claim that nobleſt of human diſtinctions, the title of *inventor*, ſhines forth on the world, a ſwarm of buſy flutterers round his glory are kindled into exiſtence, buzz in his rays, and think to ſhare his fame. Such was Bartholomew Schöen, when conſidered with reference to his brother ; ſuch probably were Paul and George Schöen, who have been mentioned as goldſmiths and engravers of this early period, and ſuch were thoſe other contemporary imitators and immediate ſucceſſors of Martin, who now claim ſome ſmall portion of our notice.

Of talents far inferior to thoſe of Martin Schöen, yet engravers to whoſe works the virtuoſi are by no means inattentive, were the Iſrael von Mechelns, father and ſon, whom Strutt has miſtakenly inclined to identify, as having been one and the ſame individual. Both were natives of Mecheln or Mekenin, a village near Bocholt, in the biſhopric of Munſter, in Weſtphalia.

The elder Iſrael von Mecheln (or Mekenin) was born in the year 1424, and, like Schöen, he was by trade a goldſmith.

The year of the nativity of the younger Iſrael has not been mentioned. The lateſt of his engravings is dated in the year 1522, and he died in 1523. It has been conjectured, that he ſtudied under Martin Schöen, from the number he has copied of that maſter's works, but this ſeems very inſufficient evidence of the fact. It rather ſeems to ſhew that the barrenneſs of his invention correſponded with the dryneſs and inſipidity of his ſtyle as an engraver.

The works of the Von Mechelns (*if* the father engraved) are numerous. That he did engrave, is inferred by the baron Heinnekin from the following circumſtance. “ An attentive examination (he ſays) will make it appear that all theſe prints are not by the ſame hand. I am almoſt certain that Iſrael, the father, engraved ſeveral, thoſe eſpecially which have the greateſt marks of antiquity, and are executed in a rude ſtyle, approaching neareſt to the work of the goldſmith. Nor, do I deny, that the ſon may have commenced originally as a goldſmith, by engraving armorial bearings, flowers, foliage, croſſes, and other ornaments : but he was a painter as well as an engraver, and a man of tolerable ability, conſidering the time in which he lived.”

Strutt, on the other hand, can ſee no reaſon for dividing the works which paſs under this name, nor can he find any other difference in the prints than might reaſonably be expected in the works of an individual artiſt, who performed ſo many : his moſt early productions being of courſe the rudeſt, but all equally defective where he has attempted to expreſs the naked parts of the human figure.

The difficulty, and the importance alſo, of the queſtion, ceaſes, when we reflect that it was part of the profeſſional buſineſs of the goldſmiths of that day, in which every apprentice was inſtructed, to ornament their productions with engraving.

Of theſe engravings, ſo little worthy of learned controverſy, the principal are ; the portrait of the ſenior Mekenen, an elderly man with a long beard, his head dreſſed with a turban. The plate is in quarto, and bears the inſcription “ Iſrael von Meckenen, Goldſchmit.” Ditto of Mekenen, junior, and his wife, inſcribed “ Figuracio facierum Iſrahelis et Ide Uxoris, I. V. M.” in 8vo.

“ The Deſcent of the Holy Ghoſt ;” “ St. Luke Painting the Virgin and Child,” and a ſet of prints from “ The Life of Chriſt ;” ſmall upright folios, though varying a little from each other in dimenſions.

Theſe are among the prints which Heinnekin ſuppoſes to be the work of Mekenen the father, and Strutt, the early productions of the ſon. They bear the evident marks of being the attempt of a novice, being wretchedly engraved and quite as ill drawn.

“ Judith and Holofernes,” of the folio ſize. In the back ground is an army, where cannon and other modern implements of war are ignorantly introduced. “ The Banquet of Herodias.” This alſo is a folio plate, twelve inches in length, and marked Iſrahel V. M. At one end is ſeen the decollation of St. John the baptiſt ; and at the other, Herodias and her father appear ſeated at table. “ Herod's Cruelty,” is a middle-ſized upright.

Of holy families, the Iſraels engraved ſeveral, the chief of which may be known from each other by the following peculiarities. In one, the Virgin Mary, habited in a long robe, is ſitting with the infant Chriſt, while beyond an encloſure appears St. Joſeph repoſing. Toward the bottom, at the right hand corner, is a ſmall graſshopper, from which it has obtained the name of the Virgin of the Graſshopper. It is in quarto, and inſcribed Iſrael V. M. (This plate has been copied, with improvements, both by Albert Durer and Mark Antonio.) In another, the Virgin Mary, ſeated in a landſcape, is about to kiſs the infant Saviour ; the Deity appears in the clouds above ; and St. Joſeph ſleeping. (This is a middling-ſized upright, and is partly finiſhed by means of ſcratches, which are apparently made with the point of the graver, ſomewhat in the manner of Rembrandt.) In another, which is dated 1480, the Virgin and Child are ſurrounded by four angels. This is alſo a middling-ſized upright.

Of other ſacred ſubjects, we ſhall mention “ The Annunciation,” in 8vo., where an angel appears holding a ſcroll, on which is the motto “ Ave. Gra,” and the Virgin is kneeling before a praying deſk, on which is inſcribed I. V. M. “ The Death of the Virgin Mary,” copied from Schoen. “ The Virgin crowned by Angels, and ſtanding on a Creſcent, while the fall of Satan is repreſented below,” an upright folio. “ The Scourging of Chriſt,” ditto. “ The Bearing of the Croſs,” a large folio, copied from Schöen, and two large folios of the “ Crucifixion of our Saviour,” which are diſtinguiſhable from each other by the following peculiarities : in the one, angels are receiving the blood from the wounds of the dying Saviour, while the Madonna and St. John appear below : in the other, which is eſteemed the ſuperior work, St. John holds a book in one hand, while the other is lifted, and the hands of the Madonna are claſped ; and the ground in the latter is almoſt left white, whereas in the former it is nearly covered with engraving.

From the legends of the Roman Catholic rubrics, the younger Iſrael has engraven, “ St. George and the Dragon,” in 4to. inſcribed I. V. M. Schöen's “ St. Anthony tormented by Dæmons ;” and “ St. Jerome,” in which the ſaint appears ſeated in a room and pointing to a ſkull. On the right hand corner is the lion's head. The latter has been copied by Lucas of Leyden, and in the opinion of Strutt is Iſrael's maſter-piece, though perhaps that diſtinction ought rather to be granted to his moral print of "A Cavalier and Lady, walking in amorous talk, while Death from behind a Tree is ſhaking an Hour-glaſs," a deſign which, whoever was its original author, had previouſly been engraven by Sporer or Schauflein, and has been ſubſequently copied by Albert Durer and ſeveral others.

Of the ſingular deſign conſiſting of three naked women, with a globe hanging above, which is inſcribed 𝕲.𝕭.𝕸. there is alſo an engraving by Iſrael.

A folio plate of "The Death of Lucretia;" a pair in quarto, of "A Woman ſinging, while a Man accompanies her on the Lute," and "A Man playing the Organ, while a Woman blows the Bellows," both marked I. M.; Schöen's richly ornamented incenſe cup; and ſeveral plates of groteſque foliage and other goldſmiths' ornaments, are all that we ſhall mention of the two hundred and fifty engravings by the Iſraels which are enumerated by Heinnekin. Neither of them appears to have had any ſettled monogram, but marked his engravings variouſly, as we have ſtated in the courſe of our liſt, ſometimes adding to his name and reſidence the word "Goldſchmit," and at others "Tzu Bockholdt," in the German character. The beſt of their works, as has been before intimated, are copies from the ſuperior productions of Martin Schöen.

Matthew, or Martin Zagel, Zaſinger, or Zinck, goldſmith and engraver, was born in the year 1430, but in what part of Germany is not known, though, from the ſubjects of two of his engravings, it may be gueſſed that he was of Munich: neither is the year of his death certain, though, that he lived to the beginning of the ſixteenth century, and engraved till the age of ſeventy-five, may be inferred from the circumſtance of one of his prints being dated in the year 1505.

The extreme of Gothic ſtiffneſs appears in his works. His compoſition is bad, and his drawing ſtill worſe: the mechanical part of his engraving, indeed, poſſeſſes a certain degree of neatneſs, but is without the fainteſt ray of taſte. It is proper, however, to obſerve, that from the delicacy, or rather faintneſs of Zagel's manner of engraving, his plates would not ſtand many good impreſſions; that many of the retouched prints, which are exceedingly bad, are abroad in the world, and that therefore, to do juſtice to the ſlender ſhare of merit which he poſſeſſed, it is neceſſary to ſee the early impreſſions of his plates; nor ſhould be left unmentioned, that in his latter engravings he diſplays a more intimate knowledge of perſpective than we find among his predeceſſors in Germany. Zagel marked ſome of his prints ſimply with the initials M. Z.; and others, as will be ſound in our firſt plate of the monograms, &c. of the engravers of Germany. Among his beſt engravings may be reckoned "Solomon's Idolatry," a middling-ſized upright, dated 1501. "A Holy Family," in which the Virgin Mary is receiving water from a fountain, in a cup of the ſame date with the preceding. "The legendary Story of St. Chriſtopher bringing the Infant Jeſus acroſs an Arm of the Sea," a ſmall upright. "A Lover ſeated in a Landſcape, entertaining his Miſtreſs," and "Two Lovers Embracing," ditto. Two large and very rare folio engravings of "The Grand Ball and Tournament at Munich:" in the former of which is repreſented a dance and card party, in which the duke of Bavaria is engaged at play, and in the latter a tournament, at which the duke is preſent. "The Martyrs St. Catherine and St. Urſula," both in 8vo. "The Martyrdom of St. Sebaſtian," in 4to. "The March to War," ditto, and "Ariſtotle the Philoſopher," a ſubject often repeated, and called by ſome Socrates and Xantippe. The laſt is a very rare print, in 4to.

Albert Glockenton was a native of Nuremberg, born in the year 1432, and who flouriſhed as an engraver at the commencement of the ſixteenth century; but the time and place of his death are uncertain. Strutt ſays of him, that if he did learn his art from Schöen, he not only imitated his manner, but copied a great number of his prints: which copies conſtitute the greater part of the works of Glockenton. He executed his plates with the graver in a neat but ſervile manner, by no means improving the drawing of his originals. He marked his engravings with a ſort of half Gothic initials of his name, as may be ſeen in our firſt plate of the monograms of the German engravers, and ſometimes added the date.

The principal works of Glockenton, after the originals of Martin Schöen, are "Chriſt bearing his Croſs," and "Chriſt crucified;" both rare and of the folio ſize: "The death of the Virgin." The ſet of the wiſe and fooliſh virgins, ten plates; the paſſion of our Saviour, a ſet of ten others, both of which are more particularly mentioned in our account of Schöen, and the "Virgin and Child at an Altar;" in 4to. The latter is ſuperior, in point of compoſition, to the German art of that period, is marked with only a Gothic G, and bears the very early date of 1466; which is perhaps the moſt ancient that is to be found on any copper-plate print whatever. Of this engraving particular mention is made under the article Glockenton. in the "Catalogue Raiſonnée du Cabinet d'eſtampes de Brandes"

Contemporary and co-equal with Zagel and Glockenton, was an engraver for whom Strutt claims a ſort of doubtful exiſtence, by the name of Wenceſlaus of Olmutz, in Bohemia. He found a copy of Martin Schöen's "Death of the Virgin" in the Monro collection, which had not only the name of this artiſt inſcribed upon it, but the date of the year in which it was engraved, namely 1481. He adds, "there is no doubt of its being a copy from Schöen, becauſe it bears the evident marks of a ſervile imitation. It is highly probable that Wenceſlaus was the diſciple of Schoen,"—"another obſervation ariſes from a ſtrict examination of this print, upon comparing it with the ancient German engravings marked with the W only; which is, that they are evidently the work of the ſame artiſt as the preceding, though they have uſually been attributed to Michael Wolgemut, the maſter of Durer. The name is perfectly plain," but the words that follow are far leſs legible, and in the opinion of the preſent writer are much more like *Olomuce Ibidem* than Olmutz in Bohemia.

Of theſe prints marked with the letter W only, Strutt mentions the following:

The "Annunciation," where the Deity appears above and a pot of flowers is introduced on the fore-ground; a ſmall upright; "The Cavalier and Lady heedleſs of Death;" "The Laſt Supper;" "The Crucifixion of St. Anthony;" ſmall and nearly ſquare; and the ſet of ſmall uprights from the "Life and Paſſion of Chriſt."

The above are all from Schöen; thoſe which follow are from the Iſraels of Mekenin.

"An old Man leading a little Boy, with a Woman following carrying a Girl at her back;" and "A Lover entertaining his Miſtreſs;" two ſmall uprights; and "The naked Women with a Globe ſuſpended from above."

We are now again arrived at the time when the Nuremberg Chronicle was publiſhed, and thoſe extraordinary works both on copper and on wood began to appear, which are known to the world under the highly reſpected name of Albert Durer.

Of the various powers of Albert; his reputation as the father of the German ſchool of painting; and his general merits as an artiſt, we have already treated pretty much at large; (ſee DURER, ALBERT.) It remains to add our liſt of his principal engravings, and to comment more particularly on ſome of thoſe which are, and deſerve to be, moſt conſpicuous. Though the defects of the artiſt are pointed out in the critical remarks which follow, and which are chiefly extracted from lectures delivered at the Royal Inſtitution in the years 1805 and 1806, yet are they calculated to lead the attentive obſerver to a more intimate acquaintance with the merits of this extraordinary engraver, and to confirm the general and juſtly merited praiſe which has now, for three centuries, been beſtowed on Albert Durer.

The reſemblances between the ſeveral objects which this maſter has introduced into his engravings, and their archetypes in nature, proceed, for the moſt part, too much upon fac-ſimile principles for the generalized dignity of his ſubjects; and his powers of imitation are too prodigally laviſhed upon ſubordinate and uneſſential parts.

The expreſſion of his figure of "Melancholy," which would elſe have approached ſublimity, is conſiderably injured by the introduction of a multitude of objects, moſt of which the mind does not readily aſſimilate with the ſentiment of melancholy. It muſt firſt be perceived or diſcovered, that theſe objects are alluſions to aſtrology, alchemy, and the occult ſciences, as they are called. The performance addreſſes itſelf, therefore, to the curious and inquiſitive part of mankind, and not to man: and as neither the eye nor the mind can at once dilate with greatneſs and deſcend to littleneſs, it is evident that the reſearch it requires muſt be the deſtruction of ſublimity.

Though there is nothing of the "holy calm," with which Collins has ſurrounded his figure of melancholy, this compoſition may ſtill be thought intereſting on another account, namely, as a true picture of the times in which it was engraven; for preciſely thus was attention perplexed and diſtracted on moſt philoſophical ſubjects in the age of Albert Durer; and as he is author of ſeven treatiſes, moſt of which are on the metaphyſics of art, he had probably experienced much of that ſpecies of melancholy which proceeds from the mental exhauſtion and diſſatiſfaction in which ſuch ſtudies often terminate. Regarded in this view, it is no inapt verification of the old adage, "The painter paints himſelf." It might have aſſiſted to reconcile us to the defects of this performance, if Albert Durer had named it Study; or, if we could fancy the figure out of the picture, we might be content to let our attention dwell awhile on the ſkill with which he has repreſented moſt of the other objects, when abſtractedly and ſeverally conſidered. This talent, however, of repreſenting the characters and textures of individual objects, is ſtill more conſpicuous, and ſomewhat leſs objectionable, in the print of "St. Jerome in the Room," wherein all the objects are rendered with a fidelity little ſhort of the camera obſcura. Regarding the art as in its infancy, we may look at this engraving with the ſame kind of pleaſure, (and we ſhould at all the works of art of this period, with the ſame candid indulgence) with which Reynolds contemplated "The Virgin and Child" by Van Eyck, in the cathedral church of Bruges—"the artiſt," ſays ſir Joſhua, "having accompliſhed the purpoſe *he* had in view."

Another of the moſt celebrated, though not the beſt, of Durer's engravings, is his "Adam and Eve." He has, in this inſtance, had recourſe to nature for his models, but his Eve is not "the faireſt of her daughters," nor his "Adam the goodlieſt of men ſince born:" yet we may perceive that he ſelected from the nature with which he was acquainted; and though we do not behold the ſymmetry and ſuperlative grace of Greek beauty, we probably ſee the felt and acknowledged beauty of Nuremberg. It will alſo be allowed, that the Paradiſe they muſt ſhortly quit, does not ſeem very deſirable to inhabit; here is no genial light, no luxuriance of vegetation, and no abundance of animal life. To uſe more of the words of Milton, nature is ſo far from wantoning as in her prime,—ſo very far from playing at will her virgin fancies, that ſhe appears, in thoſe of Shakſpeare, "bald with dry antiquity:" yet if Raphael has violated this cardinal principle of propriety, by erecting a church, and houſes two ſtories high in his Paradiſe, who ſhall throw the firſt ſtone at Albert Durer? The boles of his trees, though among the firſt, if not the very firſt that were ever engraven, have much of the truth of individual nature, and their foliage, and the fur of the cat, are expreſſed with a degree of freedom that muſt ſurpriſe thoſe who reflect that no etching has been employed, and how comparatively ill calculated are the ſleek and ſtiff lines of the unaſſiſted graver to the expreſſion of ſuch objects. The introduction of the cat and mouſe in Paradiſe could not fail to be underſtood, from its familiarity; but though ingenious, this very familiarity rendered it unfit for the occaſion. The prophet Iſaiah has far more nobly expreſſed the primæval harmony and happineſs of the brute creation.

The Eve of Albert Durer is apparently of the ſame family that Otho Venius, and Rubens, afterwards adopted for their models; and in the engraving which collectors call "The Death's Head," is a female figure, which ſtill more evidently ſhews the eſteem in which Rubens muſt have held the works, or at leaſt the women, of Albert Durer. It is not eaſy to conceive the occaſion that could have given birth to this myſterious print of Death's head. It preſents us either the ordinary routine of human life in allegory, or perhaps a ſort of poetic armorial bearing. The creſt is a winged helmet, richly ornamented, and beautifully executed; and though a ſkull, which one ſhould think could not fail to be an awful monitor, is highly emboſſed on the ſhield, the female ſupporter, heedleſs of her charge, heedleſs of the moral leſſon, and of the moral character ſhe has to ſuſtain, is obviouſly liſtening to the very ſuſpicious ſuggeſtions of a ſort of ſavage man. It appears to be one of the night thoughts of Albert Durer, and perhaps, like thoſe of Dr. Young, may be intended to mark the lamentable influence of the groſſer paſſions. Whatever its author may have intended to inculcate by this print, its execution as an engraving is admirable. The helmet, with all its pomp of heraldic appendage, and the actual and reflex lights on its poliſhed ſurface, are characteriſtically, though minutely, expreſſed; the ſkull is accurately drawn, and its bony ſubſtance is deſcribed with a maſterly hand; the author has even ſedulouſly attended to the finer enamel of its two remaining teeth. The head of the ſavage, with its beard and wild redundance of ſnaky tangled hair, has conſiderable and well-managed breadth of light and ſhade, though its character is far leſs ſavage than ſhould ſeem to belong to the reſt of the figure: its expreſſion is, doubtleſs, meant to be aſſumed and inſinuating. The countenance of the female has ſeldom been ſurpaſſed for that ſucceſsful mixture of character and expreſſion that lends a willing ear to a deluſive promiſe; and the hands of both figures are far better drawn than we have hitherto ſeen among the productions of the German ſchool: the drapery alſo, which we have been accuſtomed to ſee ſtiff, ſtarched, and complicated, is here relaxed into freedom and ſimplicity, and is ſo remarkable for ſilky texture; approaches ſo near to what is now termed pictureſque compoſition of forms and light and ſhade; and is, on the whole, ſo ſuperior to that of his Melancholy, and ſome other of his ſubſequent works, as leaves us either to wonder that Albert Durer, having once attained, ſhould ever loſe ſight of the excellence of its principles; or to infer that he did not perceive their excellence, or that the ſcience he deduced from his own obſervation of nature prevailed but occaſionally over the prejudices of his education.

In his ſmall prints of the life of Chriſt, of which Marc Antonio is ſaid to have pirated the copy-right, other inſtances occur of this ſtyle of ſuperior ſimplicity in the draperies, and ſome of broad and captivating effects of light and ſhade. His Jeſus Chriſt ſuffers greatly, or beams with God-like benevolence; his Magdalens and Madonnas are ſometimes divinely pathetic; and many other of the heads in theſe intereſting and often grand compoſitions, are exquiſitely finiſhed miniatures, remarkable for that ſort of accordance and conſiſtency of parts which we deem the internal evidence of truth and nature. The principal portraits of Durer, engraved on copper, are thoſe of the elector Frederic of Saxony, dated MDXXIIII. Albert, elector of Mayence, dated 1523. Bilibald Pirkheimer, dated 1524. Melancthon, dated 1525. Theſe are all of the quarto ſize.

In folio he has engraven his friend Eraſmus, good impreſſions of which are now become very rare, dated 1526, and two figures of himſelf, on the ſame plate, one being his portrait in the year 1509, and the other in 1517. They ſtand on either ſide of a piece of architecture.

Of the portraits of Durer, it may with truth be ſaid, that, in point of drawing, they poſſeſs the ſame internal evidence of correctneſs which diſtinguiſhes the beſt of his hiſtorical heads: in ſtyle they are laboured; but the labour is not ill-beſtowed; and the chiaroſcuro is frequently comprehenſive and clear. His compoſitions from holy writ, and thoſe legends which in his day were thought to be nearly of equal authority, are numerous. The principal of thoſe on copper are “The Adam and Eve in Paradiſe, or Sin of our firſt Parents,” which has already been the ſubject of detailed comment, a very elaborate work in folio, dated 1504. Another “Adam and Eve,” which repreſents them after their expulſion from Paradiſe. “Adam crawling, and Eve ſitting with an Infant at the Entrance of a Cavern,” in quarto. “A Man with a Beard, ſeated on the Ground (his Horſe faſtened to a Tree) careſſing a Young Woman,” a ſmall quarto plate, known by the name of “Judah and Tamar,” and believed to be the earlieſt of Albert Durer's engravings. “The Nativity,” where the Virgin Mary is adoring the Infant Chriſt, while St. Joſeph is drawing water from a well. “A Holy Family,” known, among connoiſſeurs, by the title of “The Virgin of the Butterfly,” where the Madonna is ſeated in a landſcape, with the infant in her arms, and St. Joſeph aſleep near her. Another, known by the title of “The Virgin of the Ape,” where the Infant Chriſt, kneeling, is playing with a bird, and an ape is tied near the group. Another, known by the title of “The Virgin of the Pear,” which is dated 1511, where the Infant Chriſt, holding a pear, is ſitting with his mother at the foot of a tree. Another, known by the name of “The Virgin of the Apple,” which is dated 1514. All of them are of the 4to. dimenſions. An etching of the “Holy Family,” in folio, wherein the Virgin Mary is ſtanding and holding the Infant Chriſt in her arms, and a girl is introduced at prayers, dated in the year 1519. A ſet of fifteen, including the frontiſpiece, entitled “The ſmall Paſſion,” very rare, and dated from 1507 to 1512. “Chriſt Crucified, with the Holy Women at the Foot of the Croſs,” a ſmall circle, without the artiſt's mark, and ſaid to have been done for the ſword-belt of Charles V. “The Saviour proſtrate in the Garden of Olives,” very rare, and dated 1515. “A Group of Angels bearing the Inſtruments of Crucifixion, &c.” engraved on tin, or iron tinned over, and dated 1516. “The grand Ecce Homo,” in large 4to. with a Latin inſcription, and dated in 1512, a very rare print, much ſought after by connoiſſeurs. “The Entombing of Chriſt by the Holy Women,” in ſmall folio, a print dated 1507, and in which ſeveral cats are ſtrangely introduced, but which ſome think is not by Albert Durer. “The Infant Prodigy,” a kneeling figure, in folio: ſome pretend that this is a portrait of Durer himſelf. “St. Hubert at the Chaſe,” a folio print, in which the ſaint is repreſented kneeling before a crucifix, which appears upon the head of a ſtag: the ſcene is a wood, with a caſtle at ſome diſtance.

Albert Durer has been analogically compared with our poet Spenſer, and it has been remarked, that “if any one of his performances were to be pointed out as more particularly reſembling Spenſer, it ſhould be that of the Legendary Tale of St. Hubert. They are characterized by the romantic heights of extravagance; the ſame abundance of ideas; the ſame unremitted and ſucceſsful attention to minute excellence; the ſame general air of incredibility rendered credible, and, as we ſhould ſay now, if the works of the poet and engraver were now produced for the firſt time; the ſame want of concentration, brevity, and general effect; but a temporary adoption of the ſympathies of the ſixteenth century, as far as art is concerned, reconciles us to theſe.”

Of the ſubject of St. Jerome, Durer has engraven two plates in ſmall folio, on one of which, where the ſaint is ſitting in a chamber, we have already commented; in the other he is kneeling before a crucifix, in a rocky deſart, and the engraving is far leſs elaborately finiſhed than the former.

“A naked winged Woman ſtanding on a ſmall Globe ſuſpended in the Clouds, holding in one Hand an elaborately wrought Cup, and in the other a Bridle,” a folio print, known among dealers by the name of the Larger Fortune. According to Vaſari, it ſhould be called Temperance, according to others, Prudence: but, perhaps, Albert Durer meant it for the Guardian Genius of Nuremberg, of which city a bird's eye view appears beneath.

Another “Naked Woman on a Globe,” in 12mo., called the Leſſer Fortune. She holds a long ſtick and a thiſtle. The figure of “Melancholy,” on which we have already commented. She is ſitting, her head reſting on her hand, ſurrounded by various emblems, a folio plate, of exquiſite workmanſhip, dated 1514. “The Dream of M. Wolgemut,” where he is repreſented aſleep near a frying pan: the devil is behind with a large pair of bellows, and on the ſide Venus, with Cupid walking on ſtilts. “The great Satyr,” who is attacked by a fawn whilſt repoſing with a nymph, a ſmall folio, the work of the graver, and performed with admirable ſkill. “The Sorcereſſes,” four naked women in a room: a globe, with the letters O. G. H. is ſuſpended from above, and in an adjoining chamber appears the devil ſurrounded by flames: it is dated 1497. Baldinucci thinks it is the earlieſt of Durer's engravings. It is copied from Wolgemut, and is a rare print. “A Chevalier on Horſeback, and in complete Armour, purſued by Death on Horſeback, (who is holding forth an Hour-Glaſs,) and another Spectre:” this is a very highly finiſhed and exquiſite engraving, in ſmall folio, of which good impreſſions are rare. It is by ſome termed “Death's Horſe,” and by others, with more propriety, “The Worldly Man:” it is dated 1513, and the impreſſions which were taken before this date was inſcribed, are much valued. "The Death's Head," of which we have already given a particular deſcription, in ſmall folio, dated 1503. Another heraldic ſubject of the ſame dimenſions, diſplaying a lion rampant on a ſhield, and a helmet ſurmounted by a cock ſpreading his wings. "A large Horſe," behind which marches an armed man with boots, bearing a halbert, and another horſe of more beautiful form, behind which marches another armed man with a halbert, having a griffin on his helmet: both in 4to., and dated 1505. "A diſhevelled Sorcereſs, mounted on a He-Goat, and flying through the Air, with a Diſtaff in her Right-Hand. "The Prodigal Son," a ſmall upright folio, of which the impreſſions, before the date 1513 was added, are held in moſt eſteem.

Under the article Etching we have aſcribed the invention of this mode of art to Albert Durer. The earlieſt of his etchings, which bears a date, is called "The Rape of Proſerpine," a folio print, dated 1516, and in two years afterwards appeared his more celebrated etching of the march of an army, which has been called "The Cannon," from a large piece of ordnance forming the principal object on the fore-ground: the ſcene repreſented is the entrance of a village, with a bird's eye view over an extenſive country, and three Turks are introduced near the fore-ground. Both theſe etchings are reported to have been performed on plates of iron or ſteel; and the latter, which is now become rare, is among the largeſt of the works of Albert Durer.

The principal of thoſe works of our artiſt which are commonly ſuppoſed to have been engraven on wood, are as follow:—The portraits, in folio, of Albert Durer, inſcribed "Albrect Durer counterfeyt in ſeinem alter des LVI." without the engraver's cypher; another with his cypher; the emperor Maximilian I.; a buſt with numerous ornaments, inſcribed "Imperator Cæſar Divus Maximilianus Pius Felix Auguſtus 1519;" Ulrichus Varnbuler, a rare print, with the following inſcription on a ſhield, "Albertus Durer Noricus reddere que conatur 1522."

From the numerous hiſtorical works which Durer performed in this manner, we ſelect the following: A ſet of thirteen folio prints, including the frontiſpiece, from the life and paſſion of Jeſus Chriſt, inſcribed "Paſſio Domini, &c." dated 1510, 1511. A ſet of twenty-ſeven ſmall uprights, known by the name of the Smaller Paſſion, and inſcribed "Figuræ Paſſionis Domini Noſtri Jeſu Chriſti 1519, 1520." An "Ecce Homo," in folio, engraved in a bold and broad ſtyle, and with great freedom. "The Holy Trinity, ſurrounded by the Angelic Hoſt," and dated 1511. Another "Ecce Homo," known by the title of "The Myſtery of the Maſs." A ſet of ſixteen folio pieces, incluſive of the frontiſpiece, of which the ſubjects are taken from the Apocalypſe, and the text printed on the reverſe of every leaf. A ſet of twenty-two ſmall folio prints from the life of the Virgin Mary, dated 1509, 1511: ſeventeen of this beautiful ſet of engravings were copied by Marc Antonio at Venice, to all of which copies, except one, the Italian artiſt added the cypher of Albert Durer. "The Holy Family," of the folio dimenſions, where St. Anne holds the infant Saviour, and the Virgin Mary is in the act of adoration. "The Rhinoceros," a rare print, in folio, with a German inſcription, dated 1515.

In clair-obſcure (or chiaroſcuro) printed from a ſucceſſion of blocks, the following are aſcribed to Albert Durer: "A Holy Family in a Landſcape:" two angels are crowning the Virgin Mary, and on the fore-ground are three rabbits; in large folio. Two, of legendary ſtories from the lives of St. Auguſtin and St. Chriſtopher, in large folio, the latter of which is ſcarce. A ſort of apotheoſis of the emperor Maximilian, where, accompanied by the Virgin Mary and numerous ſaints, he is adoring the Saviour. (Of this piece Huber poſſeſſed an impreſſion on vellum very richly coloured.) A pair, which are ſcarce, of "A Fortreſs in a ſtate of Siege," generally called the Siege of Vienna, dated 1527. A ſet of ſix ornamental deſigns for tapeſtry, of aſtronomical ſubjects. The whole number of engravings by Albert Durer, and after his deſigns, are ſtated to amount to 1214: but Mariette's collection amounted to no more than 420, which were ſold at his death for 1830 livres. See the article Durer in the Catalogue Raiſonnée of the Brandes cabinet.

The triumphs of the emperor Maximilian, which, when paſted together, form two very large and long prints of the frieze form, have been generally aſcribed to Albert Durer, but the reſearches of Mr. Douce of the Britiſh Muſeum, and Mr. Edwards of Pall-Mall, have determined that they are the performances of various other artiſts, though perhaps executed under the general ſuperintendance of Albert Durer.

Lucas Cranach, or Kranach, was born at Cranach, in Weſtphalia, in the year 1472 or 1474, and died at Weymar in 1553. He was educated a painter; yet whether he ſtudied under any other maſter than his father has not been recorded. He paſſed ſeveral years in the ſervice of the elector of Saxony as an artiſt, diſtinguiſhing himſelf by his engravings on copper and wood, and in that manner which is technically called *chiaro-ſcuro*. His fertility of invention far outran his judgment: led away by the livelineſs of his fancy and talent for compoſition, he took ſuch forms as were before him, following the ſtiff Gothic taſte which prevailed in his country at the time, without attempting to improve it. His manner of drawing is rather dry and taſteleſs, than abſolutely incorrect, but his heads have a moderate portion both of character and expreſſion, though they are not marked with preciſion or in a pleaſing ſtyle: his hands and feet are very defective, and a total ignorance of the art of diſtributing light and ſhade confuſes his effects.

Cranach ſometimes marked his plates with the initial letters of his name: and ſometimes with the cypher, but more frequently with the dragon holding a ring in his mouth, which will be found in our firſt plate of German marks and monograms. The dragon is the creſt of the elector of Saxony, to which, on ſome occaſions, Cranach added the electoral ſhield.

The following will probably be found among the beſt of his engravings, beginning with thoſe which are executed on copper: Portraits of Jean Frederic elector of Saxony, where an angel appears on high with a crown of laurel, in large 4to. and very rare. The two electors of Saxony, Frederic and Jean, the former of whom is holding a chaplet, in 4to. dated 1510, and almoſt ſquare. Chriſtianus II. king of Denmark and Norway, ſurrounded by ornamental architecture, armorial bearings, &c. in large 4to. Profile of Martin Luther in the habit of a monk of St. Auguſtin, inſcribed "Des Luters geſtalt," in 4to. and dated 1523.

The chief of his hiſtorical works are: "Adam and Eve after their Fall," (called by ſome the Penitence of St. Chryſoſtom) the ſcene is a deſart, where a naked woman and child appear on the fore-ground, and in the back-ground a man is crawling, a folio plate, dated 1509, marked with the cypher and little dragon of Cranach, and executed quite in his Gothic manner. "The Temptation of our Saviour in the Deſart," where the Chriſt has ſomewhat better pretenſions to merit, than generally belongs to the figures of Cranach, but the tempter is as groteſque and entertaining a devil as you would wiſh to ſee: the print is in ſmall folio, and marked L. C. W. the laſt letter denoting Wittenbourg: it is very rare and bad. A whimſical compoſition, of "Jeſus Chriſt in the Clouds," ſurrounded by angels, and inſpiring the elector of Saxony, a half length of whom appears below; a ſmall print, almoſt ſquare.

In chiaroſcuro, that is, on two blocks of wood, the one for the outline and darker ſhadows, and the other for the demitints and lights, Cranach has engraven "St. Chriſtopher carrying the Infant Chriſt over an Arm of the Sea," a folio print, dated 1507. "St. George and the Dragon," a large 4to. "St. John preaching in the Deſart," in folio, dated 1576. And, "A Naked Venus" (of ludicrous beauty) accompanied by Cupid, who is trying his bow, in folio.

The letter-preſs engravings of Cranach, commonly ſuppoſed to have been performed on wood, are as follow: Buſt of Jean Frederic, elector of Saxony; ditto of Martin Luther in the coſtume of a monk of the order of St. Auguſtin, dated 1520; both in 4to.

Whole length portraits of Martin Luther; Philip Melancthon; the emperor Charles V.; the emperor Ferdinand; Jean Fredric, elector of Saxony; and Jean Guillaume, duke of Saxony, all of the folio ſize.

A half length of the elector of Saxony, holding a book open before a crucifix, a rare print, marked with the little dragon, dated in 1552, and inſcribed with a Latin ſentence.

Of his hiſtorical works, the following are held in moſt requeſt among collectors. "Adam and Eve in Paradiſe, or the Sin of our Firſt Parents," dated 1509. "The Annunciation." "St. John preaching in the Deſart," which has been called a grand compoſition, and is dated 1516, and the "Decollation of St. John:" all of the folio ſize.

A ſet of twelve in ſmall folio from the life and paſſion of Jeſus Chriſt, inſcribed on the title page "Paſſio D. N. Jeſu Chriſti venuſtiſſimis imaginibus," &c. and dated 1509: this ſet is highly eſteemed among connoiſſeurs. Another ſet of twelve, of the Martyrdoms of the Apoſtles, in 4to. and which are held in ſtill more requeſt for rich compoſition and the expreſſion of the heads, and are on the whole ſuperior to the preceding: they are dated in the year 1549.

It is curious to reflect with how frequent inſenſibility, the Gotho-german artiſts of the age of Cranach ſelected ſubjects that called for the introduction of beauty even of the higheſt kind, and dreſt out their virgin Maries and Venuſes in all the ſtiff meagreneſs of their age and country. "Paris viſited by the three Goddeſſes on mount Ida," is a rare piece in large folio, dated 1508. "Curtius leaping into the fiery Gulph" is alſo in folio, and dated 1508. Three plates of tournaments, of which two are called the great, and the other the little tournament, dated 1509; and a pair of park ſcenes with ſtags in the rutting time, and which are very rare, conclude our liſt of the engravings of Lucas Cranach.

Hans or John Burgkmair painter, and engraver on wood, was born at Augſburg in the year 1474. He ſtudied under Albert Durer, and ſome of his engravings are dated ſo early as 1510, but the time and place of his death are unknown. He engraved chiefly, if not entirely on wood, and his prints poſſeſs much of the fire and ſpirit which diſtinguiſh thoſe of his maſter. Profeſſor Chriſt attributes to him ſome ſmall ſpirited woodencuts which were made for the ancient edition of the works of Geyler de Keiſerberg, which bear the above date (of 1510), and are marked I. B. Many of the works of this artiſt bear his name at length, the reſt are marked with one or other of the two cyphers which will be found in our plate of the monograms, &c. of the German ſchool.

The following are the engravings by Burgkmair, which are moſt ſought after by collectors: "The Emperor Maximilian I. on Horſeback;" of which deſign there is a duplicate engraving in clare obſcure, which bears the name of Joſt de Negker, but which is partly the work of Burgkmair. It is a very rare print, dated in the year 1508, both of the folio ſize. "St. George on Horſeback," alſo bears the name of Negker, and is of the folio ſize, and in clare obſcure. "Joſeph and the wife of Potiphar," is of a ſquare form, and in 4to. "St. Thomas," "St. Bartholomew," and "St. Sebaſtian," dated 1515, are all in folio. "A young Woman mourning the loſs of a Hero that Death has overcome," is a rare print in folio; by Burgkmair and Negker.

The remainder of the letter preſs cuts of this artiſt are, a ſet of two hundred and thirty-ſeven for a folio work, of which the manuſcript by Marc Treitz Sauerwein is in the Imperial library at Vienna: its title is "Der weiſs Konig" (the wiſe king), and it conſiſts of the diſtinguiſhed acts of the emperor Maximilian.

"The triumphal Entry of Maximilian," conſiſting of one hundred and thirty-five blocks or plates, have remained for a long period of time unknown at the caſtle of Ambras, but within theſe few years have been removed to the Imperial library at Vienna, ſince which, impreſſions have been taken, and ſeveral ſets have been brought to England. Many of theſe engravings are the work of Burgkmair, and are marked at the back with his name or initials, though the whole generally paſſes under the name of Albert Durer, and were probably executed under his direction. Another work, executed by theſe artiſts conjointly with Hans Schaufflein, is called the Tewrdanck; but the greater number of the prints contained in it are from the graver of Burgkmair.

Johanſen, or Hans Baldung, ſurnamed Grien or Grun, painted and engraved for the letter preſs and in clare obſcure. He was a native of Gemund in Suabia, and was born in the year 1476. He flouriſhed as an engraver through the earlier part of the ſixteenth century, and the lateſt of his works is dated in the year 1534, but the time of his death is uncertain.

His engravings are executed in a bold ſtyle, and with conſiderable power over the inſtruments of his art. Strutt ſays of him, that "his figures are rather expreſſive than correct; the naked parts of them are poorly drawn; and the extremities, though free and ſpirited, are often heavy, and not well marked:" yet conſidering the period and place at which Baldung lived, he may be regarded as a meritorious artiſt. His engravings are ſometimes marked with his name at length, and at others with the cyphers which we have given in our plate of German monograms. His principal works are, "Adam and Eve in Paradiſe." "The Fall of Adam:" in the latter, a tablet is ſuſpended from a tree, bearing the motto "Lapſus humani generis," and the date 1511. Both are of the folio ſize, and the Fall of Adam is a performance of merit in clare obſcure.

A ſet of thirteen figures in ſmall folio of the Saviour and twelve apoſtles, dated in 1514, and marked with the artiſt's cypher. "The Crucifixion," with the holy women and St. John at the foot of the Croſs, in clare obſcure. A ſet of four ſmall uprights repreſenting the Effects of Love, or Influence of Women, exemplified in the ſtories of Samſon and Dalilah, Solomon's Idolatry, David and Bathſheba, and Xantippe and Socrates, (called by ſome Ariſtotle and Phryne,) dated 1515. "A drunken Bacchus lying at the mouth of a Caſk," in 4to. "The Sorcereſs," who is mounted on a he-goat, holding a cauldron. A pair, cut in a maſterly ſtyle, of wild horſes in a foreſt, with the name of Baldung at length, and the date 1534. Another pair of ſmall landſcapes, which are ſaid to be etched on plates of iron, and are very rare.

Of Hans Bréſang, a deſigner and engraver for the letter preſs, very little more is known than that he was contemporary with Baldung, and has ſometimes been miſtaken for him from the ſimilarity of their cyphers, and their taſte in deſigning and engraving. Miſtaking the numeral 5, in the dates of his engravings, for a 6, Strutt has placed him a century too late.

Thoſe of his works which are beſt known, are "Adam and Eve in Paradiſe," of the folio ſize; bearing the cypher of Breſang, and the date 1519. A ſet of three of the 4to. dimenſions, dated 1504; *viz.* "Chriſt on the Croſs;" "Chriſt lamented by the holy Women;" and "A dead Chriſt," with angels bearing him away. Another ſet of thirteen, of the Saviour and twelve apoſtles, alſo in ſmall 4to. and the three Deſtinies in a landſcape, dated 1513, a very rare print in 4to.

Lucas or Louis Krug, or Krugen, painter, goldſmith, and engraver, was born at Nuremberg in the year 1489, and died in the ſame city in 1535. He formed his taſte, in deſigning and engraving, from ſtudying the works of Lucas of Leyden, and drew the human figure better than many of his contemporaries, though his attitudes are ill choſen, and his draperies ſtiff. His mark was a ſmall pot or jug placed between his initials on a tablet, as repreſented in our firſt plate of the monograms, &c. of the German engravers, to which the date was in ſome inſtances added. His principal engravings are as follow:

"The Nativity," "The Adoration of the Shepherds," and "The Adoration of the Kings," three ſmall uprights, dated 1516. "The Holy Family," and two prints of the Ecce-Homo, with the inſtruments of flagellation, in ſmall 4to. "St. John the Divine, writing," while the holy Virgin is dictating to him from the clouds, and below is the ludicrous incident of the devil emptying the ink-horn of the ſaint. "Two naked Women contemplating a Skull and Hour glaſs," and "A naked Woman ſitting with her Back towards the Spectator," with a city and mountain appearing in the diſtance; all ſmall uprights.

Hans Schauſflein, the third engraver of that name, was born at Nuremberg ſome time about the year 1487, and died at Nordlingen, a town in Suabia, in 1550. He ſtudied under Albert Durer, and imitated his ſtyle with conſiderable ſucceſs.

The moſt diſtinguiſhed of his performances are, "The Creation of Eve," in 4to.; "Chriſt with the Crown of Thorns, and the Virgin Mother in Grief;" and "Herodias with the Head of St. John the Baptiſt," both in folio. "The Banquet of Herodias," a grand compoſition, ſuppoſed to be engraven on two blocks in large folio. "Numa Pompilius recommending religious worſhip to the Romans," and "Lucretia ſtabbing herſelf," a pair in 4to. A ſet of eight plates of military ſubjects in folio. Another ſet of four rare prints of "The Triumphs of the Wives of the celebrated Sots," in ſmall folio. The greater number of the ſet of twenty of marriage proceſſions. Part of the ſet of an hundred and eighteen of "The Perils and Adventures of the excellent and famous chevalier Tewerdanks," a curious and very rare book, printed at Nuremberg in the year 1517.

But few libraries have the honour of poſſeſſing a complete copy of this celebrated work, of which Melchior Pfintzing ſays, in the dedication to Charles king of Spain, that he had ſeen moſt of the actions that are therein engraved and deſcribed, which in fact are thoſe of the emperor Maximilian I. under the fictitious name of Tewerdanks.

Albert Altdorfer, whom ſome have miſtakenly ſuppoſed to have been of Altdorff in Switzerland, was a native of Altdorf in Bavaria, born in the year 1488. His name is found in the regiſter of the citizens of Ratiſbon in the year 1511, where, having paſſed the routine of preparatory civil offices, he was made a member of the interior ſenate, and architect of the city of Ratiſbon, and where, in 1538, he died without iſſue.

Some of his pictures may yet be ſeen at Ratiſbon, and at the town houſe is preſerved a complete collection of his engravings. The French call him "le petit Albert," preſumptively in contradiſtinction to the *great* Albert Durer, and becauſe his engravings are ſmall, for which reaſon alſo he is uſually ranked with "the little maſters."

His merit was however not inconſiderable. He engraved both for the rolling-preſs and letter-preſs; but thoſe which he did for the latter are his beſt performances. He poſſeſſed a lively fancy, a free hand, and great facility of invention. Yet his ſtyle is German, and his drawing, though ſpirited, is incorrect. He marked his plates and blocks with the two ſorts of monograms which appear in our plate of the cyphers, &c. of the German ſchool. One of theſe marks has been attributed to Aldegrever; but the evident ſuperiority of the latter maſter is of itſelf ſufficient (independent of the cypher) to correct the miſtake.

From the ſpirited wooden cuts of Altdorfer, Holbein, of whom we ſhall preſently ſpeak, is ſaid, and probably with truth, to have derived great aſſiſtance in the progreſs of his ſtudies.

Altdorfer's principal engravings on copper are the portrait of himſelf; and that of Martin Luther, in an oval, ſurrounded by foliage; the head of an infant, one of his earlieſt works, dated in 1507; "Adam and Eve in Paradiſe;" "Solomon's Idolatry;" "Dalilah and Sampſon;" "Judith and Holofernes;" ſeveral ſmall prints of the Madonna and infant Chriſt; a Crucifixion, with numerous figures; another with the Virgin Mary and St. John, both ſmall uprights; "St. Jerome ſtanding in a Cavern," where is an altar, book, crucifix, and a tablet, with the monogram of the artiſt; another St. Jerome among buildings, accompanied by a lion; "St. George combating the Dragon;" two etchings of the death of Dido, and that of Lucretia; a pair copied from Marc Antonio, of "Venus accompanied by Cupid entering the Bath," and "Venus leaving the Bath:" theſe are ſmall uprights and in a neat ſtyle. "Cupid Sporting with Sea-horſes." "Amphion ſaved by Dolphins," dated 1525. A pair of "Laſciviouſneſs," and preſumptively, "Chaſtity," repreſented by a female ſitting on an altar, and holding a ſceptre, with numerous attendants bearing lanterns. "A Warrior precipitating himſelf into the Sea." A pair of ſmall landſcapes lengthways, one with rocks and the other with trees, which are touched with conſiderable freedom. The "Synagogue," with a Latin inſcription; and two plates of ornamented vaſes in 4to.

The number of engravings by this maſter, which are ſuppoſed to have been performed on wood, is conſiderable, probably exceeding a hundred, of which the following are moſt valued:—A ſet of forty of "The Fall and Redemption of Man," ſmall uprights, executed in Altdorfer's beſt manner, and much valued: but collectors ſhould be careful not to admit into their portfolios, inſtead of theſe, a ſet of which all but two are *copies* from Altdorfer, and which were publiſhed at Zuric A. D. 1604, under the forged name of Albert Durer. "The Sacrifice of Abraham," and "Joſhua and Caleb," both ſmall. "The Annunciation," ditto, dated 1513.

The four following are in 4to. "The Purification;" "The Maſſacre of the Innocents," dated 1511; "The Decollation of St. John the Baptiſt," and "The Reſurrection of Chriſt," both dated 1512, and the latter eſteemed one of the moſt ſpirited works of the maſter.

The beautiful virgin of Ratiſbon, engraved from her ſtatue in Ratiſbon cathedral, is engraved in chiaroſcuro, though ſome few impreſſions were printed without the half tint: this is a rare print.

Of the often repeated ſubject of St. Jerome, Altdorfer has engraven two blocks, in one of which the holy man is kneeling before a crucifix in a cavern, and the other may be diſtinguiſhed by its very romantic back ground, both are ſmall, but juſtly held in eſteem. "St. George and the Dragon," and "The Judgment of Paris," both dated in 1511, and "St. Chriſtopher and the infant Chriſt," are all in 4to. A mountainous landſcape with buildings, and a large tree on the right hand, another of a gateway, and a grand baptiſmal proceſſion, a ſort of allegory, where, inſide of a church, the virgin and child, ſome angels, and a pilgrim, appear in the proceſſion, are all of the folio ſize.

Hans Holbein the elder flouriſhed towards the cloſe of the fifteenth century, and was of Augſbourg, but afterwards removed to Baſle in Switzerland. According to profeſſor Chriſt, he engraved on wood, and certain prints marked with an H., or the cypher H.B., the B being joined to the firſt perpendicular ſtroke of the H., are attributed to him; but Strutt doubts whether they ought not rather to be aſcribed to Burgkmair or Baldung.

The great celebrity of his ſon has reflected a ſteadier light upon his name. Hans, or John Holbein the younger, was born at Augſbourg in the year 1495 or 1498, and died of the plague in London A.D. 1554. He was the pupil of his father, and gave earneſt of his very extraordinary powers, at a very early age.

About the time of his father's removal to Baſle, the genius of Holbein began to dawn on the arts of Europe. At this time, beſide engraving, as has been ſaid by various authors, for the letter-preſs in a very ſuperior ſtyle, he painted portraits, and occaſionally hiſtorical ſubjects in diſtemper and in oil, and Eraſmus, who was then ſuperintending the printing of his works at Baſle, came to ſit for his likeneſs to young Holbein.

Being charmed with his portrait, Eraſmus ſoon formed a friendſhip for the artiſt, and at his perſuaſion Holbein ſoon after travelled to England. He brought with him the portrait of his friend, and letters of warm recommendation to the great ſir Thomas More, who was at that time lord chancellor, and high in the favour of Henry VIII.

Holbein was received by the chancellor in the moſt friendly and flattering manner, and the family of the Mores, beſides ſeveral other perſons of diſtinction, and finally the king himſelf, honoured our artiſt by ſitting to him for their portraits. Patronized by ſir Thomas, and poſſeſſed of ſuch talent in the arts as had not appeared in England before, he was eaſily received into the royal ſervice upon very liberal terms, and ſo proud was Henry of the abilities of his protegée, or ſo juſt to the claims of his genius, that he frequently ſat to him for his portrait, and the ſtory which we have related of the condeſcenſion of the emperor Maximilian to Albert Durer has been often repeated of king Henry and our artiſt.

After the death of Henry, Holbein ſtill continued to enjoy the royal favour, and ſeveral portraits of Edward VI. from his hand are ſtill extant.

The career of Holbein was but ſhort, but as the poet on a leſs intereſting occaſion has beautifully ſaid, "the ſands of his hour-glaſs were diamond-ſparks," which, as they fell, glittered in the radiance of his reputation. He died, as we have before mentioned, of the plague, in his apartments at Whitehall.

For an account of his merits as a painter the reader is referred to the article Holbein. He began engraving when he was about ſixteen years of age, and very numerous and of extraordinary merit are the letter-preſs cuts which are ſaid to be from his hand, and after his own deſigns, which adorn the books that were printed about this time at Baſle, Zuric, Lyons, Leyden, and London.

Holbein appears to have formed his ſtyle, probably under the direction of his father, from ſtudying the works of his contemporary Altdorfer, who was now riſing in reputation, though not more than ten years older than our artiſt, and it ſeems highly probable that the whole of whatever letter-preſs engravings are from the hand of Holbein himſelf, are the production of thoſe fifteen years of his life which elapſed between the years 1511 and 1526, when he came to England, for it is not very likely that he would be led aſide from the advantages of the royal and noble patronage which he enjoyed in England as a painter, by any inducements which the printers and bookſellers of the continent might offer. Engaged in ſuperior purſuits, the preſent writer is inclined to think that he did no more than deſign the little wood-cuts which are aſcribed to him during his reſidence in our iſland.

The foreign writers on art, however, call him "the glory of wood engraving," and "the phenomenon of his age," adding that in order duly to appreciate his merit as an engraver, the connoiſſeur ſhould not look at the haſtily printed and worn impreſſions which are common, but ſhould have before him, early proofs, printed only on one ſide the paper, ſuch as were lately in the collection of M. Otto, an amateur of Leipzig, which, in point of delicacy, exceed all that had previouſly been exhibited.

His moſt eſteemed production in this way bears the Latin inſcription

> "Cernere vis Hoſpes ſimulacra ſimillima vivis?
> Hoc opus Holbinæ nobile cerne manus;"

and conſiſts of a ſeries of ninety ſmall letter-preſs cuts, of unequal merit, of which the ſubjects are taken from the Old Teſtament. The encomiums that have been repeatedly paſſed on the whole, namely, that "boldneſs, ſpirit, and delicacy are united in their execution," are only applicable to the beſt of theſe cuts: the reſt are ſcarcely, if at all, ſuperior to the common place of the day.

The firſt edition of this work, which is commonly termed Holbein's Bible, is ſaid to have been printed (at Lyons, by the brothers Melchior and Gaſpar Treſchel) in the year 1539, and as this was thirteen years after his departure for England, it is not eaſy to believe that theſe cuts are really *engraven* by Holbein, notwithſtanding what is aſſerted in the inſcription: and they are on the whole inferior both in deſign and engraving to the "Dance of Death," of which we ſhall preſently ſpeak.

That the craft of publiſhers on ſuch an occaſion ſhould have outſtripped the ſtrictneſs of truth, and that a name which had reſounded through Europe ſhould be uſed as the trumpet of popularity and the means of profit, would be no very extraordinary occurrence. The work was for the multitude, and the multitude, on ſuch a point, were eaſily deceived; nor could Holbein, if he were really the author of the *deſigns*, eaſily contradict the complimentary inſcription.

"The Dance of Peaſants," engraved from a picture which he painted in the fiſh-market at Baſil, and evidently before his departure for England, of which fine impreſſions are now become rare and valuable.

The cuts for "The Praiſe of Folly," of his friend Eraſmus, have alſo been aſcribed to Holbein, beſides ſeveral detached frontiſpieces, jewellery ornaments, and vignettes, and, laſtly, we ſhall mention the "Imagines Mortis," or "Dance of

Death," over Holbein's claims to which the accurate reſearch of M. Douce of the Britiſh Muſeum has thrown a ſhade of doubt that may not eaſily be diſpelled.

It conſiſts of forty-ſix ſmall upright prints, each ſurrounded by a double-line border, wherein Death, in the ſkeleton form, is poetically repreſented as leading off an individual from every ſtation and condition of life, from the emperor in his imperial ſtate, down to the meaneſt peaſant; and the general moral which combines the whole is, that Death pays no regard to age, ſex, or condition.

It ſeems proper here to be obſerved that theſe engravings are not taken, as Papillon, Strutt, and others have miſtakenly ſuppoſed, from an ancient painting on the walls of a cemetery at Baſil, and that this painting is not from the hand of Holbein, but is of much older date. The originals are drawings or ſmall pictures which have been ſuppoſed to be by Holbein, between which and the large picture in the cemetery there is this material difference, that the former forms one long and connected proceſſion of ſingle figures, each led by a ſkeleton, whereas the latter is compoſed of ſeparate groups, in which one or more living figures or ſkeletons are occaſionally introduced, as ſuited the views of the artiſt, and altogether forming a ſeries, the idea of which was no doubt ſuggeſted by the walls of the cemetery, and by the dances of death that were ſometimes found painted in the crypts of ancient cathedrals, and of which there was one at Lubec, another in the church of the Innocents at Paris, and another in our old cathedral of St. Paul.

Of Sigiſmund Holbein we ſhall ſay but little, for much could not be ſaid to his credit. He was uncle to our Hans, and painted, and engraved on wood; but his powers were very inferior to thoſe of his nephew, and even to thoſe of his brother. The prints marked with the monogram, which will be found in our firſt plate of thoſe of the German ſchool of engraving, are aſcribed to him, but Strutt doubts the fact of his having engraved them, nor does it much matter.

The cypher formed of an H and an L, which appears to that cut in the Imagines Mortis, of which the ſubject is called "The Ducheſs," is certainly not that of either of the Holbeins, and is very likely to have belonged to ſome German wood engraver, whoſe initials might be thus conjoined, who was the real engraver of the whole ſet of the Dance of Death, and who might perhaps be Hans Lederer, as is conjectured by Mr. Douce.

Bartolomeo Beham was born at Nuremberg ſome time about the year 1496, and, according to Sandrart, ended his days in Italy, a ſhort time before the middle of the ſucceeding century. He travelled thither with duke William of Bavaria, and became the diſciple of Marc Antonio, under whoſe inſtruction he advanced rapidly in his profeſſion, and whoſe ſtyle he imitated without implicitly following. He remained ſeveral years at Rome and Bologna, working chiefly in the excellent ſchool of Marc Antonio, and incorporating with the careful and patient manual execution of Germany, the accurate drawing of his maſter, and the fine taſte of Italy and Raphael. Strutt accordingly ſays of him, that "his drawing is correct and maſterly; his heads characteriſtic, and the other extremities of his figures well marked."

Sandrart ſtates of this maſter, that in his time a great many of his engravings (preſumptively engraved *plates*, and not impreſſions from them) might be ſeen in the gallery of the elector of Bavaria at Munich, and in the cabinet of the prince of Neubourg.

The collection of the works of Bartolomeo Beham is however attended with conſiderable uncertainty, from the circumſtance of many of them having been publiſhed without his name, monogram, or other mark. Strutt attributes to him the engravings that are marked with a ſmall die, on which ſometimes appears the letter B, whilſt the abbé Marolles, Huber and Roſt, contend that theſe prints are the production of Beatrici.

Of the works generally attributed to this maſter the following are the principal:—the portraits of William, duke of Bavaria; Eraſmus Balderman, at the age of 33, and Leonard van Eck, a counſellor of Bavaria, all in octavo. The emperor Charles V., at the age of 31, with the Latin inſcription "Progenies divum quintus ſic Carolus ille imperii Cæſar et ora tulit;" and the emperor Ferdinand I. with the inſcription "Proximus a ſummo Ferdinandus Cæſar Rex Romanorum ſic tulit ora genas," both in quarto, and marked B.B. Theſe are a finely engraved pair of portraits, and ſo much in the ſtyle of Marc Antonio, that Vaſari thinks the portrait of Charles V. is really engraved by that maſter.

The beſt hiſtorical works of Beham are "Adam and Eve, with the figure of Death introduced into Paradiſe." "Judith beheading Holofernes," dated 1525, and in the taſte of Marc Antonio. "The Madonna ſuckling the Infant Chriſt at a Window," (without the mark of the artiſt.) "A Sybil reading, and having before her a Boy holding a Flambeaux," (marked B. B. but apparently after Raphael.) "Suſannah and the Elders," after Julio Romano. The deaths of Lucretia and Cleopatra, both without the engraver's mark. "The Judgment of Paris," with a dark back ground, a ſmall frieze, repreſenting a combat, and marked "Titus Gracchus," and another ſmall plate of a combat, wherein ſoldiers are fighting with clubs, companion to the above. "An Infant careſſing a Dog," a ſmall circle, dated 1525. Another Child, with a ſkull near him, marked B. B. and dated 1524. An emblematical piece, inſcribed "Der Weif Lauf," in which appears a half naked woman fettered, and aſleep under a tree, an infant at her ſide, and a lamb at her feet; and an indelicate ſubject from Eccleſiaſtes.

Hans Sebald Beham, the couſin or nephew of Bartholomew, was born at Nuremberg in the year 1500, and died at Frankfort on the Maine in 1550. He is ſaid by Sandrart to have ſtudied under his relative, but Bartholomew went early to Rome, and, it muſt be remembered, was but four years older than Sebald; perhaps he merely learned of him the rudiments, and afterwards ſtudied with Aldegrever, of whom we ſhall preſently ſpeak, the works of Albert Durer.

He was obliged to quit Nuremberg on account of his libertiniſm, but ſettled ſoon after at Frankfort; where, however, he relapſed into his former courſes, and after engraving for ſome years, in the courſe of which the number of plates and tablets which he produced is ſurpriſing, he became the landlord of a tavern.

The German biographers of Sebald maintain, that when he eſtabliſhed himſelf at Frankfort, he altered his monogram, by ſubſtituting the letter B for the P which he uſed at Nuremberg; they do not ſay he did it for the ſake of concealment, and it may in ſome degree account for this variation, when we recollect that theſe letters are often orally confounded among the people of that nation. The Abbé Marolles, Le Comte, and the French writers, on the other hand, often call him Hiſbens, and Sebald de Bohemé, for which we cannot ſo readily account.

Sebald Beham ranks deſervedly high among the little maſters; he engraved chiefly from his own compoſitions, which ſhew a lively and vigorous invention, though ſomewhat hampered by the Gotho-german taſte, which was then prevalent, and which chiefly appears in the ſtarched and inelegant folds with which he loaded his draperies. His drawing of the naked, on which he ſeems to have juſtly prided himſelf, though not free from manner, is often correct, and ſometimes maſterly; his heads are expreſſive, and his other extremities carefully determined. The manual part of his engraving on copper, executed with the graver only, is clear and delicate. The prints which he has cut on wood are ſlight, but ſpirited and free, as wood engraving ought to be; for wood engraving ought not to emulate the delicacies and difficulties of the art of engraving on copper.

His two monograms will be found among thoſe of the firſt plate of the German ſchool. From thoſe which he engraved between the years 1519 and 1530, with the Nuremberg cypher, we ſelect the following; *viz.* the portraits of Sebald Beham and his wife Anne, where his cypher appears encircled by laurel. Two ſmall plates of "Adam and Eve in the terreſtrial Paradiſe," dated 1519. "St. Jerome with his Lion holding the cardinal's Hat." "The Madonna ſuckling the infant Chriſt." "The Virgin of Ratiſbon," where ſhe is repreſented ſtanding on a creſcent, and ſurrounded by radiance, and "The Death of Dido," all dated in 1520. "St. Anthony writing in the Deſart," and "St. Sebald, (the patron ſaint of Nuremberg,) ſitting among trunks of Trees, and holding in his right hand the Model of his Church," both dated 1521. "Two Peaſants marching and playing on the Flute and Bag-pipes, and a male and female Peaſant Dancing," dated 1522. "A Triton ſupporting a Nereid," dated 1523. "Force, allegorized by a Woman ſitting on a Lion," dated 1524. "A young Man ſitting under an Arbóur embracing a young Woman," dated 1526. "The Death of Cleopatra," dated 1529. An ornamented vaſe with an inſcription. "A combat between the Greeks and Trojans," inſcribed "Krichen und Droioner," and another combat, inſcribed "Achilles und Hector," both ſmall friezes.

Of thoſe which S. Beham engraved at Frankfort, between the years 1531 and 1549, and which are marked with his ſecond cypher, the following are held in moſt eſteem.

A vaſe enriched with ſculptured ornaments, at the baſe of which are two ſyrens, dated 1531. "Adam and Eve careſſing each other." "Adam and Eve in Paradiſe," between whom is Death, with a ſerpent wound round him, preſenting the fatal apple; a high finiſhed plate, dated 1543. "The emperor Trajan arreſted at the head of his Army." "Melancholy and Patience," two female figures, the former copied from the celebrated engraving of the ſame ſubject by Albert Durer, dated 1539; the latter ſitting on a column, which is inſcribed "Patientia," and dated 1540. Another pair, of Good-fortune and Evil-fortune, the former figure ſtanding and holding a wheel, the latter arreſted in her courſe by an evil genius, who is preſenting her with a lobſter or craw-fiſh. An etching of a buffoon preſenting flowers to a young woman. A ſet of the four evangeliſts, dated 1541. Another ſet of twelve of the labours of Hercules, dated from 1542 to 1548. "An Enſign beating a Drum," inſcribed "Im Baueren Kreig;" ſmall, and dated 1525. "A Roman Charity," very finely engraven, dated 1544. The arms of Beham, as granted to the family by the emperor Maximilian, a hexagonal print, inſcribed "Sebalt Beham, von Nurnberg, maler, jekt wohnhafter Burgher in Frankfurt," dated 1544. Buſt of Domitian in the manner of an antique medal. A ſet of ſix, and a title-page of the months repreſented by male and female peaſants dancing, the laſt dated 1545. "The Judgment of Paris," dated 1546. "Death ſeized from behind by a naked Female," a beautifully finiſhed plate, dated 1547, with the following words inſcribed on a ſtone, "Omnem in homine venuſtam mors abolit." "A Man endeavouring to root up a Tree," dated 1549, and inſcribed "Impoſſibile, &c." and a virgin and child copied from Bartholomew Beham, dated 1549.

The letter-preſs cuts of S. Beham have not been thus carefully arranged and ſeparated. We ſelect from them the following. His own portrait in a bonnet and without a beard. A ſet of eight from the Paſſion of our Lord, two of which are marked with his former, and two with his latter cypher. An "Holy Family," in which St. Joſeph is plucking fruit. "The Virgin and Child." "A Penitent." "St. Jerome with a Bible and Crucifix." "Immortality," repreſented by a female crowned with ſtars, and trampling on a ſkeleton, dated 1548. A public bath of Anabaptiſts, of both ſexes and all ages, of the circular form. Another public bath, a large print on four leaves. "A village Fair" of the frieze form, and "A March of Soldiers," alſo of the frieze form, and large; the four laſt-mentioned engravings are very rare; a ſet of three hundred and forty-eight, engraved for "Biblicæ Hiſtoriæ Artificioſiſſime depictæ," printed at Frankfort in 1537. But it is to be obſerved that there are two editions of this bible, of which the former is in Latin, and the latter, dated 1539, is in the German language.

Gregory Peins, or George Pentz, was alſo a native of Nuremberg, born in the year 1500. He firſt ſtudied in the ſchool of Albert Durer, and profited much by the inſtructions of that diſtinguiſhed maſter, but it was in Italy, and under Marc Antonio, that he finiſhed his taſte, formed his ſtyle of engraving, and acquired that correctneſs of drawing which we regard with ſo much admiration in his beſt works. His plates are executed entirely with the graver, which he handled with much ſkill, uniting with great preciſion a degree of freedom which was unexampled. He appears to have worked on ſome of the beſt plates that paſs under the name of Marc Antonio.

The far greater number of the engravings of Peins are of ſmall dimenſions; wherefore he is uſually claſſed among "the little maſters;" but he has produced ſome few large prints; one eſpecially of great merit, of "An Army paſſing a Ditch, and ſcaling the Walls of a fortified City," after Julio Romano; which, as Strutt has ſaid, is "an admirable ſpecimen of the artiſt's ſuperior abilities."

Peins died at the age of fifty-ſix, but where, his biographers have not mentioned: his monogram will be found in our plate of thoſe of the German ſchool; and the moſt eſteemed of his numerous works are thoſe which follow: Portraits of Gregory Peins and his wife on the ſame plate, with the inſcription "Imago Gregori Peins Imago Duxore Gregori Peins." From this engraving it ſhould appear, that the name it bears was the true name of our artiſt, and that the name Georgius Pentz, which appears under his large plate after Julio Romano, is probably an error of the publiſher Van Aelſt. Portrait of Jean Frederic, elector of Saxony, a rare print, dated 1543.

The beſt of the hiſtorical works of Peins are, a pair of "Eſther before Ahaſuerus," and "The Temptation of Job;" another ſmall pair of "Judith in the Tent of Holofernes, and Judith appearing afterwards with his Head;" another pair, finely executed, of "Solomon's Idolatry," and "The Judgment of Solomon."

Peins appears to have poſſeſſed ſome judgment, at leaſt ſome humour, in pairing his prints; the next companions which we have to notice, are "Suſannah ſolicited by the Two old Men," and "Lot intoxicated by the Two young Women, his Daughters."

From the hiſtory of the patriarch Joſeph, we find a ſet conſiſting of four plates; another ſet from the hiſtory of Tobit of ſeven, including the title-page. A pair of "The Good Samaritan, and the Converſion of St. Paul." A ſet of the Four Evangeliſts after Aldegrever, which bear the cyphers of both artiſts. Another ſet of the Seven Works of Mercy, of the circular form, and with German inſcriptions. Another ſet, very highly finiſhed, conſiſting of twenty-five, from the Life of Chriſt. "Herodias receiving the Head of John the Baptiſt." A pair of "The Rape, and Death, of Lucretia." A pair of "King Porſenna paſſing the Tiber, and Horatius Cocles ſingly defending the Bridge." Another pair from the Life of Virgil. Another pair, dated 1539, of "Cephalus and Procris, and Medea and Jaſon." "The Death of Dido," and "The Death of Virginia." A ſet of three, of "Mutius Scevola thruſting his Hand into the Fire;" "Marcus Curtius precipitating himſelf into the fiery Gulf;" and "The Puniſhment of Titus Manlius;" in the latter of which the artiſt has introduced the beheading machine, which is ſince known in France, the dreadful guillotine. A pair of "Sophoniſba" and "Artemiſia;" "The Supplication of Regulus;" "The Centaur Chiron inſtructing Achilles;" "The Triumph of Bacchus," a frieze in the antique taſte. A ſet of ſix emblematical triumphs of human nature, *viz.* of Valour, Chaſtity, Love, Time, Death, and Religion. A ſet of five of the ſenſes perſonified, with Latin inſcriptions; another ſet of the ſeven liberal arts; and another of the ſeven mortal ſins.

But his principal and largeſt work, of which we have already ſpoken, is "The taking of Carthage by the Romans," after Julio Romano.

Among that claſs of the ancient engravers of the continent who are called the "Little Maſters," from the ſmall dimenſions of their works, Henry Aldegrever ſtands in the very firſt rank. He was born at Zouſt in Weſtphalia, A. D. 1502, but of his anceſtors we find no account. Both his baptiſmal and family names have been miſtaken, for, by ſome authors, he is called Aldergraft; while others, perhaps, miſtaking ſome of the ſmaller works of Albert Altdorfer for his, ſay that his chriſtian name was Albert; but profeſſor Chriſt aſſures his readers that the name of this artiſt was Henry, and not Albert; and upon his own portrait his ſirname is written, at full length, "Aldegrever."

Nuremberg was at that time the head-quarters of German art; and thither young Aldegrever was ſent to ſtudy under Albert Durer. He imitated the ſtyle of his maſter with great ſucceſs, and gradually learned to blend with it a certain ſmall portion of the elegance and ſimplicity which Italy firſt caught from the reſurrection of Grecian art; and Germany from the engravings which were brought thither from Italy.

Aldegrever is a lofty object, which receives the firſt faint rays of a riſing ſun, and it is univerſally allowed by his critics, that had he reſided in Italy, "the genius and ability which diſplayed itſelf ſo conſpicuouſly in his own country, would have ſhone with double luſtre."

The manual part of his engraving, executed entirely with the graver, is extremely neat, and in a ſtyle evidently founded upon that of Durer. He is among the firſt who gave texture to the light parts of fleſh by the admixture of ſmall long dots, which has ſince been carried to ſuch admirable perfection by Nanteuil and others. His drawing of the naked, which he ſeems fond of introducing, is more correct than is found among his predeceſſors of Germany, and his men more correct than his women. His heads are, in general, expreſſive, and his other extremities well marked, though occaſionally ſomewhat heavy.

The time of the deceaſe of Aldegrever is not accurately known, but the lateſt of his prints is dated in the year 1558. The Abbé Marolles had ſeen at leaſt three hundred and fifty different prints from his graver, of which the following liſt contains the names of the principal; but the great demand for his works has occaſioned his plates to be much worn, and often re-touched; and Strutt, with becoming ſolicitude for his fame, adviſes the collector to be circumſpect as to the impreſſions he admits into his port-folios. His monograms may be ſeen in our plates of thoſe of the German ſchool.

The principal portraits of Aldegrever, are thoſe of himſelf without a beard, aged 28, and dated 1530. Another of himſelf, aged 35, in which he appears with a long beard; Martin Luther, dated 1540; Philip Melancthon, of the ſame date; and Albert Vander Helle, aged 28, and dated 1538; all in quarto.

His folio portraits are thoſe of William duc de Julius; John of Leyden, king of the Anabaptiſts, and Bernard Knipperdolling, another fanatic.

Of his hiſtorical engravings, the moſt celebrated are, A ſet of ſix, from the Hiſtory of Adam and Eve, dated 1540. A ſet of four, from the Hiſtory of Lot, dated 1555. A ſet of four, from the Hiſtory of the patriarch Joſeph, dated 1528 and 1532; all in 12mo.

A ſet of ſix, from the Hiſtory of Abſalom, dated 1540, A pair of "David and Bathſheba;" and "The Judgment of Solomon," in 8vo. A ſet of four, of "The Hiſtory of Suſanna and the Elders," dated 1555. Another ſet of four of "The Good Samaritan." A ſet of five, from "The Parable of the Rich Man," dated 1554. A ſet of the "Four Evangeliſts," bearing the monograms of both Aldegrever and Peins. "The Annunciation and Nativity," a pair, in 8vo. Two of "The Madonna and Infant Jeſus." Two ſmall friezes of "Battles between Hector and the Greeks, and Scipio and the Carthaginians." A ſet of ſix, of "The Deities who preſide over the Planets." A ſet of twelve, of "The Labours of Hercules," each with a Latin diſtich, dated 1550. A ſet of fourteen allegorical figures, ending with the Saviour victorious, and inſcribed "Pax noſtra Chriſtus." A ſet of the ſeven Cardinal Virtues. A ſet of the ſeven worſt Vices. Another ſet of ſeven, of "The Empire of Death," dated 1541.

The only etching from the hand of Aldegrever is now become very ſcarce: its ſubject is Orpheus and Euridice, dated in 1528, and in 12mo.

James, or Jacob Binck, was alſo of Nuremberg, or, according to ſome authors, was born at Cologne, in the year 1504, and died at Rome in 1560. His ſtyle of engraving greatly reſembles that of Aldegrever, under whom, or Albert Durer, he probably learned the rudiments of his art, and improved himſelf afterward in the ſchool of Marc Antonio: yet his ſtyle is not always the ſame; it often poſſeſſes more ſeeming facility than that of Aldegrever, and when, at the beſt, more of Italian taſte. He apparently ſtudied alſo, and imitated, that of Marc de Ravenna.

His cypher, compoſed of the initial letters of his name, is that of many other artiſts who lived about the ſame period; but he ſometimes added a little bird, and at others uſed the monogram, which will be found on our ſecond plate.

The chief works of Jacob Binck are, "A young Man dreſſed in a Bonnet, holding a Skull under his Cloak, and a Cup in his Right-Hand." This, according to Sandrart, is his own portrait; but, though the face may poſſibly reſemble him, the reſt of the compoſition is copied from an engraving of the ſame ſize by Iſrael von Mechenin.

The portraits of Francis I., Chriſtianus II. ſurrounded by ornamental architecture; a young princeſs, dated 1526; Luke Gaſſele, dated 1529; the archducheſs Elizabeth of Denmark; a pair, of Martin Luther, inſcribed "In ſilentio Veſtra," and Philip Melancthon, inſcribed "Si Deus pro nobis quis contra nos."

His principal hiſtorical engravings are, a ſmall plate of St. Jerome. "Marcus Curtius precipitating himſelf into the Fiery Gulf," marked 15 I. B. 29. A pair, of the frieze proportions, of "Infant Bacchanals gathering grapes, &c." and "The Triumph of Bacchus," wherein his car is drawn by ſatyrs, and attendant nymphs are playing on muſical inſtruments, dated 1528, 1529. A ſet of the Seven Planets perſonified. Another of the Seven Cardinal Virtues. An emblematical piece en medallion, in which a flaming heart, *i. e.* an heart of ardent virtue, is beaten on an anvil, by four allegorical females: which figures, as we are informed in Bilibald Pirkheimer's emblems, are Experience, Envy, Tribulation, and Intolerance, marked 15 I. B. 29. "Hiſtory," a female figure with wings, writing. A pair of "Peaſants marketing with People of ſuperior Condition." A ſet of twenty, of Divinities ſtanding in Niches, copied from Curalices, who copied them from Roſſo

The above are marked with the initials of the artiſt: the following are with his monogram. A pair, very ſmall, of "Eve with Two Apples, and Adam holding the Branch of a Tree." "Lot and his Daughters," a ſmall circle. "David with the Head of Goliah;" and "Judith with that of Holofernes;" both ſmall. "The Millennium, or Archangel Michael, chaining the Devil." "The Holy Family." "The Slaughter of the Innocents," a very rare print, after Raphael, but perhaps copied from the engraving by Marc Antonio. "The Deſcent from the Croſs." "St. John aſleep with the Lamb," dated 1526. "St. George and the Dragon." "Mercury travelling in a Deſart," a ſmall circle. "A Soldier defending himſelf againſt Death, who has overthrown him." "A Woman beating the Devil with a Diſtaff." "A Woman advancing with Surpriſe towards a Man who is ſeated near a Pedeſtal, on which is a Child," after Raphael, and engraved under the direction of Marc Antonio. "A Male and Female Peaſant Dancing." "The Blind Child." A vignette, with Cupids mounted on dolphins.

Strutt begs leave to add, a figure of "Saturn ſtanding in a Niche devouring One of his Children," a ſmall upright, which differs in the ſtyle of engraving from the foregoing, being more bold, ſpirited, and correct. The real meaning of this allegory muſt be, that Time is ſwallowed up by Eternity. On a tablet which is introduced is "Jacobus Binck Colonienſis, fecit 1530.

Another of "the little maſters" of Germany was Hans or John Broſamer, born at Fulda, in the circle of the Upper Rhine, in the year 1506. His manner of engraving often bears reſemblance to that of Aldegrever, but the ſchool in which he ſtudied is not known; ſometimes, however, he differs from that diſtinguiſhed maſter by interworking the lines of his draperies and backgrounds with ſtippling. His drawing of the naked is however very deficient, and in manual execution he by no means equalled the Behams. He died at the age of fifty-four, and his cypher, compoſed of the letters H and B, will be found in our firſt plate of thoſe of the German ſchool.

His principal engravings are, the portraits of Martin Luther, and the abbot of Fulda, dated in 1541.

And in hiſtory, "Samſon and Dalilah;" "David and Bathſheba;" and "Solomon's Idolatry;" dated 1543, all ſmall uprights. "Xantippe and Socrates;" "Laocoon and his ſons;" dated 1538; "The Rape of Helen;" of the frieze form, dated 1540; "Marcus Curtius leaping into the Gulf;" a ſmall circular plate; "The Judgment of Paris;" "A Crucifixion, with Angels, the Virgin Mary, and St. John;" "The grand proceſſion of Chriſtian Heroes;" a rare print, engraved on wood, and ſometimes attributed to Burgmair; and "Biblia Veteris Teſtamenti artificioſis picturis effigiata," printed at Frankfort in the year 1552, and conſiſting of a ſet of engravings on wood, chiefly, but not entirely, copied from thoſe of Holbein, which were publiſhed at Leyden in 1547; but by no means equal to the originals, either in ſpirit, neatneſs, or truth.

Auguſtin Hirſchfogel was born at Nuremberg A. D. 1506, and died in the ſame city in 1560. He was probably educated a painter, but produced ſeveral etchings, of which the landſcapes poſſeſs conſiderable merit, being etched with ſome taſte and the touch of a maſter, but when he introduced the human figure it is very incorrectly drawn. The ſingular monogram of Hirſchfogel, ſurmounted by a little croſs, will be found in our firſt plate of thoſe of the German ſchool, and his principal productions are as follow:

Part of "Raphael's ſlaughter of the Innocents," from a ſketch by that maſter, which differs from the print by Marc Antonio, dated 1545. A ſet of four, and another ſet of ſix landſcapes, from his own compoſitions of caſtle and mountain ſcenery, in 4to., dated 1546. A folio landſcape, in which is introduced an ill-drawn female intended for Cleopatra, dated 1547. An ornamented vaſe in 4to. dated the ſame year, and two ſmall views of ſea-ports, with ſhipping, &c. dated 1549.

Henry, whom Strutt has miſtakenly confounded with Hans or John Lautenſack, was alſo of Nuremberg, or, according to ſome authors, was of Doppelmayr, and born in the ſame year with the preceding artiſt. He was the ſon of a painter, and learned the principles of deſign in his father's houſe, which he probably continued to inhabit, for we find that he died in his native city in the year 1590.

The elder Lautenſack employed much of his time in engraving on the precious metals for the ſideboards and perſonal ornaments of the opulent and the great, but in the year 1567 he publiſhed at Franckfort on the Mayne the "Geometrical proportions and perſpective of the Man and Horſe;" in ſmall folio; "The Martyrdom of St. Catherine;" two ornamental plates of boys, &c.; "The decollation of St. John the Baptiſt;" "Chriſt expiring on the Croſs," and a boy ſtanding on a globe with a bow in his hand, and below whom is a deluge, with many ſmall figures, are alſo engraved by Henry Lautenſack, whoſe marks will be found in our ſecond plate of German monograms.

Of the ſame place and family with the preceding, was Hans Sebald Lautenſack, who was born in the year 1508, but of the principal events of whoſe life, and the time of whoſe death, we are ignorant.

His portraits are held in eſteem among connoiſſeurs for their truth of reſemblance; and his landſcapes, which are chiefly etchings, for their wild, or beautiful, or grand effects; but the figures which he has introduced are generally diſproportionate.

His landſcapes are of an hiſtorical character, and are commonly denominated after the figures they contain. Of theſe the following will probably be found moſt worthy of the collector's attention: "The little David combating the Great Goliah," dated 1551. "The Blind Man of Jericho, reſtored by our Saviour," and another miracle of "The Devil caſt out from the Canaanite," both dated 1559. "Balaam and his Aſs," in a very mountainous landſcape, and a very rich ſcene of "The Labours of the Vintage," are alſo dated in 1559, all of the folio ſize. An upright landſcape with a large farm, dated 1551. A pair of intereſting and extenſive ſcenes in 4to. dated 1553 and 1555. A grand tournament, of large folio dimenſions, entitled "Equeſtris pedeſtriſque pugnueicon," 1560; and another grand jouſt, entitled "Secundum Circenſium Ludorum, equeſtre certamen continens," 1560, both of which are now become very rare. A pair of views of the imperial city of Nuremberg, in large folio, each engraved on three plates, and dated 1552 and 1555.

The principal portraits by Hans Sebald, are thoſe of his father Paul Lautenſack, painter of Nuremberg, in folio. Himſelf, in ſmall folio, dated 1552. Hieronimus Seurſtab.

Georgius Roggenbach, and two other half-lengths, all in folio.

The brothers David, Jerome, and Lambert Hopfer appear to have been the ſons of a goldſmith, and flouriſhed at Nuremberg within the firſt fifty years of the ſixteenth century. They produced a great many ſpirited etchings, which Hollar afterwards made the foundation of his ſtyle. David was the moſt induſtrious of the three, but deſigned in the vicious taſte of his age and country: yet his freedom of handling is very pleaſing, and diſplays itſelf to advantage in buildings and ornaments. He uſually marked his plates with the initials of his name, between which he introduced what the Abbé Marolles appears to have miſtaken for a candleſtick, for he emphatically calls the Hopfers “le Maitres du Chandelier,” but what is really intended for a hop-plant, in alluſion to their name, which in the German language ſignifies hop-plant. Theſe letters, with the plant, ſometimes appear on a tablet, for which ſee our plate of German monograms.

The principal works of David, are the portraits of Nero and Galba, of the 4to ſize, as medallions. Carolus Rex Catholicus, the ſame. Martin Luther, dated 1523, and Claude Sturzenbecher, a rare print in folio.

Of his hiſtorical engravings, we ſhall mention, “David beheading Goliah,” in 4to. and “David Playing on the Harp before Saul,” in folio, dated 1531. “The Adulterous Woman;” “The Preſentation in the Temple;” “The Laſt Judgment;” and “A Grand Altar,” with the figures of Jeſus Chriſt, the Virgin Mary, St. John the Baptiſt, and others, all in folio. A ſort of ridiculous “Morice Dance of Groteſque Figures.” “The Monopoliſer of Grain, execrated by the People,” inſcribed, “die Sprich Salomo. Das XI. Capitel.” A ſubject from the 10th chapter of Solomon's Proverbs, dated 1534, both in folio. “The Three Great Jews, Joſhua, David, and Judas Maccabeus, on horſeback.” “The Three Chriſtian Heroes, Charlemagne, king Arthur, and Godfrey of Boulloigne,” companion to the above, both in 4to. and after Hans Burgmair. “A Grand Village,” of ſquare form and folio dimenſions. “Two Females Surveying themſelves in a Mirror, behind whom are Death and the Devil.” Two very groteſque figures, inſcribed “Bolikana, Markelfas,” in folio. “The Crucifixion betwixt the two Thieves.” Another “Crucifixion,” in which St. John and the Virgin Mary are introduced, the latter pierced by a ſword, in alluſion to her exceſſive grief; and a ſmall copy of a celebrated work of Andrea Mantegna, of “A Combat of Marine Monſters.”

Jerome Hopfer etched much in the ſame ſtyle with his brother, but was ſomewhat his inferior in merit. He made ſeveral copies from celebrated works of Albert Durer, and ſometimes engraved from his own compoſitions, marking his prints as did his brother.

His beſt works after Durer are, “St. Hubert,” “St. Jerome,” and “The Grand Cannon.” “Hercules Combating the Hydra,” is from Andrea Mantegna: and the beſt from his own deſigns are “Lucina holding a Moon in her right Hand, and a Flambeau in her left.” “Minerva holding a ſmall Figure of Victory.” A rare print of “The Engliſh and French drawn up in battle array, previous to the Fight at Agincourt.” And a battle, after Julio Romano.

Of ſtill leſs merit than his brethren, was Lambert Hopfer, who copied in etching a great number of the wood cuts of Durer, but his works diſplay little taſte and leſs correctneſs.

Among them are a ſet of fifteen of “The Life and Paſſion of Chriſt.” “The Converſion of St. Paul.” “The Fall of our Firſt Parents.” Several plates of arabeſque ornaments, and four beautiful candelabra, with an arabeſque band which is eſteemed the beſt of his engravings.

Strutt has added to theſe another Hopfer, for whom he claims equal merit with the beſt. The initial letter of his chriſtian name was an N. He worked with the graver, but imparted to his lines ſomewhat of the roughneſs of etching, and drew more correctly than David or any other of the family. To this artiſt he aſcribes “The Call of Jeremiah,” a ſmall upright, dated 1525. “A female Saint, holding a Palm Branch, and ſeveral Figures ſleeping with the Deity appearing above,” which, he ſays, is “a fine ſpirited etching.”

David Funck, a printſeller of Nuremberg, towards the beginning of the laſt century, collected and publiſhed all the plates of theſe artiſts, amounting to two hundred and thirty, under the title of “Opera Hopferiana:” ſome of which were found to be executed on plates of iron or tin.

Virgile Solis engraved both on copper and on wood, chiefly from his own deſigns; was born at Nuremberg in the year 1514, and died in the ſame city in 1570. Under what maſter he ſtudied does not appear. His early works reſemble thoſe of Beham, but when he came to engrave after Raphael, and other Italian maſters, he adopted a ſtyle more open and ſpirited. His prints on wood bear great reſemblance to thoſe of Joſt Ammon, both in deſign and execution.

Virgile Solis was a man of ability. His compoſitions are often judicious, but his drawing of the naked is not equally correct. He is claſſed among the little maſters, and uſed occaſionally three cyphers, which will be found in our ſecond plate of the monograms of the German engravers.

Mr. Evelyn ſays, that for “imitating the vile poſtures of Aretin, he had his eyes put out by the ſentence of the magiſtrate.” Strutt preſumes, that if this ſtory be true, the engravings of Solis muſt have been copies from thoſe which Marc Antonio did after the deſign of Julio Romano, (and which had nearly coſt him his life,) to which the poet Aretin did but ſupply verſes.

The engravings of Solis amount to upwards of eight hundred, of which it may ſuffice to ſpecify the following: “The Marriage of Cupid and Pſyche;” “The Aſſembly of the Gods;” and “Mount Parnaſſus,” all after Raphael. “The Bath of the Anabaptiſts,” a ſmall plate, after Aldegrever. A ſet of four plates of fragments of ancient architecture. A ſet of ſix heads of Roman emperors, ſmall. A pair of ſmall friezes, in which are numerous parroquets. A ſet of portraits of the kings of France, from Pharamond to Henry III. The above are on copper, with ſome few etchings, which are inferior to the reſt of his works.

His principal engravings on wood, are a ſet of one hundred and ſeventy from Ovid's Metamorphoſes, ſmall, and dated 1563. A ſet for the emblems of Nicolas Reuſner, dated 1581. And, another ſet for thoſe of Andrea Anciatus, both of which books were printed at Frankfort in the year 1581.

Melchior Lorch, or Lorich, was born at Flenſburg, in the dutchy of Sleſwic, in the year 1527, and died at Rome in 1586. He was diſtinguiſhed both as an artiſt and an antiquary: ſome time about the middle period of his life, he made a voyage to Conſtantinople, where he painted and engraved the portraits of the grand ſeignior and his favourite, which are now become very rare, and where he formed that collection of Turkiſh dreſſes, which were afterwards engraven on wood, and publiſhed in the year 1576, in a folio volume. His engravings are decidedly thoſe of a man of talent: he drew with conſiderable ſpirit, and a tolerable degree of correctneſs. His works on wood are executed with much freedom and boldneſs, while in thoſe on copper theſe qualities are in ſome degree loſt in the neatneſs to which he laboured his finiſhing. Strutt ſpeaks of a crucified figure, (which is deſigned ſo much in the ſtyle of Michael Angelo, that he ſuppoſes it to be engraven after ſome work of that great maſter) as a very extraordinary production. It is executed entirely with the graver, and the left leg and arms are much fore-ſhortened. He ſays, " if this figure be not quite correct in all its parts, it is however well drawn upon the whole, notwithſtanding the difficulty of the fore-ſhortenings, and is finiſhed in a ſtyle of neatneſs equal to that of Jerome or Anthony Wierix, while it is ſuperior to them in point of taſte." His monograms, which he ſometimes ſurmounted by the date of his work, will be found in our ſecond plate of thoſe of the German ſchool.

The works of Lorich, which are held in moſt requeſt among connoiſſeurs, are: the portrait of Martin Luther, dated 1548. That of Albert Durer, with four Latin verſes, dated 1550, a very rare print, done in imitation of a Cameo, and thoſe which we have mentioned above of the grand ſeignior and his favourite ſultana, very neatly executed on copper, and very ſcarce. Ariſtotle, the Stagyrite, dated 1561. " St. Jerome in the Deſart," dated 1546; and a ſmall upright of a female head, beautifully executed, are alſo on copper.

His beſt engravings on wood, are a ſet mentioned above, of the coſtume of Turkey, in ſmall folio, dated from 1570 to 1581. " The Tiburtine Sybil," dated 1571, executed in his beſt ſtyle. " A Woman preſſing her Breaſt, with numerous Animals below," and inſcribed " Ops Saturni conjux materque Deorum," a very ſpirited engraving in folio, dated 1565. And " The Deluge," a large folio, engraven on two blocks, the impreſſions from which are afterward paſted together.

Theodore de Bry, or de Brie, the elder, was born at Liege in the year 1528, and died at Frankfort on the Maine in 1598; at which latter place he chiefly reſided, but to whom he owed his early initiation to art is not known. He appears to have formed his taſte by copying the works of Sebald Beham. He worked almoſt entirely with the graver, and acquired a neat and free ſtyle, which was well adapted to ſmall ſubjects, in which numerous figures were required to be introduced, ſuch as ſtate, and funeral, proceſſions. He drew correctly: his heads in general are ſpirited and expreſſive, and his other extremities well marked, and his back grounds, though frequently ſlight, are touched with a maſterly hand.

About twenty years before his death he viſited England, and engraved at leaſt two large and laborious plates, of which we ſhall preſently ſpeak, in the city of London. He died, as his ſons in the 3d part of Boiſſard's collection of portraits inform us, March 27, 1598. De Brie marked his plates with the cypher T. B. F., and at other times with that of Rene Boivin; and his principal engravings are thoſe which follow: an etching of " St. John in the Deſart," a rare print. A pair of " The Fountain of Youth," and the " Little Village Fair," copied from Sebald Beham. " A Bacchanalian Proceſſion," from Julio Romano. Three mixtures of the groteſque with the allegorical, of the circular form. " The Golden Age," a ſmall circle, after Abraham Bloemart. A pair of portraits en medallion, of Scanderbeg and Donice his wife. A ſet of nine figures of the muſes, in folio. The plates for the four firſt volumes of Boiſſard's Roman Antiquities (of which the two laſt volumes were completed by the ſons of our artiſt). The plates of the manners and cuſtoms of the Virginians, publiſhed in " The brief true Report of the New-foundland of Virginia, by Thomas Harriet, ſervant to Sir Walter Raleigh," from drawings by J. White, printed at Frankfort by J. Wechelius, A. D. 1590, which were afterwards copied by Picart, for his " Religious Ceremonies, &c." The plates to the Latin narrative of Spaniſh cruelties in America, publiſhed 1598.

His largeſt work appeared in the ſame year, and is entitled " Deſcriptio Indiae Orientalis et Occidentalis," in nineteen tracts, which are contained in five folio volumes.

De Brie is alſo the author of a work which may be thought ſtill more intereſting to Britiſh feelings, becauſe connected with Britiſh hiſtory. It is the proceſſion of the knights of the garter in the 18th year of the reign of Elizabeth, of which Strutt gives a very particular deſcription: " The proceſſion is repreſented as moving along a portico quite open on the ſide next the obſerver, but ſupported by thirty-three pillars of the Ionic order, on the ſide from him. Over each knight companion of the order, are his arms within the garter, and, in a compartment below, his name, titles, &c. are written in French. The laſt ſtall was vacant, and there is only a fancy portrait given, without name or arms. There are ſixty portraits in the proceſſion, each of them between four and five inches in height! Under the arches of the portico is a delightful view of a hilly country, (too hilly for an Engliſh proſpect,) interſperſed with caſtles, churches, houſes, rivers, woods, &c. and an exact view of Windſor caſtle as it appeared in that reign. The roll is ſixteen feet three inches long, and was engraved on twelve plates."

Hollar to his plate of the proceſſion, copied in ſmall from this engraving, in Aſhmole's order of the garter, ſays, " the original was deſigned by Marc Garrerd, who could be then only fifteen years old." Wherefore Strutt concludes this to be a miſtake, but perhaps Garrerd made a reduced copy from this print, from which copy Hollar's plate was engraven, which would reconcile the accounts; for lord Orford dates Garrerd's drawing in the year 1584, whereas De Brie's plate was finiſhed in the year 1578; and Strutt, reaſoning from the dedication being made in the name of Thomas Dawes, Rouge-Croix, concludes that it was deſigned by him.

Strutt ſays he never heard of any other impreſſions from this plate than the proof, which, after belonging to the Norroy king at arms, came finally into the poſſeſſion of John Fenn, eſq. of Eaſt Durham in the county of Norfolk; but the engraving is mentioned by Huber, and preſumptively therefore, is not unknown on the continent.

To this detailed account of this very curious hiſtorical engraving, Strutt adds the order of proceſſion, and the names of the ſixty portraits of the knights companions and officers of ſtate; and the reader who wiſhes to be informed on theſe points, is therefore referred to his biographical dictionary.

The other plate which our artiſt is known to have engraved in London, is "The Funeral Proceſſion of ſir Philip Sydney," on thirty-four plates, forming, when paſted together, a very long roll, but more frequently forming a book. In the inſcription beneath, it is ſaid to be " contrived and invented by Thomas Lant, gent. ſervant of the honourable knight, and graven on copper by Derick, or Theodore de Brie, in the city of London 1578;" and prefixed is the portrait of Mr. Lant, aged 32.

Jean Theodore de Brie the younger was the eldeſt ſon of Theodore, of whom we have juſt concluded our account. He was born at Liege in the year 1561, and died at Frankfort on the Maine in 1623.

The engravings of Jean Theodore are on the whole ſuperior to thoſe of his father both in taſte and preciſion, and he aſſiſted his father in the literary parts of thoſe works in which he engaged, as well as in the engravings; but Jean Iſrael, the ſecond ſon of Theodore, who alſo aſſiſted, and ſucceeded him, was far leſs ſucceſsful.

The brothers John, Theodore, and Iſrael, completed the plates for Boiſſard's Roman Antiquities, and added ſeveral to the collection of portraits of illuſtrious perſons, which their father had begun to form.

Among other portraits, we find thoſe of Gerard Mercator the celebrated geographer, and Daniel Specklin, both in 4to.

The beſt hiſtorical works of Jean Theodore are, a ſet of the elements, conſiſting of four plates in 4to. "The Return of Rebecca," after Balthaſar Peruzzi. "A March of Soldiers," and "A March of Soldiers conducting Priſoners," ſometimes called "The Triumph of Death," both of the frieze form, and by ſome ſuppoſed to be after Titian. "The Village Fete," with a Latin inſcription, after Sebald Beham, and "The Fountain of Youth," after the ſame, both of the frieze form; and a ſet of ſeventy-four plates for "Proſcenium vitæ humanæ ſive Emblematum, &c." accompanied with explanations.

Jean Kelertaler was born at Dreſden in the year 1530; under whom he ſtudied is not known, but he continued engraving in his native city, until ſome time about the cloſe of the ſixteenth century. He engraved ſome plates after Jean Marie Noſſeni, who was ſculptor and architect to the elector of Saxony, of which the following are thoſe of moſt importance.

"Nimrod building the Tower of Babel;" "The Deſtruction of the Babylonian Empire;" "The Empire of Rome," in the back ground of which is the death of Cæſar. "The Empire of the Church," where the Pope is repreſented receiving the homage of Charlemagne; and "An Allegory," where a winged figure of Death, with two trumpets, is ſupporting a globe, all of the 4to. ſize.

Tobias Stimmer was born at Schaffhauſen towards the cloſe of the ſixteenth century, but reſided chiefly at Straſburg, where he was patronized by the margrave of Baden, and became both a painter and engraver of eminence. His engravings are chiefly on wood, and from his own compoſitions; the engravings in the "Noviæ Tobiæ Stimmeri ſacrorum Bibliorum figuræ verſibus Latinis et Germanicis expoſitæ," are from compoſitions by Stimmer, though he was aſſiſted in the engraving by his brother Chriſtopher, and his pupil Chriſtopher Maurer. Stimmer underſtood the human figure very well, and compoſed with ſo much taſte and judgment, that Rubens has been heard to declare, that he had ſtudied Stimmer's bible with attention and with great benefit, and Sandrart, who relates this anecdote, calls the book, "A Treaſury of Science for the art of Painting."

In the earlier part of his career, Stimmer was unfortunate, and paſſed ſome of his beſt days in painting the façades of houſes at Frankfort on the Maine, and at Straſburg. But let no man of talent, who poſſeſſes the means of ſhewing his talent, deſpair; it was the pleaſure he received from ſome of theſe, which accidentally caught his notice, that occaſioned the margrave to engage Stimmer in his ſervice, and became the foundation of his fortune. For him our artiſt painted the hiſtory of his anceſtors, and the margrave's own portrait to this day aſſerts the ſuperior powers of Stimmer in this department of art.

We have given his monograms in our ſecond plate, and his principal work, excepting his bible, is "The Annunciation," in folio.

Jean Chriſtopher Stimmer was born at Schaffhauſen in the year 1552, and died at Paris ſome time about the commencement of the ſucceeding century. He was the brother and diſciple of Tobias, and engraved on wood a great number of his compoſitions with conſiderable ſucceſs, for he drew with ability, and hatched his engravings in a bold, but mellow ſtyle.

After the death of his brother, Chriſtopher travelled to Paris, where he performed ſome engravings, and was commonly known by the name of "the Swiſs," and where he died, leaving behind him a ſon, who alſo engraved on wood a conſiderable number of tablets after Francis Chaveau.

Chriſtopher uſed the complicated cypher which will be found among thoſe of our monograms of the ſecond plate of the German ſchool, and his beſt engravings are thoſe which follow:—A ſet for the New Teſtament, with the Apocalypſe, printed at Straſburg in the year 1588. A collection of portraits of the ſcholars and theologians of the German nation, printed alſo at Straſburg by Bernard Jobio, in 1591. "Icones Affabrae;" a collection of emblems printed in the ſame year, all of the 4to. ſize; and a capital print of an hiſtorical portrait of a kneeling figure, inſcribed "Contrafacite Bildnus des Hernn Laſarus von Schwende," &c.

Joſt or Jodocus Amman or Ammon, deſigner and engraver on wood and on copper, was born at Zurich in 1539, and died at Nuremberg in 1591. Not meeting with encouragement in his youth at Zurich, he travelled to Nuremberg, a city where the arts were reported to be in a flouriſhing ſtate, the year he became of age, and in 1577 renounced the rights of a citizen of Zurich, in order the more firmly to attach himſelf to his adopted country. Strutt ſays of him, that if patience and aſſiduity of themſelves could conſtitute an artiſt, Amman would well deſerve that character, from the multitude of deſigns which he made, and the great number of plates which he engraved, amounting, according to Huber, to more than five hundred and fifty. But though a great genius may be improved by cultivation, yet it is equally certain that neither pains nor ſtudy can create a great genius. Much merit, however, was certainly poſſeſſed by our artiſt; who lived at a time when almoſt every book which appeared was ornamented with prints, and was employed by moſt of the great bookſellers, eſpecially Siegmund Feyerabandt of Frankfort.

The engravings of Joſt Amman upon copper are not equal to thoſe which he performed for the letter preſs. His invention was not very copious: his figures are tolerably proportioned, and the detail of his drawing is careful and moderately correct; animals in particular he touched with great ſpirit. His ſtyle of engraving is neat and decided, yet if his lines are more regular, they are leſs free than thoſe of many of his predeceſſors. He affixed various marks to his performances, as may be ſeen in our ſecond plate of the monograms, &c. of the German ſchool of engraving.

His principal works on copper are, a ſet of twelve illuſtrious women, beginning with Eve, under the title of "Eva die Geberirin;" a ſet of figures of warriors, ſmall uprights, marked Joſt Amman inventor 1590; the ſet conſiſts of eight, and there is a ſet of eight others, fighting with ſwords and ſticks. The four ſeaſons, and the four elements, dated 1569. A ſet of the twelve months, perſonified, and a ſet of ſixteen friezes of hunting ſubjects; a conſiderable number of etchings of ſubjects of piety, after Winceſlaus Jamitzer; the bombardment of a city, dated 1570, in folio, and the portrait of Carparis di Colignon, D. Caſtilione, marked Joſt Ammon Figurinus, 1573.

His beſt engravings on wood are, "The Creation of Man;" "The Diet of the Empire," both in folio, the latter an oval. "The Marriage at Cana," in quarto; a ſet of one hundred and fifteen, entitled, "De omnium liberalium mechanicarum et ſedentarium artium genera continens, &c. Edit. per Hoſtmann Scoperum Francof. 1564." This work conſiſts of artiſts and artiſans, repreſented in their reſpective employments: among them are ſome excellent figures, and in that which repreſents the engraver, Amman has given his own portrait. A ſecond edition was printed A.D. 1574, and a third in 1588, but the firſt is now become very ſcarce. The book is a large octavo.

A ſet of one hundred and two, beſides the portrait of Feyerabandt, for a Latin edition of Livy, printed at Frankfort 1572-3 in oblong quarto.

Another ſet for a folio edition of Pliny, printed alſo at Frankfort A.D. 1584. Another ſet for a quarto book of hunting, printed at Frankfort in 1582, which book was conſiderably augmented after the death of Amman, and reprinted in 1617. Another ſet of one hundred and three of eccleſiaſtical habits, dated 1564, and another of one hundred and twenty, for "Gynaceum, ſive Theatrum Mulierum, in quorum præcipuarum omnium per Europam, &c." in oblong quarto, printed at Frankfort, 1586.

Chriſtopher Maurer engraved from his own compoſitions, and from thoſe of T. Stimmer, both on copper and on wood. He was born at Zurich A.D. 1558, and died at Winterthour in 1614. His father Joſhua was an artiſt, and under the paternal roof he learned the rudiments of art, but was afterwards removed to Straſburg, and placed under Tobias Stimmer, where both the maſter and ſcholar were cloſe ſtudents, and ſoon began to be diſtinguiſhed by the number of intereſting and beautiful works which they produced.

The cypher of Maurer will be found in our ſecond plate of German monograms. After paſſing ſome years in the ſchool of Stimmer, he returned to his native city, and added to his reputation by his freſco pictures which adorn the façades of diſtinguiſhed houſes, and by the juſt likeneſſes he diſplayed in his portraits; with the true ſpirit of a Swiſs artiſt, he always preferred patriotic ſubjects, and has often painted the origin of the Helvetic confederacy.

Of his engravings, thoſe on copper are moſt ſought after by connoiſſeurs, particularly a ſet of bible cuts, and four emblematical etchings relative to proceedings in the courts of law, which, after the death of the artiſt, were introduced into a Latin book.

Of his letter-preſs engravings, which are neatly executed, the beſt are probably the ſet of animals of the chace, which he executed in conjunction with his maſter, and which were publiſhed at Straſburg in the year 1605. And a ſet of the bible under the title of "Hiſtoriſche Vorſtellungen über die ganze Bibel," which do honour to his inventive talent, as well as to his manual powers as an engraver.

Chriſtopher Jamitzer, or Jamnitzer, was born at Nuremberg in the year 1560, and died in the ſame city in 1617. He performed ſeveral etchings which are marked with the cypher which the reader will find among our monograms of the German engravers, but they are far from being of firſt rate merit.

Of the ſame family were Bartholomew and Wenceſlaus Jamitzer, whom we paſs as unimportant perſons.

The beſt works of Chriſtopher conſiſt of groups of boys variouſly occupied, and the beſt of theſe groups are thoſe which follow: A ſet of twelve, in 12mo.; another ſet of twelve, mounted on marine animals; another ſet of four combined with ſwans, flowers, &c.; four children dancing in an arbour. A ſet of groteſque chimeras, in quarto; Chriſtopher Jamitzer alſo engraved a portrait of himſelf ſitting in a perſpective machine, in the act of drawing or meaſuring.

Matthew Greuter was born at Straſburg A.D. 1564. He travelled more than once to Lyons and Avignon, and from thence to Rome for profeſſional improvement, in which latter city, in the year 1638, he died.

Strutt deſcribes him as a man of genius, but ſo much praiſe as is implied in this word, cannot juſtly be allowed him. He worked partly from his own compoſitions, but his drawing is by no means correct; his extremities in particular being ſadly neglected. He ſometimes executed his plates with the graver only, in a neat ſtyle, and in other inſtances has employed etching. His principal productions are, the portraits of the popes Innocent X., and Sixtus V., the latter ſurrounded with an ornamental border in which the papal coinage is introduced. Cardinal Seraphinus Olivarius Razzalius; all in quarto.

Of his hiſtorical works we ſhall only mention "The Virgin and Child," ſeated in a landſcape, after Baroccio. Mary Magdalen leaning her right hand upon a ſkull, after S. Gaetano, dated 1584; both in quarto. An emblematical print of Venus ſtanding on a globe, with various virtues and vices perſonified, very neatly finiſhed, and marked M. Greuter inv. et fec. 1587, in ſmall folio. "The Fall of Phaeton," after Windel Dieterlin, in large folio, dated 1588. "The Deſtruction of Troy," after Lanfranc, and the magnificent cavalcade of the emperor Charles V. engraved by Greuter in concert with Lucas Vorſterman, a large print of the frieze form, engraved on ſeveral plates.

As Jean Frederic, the ſon of Matthew Greuter, was born at Rome, and lived and died in Italy, our account of him will be found under ITALIAN *School of Engravers*.

Matthias Kager was born at Munich in the year 1566, and died at Augſburg in 1634. He ſtudied in Italy, and beſide ranking high among the hiſtorical painters of his time, was an engraver of merit. His ſtyle is neat, and performed chiefly with the graver, though ſometimes with the admixture of etching. His attachment to liberty, and averſion to the manners of a German court, induced him to quit that of Bavaria, and he became a citizen and finally a burgomaſter of Augſburg.

S. Kilian engraved a portrait of him in 1626. The beſt of his own prints are: "The Adoration of the Shepherds," dated 1610. "St. John Baptiſing Chriſt in the river Jordan," both of the folio ſize, and from compoſitions by himſelf: "The Holy Family," in an oval, alſo from his own picture, and in 4to. and "St. Francis ſurrounded by the Monks of his Order, to whom Chriſt and the Virgin Mary are appearing in the Clouds," a middling-ſized upright from P. Remigius Bozzulo.

Of Adam Elſheimer, ſurnamed Adam of Frankfort, who ſhould elſe have been mentioned in this place, we have already ſpoken. See ELSHEIMER.

Theodore Kruger, or Cruger, was born in the city of Munich A.D. 1576. He travelled to Italy for improvement, where he formed his ſtyle of engraving on that of Franciſco Villamena. He handled the graver, which was the ſole inſtrument of his art, with boldneſs, freedom, and facility, but his chiaroſcuro is very defective, and his outlines incorrect and hard.

His principal engravings are: "The Life of St. John the Baptiſt," on twelve upright folio plates, after Andrea del Sarto, with the portrait of the painter prefixed, and dedicated to Coſmo de Medicis, dated 1618. "The Laſt Supper," in large folio, after the ſame. "The return of the Holy Family from Egypt," where the infant is embracing Jeſus Chriſt, after F. Bigio, alſo in folio. "The infant Saviour bleſſing the little St. John," after the ſame painter. And "A Prince on a Tribunal, ſurrounded by divers Stateſmen," after Lanfranco, and inſcribed "Vox mihi."

Cruger has alſo engraven ſome portraits after Gabriel Wayer, to which he ſigns his name Ditrich Cruger, by which Chriſtian name he is beſt known in Italy.

Theodore Cruger, the younger, was born in the year 1648, and was the ſon of the preceding artiſt. The Italians call him Della Croce, the Flemings Vercruys, and the German Kruger. In the year 1710, he engraved, in concert with two others, the Florentine gallery. He alſo engraved "St. Francis at Prayer," after Carlo Maratti, and a couchant Venus, both in folio, beſide ſeveral portraits, among which is the daughter of Georgione, after that maſter; and Ludovicus Adimari, after P. Dandini.

Dominic Cuſtos, otherwiſe called Baltens, was the ſon of Pierre Balthaſar Baltens, a painter and poet, who had ſome pretenſions alſo to knowledge in the art of engraving. He was born ſome time about the year 1560 at Anvers, and died at Augſburg in 1612. His real family name appears to have been Baltens, but he ſettled at the laſt named city, at an early age, under the name of Dominique Cuſtos, and marrying there the widow of Barthelemy Kilian, the elder, was enabled to eſtabliſh a lucrative print trade, which continued to flouriſh for a long period of time.

Cuſtos had ſeveral daughters, of whom ſome were educated to the art of engraving, and ſucceeded tolerably well. He worked in a neat ſtyle, entirely with the graver, but his prints are laboured, taſteleſs, and without harmony of effect. Florent le Comte ſays he engraved portraits in the taſte of Vandyke, but as Strutt properly remarks of this miſtaken aſſertion, there is not the leaſt reſemblance between the ſtiff portraits of Cuſtos, and thoſe ſo highly and ſo juſtly eſteemed by Vandyke.

The principal engravings by this artiſt, are; the effigies of the German emperors, large whole length figures, in folio, dated 1601.

The portraits of the Fuggera family, of which the firſt edition, which is now become very rare, and is dated 1593, contains but ſixty-four portraits: in the ſecond the number of portraits is increaſed to ſixty-ſeven: the third contains a hundred and twenty-ſeven, beſides the arms of Fugger, and an ornamented title, but the names are added, of Lucas and Wolfgang Kilian. Another ſet of portraits of heroes, &c. entitled "Atrium Heroicum, Cæſarum, Regum, aliorumque ſummatum ac principium, &c."

The chief of his engravings of ſeparate portraits are thoſe of pope Sixtus V. prince Sigiſmond in the coſtume of Moldavia, after J. ab. Ach, and from the ſame painter Marcus Bragadino, dated 1591. Chriſtianus II. duke of Saxony, Henry biſhop of Augſburg, (in an oval,) Johan Philippi, biſhop of Bamberg, ditto. Maximilian, duke of Bavaria, and Elizabeth Lotharingea his wife, a pair of ovals, dated 1598, all of the folio dimenſions.

The moſt eſteemed of the hiſtorical works of this artiſt, are a ſet of "Female Saints," half lengths, after Frantz Aſpruck. A ſet of four in folio, of "L'Hiſtoire de l'Enfant prodigue," and "Judith beheading Holofernes," after John Von Auchen, of the folio ſize.

Lucus Kilian, the patriarch of a numerous progeny of engravers, was born at Augſburg in the year 1579. Under whoſe directions he ſtudied, is not known, but the works of Henry Goltzuis and Muller appear to have been his ſchool. It appears, however, that he went to Italy, in order to complete his ſtudies, where he engraved ſeveral plates from the pictures of the great Italian maſters: but returned, and died in his native city in the year 1637.

"Few artiſts have manifeſted a greater command of the graver than Kilian; whether we conſider the apparent facility with which his ſtrokes are turned over each other, or the firmneſs with which they are executed, one cannot help admiring the author, though it evidently ſtrikes us that by paying too cloſe attention to this part of his art, he neglected the correctneſs of his outlines, and fatigued the lights with unneceſſary work." Such is the opinion of our countryman Strutt: to which ſhould be added, that his drawing is not accurate, nor his chiaroſcuro broad and impreſſive.

Of the numerous works of Kilian, the following are held in moſt eſteem: "The Adoration of the Shepherds," a middling-ſized plate, from the younger Palma. The ſame ſubject, a large upright, after Spranger. Another of the ſame ſubject, after Rotenhamer. And another (a large upright) from J. Heintz. "A Holy Family," from Cornelius de Haerlem, and "The Miracle of the Loaves and Fiſhes," from Tintoret: both large uprights. "Chriſt Praying in the Garden," a ſmall upright, arched at the top, from Frederic Suſties. "A dead Chriſt," from Michael Angelo. And "A Nymph and Satyr," from J. Heintz, both ſmall uprights. "The Rape of Proſerpine," a large folio plate, from the ſame maſter. "The Entombing of Chriſt," an upright, without the painter's name, dated 1600, which perhaps, with many other of the engravings of Lucas Kilian, is from his own deſign.

The beſt portraits by this maſter, are thoſe of himſelf, aged 55, a rare print in 4to. "Petrus Cuſtos, vulgo Baltens, Pictor et Poeta Antwerpianus," dated 1609. Nicholas Chriſtophe, Prince de Rudzivil, both in 4to. The emperor Chriſtian II. dated 1615. Maria Eleonora Suevorum Gothorum Regina. Guſtavus Adolphus Suevorum Gothorum Rex. And Albert Durer, a half-length; all of the folio ſize: but whether the latter is from a picture by Rotenhamer, or after Albert Durer himſelf, the preſent writer is uncertain.

Wolfgang, the brother of Lucas Kilian, was alſo of Augſburg, and born in the year 1581. He ſtudied under Dominic Cuſtos, and, after his return from Italy, under his brother Lucas, whoſe ſtyle he imitated without attaining to the ſame degree of excellence: his prints are ſomewhat neater, but more ſtiff and formal.

Wolfgang employed the greater part of his time in engraving portraits, of which the following are thoſe of moſt importance. Erneſt Count Mansfield. Maximilian of Wallenſtein, dated 1642. Jean Major, mathematician of Augſburg. Frederic Baron de Teuffenbach. Jean Godefion, biſhop of Wurzburg, and Ferdinand III. king of the Romans, all in 4to. Of the folio ſize; the archbiſhops of Mayence, Cologne, and Treves; his own portrait, inſcribed "Labor improbus omnia vincit," and a ſet of twenty-ſeven of the emperors and archdukes of the houſe of Auſtria, from 1229 to 1623, with their lives and eulogiums, publiſhed at Augſburg, in 1629.

The moſt eſteemed of his hiſtorical works, are the "Baptiſm of Jeſus Chriſt," after Paolo Veroneſe. "The Aſſumption of the Virgin Mary," after Tintoretto; "The Deſcent from the Croſs," after Paolo Farinato, and the "Good Samaritan," after Giacomo Baſſano, all in folio. "The Reſurrection of Chriſt," arched at the top, after F. Baſſano. The four Evangeliſts, in upright ovals, from his own deſigns; and the "Feſtival of the Peace of Weſtphalia," after Joab Sandrart, in large folio, engraved on two plates, and which is now become a rare print.

Bartholomew Kilian, the third ſon of Wolfgang, was born at Augſburg in the year 1630, and died in the ſame city in the year 1696. He diſtinguiſhed himſelf at a period of life ſo early, that Sandrart emphatically ſays, "he was *born* an artiſt." At the age of eighteen he engraved a Magdalen after M. Gondelach, which induced his father to place him under M. Merian of Frankfort, after ſtudying with whom two years and a half, he travelled to Paris for further improvement. Here he remained more than three years, availing himſelf of the inſtructions of different artiſts, and here he engraved his "Aſſumption of the Virgin," after Philip Champagne, and "Crucifixion," after Teſtelin.

Returning to his native city, he continued to cultivate his art, and produced a great many excellent portraits, with ſome few hiſtorical ſubjects. Strutt is miſtaken in ſaying he worked entirely with the graver, but is right in what he aſſerts of the originality of Bartholomew's ſtyle. He worked in a manner entirely different from thoſe of the Kilians, who had preceded him; ſometimes, in order to make a ſtriking diſtinction between the fleſh and the draperies of his figures, he finiſhed the former with dots only; and at other times expreſſed the darker ſhadows of his fleſh by lines, which he blended with dots in the lighter parts. Mariette and Barthelemy talk of him as an example for a painter, but theſe writers are warmer in his praiſe than an inſpection of his work will fully warrant.

B. Kilian generally marked his engravings, of which the following liſt contains the principal, with his name at length, but ſometimes uſed only his initials, and at others, according to Huber, a cypher which does not appear to belong to him, but which we have copied, with others of the Kilian family, in the ſecond plate of our German monograms.

Six half length portraits, in folio, of celebrated proteſtant preachers at Augſburg, after B. Hopfer. Three medallions of archbiſhops of Salzburg, with allegorical accompaniments, after Henry Schoenfeldt. Johannes III. king of Poland, after Bloemart, dated 1681, a large buſt of learned execution. Maximilian Emanuel, electoral prince of Bavaria, with hiſtorical acceſſories, a celebrated work, and the ſubject of a theſis. The emperor Joſeph as king of the Romans, on horſeback, the ſubject of another academical theſis, dated 1694; which Huber pronounces one of the fineſt prints exiſting for natural grandeur; all theſe are in large folio. The portrait of Auguſtus II. Abbas Einſidlenſis, is a large upright folio, dated 1686.

The beſt hiſtorical production of Bartholomew is a "Madonna and Child," a beautiful engraving in large folio, after Caſpar Sing.

Philippe Kilian was a younger brother of Bartholomew, imitated his ſtyle, and confined his talents almoſt entirely to portraits. He engraved, among many others, the portrait of his elder brother, whom he never equalled, though many of his works poſſeſs no ſmall portion of merit.

Strutt mentions another engraver of this family of the name of Wolfgang Philip, who flouriſhed in the next century, and who executed a great number of portraits, which however have too little merit for our particular notice.

Yet to ſhew that nature had not exhauſted the Kilian ſtock of talent, we ſhall here mention a little out of his chronological place, Philippe Andrea Kilian, great nephew of Bartholomew, who was born at Augſburg A.D. 1714, and died in that city in the year 1759.

Deſcended from a family of artiſts, he imbibed, in early life, what may perhaps be termed an hereditary taſte for fine art. He firſt ſtudied drawing and engraving under Frederick of Augſburg, and afterwards became the pupil of G. M. Prieſler of Nuremberg, where he diſtinguiſhed himſelf by engraving ſome plates for the "Phyſica Sacra of Scheuchzer," and laid the foundation of his future fame.

Some years after, whilſt engaged in engraving from the Dreſden gallery, the reputation of our artiſt ſtood ſo high, that Auguſtus III. of Poland emphatically called him "the Magnet of Dreſden," and when any other engraver produced an inferior plate from the collection, was uſed to ſay, in the way of delicate reproof, that it ought to be re-engraven by Kilian.

But our artiſt, notwithſtanding theſe honours, felt ſo much reſtraint, whilſt reſiding at the court of Dreſden, or ſuch paſſionate deſire to return to his native city, that he ſought an occaſion to make ſuch arrangements as enabled him to quit Bavaria after a reſidence of ſome years.

P. A. Kilian is uſually reckoned among the moſt meritorious hiſtorical engravers of Germany. On a baſis of ſound drawing, he erected rather a ſingular ſtyle of execution; he interworked his principal or firſt courſe of lines with very delicate ſtrokes, which he croſſed with a courſe of lines exceedingly lozenge upon the firſt, and ſometimes added a third courſe ſomewhat more ſquare; at other times he interworked his ſhadows with long ſlender *pecks*, as they are technically termed among engravers. But the characters of his heads are not equal to his general knowledge of the human figure.

His beſt hiſtorical engravings are, "Jeſus Chriſt at prayers in the Garden of Olives," an upright plate of the folio ſize, from a deſign of his own. "The Adoration of the Kings," after Paolo Veroneſe; "The Woman taken in Adultery," after Tintoret; and "The Family of a noble Venetian," after Paolo Veroneſe, are all large folio plates, executed for the Dreſden gallery. "Mary Magdalen waſhing the Feet of Chriſt" is from Nicholas Graſſi; "The Baptiſm of St. Auguſtin," from J. B. Pittoni; and "Herodias with the Head of John the Baptiſt," from Carlo Dolce, are all of folio dimenſions; "Regina Angelorum," where the Virgin appears ſurrounded by Angels in Glory, after Bergmuller, and another from the life of the Virgin, after C. T. Scheffler, are a large and highly eſteemed pair of engravings. But perhaps his moſt juſtly celebrated work is a very large plate of "St. Coſmo and St. Damien," after J. Wolfgang Baumgaertner.

The beſt portraits from the graver of Philippe Andrea, are thoſe of Francis I. emperor of Germany, in a coat of armour, after Meitens. And Clemens Rezzonicus Venetus, Pontif Max, after G. D. Porta, a pair in large folio. Maria Thereſa, queen of Auſtria, an upright folio. Johan Martin Chriſtell, from a picture by P. A. Kilian, himſelf. Chriſtoph Henry Andre Geret, after J. Romelli. Field marſhal Curtius Chriſtophel Graff von Schideren, after Stranz. Ferdinand, duke of Brunſwick, general in chief of the allied army, after Ant. Peſne; and Godofredus Schnurbein, marked P. A. Kilian, pinx. et ſculp. 1750, all of the folio dimenſions.

George Chriſtopher Kilian, another engraver of the ſame family, was living at Augſburg when Heinnekin publiſhed his "Idée generale d'une Collection complete d'Eſtampes," and perhaps may be living ſtill.

Iſaac Major was born at Frankfort on the Maine in the year 1578, and died in 1630. Diſcovering an early inclination for the arts of deſign, he was placed with Roland Savery, under whom he ſtudied landſcape painting for a time, but deſirous of becoming an engraver, he placed himſelf, for inſtruction in that art, with Giles Sadeler. He united etching with the work of the graver, but his works want energy, though they were held in ſome eſtimation at the time in which he lived. His principal productions are, a ſet of ſix middling ſized landſcapes, wild ſcenes in Bohemia, from Pietro Stephani. A very large landſcape from Rowland Savery, in which St. Jerome is introduced. Another ſet of eight mountainous and ſavage landſcapes in Bohemia, in large folio, after Jer. Wolf, and an allegorical portrait of the emperor in a car of triumph drawn by eagles and ſwans.

Chriſtopher Jegher was a juſtly celebrated engraver on wood, who was born ſome time about the year 1590, but the incidents of whoſe life are but little known. He eſtabliſhed himſelf at Antwerp when he was about thirty years of age, where his extraordinary merit ſo ſtrongly recommended

mended him to Rubens, that he was engaged by that great maſter to engrave a conſiderable number of his compoſitions, and it is no ſmall praiſe to add that he ſucceeded to the perfect ſatisfaction of the painter.

After the death of Rubens, Jegher re-purchaſed moſt of theſe engravings, and publiſhed them on his own account. Collectors ſhould therefore bear in mind, that thoſe impreſſions, from which the name of Rubens as the publiſher is taken away, and that of Jegher ſubſtituted, are of the ſecond edition, and conſequently of inferior value to the firſt.

There is a degree of freedom and vigour in the ſtyle of Jegher that is perfectly homogeneous with that of Rubens; his hatchings are broad and powerful, and the imitation of the croſs hatchings is ſo well expreſſed, that his beſt prints very much reſemble drawings made with the pen and ink. He drew with maſterly correctneſs; the extremities of his figures are well marked; and his heads, though ſlight, are full of expreſſion.

His beſt, and by far the greater of Jegher's productions, are after Rubens, but he has engraved a Crucifixion after F. Franck, which is dated 1637, and ſome few more from other maſters.

The following are after P. P. Rubens: "Suſannah ſurpriſed by the Elders." "A Repoſe in Egypt," both in large folio. Some of the latter are printed in chiaroſcuro, (*i. e.* with an additional block or two to add the demitints,) and are now become ſcarce. "The infant Chriſt and St. John playing with a Lamb." "The Coronation of the Virgin Mary," and "The Temptation of Chriſt in the Deſart," all middling-ſized folios. "Hercules deſtroying Envy and Diſcord," is from the cieling at Whitehall. "The Converſation of Lovers," is a very large garden-ſcene, engraved on two blocks. "A drunken Silenus ſupported by Satyrs," is of the upright form, and a very fine compoſition of the maſter, which was alſo engraven on copper by Bolſwert.

Matthew Merian, the elder, was born at Baſle in the year 1593. His firſt ſtudies were under the direction of Theodore Meyer, who inſtructed him in drawing. He afterwards became the diſciple of Theodore de Brie. He was a man of talent, and his principal engravings are landſcapes, which he etched in a ſlight free ſtyle, and finiſhed with the graver. His views have much of that rare but valuable topographical quality, the appearance of having been really copied from the places of which they bear the names, and which quality Merian had the ſkill and the honour of imparting to his diſciple Wenceſlaus Hollar, of whom we have given an account in our progreſs of ENGLISH engraving, but whoſe monograms will be found in our third plate of thoſe of the German ſchool.

Merian married the daughter of his tutor de Brie, by whom he had iſſue: he died in the year 1657, aged 58, at Frankfort, or, according to ſome of his biographers, at Schwalbach.

His works, according to Le Compte, amount to upwards of five hundred plates. They are well known, and there is not ſo much diſparity in their merits as to make a ſelection here either eaſy or neceſſary. His marks and monograms are five in number, as will be found in our third plate.

Of Matthew Merian the younger, who was for a ſhort time in London, we have made ſlight mention in a former place.

His daughter, Maria Sybilla Merian, was a much more diſtinguiſhed character. She was born at Frankfort on the Maine in the year 1647. At the age of four years ſhe loſt her father, which in moſt caſes is a great misfortune, but not ſo here, for her mother found in her ſecond huſband, Jacques Morell, a kind and indulgent protector, who foſtered the infant genius of Maria.

Morell, as is well known, was a diſtinguiſhed painter of fruits, flowers, and inſects, and under his inſtruction our young artiſt ſoon diſtinguiſhed herſelf as a painter and natural philoſopher, to which attainments ſhe afterwards added the art of etching.

In the year 1665 ſhe married Jean André Graf, a meritorious painter of Nuremberg, who ſtudied in the ſchool of Morell. In 1679 ſhe publiſhed the firſt volume of her "Hiſtoire des Inſectes de l'Europe deſſines d'après nature, et expliqués par Marie-Sybille Merian; où l'on traite de la genêration et des différentes metamorphoſes des inſectes et des plantes dont ils ſe nouriſſent;" and in 1683, ſhe pnbliſhed the ſecond volume of the ſame work, in the execution of which ſhe paid attention to the engravings, as well as the deſigns, it being the firſt work wherein is diſplayed the minutia which is ſo important in the eye of the connoiſſeur, and ſhe managed the etching-needle with the dexterity ſhe had before evinced in the management of her pencil.

In the courſe of the next year, ſhe returned to Frankfort with her family, and, from a miſtaken zeal in religion, ſeparated from her huſband; retired with her mother and two daughters to Weſt Frieſland, and became a member of the ſociety of Labadiſtes. The fraternal ſociety of Labadiſtes, (who called themſelves brothers and ſiſters) had then aſſembled under Peter Yrond, and their head-quarters were the caſtle of Den Boſch, ſituated between Franeker and Levardin, of which the poſſeſſor's name was Sommerdyck. Here ſhe remained a conſiderable time, and here ſhe had opportunity to inſpect at leiſure a fine collection of the inſects of America, of which ſhe made very exact drawings, and from hence her thirſt after profeſſional knowledge led her to make occaſional excurſions to Amſterdam and other parts of Holland, which at that time abounded with cabinets both of pictures and natural hiſtory.

Her enthuſiaſm now took a new turn, and coinciding with the wiſhes of the Dutch naturaliſts, ſhe was induced, in the year 1699, to undertake a voyage to Surinam. On her arrival, after an agreeable paſſage, a wide field opened to her profeſſional ambition. She painted the inſects and reptiles of the country on vellum, and examined with philoſophical care their various habits and changes: but the heat of the climate, and her intenſe application, having injured her health, it became neceſſary for her to return to Europe in the following year.

She brought home an ample collection, not only of drawings, but of ſhells, dried inſects, &c. She now ſettled at Amſterdam, and immediately ſet about publiſhing the fruits of a voyage, than which none had ever been performed more truly intereſting to the naturaliſts of Europe.

Of the ſixty large folio plates contained in her "Metamorphoſes Inſectorum Surinamenſium, &c." ſeveral were executed by herſelf, and ſhe alſo ſupplied the deſcriptions. It was publiſhed at Amſterdam in the year 1705.

In the ſecond edition, which was publiſhed by the phyſician Jean Marret, in the French language, more plates and explanations were added by the author, who conſecrated the remainder of her days to delineations and reſearches of this nature.

Too far advanced in life to venture on a ſecond voyage, yet knowing that much had been left unaccompliſhed at Surinam, Maria Sybille now formed the deſign of ſending thither her eldeſt daughter, who had accompanied and aſſiſted her in her former voyage. Jeanne Helene cheerfully undertook the commiſſion, landed at Surinam, painted with hereditary ſkill all the remaining ſubjects of natural hiſtory that ſhe could find intereſting in the country, added her remarks, and tranſmitted them to Amſterdam; but death had now interpoſed to prevent this conſummation of the pleaſures of Maria

Sybille. The ſupplement was however publiſhed by her ſecond daughter Dorothea Maria, who was born in 1678, and herſelf painted flowers and inſects with great ability.

The curious, who would form an adequate idea of the knowledge and talent of this extraordinary artiſt, ſhould viſit the principal cabinets of Holland. Yet in our own national collection at the Britiſh muſeum, are ſome volumes of her paintings on vellum, which are almoſt daily turned over with wonder by its numerous viſitants.

John William Baur was a very meritorious painter and engraver of landſcape and hiſtory. He was born at Straſbourg in the year 1600, ſtudied under Frederic Brendel, and afterwards in Italy, where he reſided a conſiderable time, and where he was patronized by the duke at Bracciano and prince Guiſtiniani. In the year 1637 he removed to Venice, and from thence to Vienna, and died there three years afterwards, at the age of forty.

The landſcapes which he painted with water colours on vellum are particularly celebrated, and he engraved a vaſt number of plates from his own deſigns, ſome of which are in a ſtyle reſembling that of his contemporary Callott, to which he affixed the cypher which the reader will find in the third plate of our monograms, &c. of the German ſchool of engravers.

Melchior Kuſſell completed the volume of his works, which contains not leſs than five hundred engravings, after the death of Baur, whoſe "deſigns," in the language of Strutt, "manifeſt great marks of a ſuperior genius, but without cultivation." The cypher with which he uſually marked his engravings, of which the following are the names of the principal, will be found in our plate of monograms.

Portrait of Don Paolo Geordano II.; Orſino, duke de Bracciano, an oval, dated 1636, a rare print; a ſet of eighteen, of the coſtume of different nations; a ſet of fifteen of the battles of various nations, entitled "*Caprici* di varie Baittallie," in quarto; another ſet of fourteen battles; a ſet of eight landſcapes, and another of four, entitled "The Elements." A ſet of twenty of a ſuperior character, of the battles of "La Guerre Belgique," and

His principal work, conſiſting of one hundred and fifty plates in quarto, from Ovid's metamorphoſes, publiſhed at Vienna in 1641. Theſe are ſlightly etched, and finiſhed with the graver. The figures introduced are generally ſmall and incorrect in the drawing, the back-grounds rather dark, and the trees deficient in lightneſs and freedom. The architecture, which Baur is fond of introducing, is well deſigned, and correct in the perſpective.

Hans or Jean Ulric Franck was a native of Kaufbeuren, an imperial city of Suabia, born in 1603, and was particularly excellent in painting and etching ſmall figures. He ſettled at Augſburg, where he died in the year 1680.

In conjunction with Suſan Sandrart, A. Zelt and J. Meyer, Franck engraved a ſet of the Fountains in Rome and its environs. The beſt of his other engravings are four combats in quarto, dated 1643. "David and Abigail," and "Alexander defeating Darius," dated 1644, and both in folio.

Joachim Sandrart was born at Frankfort on the Maine in the year 1606, and began his career of art by ſtudying under Theodore de Brie and Matthew Merian, of whom we have ſpoken. At the age of fifteen he went on foot to Prague, to viſit and obtain inſtruction from Giles Sadeler, after which he placed himſelf under Gerard Honthorſt, of Utrecht, to learn the principles of painting, with whom he travelled to England. He afterwards viſited Venice, Bologna, Naples, and Rome, and received inſtructions from Titian, Paul Veroneſe, Guido, Guercino, Pouſſin, and others: in ſhort, if inſtruction and example alone could have produced a great artiſt, Joachim ſhould have been the firſt of his time. He returned however to Germany, and finally ſettled at Nuremberg, where he eſtabliſhed an academy of art, and where he died ten years afterwards, at the age of 77.

Sandrart was rather an artiſt of acquirement than of genius, and hence his works are deficient in vividneſs and warmth. He painted and engraved hiſtory and portrait; he was alſo a man of letters, and his "Academy of Architecture, Sculpture and Painting," which was firſt publiſhed at Nuremberg in the year 1679, though prolix, is ſtill celebrated through Europe.

This book, which contains much hiſtorical information, and the biography of the moſt diſtinguiſhed artiſts, is enriched with a conſiderable number of engraved portraits, beſide other prints. It was firſt publiſhed in the German language, but an edition in Latin was printed in the year 1683, and it has ſince received various additions from the ſucceſſors of Joachim Sandrart.

His own engravings are performed chiefly with the point, and the beſt of them will probably be found to be a half length figure of the goddeſs Flora, after Titian; an elderly woman contemplating a Cupid in no very delicate action: and "The Death of Cleopatra," from his own compoſitions, all in quarto.

Jacques Sandrart, the nephew of Joachim, was born at Frankfort in the year 1630, and died at Nuremberg in 1708. He ſtudied engraving at Amſterdam under Cornelius Dankerts, and afterwards at Dantzic under W. Hondius.

He ſettled finally at Nuremberg, where he purſued his art with ſingular induſtry, the number of his portraits alone being not fewer than four hundred, ſome of them of the folio dimenſions, and executed with the graver alone, in a clear and neat ſtyle, beſide which he publiſhed a number of geographical charts and other engravings.

His portraits are not uncommon, and among the moſt meritorious will be found to be thoſe of his uncle Joachim Sandrart, a half length figure, inſcribed "Seculi Noſtri Apelles." The buſts of Rodolphus II., Ferdinand II., Ferdinand III., and Frederic, prince of Norwegia and duke of Sleſwic; a half length of Hohannes Michael Délherrus, after R. Wernfels; Ermuth Sophia, electoral princeſs of Saxony, &c. Johannes Paulus Auer, painter of Nuremberg; Joachim Sandrart, junior, dated 1688; all in folio.

Jean Jacques Sandrart, the ſon of Jacques, whom we have juſt diſmiſſed, was born at Ratiſbon A.D. 1655, and died at Nuremberg in 1698. He ſtudied the arts of deſign under his father and his great uncle Joachim; his works prove the facility of his invention. He enriched the volumes of Joachim with ſeveral taſteful and ſpirited etchings, and his portraits, which are etched, and finiſhed afterwards with the graver, are deſervedly held in eſteem. His beſt works are, the portraits of Elizabeth Henrietta, princeſs of Brandenburg, ſurrounded by emblems; and Silvius Jacob de Dunkelmann, both in folio, after Adam le Clerck; "The Holy Family," after Joachim Sandrart; "Æneas ſaving his Father from the Flames of Troy," after Raphael, dated 1682. "Marphorius, or the Statue of the Rhine," among ruined edifices; "The Nile" among ruined monuments of antiquity, all in folio, and the latter pair, with many others after Joachim, are introduced into his "Academy, &c."

Jean Jacques alſo engraved ſeveral plates of merit for a folio work, entitled "Suecia Antiqua et Hodierna."

Suſan Marie Sandrart was the ſiſter of Jean Jacques, and was born at Nuremberg in the year 1658. She ſtudied under the direction of her father, and engraved with ſome ability a conſiderable number of plates of ornaments.

She engraved alſo a Bacchanal, with the inſcription "Immoderatum dulce Amorum ;" "The Aſſembly of Gods at the Marriage of Cupid and Pſyche," after Raphael, and the antique bas relief of "The Aldobrandini Marriage," after Pietro Santo Bartoli, for the academy of Joachim Sandrart, all of the folio dimenſions.

Of Hollar, who flouriſhed about this time at Prague, we have already ſpoken. See Origin and Progreſs of ENGLISH *Engraving*.

That extraordinary artiſt, Adrian van Oſtade, for an account of whoſe merits as a painter, ſee the article OSTADE, performed about this time ſome etchings, which are very juſtly admired for their freedom and ſpirit. They are not all executed in the ſame ſtyle, though the ſame mind be every where evident. Some are dark and coarſe, and were printed juſt as the aquafortis left them, while others are more neatly executed, and appear to have been ſubſequently worked upon with the triangular point, as was the cuſtom of Rembrandt and Worlidge. The two marks with which Oſtade occaſionally ſubſcribed his etchings, will be found in our third plate of the monograms of the German ſchool.

The whole of his etchings conſiſt of at leaſt fifty-two plates of various dimenſions, all from his own deſigns, of which the following are perhaps moſt worthy of being ſpecified : "Several Peaſants at the Door of a Cottage," with a fair in the back ground, a middling-ſized upright. "A Dutch Wake," the ſame. "Several Peaſants Fighting with Knives," a ſmall plate, lengthways, dated 1658. "The Cottage Dinner," the ſame, dated 1653. All theſe are in his bold ſtyle of etching. Thoſe which follow are ſuch as he finiſhed with more care. "The Painter," with an inſcription beginning in this manner : "Pictor Apellæ, pingas," and the firſt impreſſions of this plate are with the cap conſiderably above the eyes of the figure ; in the ſecond impreſſions, the cap nearly touches the eyes. "A Mountebank," a ſmall upright plate, arched at the top. "The Spectacle Seller," a ſmall upright plate. "A Man, Woman, and Child, at the Door of a Cottage," a middling-ſized plate, lengthways, dated 1652. Several peaſants, half figures, at a window, one of them is ſinging a ballad, and another holds the candle, a ſmall upright plate. "A Man Leaning over a Hatch, blowing a Horn," the ſame. "A Cottage Entertainment," with figures dancing, a middling-ſized plate, lengthways.

The biographers of lieutenant-colonel de Siegen, (an officer in the ſervice of the landgrave of Heſſe,) have conteſted with the friends of prince Rupert for the honour of the invention of mezzotinto. The lieutenant-colonel was born in the year 1620, and, according to the baron Heinnekin, executed in that manner a portrait of the princeſs Amelia Elizabeth of Heſſe Caſſel, in 1643.

For an account of prince Rupert's pretenſions to the diſcovery, ſee the article Origin and progreſs of ENGLISH *Engraving*. "An Holy Family," after Caracci, in folio, is alſo mentioned (but without a date) as a mezzotinto production of Siegen.

Jean François Ermels, who poſſeſſed conſiderable talents in the art of painting and engraving landſcapes and cattle, was born in the environs of Cologne in the year 1621, and died at Nuremberg in 1693. He ſtudied under J. Holzmann and Jean Both, and the following plates, conſiſting chiefly of landſcape ſcenery, adorned with ruined edifices and animals, were etched by him with great ſpirit and freedom. A pair of upright landſcapes, "A Rocky Scene, and a compoſition of Ancient Architecture," in 4to. "A Landſcape," in which the figures introduced are a faun and bacchante. Another, with monuments of antiquity. And a pair of "Paſtoral Scenes," with ſhepherds, cattle, and ruined edifices, all of the 4to ſize.

Matthew Keeſell, or Kyſell, was born at Augſburg in 1621, and died there in the year 1682. He ſucceſsfully mingled the work of the graver with that of the point, and his beſt prints, which are named in the following liſt, poſſeſs a large ſhare of merit. The portraits of Chriſtopher Benden, in 4to. Carolus Sulzer. Adolphus Zobelius. Andreas Winkler Johannes Michael Dilherrus, after Ulricus Mayr (an highly finiſhed head in an octagon border). Leonardus Weiſſius, after Jos. Werner, all in folio. A ſet of forty-two after Ludovico Burnacini, entitled "Il Pomo d'oro," and conſiſting of ſcenic decorations, &c. dated 1668, are folio etchings : and the only hiſtorical work from his hand, with which we are acquainted, is "The Virgin and Child," apparently from a compoſition by himſelf

Melchior Keeſell, the brother of Matthew, was born at Augſburg in the year 1622, and died in the ſame city in 1683. Here he acquired the rudiments of his art, but perfected his ſtudies under Merian of Frankfort, from whence, after reſiding ſome few years, he returned to Augſburg, and began to engrave the "Iconographia," of Wilhelm Baur, a folio work, which conſiſts of one hundred and forty-eight prints of various ſizes, conſiſting partly of the "Life and Miracles of Jeſus Chriſt," and partly of views of the "Seaports and Gardens of Italy," which work was publiſhed at Augſburg, A. D. 1682.

Strutt ſays of this artiſt, that "there is ſomething very agreeable in his manner of engraving, eſpecially when he confined himſelf to ſubjects where the figures are ſmall, for as he drew but incorrectly, his figures appear defective, as they increaſe in ſize." Baur was fond of ornamenting the back-grounds of his compoſitions with ſuperb buildings, which Keeſell has executed with much ſpirit; his rocks alſo, and mountainous diſtances, have great merit ; but his trees want freedom, lightneſs, and characteriſtic determination of their foliage ; his chiaroſcuro is alſo ſpotty and fatiguing to the eye, if this be not rather the fault of Baur.

Melchior engraved other plates beſide thoſe for the Iconographia of Baur, of which the principal are, "The Hiſtory of Ulyſſes," from Theodore van Talden ; ſome antique ſtatues, executed entirely with the graver ; and the portraits of Sebaſtianus Kirchmajerus, public profeſſor at Ratiſbon, after Benj. Block, in 4to. ; Johannes Hozius ; Maximilianus Curz, dated 1658 ; and Antonius Schottius, dated 1680, all of the folio ſize.

Jeanne Sibelle Keeſell, born at Augſburg in the year 1646, was the third daughter of Melchior, married Jean Ulrich Kraus, engraved, among other plates, a ſet of four, of the Satyr and Villagers, Juno, Venus, and Pallas, after Elſhiemer, and died in her native city in 1717.

Jonas Umbach was alſo of Augſburg, born in the year 1624, and merits an high rank among the artiſts of Germany. His prints conſiſt chiefly of etchings after his own deſigns, executed with ſpirit and an appearance of facility. He engraved one hundred and eleven plates, of which the following are the ſubjects of the principal, and died in his native city about the commencement of the ſeventeenth century. "A Madonna and Child." "An Holy Family." "A Penitent Magdalen," and "St. Peter," all of ſmall dimenſions. Four plates from "The Parable of the Good Samaritan." Four ditto of "Infantile Sports." A pair of "Triumphs of Marine Deities." "A Family of Satyrs," all of ſmall ſizes ; and a ſet of four landſcapes, adorned with ruins of ancient monuments and paſtoral figures, dated 1678, in 4to. highly eſteemed engravings.

Lingelbach, Backhuyſen, and Jean Henry Roos, alſo performed ſome meritorious etchings in Germany about this time. The animals of the latter are much celebrated, and among his beſt plates may be reckoned a ſet of twelve, of “ Domeſtic Animals,” in 4to. A pair of “ Grand Landſcapes,” adorned with cattle and ruined buildings, and “ Un Berger endormi au pied, &c.” He was born at Otterdorf, in the Palatinate, in 1631, and died at Frankfort in 1681, and his maſters were Julian Jardeyn, and Adrian de Bie.

The family of the Wolfgangs contributed but little to the advancement of engraving: we therefore paſs them briefly. George Andrea Wolfgang was originally a goldſmith and engraver on the precious metals, but afterwards ſtudied engraving on copper under Matthew Keeſell, and ſcraped ſome few mezzotintos. He was born at Chemnitz, in Saxony, A. D. 1631, and died at Augſburg in 1716. The beſt engravings of George Andrea are the portraits of George Frederic, margrave of Brandenberg, after C. Zierl, in folio, and Pierre Muller, Juriconſulti, in 4to. And, in hiſtory, “ A Grand Sacrifice to Diana,” after A. Schoenfeld, and “ Saul conſulting the Ghoſt of Samuel,” after Joſ. Werner, both of the folio ſize.

Andrea Matthew, the ſon of George Andrea Wolfgang, was born at Augſburg in the year 1662, and died in the ſame city in 1735. He ſtudied the elements of deſign under the direction of his father; but embarking for England with his brother, preſumptively at ſome port in the Mediterranean ſea, they were intercepted by an Algerine corſair, and carried into captivity. On their liberation, which was in conſequence of a ranſom paid by their father, they both returned to Augſburg, where Andre Matthew ſettled, and began to engrave portraits: he alſo engraved a print of “ The Court of Algiers,” in which he has repreſented himſelf as a ſlave.

His beſt portraits are thoſe of George Andre, his father, and Nicolaus Nuremberger, both in 4to., and in folio, John George Buttner, biſhop of Frankfort, and Chriſtopher Rad. In mezzotinto he has engraven Charles VI., king of the Romans. But, perhaps, his very beſt performance is a portrait of the margrave of Anſpach.

His younger brother, Jean George Wolfgang, was born in 1664, received the ſame inſtructions as Andrea Matthien, and ſoon after their releaſe from captivity travelled to Berlin, and in 1704 became engraver to the court. He engraved and publiſhed there a great number of portraits, among which that of the elector Frederick William, after Jacobi's equeſtrian ſtatue in bronze, is deſervedly held in moſt eſteem, though, in moſt of his portraits, the fleſh is executed with delicacy, and Jean George is, on the whole, as an artiſt, the flower of the Wolfgang family. He died at Berlin in the year 1704.

Guſtavus Andrea Wolfgang was the ſon of Andrea Matthien. He was born at Augſburg in the year 1692, and, after ſtudying portrait engraving and miniature painting under his father for a time, followed his uncle to Berlin, where he remained for many years, but returned finally to his native country, where he died in the year 1766.

His beſt portraits, of which the fleſh is engraved chiefly in dots, are thoſe of M. François Reyter, admiral pour l'Armee navale Angloiſe en Afrique. Wolfgangus Jacobus Sulzer, Reipublicæ Auguſtanæ Decemvir, after G. Eichler, and Carl. Freyher von Stien; in ſmall folio.

Jean Jacques Thurneiſen, or Thourneyſen, was born in the year 1636 at Baſle, in Switzerland, and died in the ſame city in 1718. After having learned to draw in his own country, he went to Straſbourg to ſtudy engraving under Pierre Aubry, where he remained about three years, and removed ſucceſſively to Lyons, and to the court of Turin. In 1695, he returned to Vienna, accompanied by his ſons; and his great merit, which was called by his rivals his ſuperior fortune, obtained for him the patronage of the emperor Leopold. He was now the object of envy to the artiſts of Augſburg, where he continued to reſide for ſome years; but as age approached, he wiſhed to ſee again his native land, and departed for Baſle in the year 1699, where, as we have already ſaid, he finiſhed his career.

Thourneyſen was a man of a robuſt frame, vigorous mental powers, and extreme profeſſional aſſiduity. His monogram will be found in our third plate of thoſe of the German ſchool. Among the engravings he performed, thoſe which are executed with a ſingle ſtroke or ſpiral, in imitation of Mellan, have been moſt admired, though, perhaps, not moſt juſtly. He alſo occaſionally imitated the ſquare croſſings of F. de Poilly.

His ſon, Jean Jacques the younger, worked in imitation of his father, but was leſs ſucceſsful. The beſt engravings by Thourneyſen the elder are, the portraits of Laurentius Scotus, after Luc Damaret, dated 1661. François Turretein, after P. Haud. Petrus Werenfelſius, profeſſor in the academy of Baſle, after L. F. Wetſtein, engraved of the folio ſize, (by the Thourneyſens, father and ſon,) in 1702.

Of his hiſtorical works, our allotted ſpace only allows us to mention “ The Virgin Mary, Infant Chriſt, and St. John,” in a circle, after Carl. Dauphin, a folio plate, engraved in the faſhionable ſtyle of Mellan. “ An Infant Chriſt,” after Blanchet, in 4to. “ La Bilancia Politica del Boccalini.” Two large folio plates of “ Grand Theſes in Philoſophy,” in which whole length portraits of the princes palatine of Neubourg are introduced, and the ſtatues of Laocoon, Antinous, and Latona, in the ſtyle of Mellan, for Sandrart's academy.

François Ertinger was born at Wyl, in Suabia, A. D. 1640, travelled to Italy for improvement, but died at Paris in the year 1700. As an engraver, neither his judgment nor his taſte ranks very high; but the following liſt of his beſt works will ſhew that the ſubjects of his prints at leaſt were ſometimes wiſely choſen.

A ſet of eight plates, after Rubens, from the Hiſtory of Achilles. “ The Marriage of Cana in Galilee,” a large folio, after Raymond le Fagi. A ſet of ten, from the ſame maſter of the Hiſtory of the Counts of Thoulouſe. A large folio, of a Bacchanalian ſubject after N. Pouſſin; and the portraits of Nicholas Machiavel of Florence, the celebrated political philoſopher, in 8vo. Gabriel de Pinaco, Jureconſulti; and Jean Ferdinand de Beughem, biſhop of Anvers, after F. de Cock; both in folio.

Gerard Laireſſe was born at Liege in the year 1640, and died at Amſterdam in 1711. He was inſtructed by his father, Regnier, in the rudiments of art. For an account of his merit as a painter, ſee the article LAIRESSE. He etched a vaſt number of plates, from his own compoſitions with great freedom, and the fearleſs hand of a painter who has other objects in view than the graces or blandiſhments of manual execution. His chiaroſcuro is broad and powerful, and ſo contrived as to conduct the eye of a ſpectator at once to the principal objects in the compoſition.

The major part of his deſigns were engraven by himſelf, and, as Baſan obſerves, are highly eſteemed by connoiſſeurs, and exceedingly uſeful to ſtudents in art.

The portrait of Laireſſe, in folio, ſurrounded by emblematical ornaments, has been engraven by N. Viſſcher.

The moſt eſteemed of his own engravings are, “ The Sin of our firſt Parents,” and “ Adam and Eve expelled from Paradiſe,” a pair in folio. A rich compoſition of

"Joſeph and his Brethren," and another from the Hiſtory of Solomon, both in large folio. "The Incredulity of St. Thomas;" and another in folio, from the Life of Chriſt, inſcribed "Sapientia unigena Dei Maximi." "St. Thereſa in Extaſy," a large folio. "The parting of Hector and Andromache," in folio. A rich compoſition of Marc Antony and Cleopatra, with the motto "quam Mars nunquam, vicit Venus." A march of Amazons, inſcribed "Virtus viri computa actionibus probis." A grand Bacchanalian ſubject. "Venus lamenting Adonis." A ſet of four plates of the ſeaſons. "Diana and Endymion." "Bacchus Silenus and Nymphs;" all of the folio dimenſions: and three large allegorical ſubjects, in compliment to the prince of Orange.

The prints of Laireſſe are generally inſcribed with one or other of the four monograms which the reader will find in our third plate of thoſe of the German engravers.

Samuel Bottſchild was born at Sangerhauſen, in Thuringia, A. D. 1640, and died at Dreſden in 1707. He was an artiſt of taſte; and, being poſſeſſed of elevated habits of thinking on profeſſional ſubjects, he was appointed director of the Dreſden academy, and inſpector of the electoral gallery. His excellence in freſco painting is atteſted by his picture of "The Deſcent from the Croſs," in the church of St. Martin at Halberſtadt, and by ſeveral paintings which adorn the caſtle gardens near Dreſden; and his etchings are performed with much pictureſque freedom: the general character of his art partaking much more of the grand than the graceful. His principal engravings are, "The Army of Sennacherib defeated by the exterminating Angel," in folio. A ſet of four, entitled "Le Don de l'Entendement:" "Le Don de la Science;" "Le Don de la Sageſſe;" "Le Don de la Force," in 4to. A ſet of the four parts of the day, with Latin inſcriptions. A pair of emblematical ſubjects, intitled "L'Eſperance et la Patience;" "La Foi et la Charité," ovals, in 4to. "Ulyſſes and Epius," and a ſubject from the Life of Hercules, both of the folio ſize.

Elias Hainzelmann was born at Augſburg in the year 1640, and died in the ſame city in 1693. He ſtudied engraving at Paris in the ſchool of François de Poilly, whoſe ſtyle of manual execution he imitated with great ſucceſs; and Strutt has well obſerved, that had his drawing been equally correct, his works would have ranked with thoſe of the greateſt maſters. They poſſeſs, however, eſpecially his portraits, a conſiderable ſhare of merit.

From Hainzelmann's hiſtorical works, the following will probably be found moſt worthy of ſelection: "The Silence," after Annibal Caracci; ſo called, becauſe, while the Infant Chriſt is ſleeping, the Madonna holds up her finger to St. John, as he approaches, to prevent his diſturbing the Saviour. This picture has ſince been engraved by others, but particularly by Bartolozzi in a very ſuperior ſtyle. A large upright plate of an Holy Family, after Sebaſtian Bourdon; and two others lengthways, of the ſame ſubject, from the ſame painter, in one of which the infant St. John preſents a lamb, and in the other an apple, to Jeſus Chriſt. St. Francis, after Dominichino. "The noli me tangere," or Chriſt in the garden, approached by Mary Magdalen, after Albano. "The Madonna and Child," after Raphael. Jeſus Amabilis; Mater Amabilis; St. Regard; all of the folio ſize.

His beſt portraits are thoſe of Francis Zavier, of the fraternity of Jeſuits; George Philip Riſs, after Ulric Mayr; Marcus Haberns, and Juliana Benedicta Winklerin, after the ſame. David Thoman ab Hagelſtein, after de Neve. Agnes van Schoenberg; Godfreed Eggerus; Gabriel Willer; John Jacob Haller, after D. Savoy, all in folio, and Johan Chriſtoph ab Adelmannsfelden, after C. C. Kretzſchmann, in very large folio; the head, the ſize of real life.

Jean Ulric Kraus, or Krauſſen, was born at Augſburg A.D. 1645, and died in the ſame city in 1719. He was the diſciple of Melchior Kuſſell, and married Jean Sybille his daughter, and became a cloſe imitator of the works of his contemporary Le Clerc. But all followers are neceſſarily behind. Though Kraus copied Le Clerc's life of Chriſt, (which conſiſts of ſixty ſubjects) it is ſufficiently obvious that they are but copies.

His engravings are numerous, chiefly from his own compoſitions, and the ſubjects of them, for the moſt part, views of buildings, or taken from the Old and New Teſtaments. In imitation of his model Le Clerc, he generally introduced a vaſt multitude of figures into his compoſitions, but they are leſs graceful, and far leſs well drawn. He frequently enriched his back grounds with architecture, which he appears to have well underſtood, and his chiaroſcuro is often judiciouſly diſpoſed, and his general effects good.

The cypher with which Kraus uſually marked his prints will be found in our third plate of German monograms, and the liſt of his principal works is as follows: a ſet of ſixty ſubjects copied from Le Clerc's life of Chriſt, on ſmall folio plates, two ſubjects on each, printed at Augſburg 1705. The hiſtory of the Old and New Teſtaments, in 4to. containing four ſmall ſubjects on each plate, and apparently deſigned to be bound in 8vo. ſo as to have two ſubjects only on a leaf. The number of leaves would then amount to one hundred and eighty-eight, and they are ſo numbered. The four ſeaſons, and the four elements, deſigned for the royal tapeſtries. A ſet of twelve intereſting views of the city of Nuremberg, after Andrea Graf, in folio, and a very large and capital view of St. Peter's church at Rome, after the ſame maſter.

Carl Guſtave d'Amling, or ab Ambling, was born at Nuremberg A.D. 1651, and died at Munich in the year 1702. He ſtudied under F. de Poilly at Paris, and imitated his ſtyle, but with no very great ſucceſs. He was a painter as well as an engraver, but was chiefly engaged in engraving portraits. When he attempted hiſtory, neither his drawing of the naked, nor the expreſſion of his heads is correct, and the general appearance of his prints is cold and metallic.

Yet the race is not always to the ſwift, nor the battle to the ſtrong, and Amling, notwithſtanding theſe defects, obtained court patronage, and became engraver to the duke of Bavaria.

Of his numerous portraits, we ſhall only mention thoſe of Maximilian Emanuel, electoral prince of Bavaria, after T. Macolinus Muſicus, dated 1670, a rare print. Maximilian Emanuel, elector of Bavaria, after J. B. Champagne, both in folio, and the latter eſteemed one of his very beſt performances. An equeſtrian ſtatue, alſo of his patron, and Henrietta Maria Adelaide, ducheſs of Bavaria, after Delamonce, dated 1675, in an oval, and alſo of folio dimenſions.

Of his hiſtorical works the principal are, a ſet of thirteen plates of different ſizes, of the hiſtories of the emperor Otho and Louis of Bavaria, from the tapeſtries in the caſtle of Munich, which were executed after P. Candido. Another ſet of nine in folio, from the ſame tapeſtries, repreſenting perſonifications of the months September, October, and November, the four Seaſons, Morning, and Night.

The family of Meyer flouriſhed as artiſts, and chiefly as engravers, through two centuries. Joachim was born at Straſburg early in the ſixteenth, and diſtinguiſhed himſelf by engraving a ſet of ſixty-two prints of combats with the ſword.

Andrea was a native of Zurich, and engraved ſeveral views of towns, to which he affixed one or the other of the ſingular monograms which will be found in our third plate of thoſe of the German ſchool of engravers.

Dirick was born in the ſame city, and of the ſame family, in the year 1571, and his principal work of engravings is a ſet of portraits of the illuſtrious perſons of Switzerland.

Rodolph, and Conrad, Meyer were the ſons of Dirick. The engravings of the former are chiefly portraits, with ſome few emblematical prints: he was tolerably ſucceſsful, and marked his prints as may be ſeen in our plate of German monograms. He was born in the year 1605, and lived only to the age of thirty-three.

His younger brother Conrad was born in the year 1618, and died at Zurich, the city of his nativity, in 1689. He produced a conſiderable number of prints which were chiefly from his own deſigns, among which are the cuts for an edition of Eraſmus's Praiſe of Folly. A ſet of five, which are termed a compariſon of the preſent times with thoſe of Noah and Lot. "The Deluge;" "The Laſt Judgment," and "Memento Mori." A ſet of fifteen for the Mirror of Chriſtians. A ſet of cuts for a dance of Death, partly invented by himſelf, and partly by his brother Rodolph. And ſeveral ſets of portraits of the burgomaſters, reformers, and artiſts of Zurich.

Jean Meyer reſided about the ſame time, or a little earlier, at Nuremberg, but is preſumed by Strutt to have been of the ſame family as the preceding. He etched, among other plates, a ſet of battles in a ſlight but ſpirited ſtyle, from his own compoſitions.

Felix Meyer was more celebrated. He was born at Winterhour, in Switzerland, in the year 1653, and died at Weyden in 1713; his genius developed itſelf at Nuremberg, whilſt ſtudying under F. Ermels, a celebrated painter of landſcape, to which he afterwards added the ſtudy of nature His etchings are deſervedly held in eſteem among connoiſſeurs, for the freedom and intelligence which they diſplay, combined with effective chiaroſcuro. The moſt important of theſe are, a ſet of twelve, ornamented with ruined edifices and rocks, &c. Another ſet of four of the ſcenery of Switzerland, with ancient monuments and figures, dated 1701. Another ſet of four of the ſame kind of ſubjects, and another ſet of the ſame number, of a more wild, mountainous, and rocky character, all of the 4to. dimenſions.

Joachim Francois Beiſch, or Beich, was born at Munich in the year 1665, and died in the ſame city in 1748. He ſtudied the principles of deſign under his father, who was a painter of Ravenſburg, but domiciliated at Munich. They both painted landſcape and battles, and Joachim travelled to Italy for improvement, where he reſided for ſeveral years, contemplating the ſcenery of that claſſical landſcape country, and the works of Gaſpar Pouſſin and Salvator Roſa.

On his return to Munich, he took up the etching point with ſucceſs, and produced ſeveral ſets of plates of landſcape ſcenery in a grand taſte, among which the principal are, a ſet of eight mountainous landſcapes from his own compoſitions, in 4to. Another ſet of ſix. Another ſet of ſix with rocks, cataracts, and banditti, in the ſtyle of Salvator Roſa, of the folio ſize.

George Philip Rugendas of Augſburg was born in the year 1666. He learned drawing of Iſaac Fiſcher, but afterwards ſtudied with more advantage from the works of Pietro Tempeſta, and Bourgognione. He travelled to Vienna, from thence to Venice, and from thence to Rome, where he remained a long time, and reviſited Augſburg in the year 1695. At this time the war of the Spaniſh ſucceſſion was raging in Germany, and our artiſt had opportunity to contemplate its effects, and draw battles, ſkirmiſhes, and ſieges, from nature. Among theſe the bombardment and taking of his native city by the French and Bavarians, formed an intereſting ſubject for his pencil and etching needle, and he publiſhed in ſix prints, their military operations in that neighbourhood during the years 1703 and 1704.

Rugendas deſervedly holds a diſtinguiſhed rank among battle painters. His deſigns are at once bold and correct, his compoſition orderly, his pencil facile, and his colouring performed on principle; above all, the varied attitudes and graces of his cavalry are juſtly admired.

Beſides the pictures from his hand, which are not uncommon in the galleries and cabinets of Germany, Rugendas has performed a conſiderable number of etchings and plates in mezzotinto, of which the ſubjects are chiefly hunting and battles; ſome by himſelf, and others in conjunction with his ſons, of whom he had three that were educated to the arts.

We begin our liſt with a ſelection from his etchings: a ſet of ſix of "Capricci de Georgio Filippo Rugendas," dated 1698. Three ſets of "Cavaliers Marching, in Action, &c." conſiſting of twenty-two plates, in 8vo. A ſet of ſix very capital etchings, in folio, of "Les Operations militaires des François et des Bavarois à Augſbourg et à ſes Environs," dated 1704.

His beſt mezzotintos are, "A Colonel of Huſſars on Horſeback." A ſet of four, of "Combats between Hungarian and Pruſſian Huſſars." A ſet of four, "Hunting Pieces." A ſet of four, "Battles, &c. in the Turkiſh Campaign." Another ſet of ſix, entitled "Les Operations et les Occupations militaires," &c. all in folio.

The following were produced in conjunction with his ſons: A pair of "Mountainous Landſcapes," in 4to. A pair of "Combats between Cavalry." A ſet of four, of "Marches and Halts." Another ſet of four, of "Camps and Skirmiſhes," all in 4to. A ſet of ſix, of "The Amuſements of the Camp." Two ſets of Battles, conſiſting of ſix in each. A ſet eight, of "Marches, Halts, and Combats of Cavalry," all in folio; and a ſet of twenty of various military ſubjects, in 4to.

Jaques Chriſtophe le Blond, or Blon, an engraver in mezzotinto, was born at Frankfort in 1670. He travelled to Rome in the year 1696, in the ſuite of the imperial ambaſſador, where he ſtudied painting under Carlo Maratti, but his genius being of a mechanical turn, he entered with warmth into various ſpeculations: at length he learned to ſcrape mezzotinto, and diſcovered a method of printing mezzotinto plates in colours. The Dutch painter Overbeek perſuaded him to bring his new diſcovery to Amſterdam, from whence he emigrated to England.

Eagerly bent on the execution of his new project, he executed in London ſeveral large plates in mezzotinto, from pictures by the greateſt maſters, and diſpoſed of the prints by lottery: but thoſe who obtained the prizes appear not to have held them in any very great eſtimation. He made known the manner in which he performed and printed theſe plates, in a book entitled "Coloritto, or the Harmony of Colours in Painting, reduced to mechanical practice, under eaſy precepts and infallible rules," which were printed both in Engliſh and French: but nothing is more common than the failure of *infallible* pretenſions, and the ſpirit of fine art has always evaporated in the various attempts to reduce it to mechanical practice. Le Blond's project did not ſucceed.

He afterward ſet on foot a ſcheme for copying the Cartoons of Raphael in tapeſtry, and made drawings for that purpoſe; but though money was ſubſcribed, houſes built, and looms erected at the Mulberry-ground, near Chelſea, this project alſo failed, and poor le Blond, to the no ſmall

difdiſſatisfaction of thoſe who were engaged with him, was obliged to diſappear. He died at Paris in the year 1740, in an hoſpital.

The mezzotintos which he produced are not without a conſiderable ſhare of merit ; but in his colouring proceſs he was not always equally ſucceſsful. The preſent writer has ſeen ſome, which, in reſpect of colouring, may be called good, and others which can ſcarcely be eſteemed as any thing better than bad. His colours are rarely vivid and freſh, but frequently flat and dirty, and his drawing of the naked is incorrect, eſpecially in the extremities of his figures. On the whole, his portraits will probably be found to be his beſt performances, of which the principal, are thoſe of king George II. in large folio, the ſize of life : his queen, as a companion print. The three children of king Charles I. after Vandyck, in large folio. Carondolet, after Raphael. Sir Peter Paul Rubens, after Vandyck. And a noble Venetian, with a pointed beard, after Titian, all in very large folio, the ſize of life.

The beſt of his hiſtorical works are, “ St. Agnes and St. Cecilia,” after Dominichino. “ A Repoſe during the Flight into Egypt ;” and a “ Venus Couchant,” both after Titian. “ The Triumph of Galatea,” after Carlo Maratti. “ Cupid faſhioning his Bow,” after Corregio. “ The Charity of Joſeph,” after C. Cignani. “ Chriſt on the Mount of Olives,” after Caracchi. “ Chriſt Entombed,” after Titian. And an anonymous, but very fine “ Magdalen,” all of the folio ſize.

Martin Bernigeroth was born at Ramelſburg in the year 1670, and died at Leipſick in 1733. He produced a number of portraits which is ſurpriſing, and which were collected in nine port-folios in the ducal cabinet at Dreſden, many of them being of folio dimenſions. Yet Bernigeroth does not riſe above mediocrity as an engraver.

Jean Martin Bernigeroth was the ſon and pupil of Martin. He was born at Leipſick in the year 1713, and died in the ſame city in 1767. He poſſeſſed about the ſame portion of talent with his father ; his beſt work being a portrait of Jean Adolphus, duke of Saxe Weiſſenfeld, in folio, dated 1745, which ſcarcely riſes above mediocrity.

Antoine Balthaſar Koenig was born at Berlin in the year 1676, and died in the ſame city ſome time about 1740. His prints, of which the following portraits are thoſe which are held in moſt eſteem, are not without a certain portion of merit. Frederick William, king of Pruſſia, after Weidemann. Frederick baron de Derfflinger, general of Pruſſian cavalry. Charles Gottfried Schrader, aulic counſeller to the king of Pruſſia. Alexander Hermann, Cointe de Wartenſleben, after Ant. Peſne, dated 1716. And the monument of Schrader, with a Latin inſcription.

Chriſtian Albert Wortmann was born in Pomerania ſome time about 1680. He went very young to Berlin, where he ſtudied engraving under Wolfgang, and at the age of twenty-five was ſummoned to Caſſel, where he became engraver to the landgrave of Heſſe. From Caſſel he went to Dreſden, where he engraved ſeveral portraits, and among the reſt his celebrated head of Chriſtian Frederick Boetius. In the year 1727, Wortmann was called to the court of Peterſburg, but the time and place of his death have not been recorded.

His principal engravings are the portraits of Erneſt Louis, landgrave of Heſſe Darmſtadt. Chriſtian Frederick Boetius. Joachimus Juſtus Breithaupt, doctor in theology, after J. A. Rudiger. Johan Samuel Drobiſch. Hermann Joachim Hahn. Anna, empreſs of Ruſſia, after L. Caravac. Alexis, ſon of Peter I.

In an age and country of low taſte, an indifferent painter or engraver of portraits will find encouragement, though an artiſt of no other deſcription could find ſubſiſtence. Among the petty courts of the German electors, there was probably at this time very little taſte, yet obſervation enough to diſcriminate between two or more ſet of features ; and perſonal vanity and courtly pomp enough, to catch at the means of attaining a certain ſpecies of periſhable popularity.

We have paſſed lightly over engravers of this inferior deſcription, and ſome we have entirely omitted, as they contributed nothing toward the advancement of art, but rather perhaps retarded its advancement.

From theſe men of mediocrity, attention turns with pleaſure to the contemplation of the extraordinary powers of Jacob, or Giacomo Frey. Frey was born at Lucerne in Switzerland, in the year 1681, and his life preſents a curious inſtance of the indeſtructibility of genius, which it ſhould ſeem that no rigour of adverſe fortune can ſubdue, and no fire of intemperate paſſions can conſume.

He was apprenticed to the trade of a cartwright, and in ſpite of his propenſities towards the fine arts, was obliged to follow that trade till he attained the age of two and twenty, when he ſomehow or other made his way to Rome ; but in quitting the peaceful and placid vale of Lucerne, he ſeems to have broken looſe from all ſober reſtraint, and on his arrival in Italy, his paſſions, which had hitherto been held in check, hurried him into every dangerous exceſs. Yet, as the ſame Po, which roars and riots down the Alps, winds afterward a ſtately river through the plains of Italy, ſo it was with our artiſt : when the ebullition of paſſion was over, he liſtened with delight to the advice of Arnold van Wirtenhout, and the inſtructions of Carlo Maratti, and from that period began to make ſurpriſing progreſs in the art of engraving.

A ſpeech of Maratti to Giacomo Frey, which ſtrongly marks his good ſenſe and obſervation, has been recorded : “ The engravers of hiſtory (ſaid he) make too much uſe of the *burin*, and hence ariſes a certain hardneſs in the contours, from which, however, the beſt prints of Dorigny are comparatively free. I would adviſe *you* to familiariſe yourſelf with the etching point, becauſe it operates in a far more pictureſque manner than the graver.”

Frey followed this advice. Robert van Audenarde was at this time his fellow-diſciple and liberal rival, but the rapid ſtrides of our artiſt ſoon left him at an immenſe diſtance, though a man of ability. He drew with ſuperior taſte ; had a fine eye for the harmony both of colours and chiaroſcuro ; etched with a degree of ſpirit and freedom, which have very rarely been attained ; worked over and finiſhed his etchings with the graver, at once with firmneſs and facility ; incorporating the whole by means of ſuch exquiſite feeling of the merits of his original, that it has been emphatically ſaid of his prints, that they appear rather printed than engraved. He was the Gerard Audran of Italy, and ſeemed only to differ from Audran himſelf, as Raphael, Guido, Dominichino, and Guerchino, (after whom his principal works are engraved,) differ from Le Brun. In ſhort, his feeling for the peculiar excellencies of the firſt maſters of the Italian ſchools was of the higheſt and pureſt kind ; ſo that it may be ſaid, almoſt without a metaphor, that in his engravings their forms appear revivified by the ſpirit of Giacomo Frey. He died at Rome in the year 1752, the admiration of every intelligent artiſt, yet before he had received more than an earneſt of the praiſes that are juſtly his due.

It is to be regretted, that when his plates, which were publiſhed by his ſon Philip, began to wear, they were injudiciouſly retouched, perhaps by Philip himſelf, who deſtroyed all his father's ſweetneſs and harmonious mellowneſs ; ſo that good impreſſions of the prints of Frey, in their original

ginal ſtate, are now become rare, though they have not yet attained their intrinſic value.

We add a liſt of his principal works, almoſt every one of which merit a particular criticiſm, beginning with the hiſtorical ſubjects: "The Holy Family," after Raphael, engraved from the ſame picture as the print by Edelinck, and of the ſame folio ſize. "Aurora, with the Hours, preceding the Chariot of the Sun," a large folio, from Guido, which has alſo been engraven by Audenarde, the fellow-pupil of Frey, and by Paſcalini and others. "Bacchus conſoling Ariadne, after the departure of Theſeus," (companion to the former) after the ſame maſter. "The Communion of St. Jerome," a large upright folio, from Dominichino. "The Adoration of the Shepherds," of the ſame ſize and form, from Sebaſtian Conca. "A Saint kneeling, and an Angel ſhewing him a Picture of the Virgin and Child," after Carlo Maratti, inſcribed "In conſpectu Angelorum pſalmam tibi." "The Virgin giving the Scapular to St. Simon Stock," a large upright, arched at the top, and inſcribed "Ecce ſignum ſalictis," after Sebaſtian Conca. "St. Francis de Paul reſtoring ſight to a Child," a large upright, from B. Lamberti. A large upright, from Andrea Sacchi, wherein Eccleſiaſtics appear to be aſcending to heaven. "St. Charles Borromeo obtaining from Heaven the ceſſation of the Plague," from Pietro da Cortona, both large upright folios. "A Repoſe," from Carlo Maratti, wherein St. Joſeph is offering cherries to the Infant Chriſt. And "The Martyrdom of St. Andrew," from the ſame maſter; both middling ſized uprights. "The Death of St. Petronilla," after Guerchino. "St. Paul and Ananias," after Pietro da Cortona, both in large folio. "The Rape of Europa," and "A Charity," both after Albano, and of the folio ſize. A ſymbolical ſubject, after Bianchi, inſcribed "Congregavit de regionibus liberos." And "The Beatification of the Virgin Mary," after Carrachi, both in large folio. An allegory, in honour of the church, after Carlo Maratti, inſcribed "Cuſtos Clementia mundi." "The Emperor Auguſtus ſhutting the Temple of Janus," after the ſame painter. "The Archangel Michael," and "The Conference of the Fathers of the Church, on the Subject of the Immaculate Conception," both in large folio, after Guido; the latter from the ſame original which has alſo been finely engraved by our own countryman Sharp. "The Death of St. Anna, and St. Romualdo," both after Andrea del Sacchi, and the latter a very favourite print. And the four angles of the Church of St. Charles de Catenarius at Rome, repreſenting the cardinal virtues; (viz. Fortitude, Prudence, Temperance, and Juſtice,) after Dominichino, large upright folios.

Frey alſo engraved portraits, of which the beſt are thoſe of his friend Carlo Maratti, from a picture by himſelf. Pope Innocent XIII. after A. Maſſuccius. Pope Benedict XIII. on horſeback. Pope Gregory XIII. in a chair, after the marble of Camille Ruſconi. Cardinal Hieronimus Picco de Mirandole, after Neilly. And Clementina, M. Brittan. Fr. et Hib. Regina, from a picture by himſelf; all in large folio.

Elie Chriſtopher Heiſs, an engraver of very large, but not very good mezzotintos, was a native of Memmingen, in Suabia. He was educated to the arts by his father Jean Heiſs, a painter of Memmingen, and died at Augſburg in the year 1731.

He produced a conſiderable number of plates, both in hiſtory and portrait, of which "The Salutation of the Virgin" is three feet one inch in height, by two feet two inches wide! and "a Crucifixion," from his hand, is of nearly the ſame dimenſions.

Bernard Vogel was the coadjutor of Heiſs, ſome of theſe very large plates being ſcraped by them in conjunction. He was a native of Nuremberg, born in 1683, but reſided chiefly at Augſburg, where he eſpouſed the daughter of Heiſs. In the earlier part of his career, he produced ſome tolerably good portraits with the graver, but latterly engraved only in mezzotinto. He retired from Augſburg to his native city, probably after the death of his father-in-law, and died there in the year 1737, leaving behind him a ſon, Jean Chriſtophe, who engraved ſeveral plates in mezzotinto, after Kupetzky.

The beſt works of Bernard Vogel are the portraits, performed with the graver, of Johan Michel Weickmann, after L. C. Eichler; Auguſtus Hermann Frankius, profeſſor of theology; and Johannes Michael Welſer, ſenator of Nuremberg, after J. C. Hirſchmann, all in folio.

The chief of his portraits in mezzotinto, are thoſe of Johannes Kupetzky, painter, dated the year of our artiſt's death; Michael Gottfreid Wittber, a celebrated ſurgeon, after Kupetzky; and George Bledinger, the painter, all in folio.

Chriſtopher Vogel engraved, in the ſame manner, the portrait of his father, inſcribed "Chalcographus Norimb."

Jean George Bergmuller was born at Dirkheim, in Bavaria, A. D. 1687, and died at Augſburg in 1762. He learned the rudiments of art under Andrea Wolf, of Munich, but afterwards ſtudied with more advantage under Carlo Maratti. He painted ſucceſsfully, both in oil and in freſco, and etched a great number of plates, in an able and maſterly ſtile, which he afterwards finiſhed with the graver. He was likewiſe the author of two works; one on the growth of man, which he called "Antropometria:" the other on menſuration and architecture, publiſhed 1752, and became director of the Academy of Arts, which was eſtabliſhed at Augſburg. His ſon, Jean Baptiſte, alſo followed the art of engraving with ſome ſucceſs.

The beſt of Bergmuller's prints are thoſe which follow: a ſet of four, of the Baptiſm, Transfiguration, Reſurrection, and Aſcenſion of Jeſus Chriſt. "The Madonna and Child." "The Death of St. Joſeph." "The Saviour on the Mount of Olives." "The Martyrdom of St. Catherine and St. Sebaſtian." "Juſtice, and Peace," inſcribed "Juſtitia et Pax oboculutæ ſunt." A ſet of the four ſeaſons, dated 1730. Another ſet of four of the zodiacal ſigns.

Jean Daniel Herz, draughtſman and engraver in aquafortis, was born at Augſburg A. D. 1693, and died in the ſame city in 1754.

Herz was an artiſt of original powers, rich in compoſition, bold and rough in execution, but deficient in grace and harmony of parts. He was appointed director of the imperial academy of arts at Augſburg, and filled the office with credit; but an hereditary director of an academy, nature, and ſcience, will not endure, and his ſon Daniel, to whom the directorſhip unfortunately devolved, ſoon made himſelf appear ridiculous in this ſituation, though he was a tolerably good knight of the holy Roman empire.

The ſtyle of execution of Herz the elder bears marks of great rapidity, and rapid he muſt have been, for his plates are numerous, and ſome of them of very large dimenſions.

We have ſelected the following, as thoſe which, on the whole, are moſt worthy of the portfolio of the connoiſſeur. "The Annunciation," richly compoſed, and in very large folio. "The Raiſing of the Croſs." "The Aſſumption of the Virgin." "The Adoration of the Kings." "An Ecce Homo." "The Crucifixion." "The Death of Ananias." "The Diſpute between St. Paul and the Philoſophers of Athens." And "The Judgment of Solomon;" all in very large folio. "The Coronation Proceſſion of Queen Maria Thereſa at Preſbourg;" alſo of very large dimenſions.

Jean Elie Ridinger, a very diſtinguiſhed engraver of animals, was born at Ulm in the year 1695, and died at Augſburg in 1787. His father was a reputable drawing maſter, and from him our artiſt received his earlieſt inſtructions in the art. He afterwards ſtudied painting under Chriſtopher Reiſch, but as an engraver ſtudied nature alone, and was one of her ſucceſsful votaries. He formed a ſtyle of engraving animals for himſelf, which conſiſt chiefly of etching, which is performed with characteriſtic freedom and firmneſs, tempered and harmoniſed, without being over laboured, with the graver. He appears to have ſtudied in the wildeſt and moſt unfrequented receſſes of the foreſts of Germany, and the back grounds of his ſavage animals are conceived and executed in a grand and maſterly ſtyle, occaſionally diſplaying all the wild vigour of luxuriant and uncontrolled vegetation, which can only be contemplated in the depths of untrodden foreſts, and occaſionally in his dens of bears, tygers, lynxes, &c. the moſt barren and diſmal rocky ſolitudes, inſomuch that the reflecting ſpectator is led to wonder, either at the bold truths and fertility of a daring imagination, or, if he believes that Ridinger has really viſited ſuch ſcenes, at the dangers he muſt have eſcaped.

Nor are his portraits of wild and ferocious animals, leſs than his landſcape ſcenery, the reſult of vigorous obſervation, and extenſive power over the inſtruments of his art. In tracing their habits and manners, he combined the exactitude of a naturaliſt with the talents of a conſummate artiſt.

Several of Ridinger's prints may be called hiſtorical, being repreſentations of chaſes which really took place in his time, and at which he muſt have been preſent, in the foreſts of Germany, with portraits of the animals that were killed or taken, and beneath theſe engravings there is generally a particular deſcription, or hiſtory, of the chaſe, in the German language.

He did not, however, draw the human figure, nor that of the horſe, with equal ability; and though his chiaroſcuro be often effective, yet in many inſtances his lights are too much ſcattered. He worked from his own compoſitions, and ſometimes painted, as well as engraved, a favourite ſubject, but his pictures are not common. The moſt eſteemed of his numerous engravings are thoſe which follow:

"The Terreſtrial Paradiſe," a ſet of twelve large folio plates, in which are introduced, in an appropriate manner, all the various animals; the ſubjects are connected by means of the hiſtory of Adam and Eve. Theſe are grand compoſitions, finely executed, and in England but rarely ſeen. A ſet of ſixteen fables. A ſet of heads of wolves and foxes, finely executed. A ſet of four large upright folios, which by ſome are eſteemed the maſterpieces of Ridinger, and two of which, repreſenting "Bears feaſting on a Stag," and a haunt of "Wild Boars in a Foreſt," are more eſpecially to be admired. A pair of "Stag-hunting" and "Bear-hunting," in large folio, both deſigned from nature. Another pair of hunting pieces, of "The large Wild Boar with double Tuſks," and "The Stag in Rutting-time," dated 1755, and 1757, taken by the duke and ducheſs of Wirtemberg. A ſet of ſixteen hunting pieces of the larger and ſmaller game, as practiſed in the different ſtates of Germany, with German and French explanations beneath, rich and intereſting compoſitions. A ſet of twelve plates of ſavage and carnivorous animals, all in large folio, and after his own deſigns.

Ridinger alſo engraved, with his uſual ability, a lion-hunt, after Rubens.

The Preiſſers were a numerous family of engravers, whom we ſhall paſs with brief notices, as they rarely roſe above mediocrity..

Jean Daniel Preiſler, an engraver of portraits, was of Nuremberg, and lived at the cloſe of the ſeventeenth and beginning of the eighteenth centuries. His ſon Jean Juſtin was born in the ſame city in the year 1698, aad died there in 1771. He reſided in Italy a conſiderable time, and became director of the Imperial academy of Augſburg. His moſt diſtinguiſhed works are "The Apotheoſis of Æneas." A ſet of the four elements, after Edmond Bouchardon; and another ſet of the four parts of the day, all in folio. A ſet of fifty plates of the antique ſtatues preſerved at Rome, from drawings by Bouchardon; ſmall uprights. The cielings of the Jeſuits' church at Antwerp, after Rubens, conſiſting of twenty ſmall plates, excluſive of the portraits of Rubens and Vandyke.

George Martin Preiſler, a younger brother of Jean Juſtin, was alſo of Nuremberg; he engraved, in the family ſtyle, a conſiderable number of portraits, and a ſet of twenty-one plates of ſtatues, at Rome and at Florence, from drawings by his brother Jean Martin.

The engraving of Valentine Daniel, another ſon of Jean Daniel Preiſler, was chiefly confined to book plates and portraits.

Jean Martin Prieſler, the fourth ſon of Jean Daniel, travelled from Nuremberg to Rome for improvement, and became, on the whole, perhaps, the beſt engraver of the family. He accepted an invitation to Denmark, and was living in good repute at Copenhagen in the year 1770. His ſtyle is clear and neat, but deficient in vigour, and his beſt prints are, "Chriſt bearing his Croſs," a large folio, from Paolo Veroneſe. "Semiramis, placing the Crown of Ninus upon her own Head," from Guido, a large folio, engraved with the former, for the Dreſden gallery. "A Battle," from Parrocel, and a Bacchanalian ſubject, from Pierre, both in large folio.

Jean Alexander Thiele was born at Erfurth in the year 1695, and from the rank of a common ſoldier roſe to be a diſtinguiſhed engraver and painter of landſcapes. A decided taſte for this art, and ſome pictures of Agricola, which it was his good fortune to ſee and copy in diſtemper, introduced him to the notice of that artiſt, by whoſe inſtructions he failed not to profit. He is believed to have been the firſt in Germany who attemped to paint landſcape in crayons, which, though an ineligible mode of art, is a proof of his ingenuity: he afterwards acquired a knowledge of oil-painting under Menyoky, in which he gloried, and in which he excelled. His ſtudy was the romantic part of Saxony, and more eſpecially the banks of the Elbe and the Sala. His etchings, of which the ſubjects of the principal are named below, are rude but maſterly. The celebrated Dietrich ſtudied under him at Dreſden, where he left a ſon, and where he died in the year 1752.

A pair of mountainous landſcapes, adorned with ruins of ancient buildings, dated 1725, in folio, and very rare; a pair of ſmaller landſcapes, of more ruſtic character; a ſet of three mountainous landſcapes; a landſcape of grander character, adorned with ruined monuments of antiquity, in quarto; a pair of "The ancient Port or Mouth of the Elbe," drawn from nature, and dated 1742; a pair of views at Naumburg, all in quarto; a ſet of ſix of ſuperior execution, from nature, including views of Pilnitz, Koningſtein, Muſſen, and Dreſden, dated 1726, in large folio.

Paul Troger was born at Zell, in the biſhopric of Brixen, in the year 1695, and died at Vienna in 1777. He ſtudied the rudiments of his profeſſion in his birth-place, and afterwards travelled for improvement to Fium, in the biſhopric of Trent, in order to avail himſelf of the inſtructions of D. J. Alberti, after which he went to Vienna, and ſoon became known by his prints, and by the pictures with which he adorned ſome of the churches of Auſtria. In etching, the touch of Troger is firm and preciſe, his figures are well deſigned, and his expreſſion juſt. He became director of the Imperial academy of Vienna, and engraved in a good taſte both hiſtorical ſubjects and landſcapes, the latter of which he ornamented with figures, ruins, &c.

His beſt prints are two ſmall Holy Families; "The Virgin and Child;" "St. Joſeph careſſing the Infant Chriſt;" "The Virgin in Grief, comforted by Angels;" in folio. Five ſmall landſcapes. And a pair of landſcapes, in which ancient monuments are introduced, in quarto, dated 1724.

Jacob Maennl was born at Vienna in the year 1695, and died in the ſame city at an advanced age; and, according to the baron Heinnekin, was a mezzotinto engraver of conſiderable ability. He was employed by C. Lauch, inſpector of the Imperial gallery at Vienna, to ſcrape that celebrated collection in mezzotinto, and had executed thirty-one of the plates, when the death of both the engraver and employer prevented the completion of their project.

Of theſe thirty-one prints, only eleven were ever made public; the reſt are preſumed to have been ſold by the heirs of Maennl, and are now miſſing. At the head of the work is a portrait of the emperor Charles VI., and Heinnekin and Strutt have given liſts of the ſubjects engraved.

Antoine Joſeph Prenner, or Von Prenner, after the death of Lauch and Maennl, undertook, in concert with Stampart, Altamonti, Schmutzer and others, to recommence the work from the Imperial gallery, and after a conſiderable lapſe of time produced

"Theatrum Artis pictoriæ, quo tabulæ depictæ quæ in Cæſarea Vindobonenſi Pinacotheca ſervantur," &c. in four folio parts, or volumes, of which part one was publiſhed in 1728, part two in 1729, part three in 1731, and part four in 1733.

Theſe four parts contain one hundred and ſixty prints, which are ſurrounded by borders in a bad taſte, and the work altogether is but of mediocral character. The beſt portraits by this artiſt are thoſe of Jean Gottfried Auerbach, painter to the emperor Charles VI. and count d'Odt, governor of Vienna, both of the folio ſize.

Gaſpar von Prenner, the ſon of Antoine Joſeph, was alſo an engraver, who travelled to Italy for improvement, and was engaged in engraving the "Muſeum Florentinum." He alſo produced a ſet of forty-five etchings, neatly finiſhed with the graver, of hiſtorical ſubjects from Taddeo Zucchero, and other diſtinguiſhed maſters, dated 1746.

G. A. Muller was born at Vienna ſome time about the commencement of the eighteenth century, worked in a delicate ſtyle, and, in concert with the Schmutzers, produced Rubens's ſeries of the hiſtory of Decius, of which Muller engraved two.

His other principal works are the portraits of Phillipe Louis, count de Sintzendorf, after M. Altomonte; Jacob van Schuppen, member of the academies of Paris and Vienna, after a picture by himſelf. "The two Children of Rubens at the age of adoleſcence," from a celebrated picture by that maſter, in the Lichtenſtein gallery.

The brothers, Jean Adam, Joſeph, and Andrea Schmutzer, were natives of Vienna, and born about the cloſe of the ſeventeenth, and beginning of the eighteenth centuries. They died, the former in the year 1739, the two latter in 1742.

Their grandfather, a general in the Imperial ſervice, loſt much of his property by the accidents of war; and the infidelity of the tutor to whom he had entruſted the education of his ſon, reduced that ſon to grievous extremities, but his ſufferings ſtruck out a talent with which it now appeared that nature had endowed him. He acquired the art of engraving on iron and ſteel, and ornamented locks and fire-arms with much taſte.

He brought up his ſons, the brothers of whom we treat, to the profeſſion of gun-engraving, which they quitted for the more elegant art of engraving on copper. Jean Adam was the eldeſt, but, in ſpite of application, could never attain to the eminence of Joſeph and Andrea. He engraved, however, for the gallery of Vienna under Altomonte, and his beſt prints are the portraits of the three empreſſes Eleonora, Amelia, and Elizabeth.

Joſeph and Andrea generally, if not always, worked in concert, and affixed their names, ſometimes Joſeph and Andrea, and at others Andrea and Joſeph, Schmutzer, with brotherly alternation. Joſeph poſſeſſed dexterity both in etching and re-entering with the graver, and Andrea poſſeſſed great facility in managing the tool, which was the neceſſary reſult of his being educated to engrave on ſteel, and to which he added a careful ſtudy of the works of Bolſwert, and Van Dalen. The beſt prints from the gravers of theſe brothers are the portraits of the emperor Charles VI. on foot, after M. de Meytens; the empreſs Elizabeth Chriſtina, after J. G. Auerbach; Guſtavus Adolphus, baron de Gotter, Pruſſian miniſter of ſtate; and Leymann, a librarian, or bookſeller, of Vienna, all in folio, and the two latter, alſo after Auerbach. A pair of ancient temples, in large folio, decorated with ſtatues and trophies, after Joſeph Galli Bibiena.

But their moſt diſtinguiſhed work is three folio plates, from Rubens's life of Decius, in the gallery of the prince of Lichtenſtein.

Jacques Schmutzer was the ſon of Andrea, and had the misfortune to loſe his father when he was ſeventeen years of age. By what further misfortune he came now to be ſo very poor as to be employed partly as a butcher and partly as a ſhepherd is not known, but he was employed to watch ſheep, ſometimes in the fields, but more frequently when penned up for ſlaughter. The public drawing-ſchool, however, was in the neighbourhoood of the ſheep-penns, and his love for art often induced him to confide his flock to ſome indolent comrade, whilſt he ſtole away to draw with the ſtudents of the academy.

The celebrated medaliſt Matthew Donner, apprized of theſe circumſtances, took ſome notice of the lad, and invited him home, but by ſome new accident or impulſe, he now began to ſtudy architecture; which purſuit he did not afterwards renounce for the arts of deſign. He was employed for three years as an architect in Hungary, during which time he deſigned and painted and engraved hiſtorical ſubjects at his leiſure hours, and on his return to Vienna, continued occaſionally to practice architecture.

He had now the good fortune to become known to the baron de Kettler, a great patron and protector of art and artiſts, who, charmed with his eſſays in engraving, ſolicited the prince Kaunitz, and the empreſs queen, to ſend the young Schmutzer to Paris; his ſolicitations were attended to, and our young engraver was placed under the guidance of Wille; here he perfected himſelf in the art, and in the courſe of the four years he remained in that celebrated metropolis, learned to uſe the graver with maſterly intelligence.

He was now recalled to Vienna, with high rank in his profeſſion, and was named by Maria Thereſa a Director of the academy. He ſuperintended the education of a great number of ſtudents in his mature age, and at the cloſe of the laſt century, was as great at Vienna, as Wille in Paris.

The beſt of Schmutzer's engravings are the portraits of Don Emanuel, of the illuſtrious family of Deſvails, and Joſeph von Sonnenfels, both ſmall; Martin de Meytens, the celebrated painter, after a picture by himſelf, dated 1756; C. G. E. Deitricy, another celebrated artiſt, after the ſame, dated 1765; Joſeph Wenceſlaus, prince of Lichtenſtein, after V. Fanti; the emperor Francis I., after von Liotard, dated 1769; the companion to which is the empreſs Maria Thereſa; and two portraits of prince Kaunitz, one after J. Steiner, and the other after Hagenauer, dated 1786, in a circle; a much eſteemed and rare piece of engraving.

The above are all in folio. We now proceed to ſelect from his hiſtorical engravings, "Ulyſſes diſcovering Aſtyanax and Andromache," after the prince of Saxe Teſchen, dedicated to madame the archducheſs; "Mutius Scævola before Porſenna," from a picture by Rubens in the cabinet of the prince Kaunitz, dated 1778; "St. Gregory refuſing to admit the emperor Theodoſius into the Church," after the ſame maſter, both plates in folio, and of learned execution; "Venus riſing from the Sea," from a picture by Rubens, in the gallery of count Schoenborn at Vienna, beautifully finiſhed, and four large and intereſting landſcape views at Neuwaldeck and Dornbach, in which occurs the tomb of Rouſſeau, and the ſtatues of the Gladiator and the god Mars.

George Frederic Schmidt was born at Berlin A. D. 1712, and died in the ſame city in 1775. Schmidt was deſtined by Fortune to be a tradeſman, but the voice of Taſte, (ſays Huber,) proclaimed him an artiſt. His perſeverance, after various ſtruggles, at length, ſurmounted the obſtacles that oppoſed themſelves to the gratification of his natural propenſities, and he was admitted a ſtudent in the ſchool of George Patel Buſch at Berlin, from whence his ambition, rather than his purſe, in the year 1736, carried him to Paris, where he frequented the ſchool of Nicholas de Larmeſſin, who honeſtly and earneſtly ſeconded the profeſſional wiſhes of Schmidt, by imparting to his diſciple all that it was poſſible to communicate of his knowledge of the art of engraving.

In the year 1742 he was admitted a member of the French academy of Arts, although (which at that time was an important exception) he was of the Proteſtant religion. At this time Schmidt, Prieſler, and Wille (of whom the reader will find an account under FRENCH *School of Engravers*) were diſtinguiſhed at Paris by their ſuperior merit in engraving, and were bound together by the ties of friendſhip, while there reigned between them a noble profeſſional emulation. Schmidt had recommended himſelf to the friendly regard of the celebrated Rigaud by the very fine portrait of P. Mignard, which he engraved for his reception into the Royal Academy, and Rigaud contributed to his ſpreading reputation, by ſeeking and obtaining for him ſuch engagements as were analogous to his wiſhes and talents.

In two years, however, or a little more, he was ſummoned to Berlin, and nominated engraver royal, and in the year 1757 he was ſent for to Peterſburg by the empreſs Elizabeth, to engrave her portrait, which he executed (with many others, while he remained in Ruſſia) to the great ſatisfaction, not only of the connoiſſeurs of the court, but of the beſt judges throughout the Ruſſian empire.

On his return to Berlin, in 1762, he began to diſtinguiſh himſelf in a new career of engraving, by etching in a pictureſque ſtyle after the works of Rembrandt, in which he imitated Rembrandt's own mode of execution, but generally bit-in his plates to deeper tones.

The engravings of Schmidt amount in number to nearly two-hundred, beſide the vignettes which he did for the works of the king of Pruſſia. Count Crayen publiſhed a catalogue raiſonnée of the whole, from which we have thought the following moſt worthy of ſelection, as ſpecimens of the various powers of our artiſt.

Portraits performed chiefly with the Graver, and of folio dimenſions.—Conſtantine Scarlatti, prince of Moldavia, a rare and fine print, dated 1738; Charles Gabriel de Tubieres de Caylus, biſhop of Auxerre, after Fontaine; Louis de la Tour d'Auvergne comte d'Evreux, after H. Rigaud, dated 1742; Johannes Baptiſta Roſſeau, after J. Aved, dated 1740; Charles de St. Alvin, archbiſhop of Cambray, after H. Rigaud, dated 1742; Maurice Quinten de la Tour, from a picture by himſelf, dated 1742; Jean Baptiſte Silva, a celebrated phyſician, after Rigaud, dated 1742; Pierre Mignard, firſt painter to the French king, after his friend Hyacinthe Rigaud, engraved in 1744, for Schmidt's reception into the academy, a piece regarded by connoiſſeurs as a chef d'ouvre of the maſters, and the fleſh of which is engraved in a ſtyle ſo ſoft and mellow, that it has been emphatically ſaid to be rather painted than engraved. The four laſt are in large folio.

After his return from Paris to his native city, Schmidt engraved the portraits of Antony Peſne, firſt painter to the king of Pruſſia, and Samuel Baro liber de Cocceii, both in folio, dated 1751 and 1752, and reckoned among the beſt portraits from the graver of Schmidt.

Johannes Theodore Eller, aulic-counſellor, &c. after Peſne; and Louis Albertene de Brandt baron de Grapendorf, after le Sueur, are a very rare and beautiful pair of portraits of the folio ſize.

Among the beſt portraits which our artiſt engraved at Peterſburg, are thoſe of Michel de Woronzow, count of the Holy Roman empire, and Nicholas Eſterhazy de Galantha, both in large folio, after L. Tocque, and dated 1758; Pierre Comte de Schuallow, grand-maſter of the Pruſſian artillery, from the life, and dated 1760; the empreſs Elizabeth of Ruſſia, a whole length figure, with accompaniments of the imperial coſtume, after L. Tocque, which Huber calls a ſuperb print, more eſpecially for the execution of the acceſſory parts, it is dated in 1758; count Cyrillus de Raſumowſky, after L. Tocque, and Jacobus Mounſey, from a picture by Schmidt himſelf, dated 1762, are rare and beautiful, and M. de Katt, field marſhal and miniſter of ſtate to the king of Pruſſia; the laſt portrait from the graver of Schmidt, the head in which is by himſelf, but the reſt finiſhed by Bergere the elder.

Among his hiſtorical and fancy works, may be diſtinguiſhed a pair of "The fair Greek," and "The amorous Turk," the two firſt plates which Schmidt engraved under Larmeſſin at Paris; "Tabagee Flamande," &c. in folio, after Oſtade, engraved in a ſtyle reſembling that of Viſſcher, and dated 1757; "The Virgin Mary ſitting with the Infants Chriſt and St. John," after Vandyke, dated 1773; "The Virgin at Prayers," after S. Ferrata; "The Preſentation in the Temple," after Pietro Teſta, for the Imperial gallery at Peterſburg; "Alexander and Philip the Phyſician," after Annibal Carracci, engraved in imitation of the hiſtorical ſtyle of Gerard Audran, at Berlin 1769, and "Timocles juſtified by Alexander," companion to the above, and after the ſame painter; both in large folio.

In imitation of the Taſte of Rembrandt.—A half length of a bearded old man with a feathered bonnet, deſigned by the engraver, and an old woman in profile, after Rembrandt, companion to the above; buſt of an Oriental in the ſtyle of Caſtiglione, dated 1750; buſt of a young man in a Rembrandt head-dreſs ; an old man habited as a Perſian, after Rembrandt ; portrait of a young female, and portrait of a young ſigneur, from the ſame maſter ; the Jewiſh bride, and the father of the Jewiſh bride, both after Rembrandt, and from the collection of the count de Kamki ; the profiles of Salimbeni, and count Algarotti ; the portrait of the engraver himſelf, inſcribed "Georg Fridrick Schmidt ; Konigll Preuſſ. Hof. Kupfertecher Mitglud der Maler Academien zu Berlin & Paris," dated 1752.

His beſt hiſtorical works, in the taſte of Rembrandt, are, "Jeſus Chriſt preſented to the People, and buffetted by the Soldiers," after Rembrandt, dated 1756. "The Reſuſcitation of the Daughter of Jairus," after Rembrandt, with a very fine chiaroſcuro, dated 1767. "The preſentation in the Temple," after Dietrich, companion to the above. "The Philoſopher in his Grot," by ſome called Anchiſes taking refuge in his grotto during the ſack of Troy, in the back-ground of which is a city in flames, after Rembrandt, and dated 1768. "The Repentance of St. Peter," after F. Bol. "Lot and his Daughters," after Rembrandt, from a picture in the poſſeſſion of prince Henry of Pruſſia, to whom the print is dedicated, and the funeral monument of Sir Andrew Mitchell, knight of the Bath, and ambaſſador from the king of Great Britain, who died at Berlin in 1771 ; the two laſt are of folio dimenſions.

Joſeph Wagner was born A. D. 1706, at Thalendorf, on the lake of Conſtance, and died at Venice ſome time about the year 1780. He learned the art of deſign under J. Amiconi, whom he accompanied to England and to Italy, and, obedient to the advice of this maſter, he afterwards travelled to Paris, and ſtudied engraving with very conſiderable ſucceſs under Laurent Cars. In the year 1756 he ſettled at Venice ; began to publiſh there the engravings of himſelf and pupils, and finally eſtabliſhed a beneficial commerce with ſeveral parts of Europe. Among his diſciples were Flipart, Berardi, and, above all, Bartolozzi, whoſe talents have done honour to his maſter, to himſelf, to Italy, and to England, and who ſtill lives engraving in Portugal amid the din of arms.

The ſtyle of Wagner's engraving is particularly eaſy and engaging, and is in fine art, what in manners we term amiable. It is built on the firm foundation of ſound drawing ; and partakes highly of the merits of Gerard Audran and Giacomo Frey. Like them he harmoniouſly mingled etching with the work of the graver and dry needle, and, like them, he evinced a high feeling of the merits of thoſe maſters after whom it was his fortune to engrave.

The elements of his ſtyle are, vigour tempered with mildneſs and ſuavity ; hence he is delicately bold, and, without the leaſt appearance of labour, produces, in his beſt works, an effect of finiſhing, which others labour after in vain, and which is more particularly obſervable and appropriate in infantile ſubjects, or where he has to touch the imagination with indefinite grace. In his figures of the Infant Saviour and St. John, where the characters in his original allowed him to be ſo, he is, indeed, the Fiamingo of his art ; though if living artiſts had found a place in our Cyclopædia, that honour muſt rather have been awarded to the moſt diſtinguiſhed of his pupils.

Wagner's firſt attempts in engraving are ſaid to have been the portraits of the Engliſh princeſſes Anne, Amelia, and Caroline, daughters of George II. Of his other portraits, the moſt remarkable are, a pair in folio, whole length figures of the empreſs Anne of Ruſſia, and Peter the Great, conducted by Minerva. The empreſs Elizabeth Petrowna, with a Ruſſian inſcription, and Farinelli crowned by the Muſe of Harmony ; all in folio, and after his firſt maſter, Amiconi.

Among the moſt eſteemed of his hiſtorical works are, "The Infant Chriſt aſleep in a Landſcape," a beautiful print. "The Education of the Virgin." "The Prophet Tireſias," inſcribed "Tireſias triplex modo vix modo fœmina vates ;" all of the folio ſize, and after Amiconi. "The Holy Family," elevated on a pedeſtal, at the foot of which are other ſaints, after Paolo Veroneſe. "The Interview of Jacob and Rachel," after Lucca Giordano, engraved for the Dreſden gallery. "Rebecca receiving the Preſents," after the ſame maſter, and for the ſame work. "The Death of Abel," after B. Luti, in large folio. "St. Mary Magdalen," from the ſame maſter, and of the ſame dimenſions. "The Virgin and Infant Chriſt," after Solimena. "The Aſſumption of the Virgin Mary," after Piazetta. "St. John in the Deſart," after Carlo Vanloo ; all in large folio.

A ſet of large landſcapes, ornamented with Italian paſtoral figures, after Zucarelli, and executed with much taſte, are by Wagner, in conjunction with Bartolozzi.

GERMAN *School of Muſic.* Though the language and national ſtyle of ſinging in Germany are much inferior to thoſe of Italy, the inſtrumental muſic of that country is indiſputably the firſt in the world. It is true that the violin is infinitely obliged to Corelli, Geminiani, Samis, Tartini, and Boccherini ; but for ſymphonies, and the union of wind-inſtruments with thoſe of the bow, the Italians have nothing at preſent, equal to the full pieces of the elder Stamitz, Vanhal, Haydn, and Mozart ; nor on keyed-inſtruments have they any compoſitions equal to thoſe of Emanuel Bach, Haydn, Mozart, and ſeveral other great claveciniſtes. And though the beſt German ſingers are, in general, inferior to the *piazza*, or ſtreet ſingers of Italy ; yet Germany has, now and then, furniſhed a vocal performer equal to the beſt of Italy : ſuch as Raaf, the Mingotti, the Taiber, the Toſi, Mara, &c.

M. Suard, ci-devant member de l'Academie Françoiſe, an extremely ſevere and faſtidious critic of the dramatic muſic of Italy, and a determined Gluckiſt, begins a long article in the Encyclopédie Methodique on the hiſtory of muſic in Germany ; but though the article conſiſts of twelve quarto pages, only four or five of them are beſtowed on German muſic in general, before the author haſtens to his hero Gluck, whoſe life he gives, and an ample liſt of his works, ſince he quitted the Italian ſtyle of compoſition for that of France. All this is minutely and ably done, and would be ſatisfactory to all muſical readers, if the author's zeal for Gluck, and his ſtyle were not *excluſive*, and his cenſures ſo ſevere, of all that has been admired in Italy, both in compoſition and performance, by all the reſt of Europe, except France. No vocal compoſitions but thoſe of Gluck eſcape condemnation. Metaſtaſio's dramas are not written to his mind. The compoſers are too florid, and the ſinging too important.

If M. Suard had confeſſed that the ſtyle of ſinging in France was bad, and that its native public ſingers were unable to execute ſuch ſongs as the great Italian maſters have compoſed ; and therefore that it was moſt prudent to have as little ſinging as poſſible ; the airs very ſhort and ſimple no introductory ſymphonies, or ritornels to impede the progreſs of the drama ; to ſet the poet above the compoſer, and the actor above the ſinger : with theſe conceſſions all Europe would have admitted his reaſoning to be juſt ; but when M. Suard inſiſts on all Europe implicitly following the French model in muſical dramas ; that where great opera compoſers and refined ſingers abound, they are not to be employed,

ployed, but that the melo-drama, to render it intereſting, ſhould never admit an air ſuperior to an elegant ballad, is what lovers of dramatic muſic, and judges of good compoſition and good ſinging, will never ſubſcribe to.

But though M. Suard is ſo determined a foe to all opera muſic but that of Gluck, and ſinging, except that of the natives of his own country, when he ſpeaks of the inſtrumental muſic of Germany, he is very juſt, and celebrates the ſchools of Vienna, Coblentz, Manheim, Munich, and Stutgard; which have produced the Stamitzes, the Touchis, Canabichs, Schroeters, Haydns, and innumerable other ſymphoniſts, whoſe compoſitions are known to all lovers of muſic. All theſe different ſymphoniſts (ſays with great truth M. Suard) have a peculiar character and ſtyle of their own; yet, continues he, "it muſt be allowed that all give way to the inexhauſtible Haydn for invention and originality. He unites all the reſources of ſcience to the charms of good taſte: he is noble and gay, full of grace and force; ſimple with infinite variety; and unites to movements the moſt ſweet and captivating in melody, the greateſt orcheſtral effects."

This character is written with ſuch truth, intelligence, and feeling, that we forgive the elegant and refined writer much of his bigotry for Gluck, and intolerance for all dramatic muſic, except that of France.

No praiſe is too ſtrong for the inſtrumental muſic of Germany in general by the compoſers ſo juſtly celebrated by M. Suard; but when to theſe we join Emanuel Bach, and the admirable Mozart, and his ſcholar Beethoven, it ſeems as if inſtrumental muſic, at leaſt, was arrived at its acme of perfection. This extenſive empire has likewiſe produced maſters who have even equalled the moſt eminent Italian dramatic compoſers of the laſt century; ſuch as Handel, Haſſe, Graun, J. C. Bach, Miſtewecce, Gluck, Naumann, &c., without mentioning the operas, oratories, and maſſes of Haydn, and the dramatic muſic of Mozart, perhaps the beſt of its kind. So that Germany may be ſaid frequently to vie with Italy itſelf in its own beſt ſtyle of compoſition.

GERMAN, in *Geography*, a townſhip of America, in Fayette county, Pennſylvania; containing 1835 inhabitants.

GERMAN *Flats*, the chief and poſt-town of Herkemer county, in the ſtate of New York, ſituated on the N. ſide of Mohawk river, oppoſite to Herkemer, and 24 miles E. of Whiteſtown; and containing 1637 inhabitants.

GERMAN *Town*, a town of New York, in Columbia county, containing 516 inhabitants.—Alſo, a town of Philadelphia county, in the ſtate of Pennſylvania, ſeven miles N. of the city of Philadelphia. It is a corporation, conſiſting chiefly of High and Low Dutch, and contains about 350 houſes, chiefly of ſtone, ſome of which are large and elegant, forming one ſtreet about two miles in length. The public buildings are a Preſbyterian, German-Calviniſt and Lutheran church, a Friends' meeting-houſe, and an academy. Here is a conſiderable manufacture of ſtockings, made of cotton, thread, and worſted. This is an ancient town, pleaſantly ſituated, and by its vicinity to the metropolis, well adapted for manufactures. The principal congregation of the Mennoniſts, and the parent of that ſect in America, ſubſiſts in this place. A ſevere battle was fought here between the Engliſh and Americans in October 1777.—Alſo, a poſt-town, and capital of Stokes county, N. Carolina, ſituated near the town fork of Dan river, and containing a court-houſe, gaol, and about 30 houſes; 528 miles S.W. by S. of Philadelphia.—Alſo, the chief town of Hyde county, in Newbern diſtrict, N. Carolina.—Alſo, a town of Bracken county, in Kentucky, containing 81 inhabitants.—Alſo, a town of the ſtate of New Jerſey; 17 miles W.S.W. of Morriſtown.

GERMANDER, in *Botany*. See TEUCRIUM.

GERMANDER, in the *Materia Medica*. The *common* germander, *teucrium chamædrys*, *chamædrys minor repens*, is a native of England, and flowers in June and July. The leaves and tops have a moderately bitter taſte, accompanied with a weak aromatic flavour, diminiſhed by drying the plant. They give out their virtues both to watery and ſpirituous menſtrua. The chamædrys has been chiefly eſteemed in the character of a mild aperient and corroborant; it is recommended in uterine obſtructions, intermitting fevers, and in the rheumatiſm and gout. The good effects of the chamædrys in the latter diſorder are recorded by different authors who have employed it in various forms and combinations, of which the celebrated antiarthritic, or Portland powder, is an inſtance. According to Murray the virtues of this plant ſhould be nearly allied to thoſe of Marrubium; and therefore it promiſes to be uſeful in aſthmatic affections, coughs, and infarctions of the lungs. Theſe virtues, however, are ſomewhat problematical.

The *Marum* germander, or Syrian herb maſtich, *teucrium marum*, flowers from July till September. It is a native of Spain, and is ſaid to grow plentifully alſo in Greece, Egypt, Crete, and Syria. It was firſt cultivated in England by Parkinſon in 1640, and is now to be found in many of our gardens. The leaves and younger branches of *marum*, when recent, emit, on being rubbed between the fingers, a volatile aromatic ſmell, which excites ſneezing, but to the taſte they are bitteriſh, with a ſenſation of heat and acrimony. According to Lewis (Mat. Med.) it loſes but little of its pungency by being dried; and gives out its active matter partially to water, and completely to rectified ſpirit. Diſtilled with the former, it yields a highly pungent, ſubtile, volatile, eſſential oil, ſimilar to that of ſcurvy-graſs, but ſtronger and of leſs periſhable pungency. Rectified ſpirit carries off, in the inſpiſſation of the ſpirituous tincture, a conſiderable ſhare of the ſmell and pungency of the marum, but leaves much the greateſt part concentrated in the extract; which, on being taſted, fills the mouth with a durable, penetrating, glowing warmth. Wedelius ſtrongly recommends this plant as an important remedy in many diſeaſes requiring medicines of a ſtimulant, aromatic, and deobſtruent quality; and inſtances of its efficacious uſe have been adduced by Linnæus, Roſenſtein, and Bergius. At preſent, however, marum is here chiefly uſed as an errhine, and is an ingredient in the "pulvis aſari compoſitus" of the London Pharmacopœia. The doſe of the powdered leaves is from a ſcruple to half a dram, which Murray adviſes to be given in wine.

The *water* germander, *teucrium ſcordium*, is a native of England, in marſhy ſituations, and flowers in July and Auguſt. The leaves of *ſcordium* have a ſmell reſembling that of garlick, whence its name; and to the taſte they are bitteriſh, and ſlightly pungent. When moderately and newly dried, they give out, ſays Lewis, (Mat. Med.) their ſmell and taſte both to water and to rectified ſpirit. In diſtillation their peculiar flavour ariſes with water, but the impregnation of the diſtilled fluid is not ſtrong, nor could any eſſential oil be obtained on ſubmitting to the operation ſeveral pounds of the herb. The ancients attributed to *ſcordium* a peculiar antiſeptic and alexipharmic power, and it had for many ages the character of being remarkably efficacious in all peſtilential and putrid diſeaſes. With this view it entered into the compoſition of ſeveral officinal medicines, that were ſuppoſed to be antidotes to various kinds of poiſons and infections. But, notwithſtanding this celebrity, it appears to be a very inſignificant article of the Materia Medica, and is therefore very juſtly fallen into diſuſe. Bergius, however, ſtates its virtue to be "antiputredinoſa, tonica, diaphoretica, diuretica, reſolvens;" and ſome others recommend it to be employed externally in antiſeptic cataplaſms and fomentations. Woodville Mat. Bot.

Germander, *Rock.* See Veronica.

GERMANEA, in *Botany*, named by Lamarck after Monſ. de Saint-Germain, a great admirer and cultivator of plants. Lamarck Dict. v. 2. 690. Illuſtr. t. 514. Juſſ. 116. 449. See Plectranthus, which latter appellation, given by L'Heritier, who was partial neither to M. de Saint-Germain nor his admirers, has been univerſally adopted.

GERMANIA, in *Geography*, a poſt-town of Culpepper county, in Virginia; 82 miles from Waſhington.

GERMANICIA, in *Ancient Geography*, a town of Aſia, ſituated on a plain between mount Taurus and mount Amanus, on the bank of a ſmall river which ran into the Pyramus, W. of the town.

GERMANICOPOLIS, a town of Bithynia, near the Propontide, called by Pliny Helgas and Boos-Cæte.—Alſo, a town of Paphlagonia, called *Gangra.*—Alſo, a town of Iſauria.

GERMANICUS, Cæsar, in *Biography*, grand-nephew of Auguſtus, nephew of Tiberius, and grandſon of Livia. When Auguſtus adopted Tiberius, he obliged him to adopt Germanicus, who thus, according to the Roman law, ſtood in the filial relation to them both. Germanicus married Agrippina, grand-daughter of Auguſtus, a lady not more illuſtrious for her rank than her virtues, and he himſelf grew up in the general affection of the public, on account of the excellence of his temper, and the mildneſs of his diſpoſition, and was denominated the "delight of the Roman people." Germanicus was very learned and eloquent, and, at an early age, he became illuſtrious in warfare, and was raiſed to the moſt important offices of the ſtate. When Auguſtus died, he was engaged in a war in Germany, and the affection of the ſoldiers unanimouſly ſaluted him emperor. He refuſed the honour, and then appeaſed the tumult which his indifference to the rank had occaſioned. He continued his exploits in Germany, and defeated the celebrated Arminius, and upon his return was rewarded with a triumph. The Germans fought with the greateſt bravery, but were at length obliged to yield to ſuperior diſcipline and generalſhip. The concluding battle was attended with great ſlaughter to the Germans, and gave the Roman commander occaſion to raiſe a trophy with this inſcription, "The nations between the Rhine and the Elbe ſubdued by the army of Tiberius Cæſar;" but this ſubjugation was only a temporary ceſſation of the conteſt, and, upon ſome diſaſter experienced by the Romans from the elements, the Germans renewed their attack, which afforded Germanicus an opportunity of acquiring new laurels, and he expected to have made an entire conqueſt of Germany, but the emperor, jealous of his ſucceſſes, recalled him, with many compliments upon his paſt conduct, and the proſpect of a ſecond conſulate. On his return he was honoured with another triumph, which was celebrated with extraordinary magnificence. That part of the ſpectacle which was moſt affecting to the Roman people, was the chariot of the victor, filled with his three ſons and two daughters. Germanicus was ſoon ſent into the Eaſt to quell ſome diſturbances there: the powers entruſted to him on this occaſion were very extenſive, but the ſuſpicious Tiberius had placed Piſo as a ſpy and check on the illuſtrious general. Germanicus entered upon his ſecond conſulſhip, having the emperor for his colleague; he viſited Athens, and was received in that city with all the adulation uſually practiſed by the inhabitants. He then ſailed to Eubœa and Leſbos, thence he touched upon Thrace, and croſſing into Aſia, viewed the ruins of Troy, and conſulted the oracle at Colophon. Piſo haſtily followed him, and after terrifying the Athenians with a ſevere harangue, and throwing out inſinuations againſt Germanicus, embarked for Rhodes, where he would have periſhed had he not have been ſaved by the humane aſſiſtance of the prince, whom he overtook there. Germanicus now proceeded to execute his commiſſion. He placed the crown on the head of Zeno, ſon of the king of Pontus, an ally of the Romans. He then reduced Cappadocia and other places to the ſtate of Roman provinces, and in the enſuing year he made a progreſs into Egypt, and viewed every thing that was deſerving of notice in the country, at the ſame time opening the public granaries to the people, who were ſuffering under a ſcarcity. Upon his return from Egypt to Syria, he found that Piſo had abrogated every regulation which he had eſtabliſhed among the legions, and in the cities, and his indignation at this behaviour widened the breach between them. At this time Germanicus was attacked with a diſeaſe which afterwards proved fatal, and which was imputed to the effects of poiſon, but ſome of our beſt hiſtorians, having impartially examined the collateral facts, do not think the evidence ſufficient to juſtify the aſſertion. Germanicus himſelf had no doubt that he was the victim of the malignity of Piſo, and, in his laſt moments, conjured his friends to proſecute with the utmoſt vigour the authors of his death. He died at Epidaphne, near Antioch, in the year 19, in the thirty-fourth year of his age. His death was the ſubject of univerſal lamentation at Rome. Every other concern was forgotten, and the people, without waiting for an order from the magiſtrates, forſook the forum, ſhut up their houſes, and aſſumed every token of univerſal ſorrow. A profuſion of honours was decreed to his memory, and even foreign princes and nations joined their teſtimonies of eſteem and regret. He had been highly eſteemed not only for his military accompliſhments, but alſo for his learning, humanity, and extenſive benevolence. In the midſt of war he devoted ſome moments to ſtudy, and he favoured the world with two Greek comedies, ſome epigrams, and a tranſlation of Aratus in Latin verſe. Tacitus, Suetonius, and Univer. Hiſt.

GERMANO, in *Geography*, a town of Naples, in Lavora, containing four pariſhes, four convents, and about 800 perſons. Near this place are the ruins of "Caſſinum," deſtroyed by Theodoric, king of the Goths The town is ſituated 43 miles N. N. W. of Naples. N. lat. 41° 33'. E. long. 13° 45'.—Alſo, a town of the duchy of Urbino; 13 miles E. N. E. of Urbino.—Alſo, a town of France, in the department of the Seſia, late in the lordſhip of Vercelli; four miles E. of St. Ja.—Alſo, a town on the W. coaſt of the iſland of Porto Rico. N. lat. 18° 20'. W. long. 67° 40'.

GERMANS, ſo called from the name of their country, in *Eccleſiaſtical Hiſtory*, one of the ſects of rigid anabaptiſts into which the Flemingians were divided; the other two being denominated Flandrians and Frieſlanders. See Flemingians.

Germans, *St.* or *Germains*, in *Geography*, a borough town of Cornwall, England, was, during the Anglo-Saxon era, a biſhop's ſee In 981, the Corniſh biſhop removed his ſee from Bodmin to this place; but biſhop Levinus tranſlated it to Crediton, in Devonſhire, in 1049. King Athelſtan founded a priory for ſecular canons here; to which the cathedral buildings were annexed. Of theſe nothing remains but the church, which is a curious and intereſting ſpecimen of ancient architecture. It conſiſts of a nave, two aiſles, and two towers at the weſtern end. Between the latter is a large entrance door-way, with a ſemi-circular arch, conſiſting of ſeveral ornamented mouldings. Contiguous to the church is Port-Eliot, the ſeat of lord Eliot. St. Germans, as a borough, ſends two members to parliament, both of whom are nominated and influenced by lord Eliot. A ſmall market is held here weekly; and two fairs annually. The living is a curacy in the gift of the dean and canons of Windſor. The Rev. John Whitaker, author of "The Hiſtory of Mancheſter," &c. has publiſhed two volumes, quarto, entitled "The ancient Cathedral of Cornwall, hiſtorically ſurveyed." This work contains many curious particulars reſpecting St. Germans; but the greater part is occupied by theoretical diſſertations.

GERMANUS I. in *Biography*, was patriarch of Conſtantinople in the beginning of the eighth century. His father was baſely murdered by the emperor Conſtantine Pagonatus, and himſelf, by the ſame authority, was deprived of his manhood. In 715, he was appointed to the biſhopric of Cyzicum, and from that honour he was tranſlated to the patriarchate of Conſtantinople. He was the chief oppoſer of the emperor Leo, when he iſſued his edict for prohibiting the worſhip of images; during four years the emperor bore with patience all the reſiſtance made to his decree, till at length the people, irritated by his diſcourſe, broke out in acts of rebellion; to quell theſe, Leo aſſembled a council at Conſtantinople in 730, by which the patriarch was degraded from his dignity, but permitted to retire to his paternal ſeat, where he ſpent the remainder of his days in peace and quietneſs. He died in 740, and was immediately elevated as a ſaint in the Greek and Latin churches, on account of his zeal and ſufferings in defence of image worſhip. He was author of ſeveral treatiſes; one, entitled "De ſex Synodis Oecumenicis," &c. has gone through many editions, but that by Le Moyne in his "Varia Sacra," in 1685, is by much the beſt. He wrote "An Apology for St. Gregory Nyſſen, in oppoſition to thoſe who accuſed him of falling into the errors of Origen;" and divers others miſcellaneous pieces which are inſerted in the Collect. Concil. and in the Biblioth. Patr. Moreri.

GERMANUS II. was patriarch of Conſtantinople in the thirteenth century, to which honour he was appointed about the year 1222. In 1233, he held a ſynod at the city of Nice, where he had fixed the patriarchal reſidence. He was, on account of ſome miſunderſtanding, depoſed from his dignity in the year 1240, but reſtored again juſt before his death, which happened in 1254. He was author of a work intended to illuſtrate the liturgy, and entitled "Rerum Eccleſiaſticarum Theoria," and of numerous homilies, orations, ſermons, epiſtles, decrees, &c.—There was a third Germanus, who was tranſlated to the patriarchate of Conſtantinople, from the ſee of Adrianople in the year 1267, but who reſigned his dignity within a few months after his election. Moreri.

GERMANY, in *Geography*, an extenſive country of Europe, ſituated between 45° 4′ and 54° 40′ N. lat. and between 6° 30′ and 19° 52′ E. long. compriſes chiefly the preſent empire of Auſtria, except Hungary, the greateſt part of the Pruſſian dominions, a part of Pomerania belonging to Sweden, the duchy of Holſtein, belonging to Denmark, ſome parts of Holland, ſome of the French departments on the Rhine, and all the ſtates of the new confederacy of the Rhine, with the formation of which it loſt its exiſtence as an empire.

In ancient times Germany was inhabited by various nations, which the Romans, with whom they waged war for ſome centuries, conſidered as Gauls. Of theſe the Helvetii, Boji, Tectoſagi, and Gothi (ſee GOTHS, &c.), and the Teutones, who dwelt in the Sinus Godanus near the Cimbri, were among the firſt that croſſed the Rhine, and applied to themſelves the name of Germani, probably from the Teutonic word *Geier* or *Guer*, a ſword, aſſerting, as it were, their quality of warriors. The word *Guerra*, *Guerre* in the Italian and French, which is not of Latin origin, appears to confirm this etymology. (See the hiſtory of the ancient Germans in the ſequel of this article.) It is alſo from the Teutones that, in the German language, the country is called *Teutſchland*, and latterly *Deutſchland*. (See TEUTONES.) The French gave it the name of *Allemagne* from the *Alemanni*, one of the German nations. (See ALEMANNI.) In the middle age the northern and north-eaſtern regions of Germany got an acceſſion of population from the Vandals and Slavonians; and towards the end of the ſeventeenth century, ſome parts of Germany received an inconſiderable increaſe of inhabitants, by ſome thouſands of French proteſtant refugees, who left France after the revocation of the edict of Nantes.

Buſching ſtated the extent of Germany at 11,124 German ſquare miles, 15 to a degree; but profeſſor Crome of Gieſſen, including Sileſia, ſtates it at 12,796 German ſquare miles, and its circumference at 500 German miles.

Germany is bounded on the north by the river Eider, and the canal of Holſtein, which ſeparate it from Denmark, and by the Baltic ſea; on the eaſt by Pruſſia, Poland, Hungary, Slavonia, and Croatia; on the ſouth by the gulf of Venice, Italy, and Switzerland; and on the weſt by the Rhine and the North ſea.

Maximilian, grandfather to Charles V., divided Germany into ten circles, and this diviſion was confirmed in the diet of Nuremberg in 1552; but the circle of Burgundy, which contained the ſeventeen provinces of the Low Countries, having been detached from the empire, it latterly contained only nine circles, *viz.*

I. The *Circle of Auſtria*, which compriſed, 1, the archduchy of Auſtria proper; 2, the duchy of Stiria; 3, the duchy of Carinthia; 4, the duchy of Carniola; 5, the Auſtrian Frioul; 6, the Littorale, or the territories of Trieſt and Fiume; 7, the county of Tyrol; 8, Upper Auſtria; 9, the biſhopric of Trent; 10, the biſhopric of Brixen; 11, the commanderies of the Teutonic order in Auſtria, and on the Etſch; and 12, the lordſhip Traſp, belonging to the prince of Dietrichſtein.

II. The *Circle of Weſtphalia*, which compriſed, 1, the biſhopric of Munſter; 2, the biſhopric of Oſnabruck; 3, the biſhopric of Paderborn; 4, the biſhopric of Liege; 5, the abbey of Corvey; 6, that of Stablo and Malmedy; 7, that of Werden; 8, that of Cornelius Munſter; 9, that of Eſſen; 10, that of Thorn; 11, that of Hervorden; 12, the duchy of Cleves; 13, the duchy of Juliers; 14, the duchy of Berg; 15, the principality of Minden; 16, the principality of Verden; 17, the principality of Naſſau; 18, the principality of Eaſt Frieſland; 19, the principality of Moers; 20, the duchy of Oldenburg; 21, the county of Mark; 22, the county of Ravenſberg; 23, the county of Schauenburg, 24, the county of Lippe; 25, the county of Sternberg, which now belongs to Lippe; 26, the county of Bentheim; 27, the county of Steinfurt; 28, the counties of Tecklenburg and Lingen; 29, the county of Hoya; 30, the county of Diepholtz; 31, the county of Wied;

32, the county of Sayn; 33, that of Rietberg; 34, that of Pyrmont; 35, that of Gronsfeld; 36, that of Reckheim; 37, the county of Anholt; 38, that of Holtzapfel; 39, that of Limburg in the county of Mark; 40, that of Blankenheim and Gerolſtein; 41, the counties of Kerpen and Lommerſum; 42, that of Schleiden; 43, the county of Hallermund; 44, that of Virnenburg; 45, that of Spiegelberg; 46, the county of Fagnolles or Ligne; 47, the lordſhips of Gimborn and Neuſtadt, Winnenburg and Beilſtein, Wittem, Eyſs and Schlenacken, Gehmen, Wickerad, Mylendonk and Reichenſtein; 48, the free imperial cities of Cologne, Aix-la-Chapelle, and Dortmund.

III. The *Circle of the Lower Rhine*, or the electoral circle of the Rhine, which compriſed, 1, the electorate of Mayence or Mentz; 2, the electorate of Treves; 3, the electorate of Cologne; 4, the palatinate of the Rhine; 5, the principality of Aremberg; 6, the county of Lower Iſenburg; 7, the burggraviate of Reineck; 8, the county or lordſhip of Beilſtein; 9, the commandery of the Teutonic order Coblence. The prince of Thurn and Taxis was a member of this circle, without having any territorial poſſeſſions in it.

IV. The *Circle of the Upper Rhine*, which compriſed, 1, the biſhopric of Worms; 2, the biſhopric of Spire; 3, that of Straſbourg; 4, that of Bale or Baſel; 5, that of Fulda; 6, the principality of Heiterſheim; 7, the abbey of Prüm; 8, the abbey of Weiſſenburg; 9, that of Odenheim; 10, the landgraviate of Heſſe; 11, the principality of Hersfeld; 12, the county of Katzenellenbogen; 13, the county of Hanau-Müntzenberg; 14, that of Hanau Lichtenberg; 15, the principality of Simmern; 16, the principality of Lautern; 17, that of Veldentz; 18, the principality of Deux Ponts; 19, the county of Sponheim; 20, the principality of Salm; 21, the principality of Naſſau; 22, the principality of Waldeck; 23, the county of Solms; 24, the county of Köenigſtein; 25, the county of Upper Iſenburg; 26, the poſſeſſions of the Wald or Wild, or Rau Graves and Rhine. Graves, (in Latin, Comites Saltuarii, Foreſtarii, Silveſtres and Hirſuti,) counts of Grumbach, Stein, and Dhaun; 27, the county of Leiningen; 28, the county of Witgenſtein; 29, the county of Falkenſtein; 30, that of Krichingen; 31, that of Wartenberg; 32, the lordſhips of Bretzenheim, Dachſtul, and Ollbrück; 33, the free imperial cities of Worms, Spire, Frankfort on the Maine, Friedberg, and Wetzlar; 34, the imperial borough of Friedberg; 35, the imperial villages of Müntzfelden, Sultzbach, and Soden.

V. The *Circle of Suabia*, which compriſed, 1, the biſhopric of Conſtance; 2, the biſhopric of Augſburg; 3, the abbey of Elwangen; 4, the abbey of Kempten; 5, the duchy of Wirtemberg and Teck; 6, the marggraviate of Baden; 7, the principality of Hohenzollern; 8, the abbey of Lindau; 9, that of Buchau; 10, the principality of Furſtenberg; 11, the county of Oettingen; 12, the principality of Klettgau; 13, the principality of Lichtenſtein; 14, that of Friedberg-Scheer; 15, the abbey of Salmanſweiler; 16, the abbey of Weingarten; 17, that of Ochſenhauſen; 18, that of Elchingen; 19, that of Yrſee; 20, that of Urſperg; 21, that of Kayſerſheim; 22, that of Roggenburg; 23, that of Roth; 24, the abbey of Weiſſenau; 25, that of Schuſſenried; 26, that of Marchthal; 27, the abbey of Peterſhauſen; 28, the abbey of Wettenhauſen; 29, that of Zwiefalten; 30, that of Gengenbach; 31, the abbey of Heggbach; 32, that of Gutenzell; 33, that of Rothmünſter; 34, the abbey of Baindt; 35, that of Nereſheim; 36, the commandery of Alſchhauſen; 37, the landgraviate of Stühlingen; 38, the landgraviate of Baar; 39, the county of Truchſeſs-Waldburg; 40, the county of Köenigſegg; 41, that of Eberſtein; 42, that of Fugger; 43, that of Hohen-embs; 44, that of Hohen-Geroldſeck; 45, the county of Neipperg; 46, the county of Bondorf; 47, the lordſhips of Wieſenſteig, Hauſen, Moeſkirch, Tettnang and Argen, Mindelheim and Schwabeck, Gundelfingen, Juſtingen, Eglof, Thannhauſen, Egglingen; 48, the free imperial cities of Augſburg, Ulm, Eſlingen, Reutlingen, Nördlingen, Halle, Ueberlingen, Rothweil, Heilbronn, Gmünd, Memmingen, Lindau, Dünkelſbühl, Biberach, Ravenſburg, Kempten, Kaufbeuren, Weil, Wangen, Yſni, Leutkirch, Wimpfen, Giengen, Pfullendorf, Buchhorn, Aalen, Bopfingen, Buchau, Offenburg, Gengenbach, Zell on the Hammerſbach; 49, the imperial village of Alochhauſen.

VI. The *Circle of Bavaria*, which compriſed, 1, the archbiſhopric of Saltzburg; 2, the biſhopric of Freyſingen; 3, the biſhopric of Ratiſbon; 4, the biſhopric of Paſſau; 5, the principality of Berchteſgaden; 6, the abbey of St. Emmeram in Ratiſbon; 7, and thoſe of Lower; and 8, of Upper Münſter in the ſame place; 9, the duchy of Bavaria; 10, the Upper Palatinate; 11, the principality of Neuburg; 12, the principality of Sultzbach; 13, the landgraviate of Leuchtenberg; 14, the principality of Sternſtein; 15, the county of Haag; 16, the county of Ortenburg; 17, the lordſhips of Ehrenfels, Sulzburg, Pyrbaum, Hohenwaldek and Breitenek; 18, the free imperial city of Ratiſbon.

VII. The *Circle of Franconia*, which compriſed, 1, the biſhopric of Bamberg; 2, the biſhopric of Würtzburg; 3, the biſhopric of Eichſtaedt; 4, the commandery of the Teutonic order of Mergentheim; 5, the principality of Culmbach, or Bayreuth; 6, the principality of Onolſbach, or Anſpach; 7, the principality of Henneberg; 8, that of Schwartzenberg; 9, the principality of Hohenlohe; 10, the county of Caſtell; 11, the county of Wertheim; 12, that of Rieneck; 13, that of Erbach; 14, the lordſhips of Limburg, Seinſheim, Reichelſberg, Wieſentheid, Welzheim, and Hauſen; 15, the free imperial cities of Nuremberg, Rothenburg, Windſheim, Schweinfurt, and Weiſſenburg; 16, the imperial villages of Gochſheim and Sennfeld.

VIII. The *Circle of Upper Saxony*, which compriſed, 1, the duchy of Pomerania; 2, the electorate of Brandenburg; 3, the electorate of Saxony; 4, the duchy of Saxe-Weimar; 5, the duchy of Saxe-Gotha; 6, that of Saxe-Cobourg; 7, that of Saxe-Meinungen; 8, that of Saxe-Hildburghauſen; 9, the abbey of Merſeburg; 10, the abbey of Naumburg-Zeitz; 11, the principality of Altenburg; 12, the principality of Querfurt; 13, the principality of Anhalt; 14, the abbey of Quedlinburg; 15, the abbey of Walkenried; 16, the principality of Schwartzburg; 17, the county of Mansfeld; 18, the county of Stollberg and Wernigerode; 19, the county of Barby; 20, that of Hohnſtein; 21, the principality of Hatzfeld; 22, the county of Reuſs; 23, the county of Schoenburg.

IX. The *Circle of Lower Saxony*, which compriſed, 1, the biſhopric of Hildeſheim; 2, that of Lubeck; 3, the abbey of Ganderſheim; 4, the duchy of Magdeburg; 5, the principality of Halberſtadt; 6, the duchy of Bremen; 7, the principality of Celle; 8, the principality of Grubenhagen; 9, the principality of Calenberg; 10, the duchy of Saxe-Lauenburg; 11, the duchy of Wolfenbüttel; 12, the principality of Blankenburg; 13, the duchy of Holſtein; 14, the duchy of Mecklenburg; 15, the

the principality of Schwerin; 16, the principality of Ratzeburg; 17, the county of Ranzau; 18, the free imperial cities of Lubeck, Goſlar, Muhlhauſen, Nordhauſen, Hamburg, and Bremen.

The following countries, without forming part of any of the nine circles, were likewiſe conſidered as belonging to the German empire; *viz.* 1, the kingdom of Bohemia; 2, the marggraviate of Moravia; 3, the marggraviate of Upper Luſatia; 4, that of Lower Luſatia; 5, the duchy of Sileſia; 6, the county of Montbelliard; 7, the three circles of the immediate Knights of the Empire, in Suabia, Franconia, and on the Rhine; 8, the lordſhips of Aſch and Waſſerburg, the convent of Schonthal, the burggraviate of Freudenberg, the barony of Horſtgen, the abbey of Cappenberg, that of Elten, the lordſhip of Rheda, the abbey of Burſcheid, the lordſhip of Jever, the barony of Kniphauſen, the lordſhips of Dyk, Mechernich, Schonau, Wylre, Richold, Stein, Dreyſs, Landſkron, Rhade, Saffenberg, Schaumburg, Oberſtein, the county of Homburgh, and the barony of Schauen. The German empire had alſo ſeveral fiefs in Italy.

The climate and temperature of Germany muſt in general be acknowledged to be temperate, yet it is conſiderably milder in the ſouthern than in the northern parts, where the winter is ſometimes extremely ſevere, and of long duration. The air, however, is every where ſerene and healthy, except in a few low marſhy places towards the North ſea. The vine thrives, and yields excellent wine, in all the ſouth-weſtern parts. The ſalubrity of the climate may likewiſe be inferred from the longevity of the inhabitants, ſome of whom arrive to a very great age.

There is perhaps no country in Europe in which the ſoil varies more than in Germany. Sandy plains and barren heaths predominate in the north-eaſt, and ſwamps and marſhes in the north-weſt: but ſome of the interior and ſouth-weſtern parts have an uncommonly fertile ſoil, and great attention is generally paid to its improvement. The ſouth and the ſouth-eaſt ſide is the moſt mountainous. Bohemia is ſeparated from Sileſia by the Rieſen Geburge, or the Giants' mountains. Towards Hungary are the Carpathian mountains; towards Italy the Alps. In the interior parts are the Schwarzwald, (black foreſt,) the Rauhe Alb, the Ertzgeburge, the Fichtelberg, the Harz, or Hercynian foreſt, whoſe higheſt ſummit, the Broeken, is only 3580 feet above the level of the Mediterranean ſea. In ancient times Germany was covered with foreſts, chiefly of oak, birch, pine, fir, larch, and aſh trees. Though they have been conſiderably thinned, and immenſe tracts of them converted into tillage, there are yet ſome very large woods, as the Speſſart, the Schwartzwald, the Hartzwald, and the Thuringerwald.

The extent of ſea-coaſt on the North ſea is not much above 150 Engliſh miles, and on the Baltic about 500 Engliſh miles. The principal lakes are the Boden ſee, or lake of Conſtance, in Swabia, which forms one of the boundaries towards Switzerland; the Chiem ſee, in Bavaria; the Girnitzer ſee, in Auſtria; the lakes of Damm, Neuwarp, Madue, and Wilm, in Pomerania; thoſe of Werbellin, Uckerſee, Parſtein, Schwieluch and Ruppin, in Brandenburg; the Dammer ſee, in the county of Diepholtz, beſides ſeveral ſmaller ones in Mecklenburg and other parts of the country.

But it is chiefly the great number of rivers, by which Germany is interſected in various directions, that give it immenſe advantages for trade. It counts five hundred and twenty rivers in all; ſixty navigable to a great length, and ſix, *viz.* the Danube, the Rhine, the Mayne, the Weſer, the Elbe, and the Oder, ranking among the largeſt and moſt noble rivers of Europe.

The number of mineral ſprings and baths exceeds one thouſand; the moſt famous are Carlſbad and Egra, in Bohemia; Warmbrunn, in Sileſia; Toplitz, in Auſtria; Heilbronn, in Bavaria; Wiſbaden and Seltzer, in the circle of the Upper Rhine; Freyenwalde, in Brandenburg; Dobberan, in Mecklenburg; Lauchſtedt, in Saxony; and Pyrmont, in Weſtphalia.

As almoſt all climates, or at leaſt all temperatures and ſoils, are to be met with in Germany, it abounds in almoſt all productions of nature and their varieties, and chiefly in all kinds of corn: flax of excellent quality, hemp, hops, tobacco, madders, ſaffron, rape-ſeed, rhubarb, excellent garden vegetables and orchard fruits; wine, in greateſt perfection on the banks of the Rhine, Mayne, Moſelle, and Neckar. The agriculture of Germany has been conſiderably improved of late by the efforts of Mr. Thaër and other patriotic writers. In the rearing of cattle and ſheep Germany is, however, greatly deficient. The breed of horſes, except in Mecklenburg, Eaſt Frieſland, Oldenburg, Holſtein, and ſome parts of Hanover and Wirtemberg, is very indifferent. The number of oxen is not ſufficient either for agricultural purpoſes or for conſumption. The beſt breed is in Eaſt Frieſland, Oldenburg, and Holſtein. The number of ſheep does not exceed thirteen or fourteen millions. The Spaniſh breed has been naturalized in ſome parts of the Pruſſian and Saxon dominions. The breed of hogs is much neglected; that of goats is encouraged in the mountainous parts, where they alſo rear aſſes and mules. The foreſts are ſtocked with wild boars, ſtags, deer, and hares. Poultry is abundant. Salted and ſmoked geeſe, and gooſe quills, are exported from Mecklenburg and Pomerania. Some parts of Germany are remarkable for fine larks and thruſhes, of a delicious flavour. Others abound with ſinging birds, particularly Canary birds and goldfinches, which are exported to almoſt every country of Europe. Bees are leſs attended to than in ancient times. Silkworms are reared with particular care in ſome of the ſouthern, and even northern diſtricts.

Of the mineral productions of Germany, gold forms the moſt inconſiderable part, ſmall particles of it are found in the Rhine, the Danube, the Elbe, and the Saale. Silver is more plentiful; its annual produce exceeds 200,000 marks, that of copper amounts to 100,000 cwts. The ſupply of tin from the mines is ſufficient for home conſumption. Iron of a very good quality, lead, quickſilver, cobalt, arſenic, and zinc are in great abundance. Beſides topazes, amethyſts, cornelians, agate, ſerpentine, and other rare ſtones, Germany has large quarries of curious marble, and capital mill and burr ſtones. It abounds with various ſorts of fine earth, ſuch as tripoli and porcelain earth, chiefly in the circle of Miſnia in the kingdom of Saxony; terra ſigillata, potters' clay, fullers' earth, and others. There are ſome coal mines, particularly in Weſtphalia, and abundance of peat moſs. Salt is obtained in ſeventy-ſix ſalt works, of which thoſe near Halle, in the former duchy of Magdeburg, produce the greateſt quantity. There is no rock ſalt in Germany.

The principal manufactures of Germany are thoſe of linen and woollen cloth, cotton, thread lace, china, hardware inferior to none but the Engliſh, glâſs, tobacco and ſnuff, writing paper, ſoap, wax, toys and trinkets, and ſilks, but not equal to the French. Manufactures flouriſh moſt in the Auſtrian and Pruſſian dominions, in Saxony, in the preſent kingdom of Weſtphalia, in the grand duchy of Berg, &c. The towns moſt remarkable for extenſive manufactures are Altona, Augſburg, Berlin, Bronſvick, Bremen, Caſſel, Chemnitz, Deſſau, Dreſden, Eiſenach, Erfurt, Erlangen, Francfort on the Mayne, Gorlitz, Gottingen, Gotha, Hamburgh, Hanau, Hanover, Herrnhuth, Hof, Leipzick, Lubeck, Manheim, Meiſſen, Neuſtadt on the Doſſe, Neuwied, Nurnberg, Offenbach, Plauen, Quedlinburgh, Stutgard, Ulm, and Zwickau.

Situated almoſt in the centre of Europe, bounded by the Baltic and North ſea, and interſected by many large rivers, Germany has enjoyed, till very lately, a moſt extenſive commerce. Its principal ſea ports are Hamburgh, Altona, Kiel, Lubeck, Wiſmar, Roſtock, Stralſund, Stettin, Emden, Bremen. Inland towns of great trade are Bronſvick, Magdeburg, Leipzick, Naumburg, Francfort on the Mayne, and Francfort on the Oder, Vienna, Augſburg, Nurnberg, Breſlau, and Ulm. The principal articles of exportation are timber, corn, fruit, wine, tobacco, madders, cobalt, ſmalts, potaſh, horſes, oxen, ſalt and ſmoaked meat, butter, cheeſe, honey, wax, leather, wool, cotton yarn, linen cloth to the amount of ſix millions ſterling, linen yarn, thread lace, cotton ſtuffs, hardware, lead, copper, braſs, quickſilver, china, earthen-ware, mirrors, glaſs, wooden toys and trinkets, &c. Germany imports corn, oxen, and horſes chiefly from Hungary, Poland, and Denmark, hogs from Hungary, butter from Ireland and Holland, ſilk and cotton, all ſorts of colonial produce, wine and fruit, ſilk and cotton ſtuffs, paper, jewellery and trinkets. It carries on a moſt important trade with European Turkey, from whence it gets by land as far as Semlin, and from thence upon the Danube by way of Vienna, an immenſe quantity of raw cotton, which is diſtributed all over the north of Europe, Germany and Switzerland. As it has to pay annually from three to four millions of piaſters in hard caſh to the Turks, theſe money tranſactions are carried on by means of the bankers of Vienna. The principal inſurance companies are at Hamburgh, Lubeck, and Bremen. Weights, meaſures, and coins differed in every petty principality of Germany, and this circumſtance was one of the diſadvantages which travellers at leaſt experienced from that number of free cities and ſmall ſtates for which Germany was particularly remarkable. It is true, as has been juſtly obſerved by the intelligent author of an eſſay on the Reformation of Luther, that all theſe cities snd principalities of moderate extent had their principle of life active, peculiar, and independent. Each prided itſelf on making induſtry, ſciences and arts flouriſh in its little capital.

By the treaties of Paſſau in 1552, of Augſburgh in 1555, and of Munſter in 1648, the Roman Catholic, Lutheran, and reformed religion, were acknowledged as dominant in Germany: but all other ſects enjoyed a complete toleration, and the number of Jews in ſome parts is very conſiderable.

According to Mr. Charles Villier's view of the preſent ſtate of ancient literature and hiſtory in Germany, in his report to the third claſs of the French inſtitute, the German literati poſſeſs a great facility in entering into the ſpirit of nations and of ages, different from thoſe of the preſent day, and are eminently ſucceſsful in archeological reſearches, and in the interpretation and tranſlation of the ancients, particularly of the Greeks, perhaps on account of ſome ſecret affinity between the two nations, as the analogy of the two languages ſeems to indicate. But if any ſpecies of literary production can be ſaid to belong to Germany, almoſt excluſively, it is the hiſtory of literature. The German literary and critical journals, eſpecially thoſe publiſhed at Jena, Halle, Leipſick, and Gottingen, rank among the beſt in Europe. Before the revolutionary wars, the number of authors exceeded 7000. Their literary productions found a ready market at the two fairs of Leipſick in the ſpring and autumn of every year. The number of new books publiſhed at thoſe fairs was rarely under 4000: but ſince the fall of Pruſſia, in 1807, it has never exceeded 1500. Two hundred German, and about thirty foreign bookſellers, uſed to meet at Leipſick, to barter their reſpective publications; the amount of theſe exchanges was generally above 200,000*l.* ſterling. Anciently German authors wrote moſt of their works in Latin. In the beginning of the ſeventeenth century, there were at leaſt 400 out of 700 written in that language; towards the end of the eighteenth century the proportion was only 200 in 2000. Before that period the literary labours of the Germans were confined to theology, juriſprudence, and biblical and claſſical criticiſm: but during the latter half of the laſt century they have been extended to every branch of ſcience and literature; mineralogy, natural hiſtory in general, chemiſtry, aſtronomy, and geometry have been cultivated with an intelligent ardour and perſeverance that have been rewarded with many brilliant diſcoveries. Statiſtics, which elucidates the theoretical tenets of political economy, and furniſhes important materials to the hiſtorian and the geographer, is indebted alike for its origin and its improvement to the literary induſtry of the Germans. In metaphyſics they have incurred the reproach of dogmatical obſcurity, and in their dramas and novels they are juſtly accuſed of a diſguſting affectation of morbid ſentimentality. But their epic and tragic poets, and their moral philoſophers, have immortalized themſelves by works, which have been eagerly tranſlated into all the idioms of modern Europe. To the great names of Luther, Kepler, Leibnitz, Haller, Euler, Moſheim, Puffendorff, Pott, Margraff, Hagedorn, Leſſing, Gleim, Kleiſt, Heyne, Rabener, Klopſtock, Ramler, Geſſner, who live in the records of literary fame, muſt be added thoſe of Bernouilli, Lambert, Kæſtner, Wieland, Schiller, Göthe, Herder, Zollikoffer, Spalding, Bloch, Moſes Mendelſohn, Klaproth, von Humboldt, Voſs, Hölty, Michaelis, J. A. Eberhard, Von Zach, and many others, whoſe merits are as conſpicuous as they are generally acknowledged.

The German lauguage is of Teutonic origin, and may be regarded as a primitive one, as it is the mother tongue of the Dutch, Flemiſh, Daniſh, Swediſh, and Engliſh languages. Its dominion extends from the boundaries of Lapland and Finland, to thoſe of France and Italy. In the middle ages, the ſimilarity between the idioms derived from the German was ſo great, that the German and Engliſh miſſionaries that went to Sweden, Denmark, and Norway, had no difficulty in making themſelves underſtood in thoſe countries. The learned Ihre, in his introduction to his Sueo-Gothic Gloſſary, has alſo diſcovered a ſtriking conformity between the old Teutonic and Perſian languages. That which it bears to the Greek in its conſtruction is not leſs ſtriking. The dialect known by the name of Low German, or Low Dutch, is now diſuſed in writing, and wholly confined to the vulgar in the kingdom of Weſtphalia, in the duchies of Mecklenburgh and Holſtein, and in Pomerania; it comes very near the Dutch. The High German, or High Dutch, has been conſiderably improved ſince Luther's time; it is remarkable for ſtrength, richneſs, bold inverſions, and compound words, which render it admirably fit for the higher ſtrains of epic poetry. The learned dictionaries of Adelung, Eberhard, and Campe, have ſerved to elucidate the meaning of every one of its terms, ſo that it may now be conſidered as fixed. It is ſpoken in its greateſt purity in Upper Saxony, part of Lower Saxony, and on the banks of the Necker and the Mayne. There are ſtill ſome traces of the Slavonian language left on the ſhores of the Baltic, in ſome diſtricts of Pomerania, in Sileſia, Bohemia, and Moravia: but it is diſappearing very faſt.

No country can boaſt of more and better inſtitutions for the acquiſition of knowledge and ſcience than Germany. Notwithſtanding the great extent of territory ceded to France, there are ſtill 30 univerſities, of which 17 are Proteſtant, 11 Catholic, and two mixed, *viz.*; Griefswalde, Jena, Leipſick, Wittenberg, Gottingen, Halle, Helmſtädt, Kiel, Roſtock, Altdorf, Erlangen, Rinteln, Gieſſen, Marburg, Stuttgard, Tubingen, Frankfort on the Oder, are Proteſtant univerſities; Bamberg, Wiëtzburgh, Paderborn, Fulda, Dillingen, Freyburg, Inſpruck, Vienna, Ingolſtadt, Saltzburgh, and Prague, are Catholic univerſities; and the two mixed ones are Erfurt and Heidelberg. The oldeſt of them is that of Prague, which was founded in 1348, and the moſt modern that of Erlangen, founded in 1743. Moſt of theſe learned ſeminaries, which have furniſhed the northern regions of Europe with able teachers, are provided with extenſive libraries, anatomical theatres, muſeums of natural hiſtory, botanic gardens, and aſtronomical obſervatories. The profeſſors are animated with the noble ambition of extending the fame of the univerſity in which they teach by their writings, and as the ſtudents pay a liberal fee for their lectures, this opens an honourable and uſeful competition among the teachers. Every ſtudent is at liberty to ſelect what lectures he chuſes to hear, and may employ his time as he likes. He has only a ſevere examination to undergo when he offers himſelf as a candidate for any ſituation in the law, adminiſtration, or church, or when he wants to take his degree as a doctor in medicine, without which degree he cannot be admitted into any college of phyſicians. All the other uſeleſs ſcholaſtic formalities have long ſince been abrogated.

Beſides theſe univerſities there is a great number of public or free grammar ſchools, lyceums, and other learned ſchools in Germany. The methods of teaching have been conſiderably improved within the latter half of the eighteenth century, when Baſedow, profiting by the hints thrown out by J. J. Rouſſeau, opened the Philantropinum at Deſſau, and ſet an example of liberal and ſcientific education, which was ſoon imitated by men of enlightened views and extenſive information. Campe, Villaume, Saltzmann, Trapp, and latterly Peſtalozzi, have eminently contributed to introduce better modes of inſtruction. There are alſo many eſtabliſhments deſtined to train young men for particular employments, ſuch as military, mineral, commercial, and even agricultural ſchools. Females are moſtly educated at home under the eyes of their mothers, who are particularly anxious to guard their daughters againſt the baneful influence of ladies boarding ſchools.

The numerous literary ſocieties of all kinds, public libraries, reading clubs, circulating libraries, critical journals, and other means of diſſeminating and preſerving knowledge, afford another proof of the high ſtate of civilization to which moſt countries of Germany are arrived. The moſt diſtinguiſhed of its learned ſocieties are the imperial academy of natural philoſophy at Vienna, the royal academy at Berlin, the academies at Caſſel, Erfurt, Gottingen, Manheim, München; the agricultural ſocieties at Heidelberg, Leipſick and Zelle. The beſt public libraries are thoſe of Berlin, Dreſden, Gottingen, Gotha, Hanover, Leipſick, Manheim, Stuttgard, Weimar, Vienna, and Wolfenbuttel. Though Germany may boaſt of being the cradle of the art of printing, England and France bear the palm. The generality of German books are printed without taſte, with had types, and on bad paper. A few ſplendid editions have, however, been attempted at Leipſick, and met with merited ſucceſs. The liberty of the preſs, which was never general all over Germany, has received its death-blow from the ſway which the French government exerciſes in every one of its counties, ſince the peace of Tilſit.

Of the fine arts, muſic is that in which the Germans excel. They vie with the Italians, and the names of Handel, Bach, Haydn, and Mozart are reverenced by their rivals. Germany has alſo produced ſome good painters and engravers, but few ſtatuaries and architects. With reſpect to dancing, it is far behind Italy and France. The principal academies for the encouragement of the fine arts are at Berlin, Dreſden, Leipſick, Manheim, and Vienna. The moſt celebrated galleries of pictures are at Dreſden, Vienna, Sans Souci, near Potſdam, Duſſeldorff, Manheim, and Caſſel.

The influence of the arts on the manners of a people is no where more ſtriking than in Germany, where concerts and muſical parties, together with dancing, form the chief amuſement; and the manners of the middle orders are polite and affable.

Before the peace of Luneville in 1801, the population of Germany was rated at 27 millions of inhabitants; but as it loſt 3,700,000 individuals, through the ceſſion of the countries ſituated on the left ſhore of the Rhine, its preſent population is very little above 23 millions.

The hiſtory of Germany in its ancient ſtate, its gradual advancement towards extent of territory and dominion, and its recent decline and fall, preſents to our notice a ſubject that is in a variety of reſpects peculiarly intereſting. The weſtern monarchy of Rome was firſt reſiſted, then invaded, and at length overturned by the warlike inhabitants of Germany; and it was from the woods of this country that the moſt civilized nations of Europe iſſued; and we may ſtill diſtinguiſh in the rude inſtitutions of theſe barbarians the original principles of our laws and manners. Ancient Germany, excluding from its independent limits the provinces weſtward of the Rhine which had ſubmitted to the Roman yoke, extended itſelf over a third part of Europe. Almoſt the whole of modern Germany, Denmark, Norway, Sweden, Frieſland, Livonia, Pruſſia, and the greater part of Poland, were peopled by the various tribes of one great nation, whoſe complexion, manners, and language denoted a common origin, and preſerved a ſtriking reſemblance. On the weſt, ancient Germany was divided by the Rhine from the Gallic, and on the ſouth by the Danube, from the Illyrian provinces of the empire. A ridge of hills, riſing from the Danube, and called the Carpathian mountains, covered Germany on the ſide of Dacia or Hungary. The eaſtern frontier was faintly marked by the mutual fears of the Germans and the Sarmatians, and was often confounded by the mixture of warriors, and confederating tribes of the two nations. Such was alſo the caſe with reſpect to the Gauls on the weſt, where it is ſtill more difficult to fix their boundaries on account of their conſtant fluctuation. In the remote darkneſs of the north, the ancients imperfectly deſcried a frozen ocean, that lay beyond the Baltic ſea, and beyond the peninſula, or iſlands of Sarmatia. But their neareſt northern limit was the Hercynian foreſt, at that time ſuppoſed to be impenetrable. It appears from authentic documents that the climate of ancient Germany was much colder than that of the country in its more modern ſtate. For the evidence of the fact, and the explication of it, we refer to the article CLIMATE, where the reader will alſo find ſome reflections on the influence which variety of climates is ſuppoſed to have on the minds and bodies of the different inhabitants of the globe. The keen air of Germany contributed, without doubt, towards forming the large and maſculine limbs of the natives, who were, in general, of a more lofty ſtature than the people of the ſouth, gave them a kind of ſtrength better adapted to violent exertions than to patient labour, and inſpired them with conſtitutional bravery, which is the reſult of nerves and ſpirits. "In hos artus, (ſays Tacitus, Germania, iii. 20.) in hæc corpora, quæ miramur, excreſcunt." The ſeverity of a winter campaign, that chilled the courage of the Roman troops, was ſcarcely felt by thoſe hardy children of the north, who, in their turn, were unable to reſiſt the ſummer heats, and diſſolved away in languor and ſickneſs, under the beams of an Italian ſun.

As to the origin of the Germans, although we cannot allow with Tacitus, that they were "Indigenæ," or natives of the ſoil, yet we muſt admit that ancient Germany was not peopled by any foreign colonies, already formed into a political ſociety; but the name and nation received their exiſtence, as we have already obſerved in the beginning of this article, from the gradual union of ſome wandering barbarians, probably of the ſame nation with the Celtæ and Gauls, and both, perhaps, deſcended from the ancient Gomerians, or deſcendants of Gomer, the eldeſt ſon of Japhet. (See DISPERSION *of Mankind.*) The Germans, however, were very much intermixed with the old Scythians and Sarmatians, on that ſide which joined their territories, and particularly between the two great rivers, Rhine and Danube; and they, without doubt, had adopted many of their cuſtoms, as well as intermingled ſome portion of their language with their own; but in all other parts of Germany, we find ſuch an exact conformity in their religion, laws, cuſtoms and language, as affords a very ſtrong preſumption that they were deſcended from the ſame ancient ſtock with the Celtæ or Gauls, and that they came by gradual and ſucceſſive migrations from Aſia. (See CELTÆ.) How this country came to be denominated Germany, and whence its inhabitants derived the appellation of Germans, it is not eaſy to determine. The moſt probable conjecture is, that they were ſo called, either from their affinity to the Celtes, or from the Celtic words "ghar man," a warlike man; but this was not their original name, any more than the appellations of "Teutones" or "Allemanni," by which, as we have already obſerved, they were occaſionally denominated. This name was of a more modern date, and ſeems to have had its riſe on the other ſide of the Rhine, when the Condruſi, Eburones, Cæraſi, and Pæmani croſſed that river, after the example of ſome others of their countrymen, and ſettled in Gaul. Theſe, it ſeems, were the firſt to whom the appellation of Germans was given, and which, therefore, extended no farther than the Rheniſh ſhore on the Gallic ſide, but ſoon after paſſed over to the other, and became common to other people of the ſame language and cuſtoms, till at length it became the general name of the whole nation, and the country was called from them Germania or Germany.

Whatever may be ſuppoſed to be the remote origin of the Germans, they appear to have been in a ſavage and uncivilized ſtate on their firſt ſettlement in this country. The account given of the country itſelf by Cæſar and Tacitus is ſo unfavourable, that it ſeems to be almoſt incredible, that a brave nation, for ſuch we muſt allow the ancient Germans to have been, would have been contented to remain in it, when they were deſtitute of neither ſtrength nor courage to have forced their way into others more pleaſant and fruitful. Theſe ancient hiſtorians deſcribe it as wholly barren and uncultivated; and even its variety of ſoil and climate added to the horror of it, from the dreadful foreſts, putrid and inſalubrious bogs, the inclemency of its winds, dampneſs of its ſeas, lakes, and rivers, and ſterility of its ſoil. The uncivilized ſtate of the ancient Germans may be inferred from the account given of them by Tacitus; for in his time they were unacquainted with the uſe of letters (German. ii. 19); and the uſe of letters is the principal circumſtance that diſtinguiſhes a civilized people from a herd of ſavages incapable of knowledge or reflection.

Of the uſeful and agreeable arts of life the ancient Germans were wretchedly deſtitute. Modern Germany is ſaid to contain about 2,300 walled towns, whereas, in a much wider extent of country, the geographer Ptolemy could diſcover no more than ninety places, which he decorates with the name of cities, though, according to our ideas, they would not deſerve that ſplendid title. We can only ſuppoſe them to have been rude fortifications, conſtructed in the centre of the woods, and deſigned to ſecure the women, children, and cattle, whilſt the warriors of the tribe marched out to repel a ſudden invaſion. Such is the account given of them by Cæſar; and Tacitus aſſerts that the ancient Germans had no cities. Even in their hamlets or villages they did not build their houſes contiguous to each other. They conſidered it as a badge of ſervitude to be obliged to dwell in a city ſurrounded with walls. Each barbarian fixed his independent dwelling on the ſpot to which a plain, a wood, or a ſtream of freſh water had induced him to give the preference. Neither ſtone, nor brick, nor tiles, were employed in theſe ſlight habitations. They were, indeed, no more than low huts of a circular figure, built of rough timber, thatched with ſtraw, and pierced at the top to leave a free paſſage for the ſmoke. That they conſidered cities as places of confinement rather than of ſecurity, appears from the following circumſtance: when one of their tribes had ſhaken off the Roman yoke, their countrymen required of them, as an evidence of their having recovered liberty, to demoliſh the walls of the towns which the Romans had built in their country. The Romans built ſeveral cities of note on the banks of the Rhine. But in all the vaſt countries from that river to the coaſts of the Baltic, there was hardly one city previous to the ninth century of the Chriſtian era.

In the moſt inclement winter, the hardy German was ſatisfied with a ſcanty garment made of the ſkin of ſome animal. The natives, who dwelt towards the north, clothed themſelves with furs; and the women manufactured for their own uſe a coarſe kind of linen. The game of various ſorts, with which the foreſts of Germany were plentifully ſtocked, ſupplied its inhabitants with food and exerciſe. Their monſtrous herds of cattle, leſs remarkable for their beauty than for their utility, formed the principal article of their wealth. A ſmall quantity of corn was the only produce exacted from the earth. The uſe of orchards, or artificial meadows, was unknown to the Germans; nor can we expect any improvements in agriculture from a people, whoſe property every year experienced a general change by a new diviſion of the arable lands, and who, in that ſtrange operation, avoided diſputes, by ſuffering a great part of their territory to lie waſte and without tillage. Gold, ſilver, and iron, were extremely ſcarce in Germany. Its barbarous inhabitants wanted both ſkill and patience to inveſtigate thoſe rich veins of ſilver, which have ſo liberally rewarded the attention of the princes of Brunſwick and Saxony. Although the various tranſactions of peace and war had introduced ſome Roman coins (chiefly ſilver) among the borderers of the Rhine and Danube; yet the more diſtant tribes were abſolutely unacquainted with the uſe of money, carried on their limited traffic by the exchange of commodities, and prized their rude earthen veſſels as of equal value with the ſilver vaſes, the preſents of Rome to their princes and ambaſſadors. If we contemplate a ſavage nation in any part of the globe, a ſupine indolence and a careleſſneſs of futurity will be found to conſtitute their general character. This was decidedly the caſe with reſpect to the ancient Germans. The care of the houſe and family, the management of the land and cattle, were delegated to the old and infirm, to women and ſlaves. The lazy warrior, deſtitute of every art that might employ his leiſure hours, conſumed his days and nights in the animal gratifications of ſleep and food. Nevertheleſs, the ſound that ſummoned the German to arms was grateful to his ear. It raiſed him from his uncomfortable lethargy, gave him an active purſuit, and, by ſtrong exerciſe of the body, and violent emotions of the mind, reſtored him to a more lively ſenſe of his exiſtence. In the dull intervals of peace, theſe barbarians were immoderately addicted to deep gaming and exceſſive drinking; both of which, by different means, the one by inflaming their paſſions, the other by extinguiſhing their reaſon, alike relieved them from the pain of thinking. They gloried in paſſing whole days and nights at table; and the blood of friends and relations often ſtained their numerous and drunken aſſemblies. The poſſeſſion and the enjoyment of property are the pledges which bind a civilized people to an improved country. But the Germans, who carried with them what they moſt valued, their arms, their cattle, and their women, cheerfully abandoned the vaſt ſilence of their woods for the unbounded hopes of plunder and conqueſt. The innumerable ſwarms that iſſued, or ſeemed to iſſue, from the great ſtore-houſe of nations, were multiplied by the fears of the vanquiſhed, and by the credulity of ſucceeding ages. And from facts thus exaggerated, an opinion was gradually eſtabliſhed, and has been ſupported by writers of diſtinguiſhed reputation, that in the age of Cæſar and Tacitus the inhabitants of the north were far more numerous than they are in our days. On this ſubject ſir William Temple and Monteſquieu have indulged the uſual livelineſs of their fancy. A more ſerious inquiry into the cauſes of population, ſeems to have convinced modern philoſophers of the falſehood, and indeed the impoſſibility, of the ſuppoſition. To the names of Mariana and of Machiavel, we can oppoſe the equal names of Robertſon and Hume.

A warlike nation like the Germans, without cities, letters, arts, or money, found ſome compenſation for this ſavage ſtate in the enjoyment of liberty. Their poverty ſecured their freedom, ſince, ſays Gibbon, our deſires and our poſſeſſions are the ſtrongeſt fetters of deſpotiſm. Cæſar and Tacitus inform us, that the ſtate of ſociety among the ancient Germans was of the rudeſt and moſt ſimple form. They lived entirely by hunting or paſturage. They neglected agriculture, as we have already ſeen; their chief food was milk, cheeſe, and fleſh. While ſociety remains in this ſimple ſtate, men, by uniting together, ſcarcely relinquiſh any portion of their natural independence. The authority of civil government was extremely limited among the Germans. In times of peace they had no common or fixed magiſtrate; but the chief men of every diſtrict diſpenſed juſtice and accommodated differences. In the far greater part of Germany, the form of government was a democracy, tempered indeed, and controlled, not ſo much by general and poſitive laws, as by the occaſional aſcendant of birth and valour, of eloquence and ſuperſtition. Some tribes, however, on the coaſt of the Baltic, acknowledged the rights of kings; but their kings had not abſolute or unbounded power; their authority conſiſted rather in the privilege of adviſing than in the power of commanding. Matters of ſmall conſequence were determined by the chief men; affairs of importance, by the whole community. As ſoon as a youth, born of free parents, had attained the age of manhood, he was introduced into the general council of his countrymen, ſolemnly inveſted with a ſhield and a ſpear, and adopted as an equal and worthy member of the military commonwealth. The aſſembly of the tribe was convened at ſtated ſeaſons, or on ſudden emergencies. The trial of public offences, the election of magiſtrates, and the great buſineſs of peace and war, were determined by its independent voices. Sometimes theſe important queſtions were previouſly conſidered, and prepared in a more ſelect council of the principal chieftains. The magiſtrates might deliberate and perſuade; the people only could reſolve and execute. When timid, though juſt and prudent, counſels were propoſed, they expreſſed their diſlike by a hollow murmur. But whenever a popular orator propoſed to vindicate the meaneſt citizen from either foreign or domeſtic injury, whenever he called upon his fellow-countrymen to aſſert the national honour, or to purſue ſome enterpriſe full of danger and glory, a loud claſhing of ſhields and ſpears expreſſed the eager applauſe of the aſſembly; for the Germans always met in arms. On occaſions of danger a general of the tribe was elected; and in circumſtances of preſſing and extenſive danger, ſeveral tribes concurred in the choice of the ſame general. The braveſt warrior was named to lead his countrymen into the field, by his example rather than his commands. His power expired with the war, and in time of peace the German tribes acknowledged not any ſupreme chief. Princes were, however, appointed, in the general aſſembly, to adminiſter juſtice, or rather to compoſe differences (minuunt controverſias, Cæſar) in their reſpective diſtricts. To the choice of theſe magiſtrates, birth was regarded as much as merit. To each was aſſigned, by the public, a guard, and a council of 100 perſons; and the firſt of the princes appears to have enjoyed a pre-eminence of rank and honour, which ſometimes tempted the Romans to compliment him with the regal title. The Germans reſpected only thoſe duties which they impoſed on themſelves. The moſt obſcure ſoldier reſiſted with diſdain the authority of the magiſtrates. Every individual among the ancient Germans was left at liberty to chuſe whether he would take part in any military enterpriſe which was propoſed; it became, of conſequence, the great object of every perſon, who aimed at being a leader, to gain adherents and to attach them to his perſon and intereſt. Cæſar calls theſe adherents Ambacti and Clientes, *i. e.* retainers or clients. Tacitus calls them Comites, or companions. The chief diſtinction and power of the leaders conſiſted in being attended by a numerous band of choſen youth. This was their pride as well as ornament during peace, and their defence in war. The leaders gained, or preſerved, the favour of theſe retainers by preſents of armour and of horſes, or by the profuſe though inelegant hoſpitality with which they entertained them. But even after they united in ſociety, the Germans circumſcribed the criminal juriſdiction of the magiſtrate within very narrow limits, and exerciſed almoſt all the rights of private reſentment and revenge. Their magiſtrates had the abſolute diſpoſal of the landed property within their diſtrict, and they diſtributed it every year according to a new diviſion; but they had not the power of impriſoning, or of inflicting any corporal puniſhment on a private citizen. Every individual was obliged to avenge the wrongs which his parents or friends had ſuſtained. Their enemies were hereditary, but not irreconcileable. Even murder was compenſated by paying a certain number of cattle. A part of the fine went to the king or ſtate, a part to the perſon who had been injured, or to his kindred.

Chaſtity is aſcribed, almoſt without exception, to the wives of the ancient Germans. Polygamy was not in uſe, except among the princes, and among them only for the ſake of multiplying their alliances. Divorces were prohibited by manners rather than by laws. Adulteries were puniſhed as rare and inexpiable crimes; nor was ſeduction juſtified by example and faſhion. Tacitus evidently indulges an honeſt pleaſure in the contraſt of barbarian virtue with the diſſolute conduct of the Roman ladies ; yet there are ſome ſtriking circumſtances that give an air of truth, at leaſt of probability, to the conjugal faith and chaſtity of the Germans. The German huts, open on every ſide to the eye of indiſcretion or jealouſy, were a better ſafeguard of conjugal fidelity than the walls, the bolts, and the eunuchs of a Perſian haram. Beſides, the Germans treated their women with eſteem and confidence, conſulted them on every occaſion of importance, and fondly believed that in their breaſts reſided a ſanctity and wiſdom more than human. Some of theſe interpreters of fate, ſuch as Valleda, in the Batavian war, governed, in the name of the Deity, the fierceſt nations of Germany. The reſt of the ſex, without being adored as goddeſſes, were reſpected as the free and equal companions of ſoldiers ; aſſociated, even by the marriage ceremony, to a life of toil, of danger, and of glory. In their great invaſions, the camps of the barbarians were filled with a multitude of women, who remained firm and undaunted amidſt the ſound of arms, the various forms of deſtruction, and the honourable wounds of their ſons and huſbands. The women dreaded death much leſs than ſervitude. If the day was irrecoverably loſt they well knew how to deliver themſelves and their children, with their own hands, from an inſulting victor. Heroines of ſuch a caſt may claim our admiration ; but they were moſt aſſuredly neither lovely, nor very ſuſceptible of love.

Conſcious pride taught the German females to ſuppreſs every tender emotion that ſtood in competition with honour, and the firſt honour of the ſex has ever been that of chaſtity.

The religious ſyſtem of the Germans was dictated by their wants, their fears, and their ignorance. They adored the great viſible objects and agents of nature, the ſun and the moon, the fire and the earth ; together with thoſe imaginary deities who were ſuppoſed to preſide over the moſt important occupations of human life. They were perſuaded that by ſome ridiculous arts of divination, they could diſcover the will of the ſuperior beings, and that human ſacrifices were the moſt precious and acceptable offering on their altars. If there was any difference between the Gauls and Germans in point of religion, it conſiſted only in this, that the latter, being more fierce and untractable, were not only more tenacious of their ſuperſtitious rites, but likewiſe more cruel and inhuman in them. It appears, from the teſtimonies of Cæſar, Tacitus, Diodorus Siculus, Strabo, Athenæus, and other ancient authors, that the Germans had no temples, but performed their religious rites in groves erected for that purpoſe, or in woods, foreſts, and deſert places. Temples were not introduced in Germany till long after the Gauls had erected them ; and the inferior divinities introduced among the Gauls, ſuch as Jove or Jupiter, Mars, Apollo, Mercury, Venus, Diana, &c. were alſo adopted by the Germans, though ſome of them were repreſented under different names and attributes. Jupiter was worſhipped under the name of Thor or Taran, *i. e.* the Thunderer ; this name was given by the Gauls to Mars ; and the Germans beſtowed it on their Odin or Woden ; but the name of Jupiter was never adopted by the Gauls, nor by the Germans. Both Gauls and Germans agreed in worſhipping the ſupreme deity under the name of Heſus or Eſus, and under the emblem of an oak, which was conſecrated to him. The goddeſs Hertha was one of their ancient deities, and her idol was preſerved in a wood or grove, " Caſtum nemus," upon a covered cart, and ſhe had but one prieſt to miniſter to her, who was the only perſon that was allowed to approach her. The worſhip of this goddeſs correſponded with that which the Romans and others paid to the " Earth," under the name of " Magna Deorum Mater." A ſolemn proceſſion was occaſionally celebrated in the preſent countries of Mecklenburg and Pomerania. The unknown ſymbol of the " Earth," covered with a thick veil, was placed on a carriage drawn by cows ; and in this manner the goddeſs, whoſe common reſidence was in the iſle of Rugen, viſited ſeveral adjacent tribes of her worſhippers. During her progreſs, the ſound of war was huſhed, quarrels were ſuſpended, arms laid aſide, and the reſtleſs Germans had an opportunity of taſting the bleſſings of peace and harmony. The " Truce of God," ſo often and ſo ineffectually proclaimed by the clergy of the 11th century, was an obvious imitation of this ancient cuſtom.

The influence of religion on the minds of the ancient Germans was far more powerful to inflame than to moderate their fierce paſſions. The conſecrated ſtandards, long revered in the groves of ſuperſtition, were placed in the front of the battle ; and the hoſtile army was devoted with dire execrations to the gods of war and of thunder. A brave man was the worthy favourite of their martial deities ; and the wretch who had loſt his ſhield was baniſhed alike from the religious and the civil aſſemblies of his countrymen. Some tribes of the north ſeem to have embraced the doctrine of tranſmigration ; others imagined a groſs paradiſe of immortal drunkenneſs. (See the Edda, fable 20.) All agreed, that a life ſpent in arms, and a glorious death in battle, were the beſt preparations for a happy futurity, either in this or in another world.

It is ſaid that the Germans, as well as Gauls, were early taught by their Druids, as fundamental truths, an overruling providence, and the immortality of the ſoul ; but theſe noble principles of religion and virtue were ſoon corrupted as inſtruments of divination and ſuperſtition. Cæſar ſays, indeed, (Com. l. vi. c. 21.) that the Germans had no druids, as the Celtes had ; but Tacitus, who was better acquainted with the Germans, ſpeaks frequently of their prieſts, whoſe office and authority, as he ſtates them, were ſimilar to thoſe of the Gauliſh druids, and they ſeem to have been of the ſame order of men, though perhaps they did not bear the ſame name. As to the immortality promiſed by their prieſts, it was in ſome degree conferred by the bards, who by their military ſongs kindled in the breaſts of their audience the enthuſiaſm of arms and glory. The view of arms and of danger heightened the effect of theſe ſongs ; and the paſſions which they tended to excite, the deſire of fame, and the contempt of death, were the habitual ſentiments of a German mind. A contempt of danger and of death was one of the principles which they inſtilled into the minds of their youth, and a regard to which their prieſts inculcated as the ſureſt means of reputation and wealth, and alſo of happineſs in a future life. Under the influence of this principle their armies, which conſiſted more of infantry than cavalry, were eaſily raiſed and maintained. Like the Gauls and Britons, the Germans fought in ſeparate cantons or tribes ; and thus they were induced to exert themſelves with the greater firmneſs and vigour in defence of their relations, neighbours, and friends, and for the honour of their reſpective communities. We are told, indeed, that ſome of them, eſpecially the Cimbri, formed their whole infantry into one ſquare battalion, and placed their wives, children, and baggage behind a fence made of their waggons ; and when they were prepared for an attack, a ſignal was given, which was re-echoed by an univerſal ſhout, and repeated till the engagement commenced. They uſed no art or ſtratagem in fighting, but wholly confided in a furious onſet on the enemy, which they maintained with a deſperate intrepidity till the day was won or loſt: if they were once thrown into diſorder they ſeldom rallied, but became deſperate, and either fought till they were ſlaughtered, or betook themſelves to flight; for it was reckoned inglorious to yield themſelves priſoners. The military weapons of the cavalry among the Germans were ſhields and ſpears, which they uſed in common with the foot, but the latter had, beſides their darts, bows and ſlings, and ſeldom had recourſe to their pikes and ſwords. Their arms were eſteemed their favourite furniture and chief ornament; ſo that they never appeared in public without them. The ſword was ſo ſacred, that the moſt ſolemn and obligatory oaths were thoſe which they took upon a naked blade. Nor did they aſſiſt in any ſolemn rite, without their ſword, ſhield, or ſpear. They even wore them at their familiar viſits, banquets, and religious dances; and they were frequently to be burnt or buried with them, when they died. The ſports, games, and exerciſes of the Germans, were of the maſculine kind, and ſuch as inured them to the operations of war. It was a long time before they acquired any knowledge of the liberal arts, or even that of writing; and we are told, that Charles the Great cauſed ſome of their barbarous poems, which they had been accuſtomed to ſing from memory, and which celebrated the illuſtrious actions of their ancient kings and heroes, to be committed to writing for their uſe, and by way of encouraging them to learn to read. The Saxons, it is ſaid, had ſuch a contempt for letters, that they refuſed to learn to read the goſpels till they were put into verſe, and ſet to ſuch tunes as they could eaſily ſing. Even their laws were not reduced to writing till about the 12th or 13th centuries.

The native diſpoſition of the ancient Germans diſplayed itſelf chiefly in their martial genius, and in their ſingular fidelity. In ſome caſes their love of liberty, and hatred of tyranny and oppreſſion, precipitated them to acts of treachery and even of murder; for in ſuch caſes they were eaſily incenſed, and extremely vindictive. On other occaſions, Tacitus ſays, they were noble, magnanimous, and beneficent, without ambition to aggrandize their dominions, or to invade thoſe from whom they received no injury; rather chuſing to employ their ſtrength or valour defenſively, than offenſively; to preſerve their own, than to revenge their neighbours. In their own houſes, furniture and diet, they were diſtinguiſhed by their plainneſs and ſimplicity; but at the ſame time, they were no leſs diſtinguiſhed by their hoſpitality to ſtrangers, and by their readineſs to ſuccour thoſe that were in diſtreſs. Although in moſt of their cuſtoms the Germans very much reſembled the Gauls, yet, with regard to their funerals, they were very different. The latter performed theſe obſequies with pomp and profuſion; whereas the Germans diſcharged their laſt offices to the dead with plainneſs and ſimplicity; the only grandeur they affected, was to burn the bodies of their great men with ſome peculiar kinds of wood; and afterwards they flung each man's armour into the funeral pile, and ſometimes his riding dreſs. They then depoſited their aſhes in urns, like the Gauls, Romans, and other nations. It may be obſerved in general, that the ſacrifices they offered for their dead, the preſents made to them at their funerals, and the other ſuperſtitious rites performed on theſe occaſions, were all the reſult and the evidence of an eſtabliſhed belief, that the ſoul was immortal.

The ancient Germans were a brave and independent race of men, and peculiarly diſtinguiſhed by their love of liberty and arms. They oppoſed the Roman power, after it had arrived at maturity. After their conteſt with Cæſar, who was provoked by the Treviri to invade their country, and their revolt againſt Auguſtus, which was ſuppreſſed by Agrippa, and the inſurrection which commenced among the Roman legions in Pannonia, quelled partly by Druſus, and finally by Germanicus; their other more conſiderable wars with the Romans were waged againſt the emperors M. Aurelius, Alexander, Maximin, Valerian, Aurelian, Probus, Conſtantius, Julian, Valentinian, and ſome of his ſucceſſors. Some notice is taken of theſe conflicts under the names of the Alemanni, Gepidæ, Franks, Suevi, Heruli, and Burgundians. Ther country was divided into a number of petty ſovereignties, independent of each other, though occaſionally connected by a military union, until it was reduced to the condition of a Roman province; and when the Roman empire was ſhattered by the Northern barbarians, Germany was over-run by the Franks about the year 480, and continued in ſubjection to chieftains of that nation, who governed over the Suabians, Alemans, Friſians, Saxons, Thuringians, and Bavarians, until the end of the eighth century, when Charlemagne united all Germany into one kingdom, as part of the Frankiſh monarchy. The conquered German nations had hereditary dukes of their own at firſt, and were governed by their own laws: but Charlemagne put an end to the former, and governed the different German provinces by counts and royal delegates, and in the year 800 he aſſumed the title and dignity of emperor. But the empire of Charlemagne was a ſtructure erected in ſo ſhort a time, that it could not be of long duration. Under his immediate ſucceſſor it began to totter, and ſoon after fell to pieces. The crown of Germany was ſeparated from that of France, and the deſcendants of Charlemagne eſtabliſhed two great monarchies, ſo ſituated, as to give riſe to a perpetual rivalſhip between them. But the princes of the race of Charlemagne, who were placed on the Imperial throne, were not altogether ſo degenerate as thoſe of the ſame family who reigned in France. In the hands of the former, the royal authority retained ſome vigour; the nobles of Germany, though poſſeſſed of extenſive privileges and ample territories, did not ſo early attain independence. The great offices of the crown continued at the diſpoſal of the ſovereign, and during a long period, fiefs remained in their original ſtate without becoming hereditary in the families of the perſons to whom they had been granted.

At length, the German branch of the family of Charlemagne became extinct upon the death of Louis IV. His feeble deſcendants who reigned in France had ſunk into ſuch contempt, that the Germans, without looking towards them, exerciſed the right inherent in a free people; and in a general aſſembly of the nation at Worms, in the year 911, offered the imperial crown to Otho, duke of Saxony, who declined it on account of his great age, and recommended Conrad, count of Franconia. The latter was unanimouſly elected emperor. His reign was diſturbed by the diſobedience of ſome nobles whom he ſubdued, and by the pretenſions of Henry, ſon of the duke of Saxony, his benefactor. Their quarrels, however, did not prevent Conrad from acknowledging the merit of that prince in the ſame manner as Otho had done his. He recommended Henry as the fitteſt prince to be his ſucceſſor, and his propoſal being approved by the nation, he ſent to Henry, without waiting for the hour of death, the crown, the ſceptre, the lance, the ſword, and other imperial ornaments.

Henry I. aſcended the imperial throne of Germany in 919. He was ſurnamed the *Fowler*, becauſe he was paſſionately fond of hawking. To confirm his authority, he made more uſe of perſuaſion than of arms. His deſcendants, the three Othos, were placed in ſucceſſion on the imperial throne by the ſuffrages of their countrymen. The extenſive territories of the Saxon emperors, their eminent abilities, and enterpriſing genius, not only added new vigour to the imperial dignity, but raiſed it to higher power and pre-eminence. Otho the Great marched at the head of a numerous army into Italy, and, after the example of Charlemagne, gave law to that country. On his arrival at Rome, he was conſecrated by the pope, and crowned emperor of the Romans. He created popes and depoſed them by his ſovereign mandate. He annexed the kingdom of Italy to the German empire. Elated with his ſucceſs, he aſſumed the title of Cæſar Auguſtus. A prince, born in the heart of Germany, pretended to be the ſucceſſor of the emperors of ancient Rome, and claimed a right to the ſame power and prerogative. See the biographical article OTHO.

But while the emperor, by means of theſe new titles and new dominions, gradually acquired additional authority and ſplendour, the nobility of Germany had gone on at the ſame time extending their privileges and juriſdiction. The ſituation of affairs was favourable to their attempts. The vigour which Charlemagne had given to government quickly relaxed. The incapacity of ſome of his ſucceſſors was ſuch, as would have encouraged vaſſals, leſs enterpriſing than the nobles of that age, to have claimed new rights, and to have aſſumed new powers. The civil wars in which other emperors were engaged, obliged them to pay perpetual court to their ſubjects, on whoſe ſupport they depended, and not only to connive at their uſurpations, but to permit and even to authorize them. Fiefs gradually became hereditary. They were tranſmitted not only in the direct, but alſo in the collateral line. The inveſtiture of them was demanded not only by male but by female heirs. Every baron began to exerciſe ſovereign juriſdiction within his own domains, and the dukes and counts of Germany took wide ſteps towards rendering their territories diſtinct and independent ſtates. The Saxon emperors obſerved their progreſs, and were aware of its tendency. But as they could not hope to humble vaſſals already grown too potent, unleſs they had turned their whole force and attention to that enterpriſe, and as they were extremely intent on their expeditions into Italy, which they could not undertake without the concurrence of their nobles, they were ſolicitous not to alarm them by any direct attack on their privileges. They aimed, however, at undermining their power. With this view, they inconſiderately beſtowed additional territories, and accumulated new honours on the clergy, in hopes that this order might ſerve as a counterpoiſe to that of the nobility in any future ſtruggle.

The unhappy effects of this fatal error in policy were quickly felt. Under the emperors of the Franconian and Swabian lines, whom the Germans, by their voluntary election, placed on the imperial throne, a new face of things appeared, and a ſcene was exhibited in Germany which aſtoniſhed all Chriſtendom at that time. The popes, hitherto dependent on the emperors, and indebted for power as well as dignity to their beneficence and protection, began to claim a ſuperior juriſdiction, and in virtue of authority, which they pretended to derive from heaven, tried, condemned, excommunicated, and depoſed their former maſters. Theſe pretenſions gave riſe to the factions of the Guelphs and Ghibelines, of which the former was attached to the popes, and the latter to the emperors. Pope Gregory VII. had obſerved that the princes and nobles of Germany had acquired ſuch conſiderable territories and ſuch extenſive juriſdiction, as rendered them not only formidable to the emperors, but diſpoſed them to favour any attempt to circumſcribe their power. He foreſaw that the eccleſiaſtics of Germany, raiſed almoſt to a level with its princes, were ready to ſupport any perſon who would ſtand forth as the protector of their privileges and independence. With both of theſe Gregory negotiated, and had ſecured many devoted adherents among them, before he ventured to enter the liſts againſt the head of the empire. He began his rupture with Henry IV. upon a pretext that was popular and plauſible. He complained of the venality and corruption with which the emperor had granted the inveſtiture of benefices to eccleſiaſtics. He contended that this right belonged to him, as the head of the church; he required Henry to confine himſelf within the bounds of the civil juriſdiction, and to abſtain for the future from ſuch ſacrilegious encroachments on the ſpiritual dominion. All the cenſures of the church were denounced againſt Henry, becauſe he refuſed to relinquiſh thoſe powers which his predeceſſors had uniformly exerciſed. The moſt conſiderable of the German princes and eccleſiaſtics were excited to take arms againſt him. His mother, his wife, his ſons, were wrought upon to diſregard all the ties of blood and duty, and to join the party of his enemies. At length, the emperor was even obliged to appear as a ſupplicant at the gate of the caſtle in which the pope reſided, and to ſtand there three days barefooted in the depth of winter, imploring a pardon, which he obtained with difficulty.

This act of humiliation degraded the imperial dignity. The two factions kept Germany and Italy in perpetual agitation during three centuries, and, notwithſtanding the return of ſome ſhort intervals of vigour, under the adminiſtration of a few able emperors, the imperial authority continued to decline. During the anarchy of a long interregnum, ſubſequent to the death of William of Holland, it dwindled down almoſt to nothing.

In the year 1273, Rodolphus of Hapſburgh, the founder of the houſe of Auſtria, was elected emperor, not that he might re-eſtabliſh and extend the imperial authority, but becauſe his territories and influence were ſo inconſiderable as to excite no jealouſy in the German princes, who were willing to preſerve the forms of a conſtitution, the power of which they had deſtroyed. Several of Rodolph's ſucceſſors were placed on the imperial throne from the ſame motive, and almoſt every remaining prerogative was wreſted out of the hands of feeble princes, unable to exerciſe or to defend them.

During this period of turbulence and confuſion, the conſtitution of the German empire underwent a total change. The princes, the great nobility, the dignified eccleſiaſtics, and the free cities extended their uſurpations. They claimed and exerciſed the right of governing their reſpective territories with full ſovereignty. They acknowledged no ſuperior with reſpect to any point relative to the interior adminiſtration and police of their domains. They enacted laws, impoſed taxes, coined money, declared war, concluded peace, and exerted every prerogative peculiar to independent ſtates. The forms of feudal ſubordination formed the only connection among the various members of the community. This bond of union, however, was extremely feeble.

From the acceſſion of Rodolph of Hapſburgh, to the reign of Maximilian, the empire felt every calamity which a ſtate muſt endure, when the authority of government is ſo much relaxed. The diſſenſions among its members gave riſe to perpetual private wars, which were carried on with all the violence that accompanies reſentment when unreſtrained by ſuperior authority. Rapine, outrage, exactions, became univerſal. The variety of expedients employed to reſtore order and tranquillity, prove that the grievances occaſioned by this ſtate of anarchy had become intolerable. Arbiters were appointed to terminate the differences among the ſeveral ſtates. The cities united in a league to check the extortions of the nobility, and the latter formed confederacies to maintain tranquillity among their own order. Germany was divided into ten circles, in each of which a provincial juriſdiction was eſtabliſhed. But all theſe remedies proved ineffectual. At length Maximilian inſtituted the imperial chamber, a tribunal compoſed of judges named partly by the emperor, partly by the ſeveral ſtates, and veſted with authority to decide finally concerning all differences among the members of the Germanic body, and thus reſtored ſome degree of vigour to the imperial authority.

But notwithſtanding the ſalutary effects of theſe regulations, the political conſtitution of the German empire, at the beginning of the ſixteenth century, was of a ſpecies ſo peculiar as not to reſemble perfectly any form of government known either in the ancient or modern world. It was a complex body, formed by the aſſociation of ſeveral ſtates, electors, princes, dignitaries of the church, counts, barons, and free cities, each of which poſſeſſed ſovereign and independent juriſdiction within its own territories. Of all the members which compoſed this united body, the emperor was the head. In his name all decrees and regulations, with reſpect to points of common concern, were iſſued; and to him the power of carrying them into execution was committed. But this appearance of monarchical power in the emperor was more than counterbalanced by the influence of the princes and ſtates of the empire in every act of adminiſtration. No law extending to the whole body could paſs, no reſolution that affected the general intereſt could be taken without the approbation of the diet of the empire held at Ratiſbon. In this aſſembly every ſovereign prince and ſtate of the Germanic body had a right to be preſent, to deliberate and to vote. The decrees or receſſes of the diet were the laws of the empire, which the emperor was bound to ratify, and to enforce. In this reſpect the German empire was ſimilar to the Achæan league in ancient Greece, or to that of the United Provinces of the Netherlands, and of the Swiſs cantons in modern times. But, as the acute hiſtorian of the emperor Charles V. obſerves, the Germanic body was not formed by the union of members altogether diſtinct and independent. All the princes and ſtates, joined in this aſſociation, were originally ſubject to the emperors, and acknowledged them as ſovereigns. They originally held their lands as imperial fiefs, and owed the emperor all thoſe ſervices which feudal vaſſals are bound to perform to their liege lord. But though this political ſubjection was entirely at an end, the ancient forms introduced while the emperors governed Germany with authority not inferior to that which the other monarchs of Europe poſſeſſed, ſtill remained. Thus an oppoſition was eſtabliſhed between the genius of the government and the forms of adminiſtration in the German empire. The former conſidered the emperor only as the head of a confederacy, the members of which, by their voluntary choice, raiſed him to that dignity; the latter ſeemed to imply that he is really inveſted with ſovereign power. The emperors were diſtinguiſhed by the moſt pompous titles, and by ſuch marks of dignity as intimated their authority to be ſuperior to that of all other monarchs. The greateſt princes of the empire attended and ſerved them, on ſome occaſions, as officers of their houſhold. They exerciſed prerogatives which no other ſovereigns ever claimed. They retained pretenſions to all the extenſive powers which their predeceſſors had enjoyed in any former age. But, at the ſame time, inſtead of poſſeſſing that ample domain which had belonged to the ancient emperors of Germany, and which ſtretched from Baſil to Cologne, along both banks of the Rhine, they were ſtripped of all territorial property, and had not a foot of land that belonged to them as heads of the empire. Their revenues were reduced almoſt to nothing, and the extraordinary aids which, on a few occaſions, they obtained, were granted ſparingly, and paid with reluctance. The conſequence of this ill-compacted frame of government was, that the emperors imagined themſelves to be the real ſovereigns of Germany, and aimed continually at recovering the exerciſe of thoſe powers which the forms of the conſtitution ſeemed to veſt in them, and which their predeceſſors Charlemagne and the Othos had actually enjoyed. The princes and ſtates, aware of theſe pretenſions, watched the motions of the imperial court to circumſcribe its power within limits ſtill more narrow. This jealouſy of the imperial authority increaſed conſiderably from the time that the elective power was veſted in a few princes of chief dignity.

During a long period, all the members of the Germanic body had a right to aſſemble, and to make a choice of the perſon whom they appointed to be their head. But amidſt the violence and anarchy which prevailed for ſeveral centuries in the empire, ſeven princes, who poſſeſſed the moſt extenſive territories, and who had obtained an hereditary title to the great offices of the ſtate, acquired the excluſive privilege of nominating the emperor. This right was confirmed to them by the golden bull (ſee BULL); the mode of exerciſing it was aſcertained, and they were dignified with the appellation of *Electors*. (See ELECTOR.) The nobility and free cities, being thus ſtripped of a privilege which they had once enjoyed, were leſs connected with a prince, towards whoſe elevation they had not contributed by their ſuffrages, and came to be more apprehenſive of his authority. The electors, by their extenſive power, and the diſtinguiſhing privileges which they poſſeſſed, became formidable to the emperors, with whom they were placed almoſt on a level in ſeveral acts of juriſdiction. Thus, the introduction of the electoral college into the empire ſtrengthened the principles of diſcord in the Germanic conſtitution, which were continually alimented by the various and repugnant forms of civil policy in the ſeveral ſtates. The free cities were ſmall republics, in which the maxims and ſpirit peculiar to that ſpecies of government prevailed. The princes and nobles to whom ſupreme juriſdiction belonged poſſeſſed a ſort of monarchical power within their own territories. Their common deliberations could not be carried on with the ſame ſpirit while the love of liberty and attention to commerce were the reigning principles in the cities; and the deſire of power, and ardour for military glory, the governing paſſions of the princes and nobility. The ſecular and eccleſiaſtical members of the empire were as little fitted for union as the free cities and the nobility. Conſiderable territories had been granted to ſeveral of the German biſhoprics and abbeys, and ſome of the higheſt offices of the empire, having been annexed to them unalienably, were held by the eccleſiaſtics raiſed to theſe dignities. The younger ſons of noblemen of the ſecond order, who had devoted themſelves to the church, were commonly promoted to theſe ſtations of eminence and power; and it was no ſmall mortification to the princes and great nobility, to ſee perſons raiſed from an inferior rank to the ſame level with themſelves, or even exalted to ſuperior dignity. The education of theſe churchmen, the genius of their profeſſion, and their connection with the court of Rome, rendered their character, as well as their intereſt, different from thoſe of the other members of the Germanic body, with whom they were called to act in concert. Thus another ſource of variance was opened.

To all theſe cauſes of diſſenſion muſt be added one more, ariſing from the unequal diſtribution of power and wealth among the ſtates of the empire. The electors and other nobles of the higheſt rank not only poſſeſſed ſovereign juriſdiction, but governed ſuch extenſive, populous, and rich countries, as rendered them great princes. Many of the other members, though they enjoyed all the rights of ſovereignty, ruled over ſuch petty domains, that their real power bore no proportion to this high prerogative. The electors and emperors, by turns, endeavoured to extend their own authority, by encroaching on thoſe feeble members of the Germanic body, who ſometimes defended their rights with much ſpirit, but more frequently, being overawed or corrupted, tamely ſurrendered their privileges, or meanly favoured the deſigns formed againſt them.

But the empire of Germany comprehended countries of ſuch vaſt extent, and was inhabited by ſuch a martial and hardy race of men, that when the abilities of an emperor, or zeal for any common cauſe could rouſe this unwieldy body, it was ſtill able to act with force. Charles V. grandſon of Maximilian, and heir to the kingdom of Spain, in right of his mother, was elected emperor in the year 1519. In his reign happened the reformation of religion cauſed by Luther, which occaſioned inceſſant wars till 1648. (See LUTHER and REFORMATION.) There were moments when Charles V. flattered himſelf with the hope of being able to hold the balance between the Roman Catholics and the Lutherans. But the contending parties were too much inflamed with animoſity, and in addition to his wars againſt Francis I. of France, he was forced to ſuſtain a violent one in the heart of the empire. Fortune, which ſmiled upon him in the beginning of his reign, forſook him towards its end. He abdicated the imperial throne, in 1558, in favour of his brother Ferdinand I., who had the addreſs of getting his ſon Maximilian II. declared king of the Romans, or ſucceſſor to the imperial crown in his life-time. This precaution became familiar to the houſe of Auſtria, and kept the imperial ſceptre in that family, until the extinction of the German empire. By his laſt will Ferdinand ordered that if either his own male iſſue, or that of his brother Charles ſhould fail, his Auſtrian eſtates ſhould revert to his ſecond daughter Anne, wife to the elector of Bavaria. This circumſtance is the origin of the oppoſition made by the houſe of Bavaria, in later times, to the Pragmatic ſanction in favour of Maria Thereſa, mother of Joſeph the ſecond.

The reign of Maximilian II. was diſturbed by internal commotions, and an invaſion from the Turks. He died in 1576, and was ſucceeded by his ſon Rodolph, who was involved in wars with the Hungarians, and in differences with his brother Matthias, to whom the empire devolved at his death. Having no children, Matthias conferred the crown of Hungary on his couſin Ferdinand arch-duke of Auſtria, and cauſed him to be elected king of Bohemia, which election proved the ſource of a long war. Ferdinand perſecuted the numerous ſectaries in Bohemia. They took up arms; the brave Mansfeld fought at their head, and Matthias, who came to the aſſiſtance of his kinſman, died of vexation, for not having been able to obtain a complete triumph over the Bohemians. A tender of the imperial crown was made to Maximilian, duke of Bavaria, who prudently declined the offer. Ferdinand was therefore proclaimed emperor in 1619, but the Bohemians, maintaining that the ſame individual could not wear the crown of Germany together with that of Bohemia, conferred the latter on Frederick, the elector palatine. Yielding to the intreaties of his ſpouſe Elizabeth, daughter of James I. of England, againſt his own conviction, Frederick made a ſplendid triumphal entry into Prague; but a few days after, his army was attacked on the heights near the town, and completely routed. He was obliged to fly with his wife and children, and found at laſt an aſylum in Holland. His defeat was the beginning of the thirty years' war which ravaged Germany from the Danube and the Rhine to the ſhores of the Baltic, without little intermiſſion from the battle of Prague to the peace of Weſtphalia. The unfortunate Frederick, who had been put under the ban of the empire, died broken-hearted. Ferdinand's arms were almoſt conſtantly victorious againſt the Proteſtant princes for the ſpace of ten years. He was on the point of cruſhing their party when Guſtavus Adolphus of Sweden ruſhed upon him. In vain did the Imperialiſts commanded by Tilly endeavour to check his career; they were defeated and diſperſed. Ferdinand was going to ſue for peace when the fall of the Swediſh monarch at Lutzen re-animated his hopes: Wallenſtein's defection did not arreſt his arm. He continued fighting againſt his Proteſtant vaſſals to the hour of his death, which happened in 1637. The war raged with unabated fury under his ſon Ferdinand III. who was appointed his ſucceſſor on the imperial throne. The Proteſtant cauſe was ably defended by the heroes brought up under the great Guſtavus Adolphus. Hiſtory will never forget the names of the duke of Saxe Weimar, of Bannier, Torſtenſon, Piccolomini, Merci, Wrangel, and many others who ſhook the Auſtrian power, till at length a general peace was concluded in 1648, which being guaranteed by Sweden and France, has been conſidered for a century and a half as forming the baſis of the political ſyſtem of Europe, under the name of the peace of Munſter or peace of Weſtphalia.

Leopold I. who was elected emperor of Germany, after the death of his father Ferdinand III. in the year 1657, had to combat the French on one ſide, and the Turks on the other. The latter advanced to the walls of Vienna, but were compelled to raiſe the ſiege by the valour of John Sobieſki, king of Poland. The fertile province of Alſace was conquered by France, but the Turks, having been repeatedly defeated by prince Eugene of Savoy, were forced to cede Tranſylvania by the peace of Carlowitz in 1699. During Leopold's long reign, the duke of Hanover was admitted into the electoral college, the elector of Saxony obtained the elective royal crown of Poland, the elector of Brandenburg was acknowledged hereditary king of Pruſſia, and a prince of the Bourbon family was ſeated on the Spaniſh throne. Leopold died in 1705. The reign of his ſon Joſeph I. laſted but ſix years, and is remarkable only for the victories which the great duke of Marlborough gained in his cauſe over the French. As he left no male iſſue, the elector of Mayence exerted all his influence to procure the imperial crown to his brother the archduke Charles, who was at that time in Spain, diſputing the crown of that kingdom with Philip of Anjou, grandſon to Louis XIV. The elevation of Charles to the empire terminated the conteſts which had haraſſed Spain and Germany. The peace of Utrecht, concluded in 1713, was followed by that of Baden with France in 1714, and that of Paſſarowitz with the Turks in 1717.

Charles VI. intent upon ſecuring his hereditary dominions to the archducheſs Maria Thereſa his daughter, framed that famous Pragmatic ſanction which was ſoon to diſturb again the peace of Germany. Happily for him the crown of Great Britain devolved to the houſe of Hanover, which circumſtance drew the connection of Auſtria and England againſt their common enemy more cloſe. Charles VI. married his daughter to Francis duke of Lorraine, and died in 1740. No ſooner was he in the grave than the Pragmatic ſanction was attacked on all ſides. The great Frederick of Pruſſia conquered Sileſia, and Spain and Bavaria preferred their claims on ſeveral provinces. The intrigues of France cauſed the imperial throne to be filled, after an interregnum of two years, by the elector of Bavaria, who took the name of Charles VII, and was proclaimed emperor in 1742.

But after five years of diſaſtrous warfare, he died deprived nearly of all his ſtates. Maria Thereſa had ſufficient influence to place her huſband on the throne of the empire in 1745. Francis I. was acknowledged as emperor of Germany by the king of Pruſſia at the peace of Dreſden, ſigned on the 25th of December 1745, and by the French, at the peace of Aix-la-Chapelle in 1748.

The interval of peace which Germany enjoyed was not of long duration. Frederick the Great of Pruſſia having diſcovered the plots which were formed againſt him by the emperor, the elector of Saxony, Ruſſia and France, and being ſubſidized by England, occupied Saxony, and reſiſted the attacks of his numerous enemies with alternate ſucceſs, for the ſpace of ſeven years. Peace was at length ſigned once more at Hubertſburgh on the 15th of February 1763. Francis I. died two years after. His ſon Joſeph II. who had been declared king of the Romans in 1764, was proclaimed emperor after his death. His attempt to poſſeſs himſelf of part of the dominions of Charles Theodore, the laſt elector of Bavaria, who died in December 1777, diſturbed the peace of Germany for a ſhort time. No battle of any conſequence was fought between the Auſtrian and Pruſſian armies; but the ſevere winter campaign of the latter end of 1778, and the beginning of 1779, having thinned the ranks of both, the treaty of Teſchen was concluded on the 13th of April 1779, and the peace of Weſtphalia appealed to, and confirmed for the laſt time. Maria Thereſa left her hereditary dominions to her ſon Joſeph II. at her death, which happened in 1780. Frederick the Great of Pruſſia, who was the laſt pillar of the Germanic conſtitution, died in 1786. Ambitious of imitating the example of his illuſtrious opponent, Joſeph II. introduced many ſalutary reforms in the adminiſtration of his dominions, proclaimed an unbounded religious toleration, ſuppreſſed a number of uſeleſs convents, aboliſhed the uſe of the rack in criminal inquiſitions, and extinguiſhed the remains of ſervitude and villainage which oppreſſed the peaſants of his dominions. But his well-intended innovations were too ſudden. Diſcontents broke out in the Netherlands, which he vainly attempted to ſtifle by force inſtead of adopting conciliatory meaſures. The rebellion of his Flemiſh ſubjects broke his heart. He died childleſs, though he had been married twice; and his brother Leopold, grand duke of Tuſcany, ſucceeded him on the imperial throne in 1790. His unfortunate engagement with the king of Pruſſia and the elector of Saxony, to oppoſe the French revolution with all their might, and to aſſiſt the emigrants in their attempts to re-enter France by force, haſtened the violent meaſures of the war party in France, which ultimately led to the extinction of the German empire. He died on the 1ſt of March 1792. His ſon Francis II. was raiſed to the imperial throne in the middle of July following. He embarked in the confederacy formed againſt France, loſt the Auſtrian Netherlands, the Briſgau, and all his poſſeſſions in Italy, and was at length obliged to abdicate the imperial throne of Germany, and to be contented with the title of emperor of Auſtria. See CONFEDERATION *of the Rhine.*

The peace of Weſtphalia, which had been regarded as the baſis of the political ſyſtem of Europe, had, in fact, ſown the ſeeds of the diſſolution of the German empire, by conferring on each prince and ſtate of the German confederacy the privilege of contracting alliances in their own names Their intereſts were continually claſhing with each other. The irreſiſtible force of revolutionary France has only accelerated a diſorganization, which would infallibly have taken place, through the rivalſhip of the Auſtrian and Pruſſian monarchs, ſupported, one by the Catholic, and the other by the Proteſtant ſtates. Compoſed of ſuch diſcordant materials, it is rather a matter of ſurpriſe that its exiſtence as a ſtate ſhould have been protracted to the length of one thouſand years.

The Germans never formed a nation united by the ties of ſimilar habits, laws and religion. Theſe differed in almoſt every petty principality, and the tie of language, from its many idioms and different pronunciation, was ſo weak, that the national hatred of the inhabitants of the Pruſſian dominions againſt thoſe of the Auſtrian ſtates was as great as that which prevails between the Engliſh and the French. The difference between the Proteſtant and Catholic countries was alſo ſo conſiderable, that whilſt farmers in the former enlivened their leiſure by ſtudy, the clergymen in the latter were even ignorant of the firſt four rules of arithmetic. Palitzſch, a Saxon farmer, who was a fellow of the Royal Society of London, died in 1788, and ſix months before his death a clergyman was wanted, in the gazette of Cologne, capable of teaching the rudiments of common arithmetic. The only feature which may be marked as a national one in the Germans of all perſuaſions and places, is the induſtry and perſeverance of the middle and lower ranks, and the pride and haughtineſs of the nobility. As ſoldiers, the Germans, when ably commanded, have always ſhewn themſelves endowed with ſteady courage and perſevering ſtrength. But the name of German is extinct. Henceforth the traveller muſt inquire into the peculiar character and diſpoſition of the Auſtrian, Pruſſian, Saxon, Bavarian, Weſtphalian, and the inhabitant of Wirtemberg, Baden, Berg, Heſſe Darmſtadt, Naſſau, and the other ſmaller ſtates of the confederacy of the Rhine. GERMEN, or GERM. See EMBRYO.

GERMEN, in *Botany* and *Vegetable Phyſiology*, the rudiments of the fruit, conſtituting one of the two eſſential parts of the piſtil of a flower, the ſtigma being the other; the ſtyle, which uſually elevates the latter, not being indiſpenſable, nor always preſent. The Latin word *germen* properly means a bud, or ſprout (ſee GEMMA); which latter, in ſcientific language, is now univerſally uſed in its ſtead. Linnæus therefore applied *germen* technically, and very happily, to the ſeed-bud, or origin of the future offspring, which had as yet no appropriate name. In this he is generally followed, even by the only perſon who could effectually have contended with him in ſuch a point, the celebrated Juſſieu. Nevertheleſs, Gærtner, aſſuming ſome well-founded authority on account of his valuable labours reſpecting fruits and ſeeds, prefers the word *ovarium*, borrowed from anatomiſts, for it is not claſſical Latin. The only reaſon for this innovation is, as he is pleaſed to expreſs it, that Linnæus "*ſatis improprie*" calls this part *germen*. The authority of Gærtner has unfortunately miſled one excellent writer of late to adopt the term *ovarium*, to which we object, not ſo much for its want of claſſical authority, as it might well be defended on the ground of analogy, but becauſe it is not appropriate, and is not uſed by Gærtner in the original anatomical ſenſe, but in a new and arbitrary one. Vegetables have no ſuch organ as the *ovarium* of animals. Malpighi, much more correctly, calls the *germen* the *uterus*; but this is improper for plants with naked ſeeds; whereas *germen* is applicable in all caſes to the rudiment of the fruit, whatever its nature may be. Such a comprehenſive term is of the more value, as not having any reſpect to the diſputable point of whether any ſeeds be really naked or no. We agree with Gærtner that they cannot in their origin be naked, but muſt have ſome integument through which they are impregnated; ſee Fecundation *of Plants*. In an advanced ſtate the ſame able author could not but allow the exiſtence of naked ſeeds in a certain ſenſe, that is, ſuch as have only their own eſſential integuments, but no real *pericarpium* or ſeed-veſſel.

Gærtner very ſucceſsfully combats the Linnæan hypotheſis, that the germen originates from the pith of the plant, as the ſtamens from the woody part. This idea was purely hypothetical, and is unſupported by any anatomical fact, however ingenious the theory of generation deduced from it by the illuſtrious Swede.

The germen is formed as early as any part of the flower, of which indeed it frequently conſtitutes the baſe. Before the ſtigma is ripe for impregnation, all the internal parts of the germen, eſpecially the young ſeeds, receive their due ſhape and ſtructure, except only the embryo, the rudiments of which can ſcarcely be detected at that period. If no impregnation takes place, the germen, and even the ſeeds ſometimes continue to grow, but a cavity only in ſuch caſe will be found in the place of the embryo, which has at leaſt proved abortive and withered away, if it ever had any exiſtence. More frequently indeed only the huſks or withered rudiments of ſeeds are found in an advanced unimpregnated germen; and ſtill more generally the whole germen withers if the ſtamens and ſtigma have not performed their office.

Germens are either ſolitary or numerous, ſimple or aggregate, in different genera of plants. With reſpect to ſituation, it is important to note whether the germen be ſuperior, that is, above the baſes of the calyx and corolla, or inferior, below them. Such a difference commonly marks a very eſſential generic diſtinction, yet in that moſt natural genus *Saxifraga*, ſome ſpecies have a ſuperior and others an inferior germen. This proves, on a careful anatomical inveſtigation, to depend merely on a greater or leſs degree of elevation of the organ in queſtion within the cavity of the calyx. Indeed ſuch an inveſtigation of flowers in general will ſhew that there is perhaps no ſuch thing as an inferior germen, ſtrictly ſpeaking, becauſe there muſt neceſſarily be a continuation of the integuments of the flower and their veſſels, in ſome form or other, along the outer part of what is commonly deemed an inferior germen, to the ſtalk whence their nouriſhment is derived. But this "were to conſider too curiouſly." The line is in almoſt every caſe drawn with ſufficient diſtinction for all uſeful purpoſes, and is generally indicated in due time by a ſpontaneous ſeparation of parts. *Sanguiſorba* is erroneouſly judged by Linnæus to have the germen below the corolla though above the calyx, a ſtrange and unexampled circumſtance indeed! He was miſled by the cloſe adheſion of the thin pellucid tube of the corolla to the germen. In *Adoxa*, however, there is an approach towards ſuch a ſingularity of ſtructure, the calyx being inſerted half way down, while the corolla crowns the germen, for this plant, being akin to *Saxifraga*, partakes of that irregularity of poſition in the germen which we have already deſcribed.

Nothing is more wonderful than that difference of vaſcular conſtitution in the germen of different genera or natural orders, by which, though in all caſes nearly equally juicy while young and growing, in ſome it becomes coriaceous, or woody, and dry, as it ripens, while in others it attains a ſoft pulpy conſiſtence, which obliterates all its original internal ſtructure. The wiſe ends anſwered by theſe differences are indeed apparent, but the means by which they are accompliſhed are, if not inſcrutable, hitherto unexplained. S.

GERMER, St., in *Geography*, a town of France, in the department of the Oiſe; 12 miles W. of Beauvais.

GERMERSHEIM, a town of France in the department of Mont Tonnerre, and chief place of a canton, in the diſtrict of Spire; 5 miles S. of Spire. The place contains 1251, and the canton 11,745 inhabitants, in 16 communes. It is ſituated at the conflux of the Queich and the Rhine, and was erected into a town by Rodolphus I., who died here in 1290. It was taken by the French in 1794. N. lat. 49° 12'. E. long. 8° 25'.

GERMINATION, in *Vegetable Phyſiology*, the firſt beginning of vegetation in ſeeds, is accompliſhed by moiſture, heat, and air, acting mechanically and chemically on the ſubſtance and component parts of the ſeed, as well as ſtimulating its vital principle. Theſe agents muſt perform their functions together, in order to produce a ſalutary effect, otherwiſe the vital principle, or the chemical properties of the ſeed, may be ſtimulated or ſpoiled, nor muſt their application, generally ſpeaking, be longer delayed than uſually happens in the ordinary courſe of nature. Some ſeeds, indeed, may be kept out of the ground for years, or may remain buried far beneath its ſurface, we know not how long, without loſing their vegetative power; while others muſt ſcatter themſelves in their own way, immediately from the ſeed-veſſel, in order to ſucceed with certainty. A ſeed abſorbs, through the veſſels of its baſe, or ſcar, any moiſture that comes in its way, and it ſoon meets with ſuch a ſupply when committed to the ground, at the ſame time receiving, throughout its whole ſubſtance, a definite portion of heat, ſome ſeeds requiring more than others. Atmoſpherical air is alſo neceſſary to the germination of ſeeds, on account of the oxygen gas which makes a part of its compoſition, and which modern chemiſts have found to be abſorbed by ſeeds, in the moments of incipient germination, from or through the ſurrounding ſoil. This appears from their being incapable of vegetation while buried deep in the earth, or while under the exhauſted receiver of an air-pump; though ſuch as have been ſo ſituated immediately grow, when the atmoſphere has acceſs to that part of the ſoil in which they lie. By the above agents the bulk of the ſeed is increaſed, and its vital principle ſtimulated. The integuments burſt, and the radicle, or young root, protrudes, which being moſt ſuſceptible of the ſtimulus of moiſture, for that reaſon (as Dr. Darwin ingeniouſly judged,) elongates itſelf in the direction where it meets with this ſtimulus, increaſing chiefly at the extremity, and deſcending into the earth. It is a well-known fact that the radicle takes this direction, in whatever poſition the ſeed may happen to lie. Dr. Darwin's ſeems to us the beſt explanation of this curious law of the vegetable conſtitution, and preferable to any one founded on principles of mechanics or of gravitation. Accordingly, the rudiments of the young plant, conſiſting of the cotyledons and plumula or bud, being moſt ſtimulated by air, raiſe themſelves out of the ground, entirely for the moſt part, in purſuit of it. If ſome few cotyledons do remain and wither under ground, it is only becauſe they have already met with a ſufficiency of air or oxygen to anſwer their deſtination. See Cotyledones.

During the proceſs of incipient germination, the immediately neceſſary ſupplies of nouriſhment, till the young root can derive any from the ſoil, are furniſhed by the *albumen*, a ſubſtance either conſtituting a ſeparate body of itſelf, as in graſſes, corn, palms, &c., which, from a hard, dry, and taſteleſs maſs, changes, by the action of water and oxygen, into a milky or ſaccharine fluid, witneſs the operation of malting; or the ſame ſubſtance is lodged in, or united with, the bulk of the cotyledons, as in the leguminous tribe. If the *albumen* happens to ſuffer chemical deterioration, by keeping or otherwiſe, the ſeed germinates more feebly, or not at all. Hence gardeners prefer old ſeeds of melons and cucumbers, as producing leſs luxuriant plants, and more fruit in proportion. We preſume the conſequences of keeping affect the chemical qualities of the albumen before the vital principle ſuffers, becauſe of the ſucceſs of recent French chemiſts, who by the copious application of oxygen reſtore their original nature. See this whole ſubject more fully detailed in the Tranſactions of the Linnæan Society, vol. 9. p. 204—217. S.

GERMISCH, in *Geography*, a town of Germany, in the biſhopric of Freyſing; 21 miles S. of Weilhaim.

GERMONIO, Anastasio, in *Biography*, was born at Sala, in Piedmont, in 1551; his education was almoſt entirely neglected till he had attained the age of manhood. Feeling, at this period, his own deficiency, he applied himſelf with ſo much diligence, that in the courſe of a few months he felt equal to engage in the ſtudy of the law. He took his degree at the univerſity of Turin, and was appointed to the profeſſorſhip of the canon-law, an office which he held, in conjunction with other poſts of honour and emolument, till his archbiſhop was created a cardinal; he then accompanied him to Rome, and acquired the eſteem of Sixtus V. and the ſucceeding pontiffs. He was appointed by Clement VIII. to aſſiſt in compiling the ſeventh book of decretals, in which were inſerted the decrees of the council of Trent, with explanations. After this he was entruſted by the dukes of Urbino and Savoy with the management of their concerns at the ſee of Rome. So high was his reputation, that two biſhoprics were offered him which he refuſed, but at length accepted of the archbiſhopric of Tarantaſia, in Savoy. He was next ſent embaſſador, by duke Charles Emanuel, to the court of Madrid, where he died in 1627. Beſides his notes on the Decretals, and other ſmaller pieces on the Digeſt and Code, he publiſhed "De Sacrorum immunitatibus Lib. tres, &c." printed at the Vatican, 1591;—"Pomeridianæ ſeſſiones in quibus Latinæ Linguæ dignitas defenditur," &c. His writings are highly eſteemed for the purity of the language and the accuracy of the reaſoning. Moreri.

GERMS, in *Geography*, a town of Auſtria; 62 miles W.N.W. of Vienna. N. lat. 48° 32′. E. long. 15°.

GERMUK, a town of Aſiatic Turkey; 45 miles W. of Diarbekir.

GERN, a town of Ruſſia, in the government of Tala; 28 miles W.S.W. of Tula.—Alſo, a town of Bavaria; 15 miles W.N.W. of Braunau.

GERNACH, a town of Germany, in the principality of Wurzburg; 5 miles W.N.W. of Geroldſhofen.

GERNOI, a fortreſs of Ruſſia, in the government of Kolivan, ſeated on the Irtiſch; 204 miles S.W. of Kolivan. N. lat. 51° 44′. E. long. 78° 14′.

GERNOIARSKOI, a fortreſs of Ruſſia, in the government of Kolivan, on the Irtiſch; 196 miles W.S.W. of Kolivan. N. lat. 52° 30′. E. long. 77° 14′.

GERNORIETZKOI, a fortreſs of Ruſſia, in the government of Kolivan, on the Irtiſch, 180 miles W.S.W. of Kolivan. N. lat. 52° 45′. E. long. 77° 14′.

GERNRODE, a town of Germany, in the principality of Anhalt Bemburg, in which was an abbey founded in 960, and richly endowed for ladies, by Gero, margrave of Luſatia, which was ſecularized in favour of the houſe of Anhalt, at the peace of Weſtphalia; 30 miles W. of Deſſau. N. lat. 51° 45′. E. long. 11° 20.

GERNSHEIM, or Gerensheim, a town of Germany given, in 1802, to the landgrave of Heſſe Darmſtadt; 81 miles E.S.E. of Mentz.

GERNYOSZEG, a town of Tranſilvania, on the river Maros; 10 miles S.W. of Kereſztur.

GEROCOMIA, of γηρω, *aged*, and κομιζω, *I cheriſh*; a term uſed by the ancients for that ſort of medicinal practice which treated of the proper regimen to be obſerved in old age.

GERODA, in *Geography*, a town of Germany, in the territory of Eichsfeld, with a rich Benedictine abbey; eight miles N.E. of Duderſtadt.

GERODOT, a town of France, in the department of the Aube; nine miles E. of Troyes.

GEROLDSHOFEN, a town of Germany, in the biſhopric of Wurzburg; 20 miles N.E. of Wurzburg.

GEROLDSTEIN, a town of Germany, in the county of Katzenelnbogen; ſeven miles S. of Naſtede.

GEROLSTEIN, a town of France, in the department of the Sarre, and chief place of a canton, in the diſtrict of Prum; 24 miles N. of Treves. The place contains 350, and the canton 2892 inhabitants, in 29 communes. N. lat. 50° 16′. E. long. 6° 38′.

GERON Point, a cape of Ireland, in the county of Antrim, on the eaſt coaſt. W. long. 5° 50′. N. lat. 55° 3′.

GERONA, or Gironne, Lat. *Gerunda*, a town of Spain, in the province of Catalonia, the ſee of a biſhop, ſuffragan of Tarragona. This is a fortified town, of nearly a triangular form, ſituated on the ſide and at the foot of a ſteep mountain; the river Tar runs through it. The ſtreets are narrow and crowded, but the houſes are tolerably well built. It has ſeveral churches and convents; and its population amounts to about 14,000 perſons, a fourth of which number conſiſts of prieſts, monks and nuns, ſcholars and ſtudents. Several provincial councils have been held in this place, one in 517, another in 1068, &c. The trade of this town is inconſiderable, and its only manufactories conſiſt of a few looms for ſtockings, coarſe cloths, and woollen and cotton ſtuffs. The cathedral and collegiate churches are the two moſt remarkable edifices in Gironne. The treaſury of the cathedral is richly furniſhed with chalices, croſſes, ſhrines, relics, &c. of gold and ſilver ſet with jewels. In the Capuchin convent there is an Arabian bath, conſtructed in the moſt elegant ſtyle, and conſiſting of columns ſtanding on an octagon ſtylobate, or low-baſe, encircling a reſervoir to contain water. The univerſity of Gironne, founded in 1521 by Philip II., was aboliſhed in 1715 by Philip V. After the ſuppreſſion of the Jeſuits, public inſtruction was concentrated in one college, accommodating 900 ſtudents, who are taught the Latin grammar, rhetoric, philoſophy, and theology. The library is ſelect and extenſive. Schools are kept by the community of the Beguine nuns for the gratuitous inſtruction of poor girls; 47 miles N.E. of Barcelona. N. lat. 42° 10′. E. long. 2° 35′.

GERONIMO, St., a town of Mexico, in New Biſcay; 90 miles N. of Parral.

GERONTE, a ſmall iſland in the Mediterranean, near the coaſt of Natolia. N. lat. 36° 20′. E. long. 30° 4′.

GERONTES, in *Antiquity*, a kind of judges, or magiſtrates, in ancient Sparta, anſwering to what the Areopagites were at Athens. See Areopagus.

The word is formed of Greek, γερων, which ſignifies *old man*. Whence alſo the words *gerontic*, ſomething belonging to an old man; and *geronicon*, a famous book among the modern Greeks, containing the lives of the ancient monks.

The ſenate of gerontes were called *geruſia*, that is, aſſembly or council of old men.

The gerontes were originally inſtituted by Lycurgus: their number, according to ſome, was twenty-eight; and, according to others, thirty-two. They governed in conjunction with the king, whoſe authority they were intended to balance, and to watch over the intereſts of the people. Polybius defines their office in few words, when he ſays, "per ipſos, et cum ipſis omnia adminiſtrati." None were to be admitted into this office under ſixty years of age, and they held it for life. They were ſucceeded by the Ephori.

GERONTESSA, in *Geography*, a ſmall iſland in the gulf of Engia; four miles ſouth of Engia.

GERONTOXON, in *Surgery*, a little ulcer, ſhaped like the head of a dart, and making its appearance occaſionally on the cornea of old perſons. The term is derived from γερων, *an old perſon*, and τοξον, *a dart*.

GEROPOGON, in *Botany*, from γερων, *an old man*, and πωγων, *a beard*, alluding to the long hoary down of the ſeed. Linn. Gen. 398. Schreb. 525. Willd. Sp. Pl. v. 3. 1491. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 3. 110. Juſſ. 170. Lamarck. Illuſtr. t. 646. Gærtn. t. 160.—Claſs and order, *Syngeneſia Polygamia-æqualis*. Nat. Ord. *Compoſitæ Semifloſculoſæ*, Linn. *Cichoraceæ*, Juſſ.

Gen. Ch. *Common calyx* ſimple, of numerous upright, lanceolate, ſomewhat awl-ſhaped, keeled leaves, longer than the corolla. *Cor.* compound, ſomewhat imbricated, uniform; each floret hermaphrodite, with a corolla of one petal, ligulate, abrupt, five-toothed; the outer ones equal in number to the calyx-leaves, inner ones fewer and ſhorter. *Stam.* Filaments five, very ſhort; anthers united into a cylindrical tube. *Piſt.* Germen oblong; ſtyle thread-ſhaped, the length of the ſtamens; ſtigmas two, thread-ſhaped, recurved. *Peric.* none, except the permanent, oblong, upright, gaping calyx. *Seeds* of the circumference awl-ſhaped, as long as the calyx; their crown ſtalked, of five ſpreading rough briſtles: thoſe of the diſk awl-ſhaped, but ſhorter, their crown feathery. *Recept.* naked.

Eſſ. Ch. Receptacle naked. Calyx ſimple, of many leaves. Seeds of the diſk with a feathery crown; thoſe of the circumference with one of five naked rays.

Obſ. Linnæus originally deſcribed the receptacle as naked, which is confirmed by Gærtner, Willdenow, and Jacquin. Afterwards he attributed chaffy ſcales to this part, which is adopted by Schreber, but, as we believe, without foundation. Jacquin, in conſideration of the etymology, properly makes this genus, as well as *Tragopogon* and *Andropogon*, of the maſculine gender.

Two certain ſpecies of *Geropogon* only are known. They have the cloſeſt natural affinity to *Tragopogon*, but differ in the briſtly, not feathery, crown of their external row of ſeeds. The genus is merely artificial, as not at all ſupported by habit, nor is the difference in the crown of the ſeeds greater than what occurs amongſt indubitable ſpecies of one genus in others of this natural order.

1. G. *glaber*. Linn. Sp. Pl. 1109. Jacq. Hort. Vind. v. 1. t. 33.—"Leaves ſmooth."—Native of Italy and the Levant, ſometimes kept in botanic gardens for curioſity only. It is annual, with a branched *ſtem*, 12 or 18 inches high, clothed with many alternate, claſping, long, graſſy, ſmooth *leaves*, each branch terminated by a ſmall, inconſpicuous, pale pink *flower*, like the pink hawkweed, but far leſs handſome. The *ſeeds* are larger and more remarkable. The *herb* abounds with milky bitteriſh juice. Nothing can be more cloſely allied than this plant to *Tragopogon porrifolius* of Linnæus: ſee Engl. Bot. t. 638.

2. G. *hirſutus*. Linn. Sp. Pl. 1109. (Tragopogon gramineo folio, ſuaverubente flore; Column. Ecphr. t. 231.)—"Leaves hairy."—Found by Columna, who alone of all botaniſts ſeems actually to have ſeen this ſpecies in a wood of wild pear-trees near Cirinola in Italy, flowering in May. It appears to differ from the preceding, chiefly in the roughneſs of its *leaves*, which nevertheleſs is ſo preciſely and forcibly indicated by Columna, that we dare not preſume it not to be a ſufficient diſtinction. All authors have adopted this plant from Columna, nor had Linnæus a ſpecimen.

A third ſpecies occurs in recent writers, G. *calyculatus*; Linn. Syſt. Veg. ed. 13. 592. (Tragopogon calyculatus; Jacq. Hort. Vind. v. 2. 48. t. 106.) This was received by Jacquin from Italy, and he ſent a ſpecimen to Linnæus, who referred it to *Geropogon*. The habit is that of a *Scorzonera*. *Root* perennial. *Flower-ſtalk*, *calyx*, and upper *leaves* hairy. *Calyx* of a double row of ſcales, ſhorter than the *corolla*, which is yellow. Crown of the *ſeed* ſlightly hairy, and, as far as we can perceive, uniform.—This is certainly no genuine *Geropogon*, and we are convinced it is the identical *Scorzonera hirſuta* of Linnæus, well figured in Columna's Ecphraſis, t. 233, though unfortunately we cannot prove it to demonſtration, there being no ſpecimen of the latter in the Linnæan herbarium. The plant in queſtion is however the *Geropogon hirſutus* of Allioni, Fl. Pedem. v. 1. 229, as his ſynonyms ſhew, though he took it to be annual. S.

GERRARD, in *Geography*, a county of Kentucky, in America, containing 6083 inhabitants, of whom 1234 are ſlaves.

GERRARDS, Peter van Zyl, in *Biography*, a painter, born at Amſterdam in 1607. He came to England and lived in the ſame houſe with Vandyke on terms of friendſhip and intimacy. He ſtudied his manner ſucceſsfully, and on his return to Amſterdam was ſo highly thought of, as to bear the name of the ſecond Vandyke.

GERRES, Geruli, or *Giroli*, in *Ichthyology*, names given by the Venetians to a fiſh common in that part of the world. It is the ſmaris, or mæna alba of authors. Artedi very judiciouſly makes it a ſpecies of the ſparus, and diſtinguiſhes it from others, by its having a black ſpot on each ſide, and the pectoral and tail-fins red.

GERRHA, Γεῤῥα, among the Greeks, wicker hurdles, reſembling the Roman *vineæ*, which the Romans held over their heads to ſhelter themſelves.

GERRHÆ, or Gerrhi, in *Ancient Geography*, a people of Scythia, in Europe, S. of the Danube.—Alſo, a people of Aſiatic Sarmatia, not far from the Caſpian ſea.

GERRHUS, a river of Sarmatia, which runs into the Palus Mæotides.—Alſo, a river of Aſia, in Albania.

GERRI, in *Geography*, a town of Spain, in Catalonia; 27 miles N. of Balanguer.—Alſo, a town of Africa, in Nubia, ſituated on the Nile; containing about 140 houſes; 150 miles N.N.E. of Sennaar. N. lat. 16° 15'. E. long. 33°

GERRISH, a ſmall iſland, near cape Neddock, cloſe to the main land of the diſtrict of Maine, in America.

GERRY, a townſhip of America, in the ſtate of the Maſſachuſetts, and county of Worceſter; incorporated in 1786, and containing 14,000 acres of land, in which are 802 inhabitants; 30 miles N.W. of Worceſter.

GERS, a river of France, which riſes near La Barthe de Neſtes, in the department of the Upper Pyrenées, traverſes the department of the Gers, and runs into the Garonne, about three miles S.E. of Agen.

Gers, one of the nine departments of the ſouth-weſt, or Garonne region of France, bounded on the N. by the department of the Landes and the Lot and Garonne, on the E. by the department of the Upper Garonne, on the S. by the departments of the Upper and Lower Pyrenées, and on the W. by the department of Landes. This department is compoſed of Condommois, Armagnac, and Comminges, and takes its name from the river which croſſes it from ſouth to north. Its capital is Auch. It is ſituated in N. lat. 43° 40′; its territorial extent is 7,047$\frac{1}{2}$ kiliometres, or about 339 ſquare leagues, and the number of its inhabitants is eſtimated at 291,845. It is divided into five diſtricts, *viz.* Condour, containing 67,103 inhabitants, Lectoune, with 57,445, Auch, having 52,825, Lombes, with 37,393, and Mirande, with 77,079 inhabitants. The number of its cantons is 30, and of its communes 700. The total of its contributions, perſonal, ſumptuary, and on moveables and immoveables, &c. is 2,663,310 francs, and the expence of adminiſtration, juſtice, and public inſtruction, is 278,498 francs. The ſoil of this hilly department is indifferently fertile, yielding moderate crops of grain, wine, fruits, and good paſtures.

GERSA, or Gairsa, an iſland of Scotland, five miles E. of Enhallow, two S. of Weir, and one E. of Mainland, is two miles long and one broad, and contains 50 inhabitants. The greateſt part conſiſts of a conical hill; ſteep on the W. ſide, and towards the E. more plain and fertile. The only harbour is that of Millburn on the E. coaſt. See Gairsa.

GERSAU, or Gerisau, a village or town of Switzerland, at the foot of the Rigi, and the ſmalleſt republic in Europe. Its territory is about a league in breadth, and two leagues in length; ſituated partly on a ſmall neck of land at the edge of the lake of Schweitz, and partly lying upon the rapid declivity of the Rigi. It contains about 1200 inhabitants, having their general aſſembly of burgeſſes, their landamman, their council of regency, their courts of juſtice, and their militia. In the whole republic there is not a ſingle horſe; and the only way of arriving at the town is by water, excepting a narrow path down the ſteep ſides of the mountain, which is almoſt impaſſable. Geriſau is entirely compoſed of ſcattered houſes and cottages of a very neat and pictureſque appearance; each dwelling is provided with a field or ſmall garden. The inhabitants are much employed in preparing ſilk for the manufactures of Baſle. This little republic is under the protection of the four cantons, Lucern, Uri, Schweitz, and Underwalden; and in caſe of war furniſhes its quota of men. The town is ſix miles diſtant S.W. from Schweitz. N. lat. 46° 55′. E. long. 8° 20′.

GERSCHITZ, a town of Bohemia, in the circle of Konigingratz; nine miles N.W. of Konigingratz.

GERSCHNITZ, a town of Germany, in the principality of Bayreuth; ſix miles E. of Bayreuth.

GERSDORF, a town of Germany, in the principality of Querfurt; four miles N.E. of Juterbock.

GERSON, in *Biography*, chancellor of the church and univerſity of Paris at the beginning of the fifteenth century; according to whom the ground-work of all diſcant was the plain-chant; and in his treatiſe upon the education of children for the choir of Notre Dame, he enjoins a particular attention to chanting, counterpoint, and diſcant, as the three moſt eſſential branches of their inſtruction and ſtudy. (Magiſter cantûs ſtatutis horis doceat pueros planum cantum principaliter, et contrapunctum, et aliquos diſcantus honeſtos—decent and ſober melodies.) He likewiſe tells us, that in this cathedral, during his time, the choiriſters were only allowed, by the ſtatutes, to practiſe diſcant till their voices broke. (Nec faciat eos tantùm inſiſtere in talibus, quod perdant in grammatica profectum; attento maximè quod in eccleſia noſtra diſcantus non eſt in uſu, ſed per ſtatuta porhibitus, ſaltem quoad voces quæ mutatæ dicuntur). The Abbé Lebeuf underſtands theſe laſt words as we have tranſlated them: (Le déchant n'étoit point en uſage dans l'egliſe de Paris, et qu'au contraire il étoit défendu par les ſtatuts, au moins á l'égard des voix qui avoient paſſé le tems de la mutation. Traité Hiſt. ſur le Chant. Eccles. p. 92.) The indefatigable Abbé Lebeuf found in the king of France's library the ſtatutes here alluded to, which had been framed in the 13th century, and from which the chancellor had been ordered to make extracts in 1408. He concludes the fourth article of his tract, which relates to pſalmody, by informing us that no written diſcant was allowed in church miſſals or graduals, except for the exerciſe and improvement of the ſinging boys. (Nec debet in cantu notulato regulariter immiſceri diſcantus, pueris exceptis propter exercitationem ſuam. Gerſon, tom. iv. ultimæ edit. p. 717.)

GERSPACH, in *Geography*, a town of Germany, in the county of Eberſtein, on the Murg; taken by the French in 1794; three miles S.E. of Baden. N. lat. 48° 48′. E. long. 8° 20′.

GERSPRINTZ, a town of Germany, in the county of Erbach; ſeven miles N.W. of Erbach.

GERSTEN, Christian Louis, in *Biography*, was born at Gieſſen in 1701: here he was educated, and in the year 1733 he was appointed profeſſor of mathematics and the mechanical ſciences in that city. On account of ſome diſpute he was diſmiſſed from his office, and left Gieſſen in 1744; he went firſt to Altona, and from thence to Peterſburgh; but meeting with no encouragement, he returned and attempted to get reinſtated in his office, but failing in his deſign, he inſulted the landgrave, was arreſted at Franckfort in 1748, and doomed to perpetual impriſonment in the caſtle of Marburg, with an annual allowance of 200 florins. Here he employed himſelf in teaching the mathematics to thoſe young perſons who came to his priſon for inſtruction, and his leiſure moments were occupied in ſtudying the phenomena of the atmoſphere, and the changes which take place in it, ſo as to become very expert in the ſcience of meteorology. In the year 1760 he was liberated from his confinement, but his freedom was not complete; he was admitted at large for a time by way of proving whether he was entitled to a general diſcharge: eſcaping however from his ſhackles he went privately to Franckfort, where he kept himſelf concealed, or at leaſt quiet, till he died in 1762. His works were numerous, and written in the Latin language: they chiefly relate to meteorology, to the methods of calculating eclipſes, and to the ſtructure of aſtronomical inſtruments. He was eſteemed by his contemporaries for his integrity and his learning. He ſent ſome papers to the Royal Society of London, of which ſeveral were inſerted in the volumes of their Tranſactions. Moreri.

GERSTUNGEN, in *Geography*, a town of Germany, in the principality of Eiſenach, on the Werra; 8 miles W. of Eiſenach.

GERSWALDE, a town of Germany, in the Ucker Mark of Brandenburg; 9 miles S. of Prenzlaw.

GERTHAUSEN, a town of Germany, in the county of Henneberg; 10 miles W. of Meinungen.

GERTRUDENBERG, a town of Germany, in the biſhopric of Oſnabruck; 1 mile E. of Oſnabruck.

GERTRUYDENBERG, St., a town of Brabant, but in later times ſubject to Holland, with a good harbour, formed by the Merwe, which here extends to a conſiderable lake, called "Bies Boſch," over which is a paſſage of two hours to Dort. It is built in the form of a creſcent, with regular fortifications, good baſtions, and forts with ſluices: by means of which they can lay the adjacent country under water. In ancient charters it is called "Mons Littoris," the mountain of the ſhore. In 647, Pepin de Landen, duke of Brabant, gave it to his daughter Gertrude, who built a church dedicated to St. Amand, biſhop of Tongres; but the place afterwards becoming celebrated by the death and pretended miracles of Ste. Gertrude, it has ſince been called "Mont de Ste. Gertrude," or Gertrudenberg. The caſtle was built in 1321. After paſſing through many viciſſitudes, it was ſummoned by the French in February 1793, and taken; but ſoon after evacuated. The French took it again in 1795. It is diſtant 10 miles S.E. of Dort, and 7 N.E. of Breda. N. lat. 51° 40′. E. long. 4° 44′.

GERTZ, a town of Germany, in the principality of Wurzburg; 5 miles W.S.W. of Munerſtat.

GERVAIS, Armand Francis, in *Biography*, was born at Paris about the year 1660: he was educated with the Jeſuits, and at fifteen years of age he entered among the bare-footed Carmelites. At the age of twenty-two he was appointed by his ſuperiors to teach theology to the younger members of the order; and he was at the ſame time diſtinguiſhed as a pulpit orator. Some years after this he withdrew into the monaſtery of La Trappe, where he ſucceſſively filled very important offices belonging to that order. The changes which he introduced, and the reforms which he meditated, created an alarm; and in 1698 he reſigned his offices, and quitted his reſidence in the monaſtery. From this period he wandered about, from ſolitude to ſolitude, following the ſame aſcetic courſe of life which he had been in the habit of practiſing in the college. Having, in 1745, publiſhed the firſt volume of an intereſting "General Hiſtory of the Ciſtercian Order in France," in which was a ſevere attack upon the Bernardins, he was arreſted and impriſoned in the abbey of Notre Dame des Reclus, in the dioceſe of Troyes, where he died in 1751, at the age of ninety-one. He publiſhed, beſides the work alluded to, "The Life of St. Cyprian," with an abridgment of his works, including notes and diſſertations: "The Lives of Peter Abelard and of his wife Heloiſe;" "The Hiſtory of Suger, Abbot of St. Denys," in three volumes, 12mo. "The Life of St. Irenæus," in two vols. 12mo. Alſo lives of St. Paul, Epiphanius, Ruffinus, and other eminent perſons. He was diſtinguiſhed as a controverſialiſt, and was the opponent of Father Courayer on the ſubject of Engliſh ordinations. He is characterized as a man of great learning and ſingular virtues, but his manners were auſtere, impetuous, and forbidding. Moreri.

Gervais, *St.* in *Geography*, a town of France, in the department of the Puy de Dôme, and chief place of a canton, in the diſtrict of Riom; 15 miles N. W. of Riom. The place contains 2180, and the canton 9204 inhabitants, on a territory of 282½ kiliometres, in 11 communes.

Gervais-*de-Maſſey*, *St.* a town of France, in the department of the Orne, and chief place of a canton, in the diſtrict of Domfront; 9 miles N. N. E. of Domfront. The place contains 1068, and the canton 17,228 inhabitants, on a territory of 132½ kiliometres, in 14 communes.

Gervais-*la-Ville*, *St.* a town of France, in the department of Herault, and chief place of a canton, in the diſtrict of Beziers. The place contains 1263, and the canton 8641 inhabitants, on a territory of 137½ kiliometres, in 10 communes.

GERVASE of Tilbury, in *Biography*, an hiſtorian of the thirteenth century, a native of Tilbury, in Eſſex, and nephew to king Henry II. He was, through the intereſt of Otho IV. made marſhal of the kingdom of Arles. He wrote a commentary on Geoffrey of Monmouth's Britiſh Hiſtory, and alſo a tripartite Hiſtory of England. His other works are "A Hiſtory of the Holy Land;" "Origenes Burgundionum;" "Mirabilia Orbis," and a Chronicle; entitled "Imperialium Otiorum." The compilation of the exchequer book, entitled "Liber Niger Scaccarii," was aſcribed to him; but Mr. Madox, who publiſhed a correct edition of it, gives it to Richard Nelſon, biſhop of London. Moreri. Gen. Biog.

GERVASIO Gatti, the nephew of Bernardo; was alſo a painter of conſiderable merit in the ſame ſtyle of colouring, as is evident in a picture of St. Sebaſtian, in the church of St. Agatha at Cremona, where it is united to the deſign of the antique; and alſo in the Martyrdom of St. Cecilia, at St. Pietro, in the ſame city.

GERVASO, St. in *Geography*, a town of Italy, in the department of the Mela; 15 miles S. of Breſcia.

GERUMA, in *Botany*, barbarouſly corrupted by Forſkall from an Arabic name *Djerrum*. Forſk. Ægyptiaco-Arab. 62. Juſſ. 264. Lamarck. Dict. v. 2. 702.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. "*Meliæ*, or perhaps *Malvaceæ*," Juſſ.—"*Rhamni?*" Lamarck.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, flat, five-toothed, ſmall, green, permanent. *Cor.* Petals five, lanceolate, abrupt, ſpreading, thrice as long as the calyx, white. Nectary, a thick ring ſurrounding the germen, bearing the ſtamens on its outer edge. *Stam.* Filaments five, erect, half the length of the corolla; anthers erect, triangular. *Piſt.* Germen globoſe, deeply immerſed in the nectary; ſtyle thread-ſhaped, ſmall; ſtigmas three, widely ſpreading, red, wedge-ſhaped, emarginate at the extremity. *Peric.* Capſule ſuperior, oval, of four, or perhaps five, cells, and as many valves. *Seeds*, two in each cell, oval, inſerted into a triangular white pulp; one of them often abortive.

Eſſ. Ch. Calyx with five teeth. Petals five, abrupt. Nectary, a ring round the germen. Stigmas three, emarginate. Capſule ſuperior, ovate, of four or five cells. Seeds two, affixed to a pulpy receptacle.

1. G. *alba*. Leaves alternate, oval-oblong, ſomewhat ſerrated.

This is all that can be gathered from Forſkall's account, and it forms a botanical enigma. Some circumſtances indicate an affinity to Juſſieu's *Euphorbiæ*. The accounts of the ſtigmas and of the fruit are the moſt remarkable. Nothing is ſaid of the habit, duration, or ſenſible qualities.

GERUND, in *Grammar*, a ſort of tenſe, or time, of the infinitive mood: very like to the participle, but indeclinable.

The word is formed of the Latin *gerundivus*; and that from the verb *gerere*, *to bear*.

The gerund expreſſes not only the time, but alſo the manner of an action; as, he fell in running poſt.

It differs from the participle, in that it expreſſes the time, which the participle does not. And from the tenſe properly ſo called, in that it expreſſes the manner, which the tenſe does not.

Grammarians are much embarraſſed to ſettle the nature and character of the gerunds: it is certain they are no verbs, becauſe they do not mark any judgment or affirmation of the mind, which is ſuppoſed to be the eſſence of a verb: and beſides, they have their ſeveral caſes, which verbs have not.

Some, therefore, will have them to be adjectives paſſive, whoſe ſubſtantive is the infinitive of the verb: on this footing they denominate them verbal nouns, or names formed of verbs, and retaining the ordinary regimen thereof.

Thus, ſay they, *tempus eſt legendi libros*, or *librorum*, is as much as to ſay, *tempus eſt τὸ legere libros*, vel *librorum*. But others diſpute this deciſion.

The Greeks have neither gerunds nor ſupines; but inſtead of them they make uſe of the infinitive, in the ſame manner as the French; πρὸς τὸ πιεῖν, *pour boire*. When the article happens to be made uſe of, then its genitive is put for the gerund in *di*, as τοῦ ποιῆσαι, *faciendi*, of doing; the dative or ablative τῷ is put for the gerund in *do*; and the neuter for the gerund in *dum*. But the infinitive in this ſenſe is often expreſſed without the article, as Ἄριστος ἀκοντίζειν, *jaculandi peritus*, an excellent archer; Δῶκε φέρειν, *ferendum dedit*, he gave it to carry. In Greek, however, the termination τέον correſponds to the Latin gerunds; thus, from λέγω, to ſay, is deduced λεκτέον, *dicendum*, it muſt be ſaid. Theſe verbal adjectives, as they may be called, ſometimes denominated gerunds, are uſed occaſionally either in an active or a paſſive ſenſe; την γην θεραπευτεον, it is for thee to cultivate the ground: τη γνωμη ὑπηρετειν ἐθιστεον το σωμα, και γυμναστεον συν πονοις και ἱδρωτι, the body ſhould be accuſtomed to obey the underſtanding, and be diſciplined with toils and ſweat. Xenophon.

An ingenious grammarian obſerves, that the Latin gerunds in *di*, *do*, and *dum*, are but the participle in *dus* in the oblique caſes; and as this is taken from the preſent participle, they have its ſenſe, namely, an *active* ſenſe. On the ſame principle that participles expreſs *powers* or *habits* in action, and their tendency is to ſignify thoſe powers, and not their *operation*, *i. e.* to become abſtract nouns; the oblique caſes of the participle in *dus*, when alone, become in their nature abſtract nouns. Hence gerunds, being thus nouns in reality, are governed like other nouns in the genitive, dative, accuſative, and ablative, either with or without a prepoſition; as *ratio ſcribendi*, the art of writing; *charta utilis ſcribendo*, paper is uſeful for writing; *promptus ad audiendum*, ready for hearing, or to hear; *memoria excolendo augetur*, the memory is increaſed by cultivating. Gerunds alſo, having the nature of nouns, may govern a genitive; as *facultas agrorum ſuis latronibus condonandi*, the power of the beſtowing of his lands on his thieves. The gerunds, however, as retaining in a degree their verbal character, govern the caſe of their reſpective verbs, as *viſendi domum poteſtas*, *venit ad recipiendum pecunias*, *parcendo victis*. As adjectives aſſume the nature of nouns when uſed alone in the neuter termination, ſo the gerunds in *dum*, the neuter of participles in *dus*, become ſubſtantives, denoting, with *eſt*, neceſſity or obligation, as *vivendum eſt mihi recte*, living well muſt be to me, or I muſt live well. Jones's Grammar of the Latin Tongue, 1800.

GERY, St. in *Geography*, a town of France, in the department of the Lot, and chief place of a canton, in the diſtrict of Cahors, 5 miles N. W. of Cahors. The place contains 1250, and the canton 6035 inhabitants, on a territory of 180 kiliometres, in 9 communes.

GERYON, a name given by ſome of the affected chemical writers to quickſilver.

GERZAT, in *Geography*, a town of France, in the department of the Puy de Dôme; 4 miles N. E. of Clermont.

GERZEN, a town of Bavaria; 11 miles E. of Landſhut.

GESAN, a town of the Arabian Irak; 8 miles S. E. of Mendali.

GESAS, a town of Sileſia, in the principality of Neiſſe; 3 miles S. E. of Patſchau.

GESEKE, a town of Germany, in the kingdom of Weſtphalia; 9 miles E. S. E. of Lipſtadt.

GESERICH, a lake of Pruſſia, in Oberland, near Dutch Eylau.

GESERVAGHERD, a town of Perſia, in Choraſan; 30 miles S. of Esfenan.

GESHEN, *Rocks and rivers of*. See AMHARA.

GESHURITES, in *Scripture Geography*, a people who dwelt beyond Jordan, in the half tribe of Manaſſeh.

GESIS, in *Geography*, a town of Germany, in the county of Feldkirch; 4 miles E. of Feldkirch.

GESKENDORF, a town of Pruſſia, in Oberland; 7 miles S. S. E. of Salfeldt.

GESMOLD, a town of Germany, in the biſhopric of Oſnabruck; 12 miles S. E. of Vorden.

GESNER, CONRAD, in *Biography*, "the greateſt naturaliſt the world had ſeen ſince Ariſtotle," the firſt who ever collected a muſeum of natural hiſtory, and the diſcoverer of the only true principles of botanical arrangement in the flower and fruit, "to which the very exiſtence of botany as a ſcience is owing," was born at Zurich in 1516. Like moſt of thoſe who have rendered the moſt eminent ſervices to ſcience or their fellow-creatures, he had to contend with the greateſt difficulties, eſpecially with poverty in his youth, and with a feeble and ſickly conſtitution to the day of his death. He very early imbibed an ardent love of plants from his mother's brother, named Friccius, and this ſeems to have led him to the ſtudy of animals, and even of foſſils. He was educated for the medical profeſſion, which he ſubſequently practiſed in his native town, and to the emoluments of which he was indebted for the means of purſuing and promoting, by various expenſive means, his darling ſtudies. He founded and ſupported a botanic garden; kept a painter and an engraver in wood conſtantly in his ſervice, and acquired a very extenſive library. He exerciſed the pencil himſelf with great ſucceſs, to which the excellence of the botanical cuts he has left us, with reſpect to the habit as well as fructification of plants, is owing. Many of theſe appear in the *Epitome* of Camerarius, and a large collection of the whole has been publiſhed in more recent times by Trew and Schmiedel, printed from the original blocks. Geſner undertook various laborious journeys in purſuit of plants, eſpecially on the Alps; and while he was, perhaps, the moſt learned naturaliſt of his own or any age, he rivalled the moſt experienced of his contemporaries in practical obſervation. He united to the inveſtigation of the external characters of plants, the moſt aſſiduous attention to their medical properties, and his own health and life were frequently endangered by the experiments he made for the good of others. He was reported to have killed himſelf with a doſe of two drams of the root of *Doronicum*, but though his ſtomach was at firſt debilitated, he ſpeedily recovered, and amuſed his friends with a narrative of his caſe. At length this great man fell a victim to the more immediate duties of his profeſſion, having caught the plague, of which he died on the 13th of December, 1565, aged 49. When he found his end approaching, he requeſted to be carried into his muſeum, where he expired amid the monuments of his labours, thankful for what he had been able to accompliſh, and ſupported by all the pious hopes and conſolations of a Chriſtian philoſopher. His piety and benevolence were no leſs eminent than his talents. He was the general peacemaker among ſuch of his literary acquaintances as were more iraſcible or leſs candid, and he laid aſide, for a while, his own immediate employments, to devote his ſervices to the family of a deceaſed friend, Moiban, whoſe work on Dioſcorides he ſuperviſed, and publiſhed for their emolument. He was much attached, by ſimilarity of taſte, to Valerius Cordus, who died in 1544 at Rome, on his travels, at the early age of 29, and whoſe "Hiſtoria Plantarum" was ſubſequently edited by Geſner. Theſe able botaniſts had never had a perſonal interview, and Geſner was more intimately acquainted with a young man named David Kyber, who died, at nearly the ſame age, of the plague at Straſburgh in 1553, and whoſe "Lexicon Rei Herbariæ Trilingue" (Latin, Greek, and German) he publiſhed the ſame year, with a very affectionate and conſolatory epiſtle to the father of the author.

The principal works of Conrad Geſner are the following, not to mention various little treatiſes relating to Botany, or to the Materia Medica, which from time to time came from his ready and prolific pen, ſome of them accompanying the books he edited for other people.

" Bibliotheca univerſalis," or a catalogue of Latin, Greek, and Hebrew books, printed at Zurich, 1545, in one volume folio, with criticiſms, and often ſpecimens of each. This ſeems to have given Haller the idea of his own " Bibliotheca Botanica," and " Bibl. Anatomica."

" Hiſtoriæ Animalium," compriſed in five books, making three great folio volumes in a very ſmall type, with numerous wooden cuts. The firſt was publiſhed at Zurich in 1551, the laſt in 1587, after the deceaſe of the author. There is alſo an edition in German. This is a vaſt compilation, and critical reviſal of all that had been done before him in Zoology, with every thing that he could ſay of his own knowledge to illuſtrate the ſubject, and many incidental botanical, as well as medical remarks. Inſtead of being the work of a phyſician, who raiſed and maintained himſelf by his practice, and who was cut off in the middle of a moſt active and uſeful life, one would ſuppoſe it the labour of a recluſe, ſhut up for an age in his ſtudy, and never diverted from his object by any other cares. This work is arranged according to the plan of Ariſtotle, only the oviparous quadrupeds are ſeparated from the viviparous. It does not extend to inſects or ſhells. The former however had not eſcaped the attention of Geſner, for his labours reſpecting them make a part of the work of Mouffet, entitled " Inſectorum ſive Minimorum Animalium Theatrum," publiſhed at London in 1634, the earlieſt book on entomology.

The " Icones Animalium," with their nomenclature, form a ſeparate publication from the above, conſiſting of the wooden cuts and names only.

" Aquatilium Animantium Enumeratio juxta Plinium," a little 8vo. printed at Zurich in 1556. A liſt of the German and Engliſh names is ſubjoined.

A little work in Latin, " De Lacte," treating of milk and its preparations, from various authors. Zurich, 1541, in 8vo.

" De Secretis Remediis Theſaurus;" a Pharmacopœia, which has gone through a number of editions in various languages.

" De raris et admirandis herbis, quæ ſive quod noctu luceant, ſive alias ob cauſas, Lunariæ nominantur." A curious and learned little work, with wooden cuts, in 4to. Zurich, 1555. It is accompanied with a deſcription of the celebrated mount Pilat, or *Mons Fractus*, the northern extremity of the Alps, which Geſner viſited in 1555. Several alpine plants are here, for the firſt time, noticed.

" De omni rerum Foſſilium genere." Zurich, 1565, 8vo. Alſo " De rerum Foſſilium, Lapidum et Gemmarum maxime figuris," with wooden cuts, more curious than uſeful.

The botanical remarks relative to the ſcientific arrangement of plants, on which the ſupereminent merits of this great man are founded, are chiefly to be gathered from his letters, which were publiſhed after his death. From the number of wooden cuts, and of drawings, which he had prepared, it is probable he meditated a general botanical work, the future arrangement of which frequently occupied his thoughts, and prompted many of theſe letters.

Geſner married at the early age of 20, for which he was accuſed of imprudence, but it does not appear that he had any reaſon to repent. His wife ſurvived him, and notwithſtanding the dangerous nature of his diſeaſe, which was accompanied with a peſtilential carbuncle, ſhe did not deſert his death-bed, for he expired in her arms. He left no offſpring. His remains were honourably interred, the day after his deceaſe, in the cloiſter of the great church at Zurich, near thoſe of his intimate friend, Fryſius, who died the preceding year. Abundance of Latin, and ſome Greek verſes, were compoſed to his honour, and his life, written by his countryman Joſias Simler, was publiſhed in the enſuing year. From this work, and Haller's Biblioth. Bot. much of the above information is derived. Haller mentions Geſner as probably the firſt perſon who, being ſhort-ſighted, found the advantage of concave glaſſes. S.

We have received the following additional account of C. Geſner, in relation to his medical profeſſion.

His father, who was a worker in hides, was killed in the Swiſs civil war, and left him in ſuch poverty, that he went to Straſburg, and entered into a ſituation as a ſervant. His maſter, having obſerved his great inclination to reading, allowed him to employ the time, which was not abſolutely neceſſary to his ſervice, in ſtudy; and he made ſuch progreſs while at Straſburg, that, having acquired a little money, he went to Paris, where he firſt attained an ample knowledge of the Latin and Greek languages, and of rhetoric, and afterwards applied to the ſtudy of philoſophy and medicine: but as he ſoon found the means of ſubſiſtence fail, he was under the neceſſity of returning to his native country, and of teaching the languages and philoſophy for a livelihood. This expedient was ſucceſsful, and even procured him the means of viſiting Montpellier, where he reſumed the ſtudy of medicine, which he completed, by taking the degree of doctor at Baſil in the year 1540. He then determined to ſettle at Zurich, where his merit procured him the appointment of profeſſor of philoſophy, and he diſcharged the duties of that office, with univerſal reputation and eſteem, during twenty-four years. Theſe duties, and his ſtudies in the cloſet, prevented him from entering largely into the practice of medicine; in which, however, his extenſive knowledge furniſhed him with ſuch numerous reſources, that his practice was extremely ſucceſsful, and he roſe ſuperior to the prejudices of his contemporaries. Geſner had always a decided predilection for the ſtudy of botany, which he early conceived and retained through life, as we have already mentioned in the former part of this article. It was not without great trouble and difficulty that he became a ſcientific man; for he was of a delicate and ſickly conſtitution; but his ſpirit and courage gave him ſtrength to ſupport the fatigues of body and mind. Notwithſtanding the delicacy of his habit, he traverſed the Alps in ſearch of plants; and among other journeys over thoſe mountains, he made one with Jean Bauhin in 1561. He even culled plants from the waters, and has been known to plunge into the lake of Zurich to procure thoſe which grew there. Ever animated by the ſame ſpirit, he viſited Paris again, travelled through the ſouthern provinces of France, and thence paſſed into Italy. In order to ſtudy the nature of fiſhes, he went to Venice with a view to inveſtigate thoſe of the Adriatic, and ſometime afterwards he repaired to Straſburg to examine thoſe of the Rhine. From theſe ſources of information, from a conſtant perſonal obſervation, conjoined with the ſtudy of the writings of the ancients, he obtained the means of accompliſhing that immenſity of treatiſes, which a man, who only attained to 49 years of age, could hardly be ſuppoſed capable of producing.

Gesner, John Matthias, was born at Roth, in Anſpach, in 1691, where his father was a clergyman. He received the firſt part of his education at the gymnaſium of Anſpach, and was quickly diſtinguiſhed by his progreſs in the ancient and oriental languages. From Anſpach he went to Jena, where he exhibited his learning and talents in ſeveral publications. In 1715 he was appointed co-rector of the gymnaſium of Weimar, and keeper of the public library. In 1730 he accepted of the rectorſhip of Thomas's ſchool at Leipſic, and on the eſtabliſhment of the univerſity of Gottingen he was invited to be the profeſſor of rhetoric, an office in which he was ſo greatly diſtinguiſhed, as to acquire the reputation of being the moſt able philologiſt of the age. He was at the ſame time made librarian and preſident of the German ſociety, and to his inſpection all the ſchools of Gottingen were given. On the appointment of the Royal Society at Gottingen he was the firſt member of the hiſtorical claſs, and was afterwards appointed a counſellor of ſtate, and perpetual director. He died in 1761. His works are much too numerous to be named in this place, but they were ſuch as to entitle him to almoſt the higheſt rank in the literary world. Among others may be noted his "Index etymologicus Latinitatis:" and his "Theſaurus Latinæ Linguæ et Eruditionis Romanæ," 4 vols. fol. Geſner, in this elaborate work, followed the order of Stephanus, but added ſuch notes and other improvements as appeared neceſſary. Theſe additions conſiſt chiefly in the number of remarkable phraſes and paſſages from the Roman claſſics with illuſtrations. Gen. Biog.

Gesner, Solomon, was born at Boleſlau, in Sileſia, in the year 1559. Having received the early part of his education at his native place, he was ſent to Breſlaw to purſue the ſtudies neceſſary to his future profeſſion. From this place he went to Straſburg, where he was ſo fortunate as to obtain an academic exhibition for five years, which he employed in the ſtudy of philoſophy, the mathematics, and the learned languages, as well the Hebrew, Chaldee, and Syriac, as thoſe of Greece and Rome. He now became private tutor to a noble Livonian, and when he was 24 years of age he was admitted to the degree of M. A. In 1592, he was invited to fill the theological chair in the univerſity of Wittemberg, and almoſt immediately entered upon the duties of his office, and was at the ſame time admitted to the degree of D. D. He alſo occupied the important poſts of dean and rector of the univerſity, aſſeſſor in the eccleſiaſtical conſiſtory, and firſt preacher in the church. His cloſe application to buſineſs injured his health, and he fell a ſacrifice to a complication of diſorders in 1605, when only in the 46th year of his age. His works are a Latin tranſlation of "The Prophecy of Hoſea," "Diſquiſitions on the Pſalter," treating of the dignity, the uſe, the argument, and the connection of the Pſalms, and many other works of a theological and controverſial nature. Gen. Biog.

Gesner, John, a canon of Zurich, and profeſſor of natural philoſophy and mathematics in that univerſity, probably belonged to the ſame family as the great Conrad. He was the intimate friend of Haller, in whoſe ſociety he ſtudied at Leyden and Baſle, and with whom he maintained a cloſe correſpondence during the life of that diſtinguiſhed man. Their taſte for botany was the ſame, and their characters ſimilar. His letters make an intereſting part of the "Epiſtolæ ad Hallerum," and abound with ſolid and curious botanical criticiſm and information. He paid much attention to the cryptogamic claſs, and other difficult branches of the ſcience, as well as to the anatomy and phyſiology of plants. He ſurvived his learned friend 12 years, dying in 1790, at the age of 81.

This author publiſhed two phyſiological diſſertations on plants in 1740 and 1741, reprinted at Leyden in 1743, along with Linnæus's "Oratio de peregrinatione intra patriam." In theſe he treats of the life and ſtructure of vegetables, their propagation, ſexes, elaſtic motion of ſome of their ſtamens, and their methodical claſſification. He reviews the experiments and obſervations of Leeuwenhoeck, Malpighi, Grew, Hales, &c. announces the then novel ſyſtem of Linnæus, whom, with a kind of prophetic ſpirit, he calls "a man deſtined to reform all natural hiſtory." Theſe diſſertations are the beſt and moſt compendious epitome poſſible of all the botanical ſcience of that day, in which the improvements of each writer are ſet in the moſt juſt and inſtructive point of view for their mutual illuſtration.

With all his knowledge, the ſubject of our preſent article, and even his friend Haller, were impoſed on by one of the groſſeſt deceptions. A perſon preſented him with a common meadow Crowfoot, on ſome branches of which were ſtuck flowers of the common Daiſy. He immediately publiſhed, in 1753, a learned diſſertation on vegetable monſters, entitled "de Ranunculo bellidifloro," in which he exhibits a figure of this ſtrange anomaly. As Haller had given his ſanction to the diſcovery, botaniſts could ſcarcely ſuppoſe it was an evident miſtake, till ſir Joſeph Banks obtained the original ſpecimen after Geſner's death. On its being ſoftened with boiling water, in the preſence of ſeveral botaniſts, amongſt whom was the writer of this, the ſtem of the *Ranunculus* came out of the baſe of the daiſy, as from a ſheath; and indeed the different pubeſcence of each was very diſtinguiſhable before their ſeparation. A hiſtory of the whole is given by Mr. Konig, in his Annals of Botany, v. i. 368, with a plate drawn for ſir Joſeph Banks by Mr. Bauer, and ſigned by all the witneſſes.

Geſner publiſhed at different times eleven diſſertations in quarto, from 1759 to 1773, under the general title of "Phytographia Sacra." Some of the latter only are illuſtrative of the plants of ſcripture, the reſt being of a general nature, containing various anatomical and phyſiological, as well as botanical and economical matter. He adopts the Linnæan ſyſtem, and furniſhes many remarks confirming the ſexual doctrine.

He meditated a very extenſive work on the characters of plants, for which he had prepared a conſiderable number of exquiſitely engraved, though too much crowded, plates, ſome of which are in our hands; but this publication never took place.

He wrote alſo on extraneous foſſils, and compoſed an index to Weinmann's *Phytographia*, printed in 1787 in 8vo. A catalogue of his library for ſale was publiſhed in 1798, by which it appears to have been one of the beſt collections of botanical books ever offered to the public. S.

GESNERIA, in *Botany*, named by Plumier in memory of the great Conrad Geſner; ſee that article. Linn. Gen. 308. Schreb. 404. Willd. Sp. Pl. v. 3. 230. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 331. Juſſ. 165. Plum. Gen. 27. t. 9. Lamarck Illuſtr. t. 536. Gærtn. t. 177.—Claſs and order, *Didynamia Angioſpermia*. Nat. Ord. *Perſonatæ*, Linn. *Campanulaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, ſuperior, in five deep, acute ſegments, permanent. *Cor.* of one petal, incurved and recurved; tube thickiſh, with a contraction at the neck and a funnel-ſhaped throat; limb five-cleft, obtuſe; its upper ſegments concave, or erect, the three lower flat and ſpreading. *Stam.* Filaments four, moſtly ſhorter than the corolla, two longer than the others; anthers arrow-ſhaped, ſimple. *Piſt.* Germen inferior, depreſſed, roundiſh; ſtyle thread-ſhaped, parallel to the ſtamens; ſtigma capitate. *Peric.* Capſule roundiſh, crowned with the ſpreading calyx, imperfectly two-celled, the partition being longitudinally interrupted in the middle. *Seeds* very numerous, minute. *Receptacles* attached to the partition at each ſide.

Eſſ. Ch. Calyx five-cleft, crowning the germen. Corolla incurved and recurved. Capſule inferior, imperfectly two-celled. Seeds numerous.

Obſ. We prefer, with Linnæus, the name *Geſneria* to *Geſnera*, as the moſt correct in its conſtruction, and ſupported by the beſt analogies, though Plumier originally wrote the latter. In ſuch caſes it is needleſs to burthen the reader with preciſe quotations, and we merely adopt the orthography that appears the beſt, except there be any difference worth commemorating.

Linnæus has given but three ſpecies of this genus, to which Swartz has added ſeven new ones, beſides the Linnæan *Craniolaria fruticoſa*, in his Prodromus Fl. Ind. Occ. where he alſo made the *Cyrilla* of L'Heritier a *Geſneria;* ſee Cyrilla. But in his Fl. Ind. Occ. 1032 he ſubmits to the opinion of thoſe who reckon it diſtinct. All the *Geſneriæ* are of Weſt Indian origin, and very little known in Europe, except the *tomentoſa*, kept in botanic gardens for its rarity rather than beauty. Several of the ſpecies firſt deſcribed by Swartz are eminently handſome, and well deſerve to be introduced into our ſtoves, eſpecially his *ventricoſa*, which bears tubular curved ſcarlet flowers, with projecting ſtamens, like ſome of the fineſt *Ericæ*. All the ſpecies are ſhrubby, except *G. pumila* of Swartz, whoſe leaves reſemble a *Primula* or *Ajuga*, and *G. acaulis* of Linnæus, Sp. Pl. 850. (Rapunculo affinis, &c. Sloane Jam. v. 1. t. 102. f. 1.) both which are herbaceous, and ſcarcely riſe above the ground. The *leaves* in all are ſimple, alternate, moſtly ſtalked, more or leſs crenate, toothed, or ſerrated, rough or ſmooth. *Flowers* corymboſe, moſtly on a long common ſtalk. *Corolla* variouſly ſhaped in different ſpecies, but always more or leſs curved, from above one to two inches long. They chiefly grow in rocky, ſhady, mountainous places in Jamaica, or in Hiſpaniola. Full deſcriptions of all that Dr. Swartz has obſerved may be found in his Fl. Ind. Occ. v. 2. 1015—1031.

GESORIACUM, in *Ancient Geography*, a town of Gaul, belonging to the Morini; now *Boulogne*.

GESSENE, in *Geography*, a town of Bohemia, in the circle of Boleſlau; nine miles N. E. of Turnau.

GESSERIT, Quamdiu. See Quamdiu *ſe bene geſſerit*.

GESSES is the furniture belonging to a hawk. See Jesses.

GESSI, Francesco, in *Biography*, a favourite diſciple and imitator of Guido Rheni in the art of painting, ſome of whoſe works are little inferior to thoſe of his maſter, and are often ſold for his. He is generally known by a want of fulneſs of execution, and of energy in his actions.

GESSIGO Point, in *Geography*, a cape of Ireland, in the county of Sligo, at the northern extremity of Sligo bay. N. lat. 54° 22′. W. long. 8° 33′.

GESSO, a town of Naples, in Abruzzo Citra; 15 miles N. E. of Civita Borella.

GESSOPS, a town of the ſtate of Maryland, in America; eight miles E. S. E. of Fort William.

GESSOR, a name uſed by ſome of the Arabian writers for galbanum.

GESTA, in *Geography*, a town of Sweden, in Weſt Gothland; 23 miles N. E. of Uddevalla.

GESTATION, Uterine, or *utero-geſtation*, in *Midwifery*, the bearing or containing a fœtus in the womb. See Conception.

Gestation is alſo a term in the *Ancient Medicine*, uſed for a ſort of exerciſe, by us called carriage.

It conſiſted in making the patient ride on horſeback, or in a chariot, or a boat; or even in rocking him in his bed, if he could not endure a more violent agitation.

Aſclepiades firſt brought frictions and geſtation into practice. The deſign of geſtation was to recover ſtrength, after a fever, &c. was gone.

GESTE, in *Geography*, a town of France, in the department of the Mayne and Loire; 12 miles N. W. of Chollet.—Alſo, a river of Germany, which runs into the Weſer, near its mouth; called alſo *Geiſte*.

GESTICULATION, the making of affected, indecent, or unſuitable geſtures, or even of proper ones in too great number. Geſticulation is a grievous fault in an orator.

GESTINEN, in *Geography*, a town of Switzerland, in the canton of Uri; 15 miles S. of Altorff.

GESTRICIA, a province of Sweden, about 51 miles long and 10 wide; bounded on the N. by Helſingland, on the E. by the gulf of Bothnia, on the S. by Upland, Weſtmanland, and Dalecarlia, and on the W. by Dalecarlia. The inhabitants do not concern themſelves with agriculture, but derive their chief ſupport and wealth from mines, forges, foreſts, lakes, and rivers. The capital of this province is *Gefle*, which ſee.

GESTU *et Fama*, in *Law*, an ancient writ, where a perſon's good behaviour was impeached; now out of uſe.

GESTUNGSHAUSEN, or Geshausen, in *Geography*, a town of Germany, in the principality of Coburg; ſeven miles E. of Coburg.

GESTURE, a motion of the body, intended to ſignify ſome idea or paſſion of the mind.

Quintilian defines geſture, *totius corporis motus & conformatio*. Geſtures are a kind of natural language, which ſupplies the uſe of ſpeech in thoſe naturally dumb. The mimes and pantomimes were very great proficients in the ſtyle of geſture.

Geſture conſiſts principally in the action of the hands and face; and may be defined, a ſuitable conformity of the motion of the countenance, and of ſeveral parts of the body, in ſpeaking of the ſubject matter of the diſcourſe. (See Action.) With regard to oratory, geſture may properly be called the ſecond part of pronunciation; in which, as the voice ſhould be ſuited to the impreſſions it receives from the mind, ſo the ſeveral motions of the body ought to be accommodated to the various tones and inflections of the voice. When the voice is even and moderate, little geſture is required; and nothing is more unnatural and diſguſting than violent motion, in diſcourſing upon ordinary and familiar ſubjects. The motions of the body ſhould, therefore, riſe in proportion to the vehemence and energy of the expreſſion, as the natural and genuine effect of it.

Geſture is either *natural*, or from *imitation*. The former denotes ſuch actions and motions, either of the whole body, or of ſome particular part of it, as naturally accompany our words, juſt as theſe reſult from the impreſſions of our minds. As to the whole body, it ſhould not continue long in the ſame poſition, but be conſtantly changing, with a gentle and moderate motion. As to the ſeveral parts of the body, the head is the moſt conſiderable: to lift it up too high, has the air of arrogance and pride: to ſtretch it out too far, or throw it back, appears clowniſh and unmannerly; to hang it downwards on the breaſt, ſhews an unmanly baſhfulneſs and want of ſpirit; and to ſuffer it to lean on either ſhoulder, argues ſloth and indolence: in calm and ſedate diſcourſes, the head ſhould keep its natural ſtate and upright poſture, occaſionally moving, and turning gently, ſometimes on one ſide, and ſometimes on the other, as occaſion requires, and then returning back to its natural poſition. It ſhould always accompany the other actions of the body, except in averſion, which is expreſſed by ſtretching out the right hand, and turning the head to the left. But nothing is more indecent than violent motions and agitations of the head.

The paſſions are principally repreſented by the countenance; and the ſeveral parts of the face contribute to the proper and decent geſture of the whole. In a calm and ſedate diſcourſe, all the features retain their natural ſituation. In ſorrow, the forehead and eye-brows lower, and the cheeks hang down; but in expreſſions of joy and chearfulneſs, the forehead and eye-brows are expanded, the cheeks contracted, and the corners of the mouth drawn upwards. Anger and reſentment contract the forehead, draw the brows together, and thruſt out the lips; and terror elevates both the brows and forehead. To theſe natural ſigns of the paſſions, the orator ſhould endeavour to conform.

The motions of the eyes require the moſt careful management; becauſe, as Cicero obſerves, (De Orat. lib. iii. cap. 59.) other parts of the countenance have but few motions; whereas all the paſſions of the ſoul are expreſſed in the eyes by ſo many different actions, that cannot poſſibly be repreſented by any geſtures of the body, if the eyes be kept in a fixed poſture. Thus, in ſpeaking on pleaſant and delightful ſubjects, the eyes are briſk and chearful; but they ſink and are languid in delivering any thing melancholy and ſorrowful. In anger, the eyes diſcover a certain vehemence and intenſeneſs; in expreſſions of hatred and deteſtation, the eyes are turned either aſide or downwards: thus Virgil has expreſſed Dido's reſentment and diſdain of Æneas,

> "Illa ſolo fixos oculos averſa tenebat."
> Æn. lib. vi. ver. 469.

The eyes are alſo ſometimes turned downwards, to expreſs modeſty; and they ſhould be always turned towards the object which is addreſſed. A gentle and moderate motion of the eyes is commonly moſt ſuitable, whereby they may be directed to ſome of the audience with an air of reſpect and modeſty; but their motions ought to vary, according to the different nature of the paſſions which they are deſigned to diſcover in the ſpeaker, and convey to his hearers.

The ſhoulders ſhould neither be elevated nor depreſſed: a continued motion of the arms ſhould be avoided; their action ſhould be very moderate, and follow that of the hands, which need never be idle: Quintilian lays great ſtreſs on the action of the hands, when he ſays, "The hands, without which all geſture is lame and weak, have a greater variety of motions than can well be expreſſed: for they are almoſt equal to our words. Do we not deſire with them, promiſe, call, diſmiſs, threaten, beſeech, deteſt, fear, enquire, deny? Do not they expreſs joy, ſorrow, doubt, confeſſion, penitence, meaſure, plenty, number, and time? Do not they excite reſtraint, prove, admire, and ſhame? That in ſo great a variety of ſpeech among all nations and countries, this ſeems to me the common language of mankind." Inſt. Orat. lib. xi. cap. 3.

As all bodily motion is either upward or downward, to the right or left, forward or backward, or circular, the hands are employed by the orator in all theſe, except the laſt; and as they ſhould correſpond with our expreſſions, they ought to begin and end with them. In admiration, and addreſſes to heaven, they muſt be elevated, but never raiſed above the eyes; and in ſpeaking of things below us, they are directed downwards. Side motion ſhould generally begin from the left, and terminate gently on the right: in demonſtrating, addreſſing, and on ſeveral other occaſions, they are moved forward; and in threatening, ſometimes thrown back: when the orator ſpeaks of himſelf, his right-hand ſhould be gently laid on his breaſt. When no other motion is neceſſary, the hands ſhould be kept about as high as the breaſt, ſo as to make nearly a right angle with the arm. They ſhould never be ſuffered to hang down, nor to loll upon the cuſhion or bar. The left-hand ſhould never move alone, but accommodate itſelf to the motions of the right: in motions to the left, the right-hand ſhould not be carried beyond the left ſhoulder: in promiſes and expreſſions of compliment, the motion of the hands ſhould be gentle and ſlow; but in exhortations and applauſe, more ſwift. The hands ſhould be generally open; but in expreſſions of compunction and anger, they may be cloſed. Neither the breaſt nor the belly ſhould be thruſt out; the trunk ſhould be eaſy and flexible, ſuiting itſelf to the motions of the head and hands; and the feet ſhould be kept ſteady.

There are other geſtures, which ariſe from *imitation*, as when the orator deſcribes ſome action, or perſonates another ſpeaking: but here he ſhould be careful not to overact his part, by running into any ludicrous or theatrical mimicry, or changing his action or voice in a manner unſuitable to his own character. See farther on this ſubject, Ward's Oratory, vol. ii. p. 344, &c. p. 360, &c. Sheridan's Lect. on Elocution, lect. vii. p. 113, &c. See alſo ACTION, IMITATION, PRONUNCIATION, and VOICE.

GESTUS BONUS, in *Law*. See GOOD *a-bearing*.

GESVALDO, in *Geography*, a town of Naples, in Principato Ultra; 13 miles N.W. of Conza.

GESVES, a river of Africa, which runs into the Atlantic, a little to the north of the iſland of Biſſagos.

GESULA. See GEZULA.

GETA, SEPTIMIUS, in *Biography*, ſecond ſon of the emperor Severus, and brother and partner of Caracalla, was born at Milan in 189, and was raiſed to the title of Auguſtus. In the eighth year of his age he was moved with compaſſion at the fate of ſome of the partiſans of Niger and Albinus, who had been ordered to be executed, and his father, ſtruck with the humane feelings of his child, remitted the ſentences. Though he was not free from the vices of an heir to the empire, yet the mildneſs of his diſpoſition made him a greater favourite with the people than his brother, and this circumſtance inflamed their mutual hatred. On the death of Severus both princes ſucceeded to a joint ſovereignty, but their union was of ſhort duration. Caracalla, jealous of his brother's popularity, ordered him to be poiſoned, and when he found the infamous act could not be effected, he murdered him with his own hands in the preſence of his mother Julia, who, in the attempt to defend her favourite ſon, was ſeverely wounded in the arm by Caracalla. Geta had not reached the twenty-third year of his age when he fell a victim to the brutality of his brother. Before his death, Severus had, in the anguiſh of a diſappointed father, foretold that the weaker of his ſons would fall a ſacrifice to the ſtronger, who, in his turn, would be ruined by his own vices. Univer. Hiſt. Gibbon's Rom. Hiſt. See alſo the article CARACALLA.

GETA, in *Geography*, a town of Sweden, on the N. coaſt of the iſland of Alan. N. lat. 60° 25'. E. long. 9° 50'.

GETÆ, or GETES, a tribe of Scythians, who, according to Herodotus (l. iv.), inhabited that part of Thrace which is near the Iſter or Danube. Strabo ſays (l. vii.) that they had the ſame language with the Thracians, and he repreſents them as occupying thoſe arid and uncultivated plains which lie along the ſea-coaſt between the mouths of the Iſter and that of the Tyras, in which the army of Darius, in its march againſt the Scythians, was in danger of periſhing for want of water. Pliny (l. iv. c. ii.) ſays, that they inhabited that declivity of Mount Hæmus which is turned towards the Danube. Under the empire of Trajan, the Getæ were ſubjected to the Roman dominion. Herodotus ſpeaks of Zamolxis as the legiſlator of the Getæ, and he ſays that from him they derived the dogma of the ſoul's immortality; and Trajan attributed to this principle the intrepidity with which they encountered death in the perils of war. The Getæ poſſeſſed only a ſmall ſpace along the coaſt, but their territory extended to a conſiderable diſtance in the interior of the country. Thoſe who inhabited the weſtern part in aſcending the Danube, were called "Dacians;" but thoſe who were more appropriately denominated Getæ, occupied the eaſtern parts near the Euxine ſea; and thoſe who inhabited the banks of the river Tyras, were called "Tyrigetes." They had all the ſame language. Theſe people were continually intermixing themſelves with the Scythians, Baſtarnæ, Sarmatians, Mœſians, and Thracians. The Getæ were without doubt the ſame people with thoſe who were called Goths, and whoſe migrations were ſo extenſive. See Goths.

GE-TCHAO, a town of China, of the third rank, in Chang-tong; 27 miles E.S.E. of Lu.

GETE, part of the country of the Eluts, in Chineſe Tartary, ſo called even to the time of Timur, is regarded by ſome geographers as the country of the ancient Maſſagetæ, towards the lakes of Palkati, Balkaſh or Tengis, and Zaizen. The contaiſch, or great Khan, uſed chiefly to reſide at Harcas, or Erga, on the river Ili, which flows from the S.E. into the lake of Balkaſh. See Jats.

GETHSEMANE, in *Scripture Geography*, a village in the mount of Olives, whither Jeſus ſometimes retired, and in a garden of which he endured his agony, and was taken by Judas. Matt. xxvi. 36, &c.

GETHYLLIS, in *Botany*, (γηθυλλις, is an ancient Greek name for ſome ſort of pot-herb of the onion-tribe, and is therefore well-enough applied to this bulbous plant, as it appears to be derived from γηθος, *gaiety* or *joy*, and may allude to the beauty of its bloſſoms.) Thunb. Nov. Gen. 13. Linn. Gen. 235. Suppl. 27. Schreb. 228. Willd. Sp. Pl. v. 2. 104. Mart. Mill. Dict. v. 2. Juſſ. 54. (Papiria; Thunb Act. Lund. p. 1. ſect. 2. 111.)—Claſs and order, *Hexandria Monogynia*. Nat. Ord. *Spathaceæ*, Linn. *Narciſſi*, Juſſ.

Gen. Ch. *Cal.* none, except an obliquely truncated cylindrical ſheath. *Cor.* of one petal, ſuperior; tube very long, thread-ſhaped; limb widely ſpreading, regular, in ſix deep, elliptic-oblong, equal ſegments. *Stam.* Filaments ſix, inſerted into the mouth of the tube, ſhorter than the limb, often divided; anthers linear, vertical, rolled inwards, often two to each filament. *Piſt.* Germen inferior; ſtyle ſimple, capillary, longer than the ſtamens; ſtigma capitate. *Peric.* Berry club-ſhaped, obtuſe, radical, ſeſſile on the bulb itſelf, ſomewhat fleſhy, of one cell. *Seeds* imbedded in pulp, globoſe, ſmooth, lying over each other in a triple ſeries.

Eſſ. Ch. Corolla with a very long thread-ſhaped tube; limb in ſix deep ſegments. Berry radical, club-ſhaped, of one cell. Seeds numerous.

Obſ. Linnæus, miſled by the occaſional luxuriance of the ſtamens, placed this genus in the claſs *Dodecandria*.

Four ſpecies are defined in Willdenow, beſides his and Jacquin's G. *plicata*, Hort. Schoenbr. v. 1. 42. t. 80, which is *Hypoxis plicata* of Linnæus, and we are at a loſs to diſcover why it is removed to *Gethyllis*, for which no reaſon is given, nor does the deſcription in Jacquin ſuggeſt any, except the length of the tube. The fruit, when known muſt decide this queſtion.

G. *ciliaris*, Linn. Supp. 198. Jacq. Hort. Schoenbr. v. 1. 41. t. 79, is a good example of the genus. The *bulb* is globoſe, with a very ſtrong tuberous baſe, and thick fibres. *Stem* none. *Leaves* ſeveral, three or four inches high, linear, obtuſe, fringed, ſpirally twiſted. *Flower* the height of the leaves, greeniſh-white, the ſize of a daffodil.

G. *ſpiralis*, Gawler in Curt. Mag. t. 1088, has a white flower, externally purpliſh, and very narrow, flat, ſmooth leaves. It is diſtinguiſhed in that work from the original ſpecies G. *afra*, Linn. Sp. Pl. 633. Herb. Linn. on the authority of ſome ſpecimens and drawings of the late excellent Mr. Maſſon, in the hands of Meſſrs Lee and Kennedy, in which both plants are well defined. According to this authority, G. *afra* is ſaid to have properly twelve ſtamens. Thunberg certainly confounded theſe two.

All the ſpecies of *Gethyllis* have the habit of a *Colchicum*, but the berry, ſaid to be very pleaſantly ſcented and well-taſted, is their ſtriking characteriſtic. They are natives of the Cape of Good Hope, rarely ſeen in our gardens, where they do not eaſily bloſſom.

GETONIA, a name given by Dr. Solander, and, as we preſume, derived from γητης, *a ruſtic*, but of its application in the preſent inſtance we have no information. Roxb. Coromand. v. 1. 61. (Calycopteris; Lamarck Illuſtr. t. 357.)—Claſs and order, *Decandria Monogynia*. Nat. Ord. *Holoraceæ*, Linn. *Eleagni*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, ſuperior, deeply divided into five equal, elliptical, obtuſe, ſpreading ſegments, permanent. *Cor.* none. *Stam.* Filaments ten, ſhorter than the calyx, inſerted in two rows into the lower part of its ſegments, capillary, erect; anthers incumbent, roundiſh. *Piſt.* Germen inferior, ovate, furrowed; ſtyle thread-ſhaped, ſhorter than the ſtamens; ſtigma ſimple. *Peric.* none, except the cruſt of the ſeed, which is ovate, furrowed, crowned with the large withered calyx. *Seed* ſolitary, ovate.

Eſſ. Ch. Calyx in five deep ſegments, ſuperior. Corolla none. Seed coated, crowned with the enlarged withered calyx.

1. G. *floribunda*. Roxb. Corom. v. 1. 61. t. 87.—Native of foreſts on the coaſt of Coromandel, where it was firſt noticed by Kœnig, flowering in February and March. The *ſtem* is woody and climbing, with long, round, leafy branches, downy like the whole plant. *Leaves* oppoſite, ſtalked, ovate, acute, entire, about two inches long. *Flowers* in axillary and terminal, compound leafy cluſters, with oppoſite ſtalks, inodorous, greeniſh-white. *Seed* and permanent calyx of a ruſty hue.—The natives call this ſhrub Bandy-moorroodoodoo.

We have no doubt of the propriety of Lamarck's ſynonym, which our lamented predeceſſor, the Rev. Mr. Wood, not knowing the *Getonia*, could ſcarcely aſcertain. (See Calycopteris.) If we be right, the main branch in Lamarck's plate is diminiſhed, the ſeparate fruits only, and permanent ſtamens, being of the natural ſize.

GETTYSBURGH, in *Geography*, a ſmall poſt-town of America, in the ſtate of Pennſylvania and Adams county, ſituated at the head of Rock creek, one of the head-waters of the Monococy; containing about 30 houſes; 9 miles N. of the Maryland line, and 118 W. by S. from Philadelphia.

GETZENDORFF, a town of Auſtria, ſeated on the river Raiſenpach; 12 miles S.E. of Vienna.

GEVASI, a town of the Arabian Irak, on the Tigris; 95 miles S.E. of Bagdad.

GEVAUDAN, a mountainous country of France, ſo called before the revolution, ſituated in Languedoc; of which Mende was the capital.

GEVES, a town of Africa, ſituated on a river of the ſame name, S. of the river St. Domingo.

GEUL, a river of France, which runs into the Meuſe, about 5 miles below Maeſtricht.—Alſo, a town of France, in the department of the Lower Meuſe; 5 miles N. of Wyck.

GEUM, in *Botany*, is mentioned by Pliny, though we learn nothing from that author reſpecting the derivation of its name. Ambroſinus conjectures that it comes from γαιω, *to be ſplendid*, becauſe its beautiful flowers and ſeeds are the boaſt and glory of the Alps.—Avens, or Herb-bennet.—Linn. Gen. 256. Schreb. 343. Willd. Sp. Pl. v. 2. 1113. Lamarck. Illuſtr. t. 443. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 554. Juſſ. 338. Gærtn. t. 74. (Caryophyllata; Tourn. t. 151. Lamarck. Dict. v. 1. 398.) Claſs and order, *Icoſandria Polygynia*. Nat. Ord. *Senticoſæ*, Linn. *Roſaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, in ten ſegments, rather upright; the alternate ſegments very ſmall, acute. *Cor.* Petals five, rounded; claws narrow, the length of the calyx, into which they are inſerted. *Stam.* Filaments numerous, awl-ſhaped, of an equal length with the calyx, and inſerted into it; anthers ſhort, broadiſh, obtuſe. *Piſt.* Germens numerous, collected into a head; ſtyles inſerted into the ſide of each germen, hairy, long; ſtigmas ſimple. *Peric.* none; common receptacle of the ſeeds oblong, hairy, placed on the reflexed calyx. *Seeds* numerous, compreſſed, rough; each tipped with the long geniculated ſtyle.

Eſſ. Ch. Calyx in ten ſegments, inferior. Petals five. Seeds with a jointed awn. Receptacle columnar.

Only five ſpecies of *Geum* are deſcribed by Linnæus in the laſt edition of his Species Plantarum, though in Willdenow's edition we meet with eleven of this genus, of which number G. *urbanum* and *rivale* are the only Britiſh ones, and to which we are enabled, by the aſſiſtance of Dr. Smith, to add two nondeſcripts from his herbarium.

1. G. *urbanum*. Common Avens, or Herb-bennet. Linn. Sp. Pl. 716. Engl. Bot. t. 1400.—" Leaves ternate. Stipulas rounded and cut. Flowers erect. Awns of the ſeeds hooked, naked."—Frequent in woods and hedges, perennial, flowering from May to Auguſt. The *root* is fibrous, and ſlightly aromatic. *Stem* erect, about two feet high, branched at the upper part, clothed with deflexed hairs. *Leaves* unequally ternate, hairy, lobed and cut. *Stipulas* very large. *Flowers* terminal, ſolitary, erect, yellow, with petals ſhorter than the calyx. *Seeds* rather hairy, with naked purpliſh awns.

2. G. *rivale*. Water Avens. Linn. Sp. Pl. 717. Engl. Bot. t. 106.—" Radical leaves lyrate. Stipulas ovate, acute, cut. Flowers drooping. Awns twiſted and feathery."—Found in meadows and moiſt woods more commonly than is uſually imagined, perennial, flowering in June and July. *Root* ſpreading, woody, aſtringent and aromatic, ſometimes of uſe in intermittent fevers. *Stem* about a foot high, drooping at the top. *Leaves* lyrate, or confuſedly pinnate, ſerrated, hairy. *Petals* erect, never fully expanding. The general appearance of this elegant ſpecies, an univerſal favourite amongſt botaniſts, is thus juſtly deſcribed in Engliſh Botany, " the rich combination of the dark-green wrinkled leaves, with the glowing red-brown of the ſtem and calyx, and ſingularly delicate colour of the petals, added to the graceful poſition of the flowers, render this one of the moſt pictureſque of our native plants."

3. G. *virginianum*. American Avens. Linn. Sp. Pl. 716. (G. canadenſe; Jacq. Hort. v. 2. 82. t. 175.)—" Stem-leaves ternate; the upper ones lanceolate. Stipulas oblong. Flowers erect. Awns of the ſeeds naked, hooked."—Native of North America, from whence it was introduced by Mr. P. Miller in 1739. It is nearly allied in habit to G. *urbanum*, but the *petals*, which are ſhorter than the *calyx*, are white, and the whole plant is of a greener hue. Its *leaflets* are alſo more attenuated towards the baſe. It flowers in June, and is a hardy perennial. *Root* inodorous. *Radical-leaves* generally bipinnate. *Seeds* ſmooth.

4. G. *ſtrictum*. Upright Avens. Willd. Sp. Pl. v. 2. 1113. (G. aleppicum; Jacq. Ic. Rar. v. 1. 10. t. 93.)—" Stem-leaves pinnate; leaflets and ſtipulas cloven and cut. Flowers erect. Petals longer than the calyx. Awns of the ſeeds naked, hooked."—Native of North America. A hardy perennial, flowering in June and July. *Flowers* yellow. *Fruit* hairy. The whole plant is covered with whitiſh hairs.

5. G. *japonicum*. Japan Avens. Willd Sp. Pl. v. 2. 1114. Thunb. Japon. 220.—" Leaves ſimple, moſtly three-lobed, ſhaggy. Flowers erect. Fruit hairy. Awns naked."—There is no figure of this ſpecies, which is perennial, and grows in Japan. *Stem* round, rather more than a foot high. *Flowers* terminal, with petals as long as the calyx. *Seeds* ovate, covered with greyiſh hairs.

6. G. *pyrenaicum*. Pyrenean Avens. Willd. Sp. Pl. v. 2. 1115. (Caryophyllata pyrenaica, ampliſſimo et rotundiori folio, nutante flore; Tourn. Inſt. 295.)—" Flowers drooping. Petals longer than the calyx. Awns hairy, twiſted at the baſe."—This is taken up by Willdenow from Tournefort, and is perennial, found on the Pyrenées. Its appearance is ſimilar to G. *rivale*, but differs in the large ſize of its radical leaves, and ſhape of its awns, which are thinly covered with hairs, and naked at the top. *Stem* erect, about a foot and half high. *Seeds* very woolly.

7. G. *atlanticum*. Avens of Mount Atlas. Willd. Sp. Pl. v. 2. 1116. Desfont. Atlant. v. 1. 402.—" Lower-leaves pinnate. Stem generally ſingle-flowered. Fruit hairy. Awns twiſted."—A native of Mount Atlas, perennial. *Stem* nearly two feet high, ſimple. *Stipulas* large, ovate, cut. *Flowers* yellow. This is nearly allied to G. *montanum*, but differs in having fewer leaflets, a taller ſtem, and twiſted, not bearded, awns.

8. G. *potentilloides*. Siberian Avens. Willd. Sp. Pl. v. 2. 1116. (Dryas geoides; Jacq. Hort. v. 3. 38. t. 68.)—" Leaves pinnate, toothed. Stem with about two flowers. Calyx of the fruit erect. Awns ſtraight, naked."—Native of the mountains of Siberia, and introduced into Kew gardens in 1780 by Dr. Pallas. We have it from Chelſea garden. It flowers in June, and is a hardy perennial. *Root* inodorous, but with an aromatic taſte. *Petals* yellow, larger than the diviſions of the *calyx*. *Seeds* with long awns.

9. G. *montanum*. Great Mountain Avens. Linn. Sp. Pl. 717. Jacq. Auſtr. v. 4. t. 373.—" Leaves pinnate, hairy; the outer leaflet very large, round; the lower ones regularly decreaſing. Stem ſingle-flowered. Awns upright, ſhaggy."—This, and the following ſpecies (G. *reptans*) are found moſt abundantly on the higheſt alps of Auſtria and Switzerland, where they are extremely ornamental during the months of July and Auguſt. Mount Cenis is deſcribed by travellers as a favourite habitat of theſe beautiful plants. The *root* of G. *montanum* is fibrous, aſtringent, and ſomewhat aromatic. *Stem* round, leafy, from three or four inches to a foot in height, erect, generally ſingle-flowered, ſimple. *Petals* roundiſh, yellow, longer than the *calyx*. *Seeds* oval, brown, with a long feathery *awn*.

10. G. *reptans*. Creeping Avens. Linn. Sp. Pl. 717. Jacq. Auſtr. v. 5. 38. t. app. 22.—" Leaves pinnate, cut,

hairy. Runners of the ſtem creeping. Stem ſingle-flowered. Awns upright, ſhaggy."—Place of growth and time of flowering ſame as in the preceding ſpecies. *Root* yellowiſh. *Runners* long, reddiſh. *Flower-ſtalks* erect, reddiſh, ſhaggy. *Petals* five or eight, ſometimes ten, large, yellow. *Seeds* retaining the *ſtyle*, which is broken off in the middle and looks like a jointed *awn*.

11. G. *anemonoides*. Anemone Avens. Willd. Sp. Pl. v. 2. 1117.—" Leaves pinnate, ſmooth; leaflets wedge-ſhaped, toothed at the top. Stem ſingle-flowered. Awns upright, ſhaggy."—There is no figure of this rare ſpecies extant. Willdenow has very properly reduced it to *Geum*, though the plant was formerly known as *Dryas pentapetala*. (Linn. Sp. Pl. 717.) Native of Kamtſchatka. *Root* perennial, throwing out filiform, woody *creepers*. *Stipulas* narrow. *Petals* five, large, round, white, ſpreading. *Seeds* numerous, tipped with an hairy awn, and longer than the *flower*. It appears by the Linnæan Herbarium to be a very elegant ſpecies.

12. G. *parviflorum*. Small White Avens.—Radical leaves lyrate, taller than the ſtem. Stipulas cut. Flowers nearly ſeſſile. Petals ſhorter than the calyx. Awns feathery.—Gathered by Commerſon in the ſtraits of Magellan. The radical *leaves* are interruptedly lyrate, hairy, bluntly cut and crenate, about three inches long, moſt reſembling thoſe of G. *rivale*. *Stem* ſolitary, ſcarcely two inches high, clothed with ſhort denſe hairs, and bearing two or three ternate wedge-ſhaped leaves, and as many ſmall, nearly ſeſſile *flowers*, which appear to be ſomewhat drooping, but this can ſcarcely be determined by the dried ſpecimen. The *petals*, ſaid by Commerſon to be white when freſh, are ſmaller than the ſegments of the *calyx*. *Germens* hairy as in G. *rivale*.

13. G. *calthifolium*. Marſh-marigold leaved Avens.—Radical leaves kidney-ſhaped, almoſt circular, ſharply crenate; on ſlightly leafy ſtalks. Calyx turbinate, with lanceolate ſegments. Awns hairy.—Gathered by Mr. Menzies on the weſt coaſt of North America.—This is remarkable for the reſemblance of its radical leaves in ſhape and ſize to thoſe of *Caltha paluſtris*, except their being ſlightly hairy, and their long footſtalks being furniſhed with a few little oblong or three-lobed leaflets, indicating an approach to a lyrate leaf altogether. *Stem* above a foot high, erect, bearing three or four ſmaller, ſeſſile rounded *leaves*, more deeply crenate or cut, and terminating in about three *flowers*, on ſlender ſtalks. *Calyx* hairy at its baſe, turbinate; its ſegments oblong-lanceolate, obtuſe, at length erect, the larger ones equal in length to the *petals* which are yellow and broad, like thoſe of a common Crowfoot. *Awns* ſtraight, bluntiſh, hairy in the lower part, poſſibly becoming hooked at an advanced period.

Geum *Urbanum*, in the *Materia Medica*, is a common Britiſh plant, called *Avens*, in woods and hedges, flowering from May till Auguſt. The root, which is the part medicinally employed, has an aromatic and ſomewhat aſtringent taſte, and a pleaſant ſmell of the clove kind, eſpecially when it is produced in dry and warm ſoils. It gives out its aſtringent matter equally to watery and ſpirituous menſtrua; but its aromatic part moſt perfectly to the latter. In diſtillation with water it yields a ſmall quantity of whitiſh concrete oily matter, of a very grateful fragrance. This plant, though little uſed in Britain, is held in great eſtimation for various virtues on the continent; but the character, under which it has been received ſince the year 1780, is that of a febrifuge; many inſtances having been adduced of its efficacy in obſtinate intermittents, after the Peruvian bark had failed. It is ſaid that a tincture of the root, made in the proportion of four ounces of the root digeſted with a quart of brandy in a ſand heat, and given in the quantity of half an ounce or more, two, three, or four times a day, ſeldom fails to cure agues. Others have given it with equal ſucceſs in decoction, powder, or electuary, in the proportion in which the Cinchona bark is commonly employed. This root has alſo been found uſeful in ſeveral chronic diſorders, as a general tonic and aſtringent; and experiments made by Buchhave evince its antiſeptic power to exceed that of Peruvian bark. Woodville, Med. Bot.

GEVOLLUNG, in *Geography*, a town of Auſtria; eight miles S. of St. Polten.

GEVREY, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the diſtrict of Dijon; 7 miles S. of Dijon. The place contains 1128, and the canton 7894 inhabitants, on a territory of 260 kiliometres, in 36 communes.

GEVUINA, in *Botany*, a barbarous Chili name, adopted by Molina.—Juſſ. 424.—Claſs and order, *Didynamia Angioſpermia*. Nat. Ord. uncertain.

Gen. Ch. *Cal.* none. *Cor.* Petals four, placed croſswiſe. *Stam.* Filaments four, two of them very ſhort. *Piſt.* Germen ſuperior, ſimple; ſtyle one; ſtigma thickiſh. *Peric.* Capſule nut-ſhaped, coriaceous, of one cell. *Seed* ſolitary. A *tree*, native of Chili, where Dombey and Molina have gathered it. The *leaves* are pinnated, compoſed of four or five pair with an odd one. *Flowers* terminal, ſpiked, two together, many of them abortive. *Fruit* eatable, like a hazel-nut, whence the Spaniards call it *Avellano*. *Seed* deſtitute of albumen. *Capſule* much like that of the *Calophyllum*. Juſſ.

GEUSS, John Michael, in *Biography*, was born in Holſtein in 1745. His father undertook the care of his education, and found in his ſon a turn for mathematical and philoſophical purſuits, which he encouraged, and by which he became diſtinguiſhed, and was choſen profeſſor of the mathematics in the univerſity of Copenhagen. His principal work was the " Theory of the Art of conſtructing Mines," in the compoſition of which he was aſſiſted by the MSS. of Belidor, which he had the good fortune to obtain, though they had been ſuppreſſed in France, after the death of that able engineer. He publiſhed alſo a " Treatiſe on the Art of conſtructing Mines." He gave a tranſlation in the German language, from the Daniſh, of Olafſen and Povelſen's voyage to Iceland, which was printed in two volumes 4to. He ſent ſeveral valuable papers to Brehm's, Ingenieur-und-Artillerie Magazin, and publiſhed a ſet of logarithmic tables.

GEUTZ, in *Geography*, a town of Germany, in the duchy of Anhalt-Cothen, near Cöthen.

GEWICZE, Gewitz, or *Geevitſch*, a town of Moravia, in the circle of Olmutz; 24 miles weſt of Olmutz. N. lat. 49° 45′. E. long. 16° 35′.

GEWOLD, Christopher, in *Biography*, flouriſhed in the ſeventeenth century. He was one of the aulic counſellors of Maximilian, firſt elector of Bavaria, who confided to his care the archives of the duchy, in order that he might make uſe of them as an hiſtorian. His works relate chiefly to the hiſtory of his own country; of theſe we may mention " Genealogia Sereniſſimorum Bojariæ Ducum, 1605." " Chronicon Monaſterii Reicherſpergenſis." " Delineatio Norici veteris, ejuſque Confinium;" and " Commentarius de Septem viratu Romani Imperii." Moreri.

GEX, in *Geography*, a ſmall territory of France, in the cidevant province of Burgundy, extending from Fort d'Ecluſe to the village of Croſſay, and from the town of Gex to Geneva, being ſeven leagues in length and three in breadth, watered by the Rhine and other ſtreams, and bounded on the weſt by mount Jura, which yields excellent paſtures. The principal articles of trade are cheeſe, wine, and coal. It now forms a part of the department of lake Leman.

Gex, a town of France, in the department of Leman, and chief place of a canton, in the diſtrict of Geneva, ſituated at the foot of mount St. Claude; 9 miles N. N. W. of Geneva. The place contains 2461, and the canton 9209 inhabitants, on a territory of 212½ kiliometres, in 14 communes. N. lat. 46° 20′. E. long. 6° 8′.

GEYER, a town of Germany, in the circle of Erzgeburg, ſituated in the midſt of mines, and having manufactures of vitriol, ſulphur, alum, and arſenic; 6 miles W. S. W. of Wolkenſtein.

GEYERSBERG, a town of Bohemia, in the circle of Konigingratz; 28 miles E. N. E. of Chrudim.

GEYRACH, a town of the duchy of Stiria; 9 miles S. S. E. of Cilley.

GEYSS, or Geysa, a town of Germany, in the biſhopric of Fulda, ſituated on the Ulſter; 15 miles N. E. of Fulda. N. lat. 50° 43′. E. long. 10°.

Geyss *Rucken Jaſſelek*, a mountain of Germany, which ſeparates Upper Carniola from the county of Cilley; 6 miles N. E. of Stein.

GEYSZING, New, a town of Saxony, in the margraviate of Meiſſen; 12 miles S. E. of Pilnitz.

GEZAEL, a town of the Arabian Irak, on the Euphrates; 120 miles W. N. W. of Baſſora.

GEZAN, or Dsjesan, a ſea-port town of Arabia Felix, in the principality of Abu-Ariſch (ſee *Abu*-Arisch); 23 miles W. of Abu-Ariſch, the capital of the principality. This province of Gezan, ſituated on the Arabic gulf, and in a fertile country, carries on a conſiderable trade in ſenna, of which great plenty is furniſhed by the circumjacent territory, and alſo in coffee, which is brought hither from the mountains of Haſchid-u-Bakil. It has a trade likewiſe with the ports on the oppoſite ſide of the Arabic gulf; but has no intercourſe with the ſubjects of the Imam.

GEZEID, a town of Egypt, on the right bank of the Nile; 27 miles N. N. W. of Cairo.

GEZIRA, or Jasseera, a town of Aſiatic Turkey, and capital of a pachalic, in the province of Diarbekir, on the right bank of the Tigris. The whole province of Diarbekir is alſo called "Al Gezira;" 75 miles S. E. of Diarbekir. N. lat. 37° 16′. E. long. 40° 42′.

GEZIRA Cubros, in the *Materia Medica of the Ancients*, a name given to talc by Avicenna, Serapion, and others. Theſe authors do not give any explication of what ſort of ſubſtance they mean by this name, but ſeem to ſuppoſe it a thing univerſally known, and only give a liſt of its qualities.

GEZIRAT al Dahab, or *Gezirat Iddabab*, or the *Golden Iſland*, in *Geography*, an iſland in Lower Egypt, formed by canals cut from the left bank of the Nile, oppoſite to Faoua.

Gezirat al Teir, or *Iſland of Birds*, an iſland in the Red ſea. N. lat. 22° 18′. E. long. 37° 56′.

GEZULA, or Gesula, an inland province of the empire of Morocco, E. of the province of Suz, and N. of Vled de Nun: this, together with the province of Dra, lies in the vicinity of mount Atlas which, in this ſouthern part of the country, extends almoſt to the ſea. The inhabitants of this province are conſidered as the moſt ancient people of Africa. The country produces a great quantity of barley, and affords paſture for cattle: it has mines of iron and copper, of which are made various utenſils, that are exchanged for cloth, ſpices, horſes, and other neceſſaries. It has every year a fair, which laſts two months, for the ſale and exchange of cattle and merchandize in general. The people are free, being allies rather than ſubjects of Morocco. Their arms conſiſt of ſabres, large ſharp two-edged ſwords and lances. They are numerous, but have no towns, and they generally live in camps and villages.

GFOLL, a town of Auſtria; 8 miles W. N. W. of Crems.

GHALESKA, a town of Arabia Felix, which was once a famous city and ſea-port, but now ſunk into decay, about 20 cottages only remaining to ſhew the place where it ſtood, and the inhabitants are provided only with dates, and the milk and fleſh of a few ſheep; 20 miles S. of Hodeida.

GHALGHULUWA, in *Zoology*, the Ceyloneſe name of a ſpecies of Eaſt Indian ſerpent, a ſnake of a pale brown, variegated with tranſverſe ſtreaks of white, and found among rocks and ſtones.

GHAN is a name given in Muſcovy to caravanſeras.

GHANA, as Edriſi and Abulfeda call it, or Ghinny, in *Geography*, a city and capital of a kingdom in Africa, ſituated nearly midway between the Indian ſea and the Atlantic on the E. and W.; and between the Mediterranean and the Ethiopic ſeas on the N. and S.; and, therefore, conſidered by major Rennell as the point on which the *central* and *eaſtern* poſitions depend. This country lies on the borders of the Neel-Abeed, or Guin river, and is bounded on the N. by Caſhna or Kaſſina, on the E. by Wangara, on the S. by Melli or Lamlem, and on the W. by Mekzara and Kaſſina. The city is placed in Rennell's map on the north bank of the river. According to Edriſi, Ghana is diſtant 37 journies (each day's journey of Edriſi being about 19.06 geographical miles) from "Germa," through Agadez, or Agadoſt. Germa is an ancient and ruined city of Fezzan, about four journies E. S. E. of Mourzouk, in N. lat. 27° 25′. E. long. 16° 20′. Agadez is 25 of Edriſi's journies from Germa, bearing S. by W. or S. S. W. from the capital of Fezzan. Ghana is 12 days of Edriſi's ſcale to the ſouthward of Agadez, or about 229 geographical miles. It appears that Ghana lies ſomewhat to the eaſt of the line which paſſes through Agadez from Germa, and Mr. Rennell has taken 700 as the general line of diſtance from Germa to Ghana. Mr. Matra was told, at Morocco, that Ghinny (Ghana of Edriſi) was 40 journies from Kabra, the port of Tombuctoo, along the bank of the Niger. Theſe, taken at the caravan rate between Fezzan and Egypt, Morocco and Jarra, &c. that is, at 16.3 per day, produce 652 geographical miles. The interſection of this line with that from Germa places Ghinny in N. lat. 16° 10′. E. long. 13° 2′; in which poſition it ſtands at 760 miles from the city of Benin, on the coaſt of Guinea. For the further ſettlement of this important point in adjuſting the map of Africa, ſee Rennell's Proceedings of the African Aſſociation, p. 119, &c.

GHANARA, a city of Africa, the capital of Wangara, ſituated on a river, which runs into the Niger, or rather into a lake (the Lybia Palus of Ptolemy) formed by the Niger. N. lat. 13° 40′. E. long. 15° 40′.

GHASSA, or Gassa, capital of a diſtrict in the northern part of Bootan, in the Eaſt Indies, and the ſtation of a zompoon, or provincial governor. The higheſt mountain in its neighbourhood, whoſe head is eternally covered with ſnow, ſends forth a ſpring of water at its baſe of ſo great a degree of heat, that few are found capable of bearing, even for a ſhort time, any part of the body immerſed in it. It is ſituated near the ſpring-head of Pa-tchieu river. N. lat. 27° 53′. E. long. 89° 18′.

GHAT, a ſmall iſland in the river St. Lawrence. N. lat. 35° 30′. W. long. 93° 20′.

GHAVKANI, a town of Perſia, in the province of Irak; 25 miles E. of Iſpahan.

GHEBAN. See Geban.

GHEBRABA, a town of Perſia, in the province of Irak; 5 miles N.W. of Iſpahan.

GHEDI, a town of Italy, in the department of the Mela; 10 miles S. of Breſcia.

GHEDEMIS. See Gadamis.

GHEDEN, a town of Aſiatic Turkey, in the government of Sivas; 15 miles S. of Amaſieh.

GHEDMAN, a town of Perſia, in Choraſan; 18 miles S. of Herat.

GHEIRA, a town of Aſiatic Turkey, in Natolia; 38 miles N.N.E. of Mogla.

GHEIVE, a town of Aſiatic Turkey, in Natolia; 20 miles E.N.E. of Iſnik.

GHELA, a town of Arabia, on the coaſt of the Red ſea, anciently called "Ocelis;" 48 miles S.S.E. of Mocha.

GHELEN, Sigismond, in *Biography*, was born of a reſpectable family at Prague. When he had attained to a proper age for improvement by foreign travel, he went into France and Italy, and acquired an accurate knowledge of the languages of thoſe countries. On his return he [illegible] through Baſil, and made himſelf known to Eraſmus, at whoſe recommendation Froben engaged him as his corrector of the preſs, by which he gained a ſmall but competent maintenance. He ſoon aſſumed a higher office than that of corrector of proof-ſheets, and joined to it the duties of a critic and tranſlator. He publiſhed a dictionary of the Greek, Latin, German and Dalmatian languages; and annotations upon Pliny and Livy. He tranſlated from the Greek into Latin the Antiquities of Joſephus, ſome Homilies of Chryſoſtom, and many other learned works. Juſt before his death, which happened in 1554, he had employed his talents on, and nearly finiſhed, a verſion of Juſtin Martyr's works. Beſides thoſe already mentioned he was editor of many other works. He was acute and ingenious, and wrote with elegance and fluency. In his private character he was mild and placid, ſimple and ſincere. Moreri.

GHEMARA. See Gemara.

GHEME, in *Geography*, a town of Italy, in the department of the Gogna; 13 miles N.N.W. of Novara.

GHEMISH, a town of Aſiatic Turkey, in the government of Sivas; 24 miles W. of Amaſieh.

GHENNA. See Ghinna.

GHENT, a city of France, and chief place of a diſtrict, in the department of the Scheldt, formerly capital of Auſtrian Flanders, ſituated on the conflux of the rivers Scheldt, Lis, Moeze, and Lieve, which, together with a number of canals, interſect it in a variety of directions, and divide the town into 26 ſmall iſlands. It is encompaſſed by walls about 15 miles in circumference, and includes gardens and corn-fields. Since the French revolution it has been divided into four quarters, *viz.* North, South, Eaſt, and Weſt, and as many cantons. The former contains 15,000, and the correſponding canton 17,454 inhabitants, on a territory of 22½ kiliometres, in two communes; the ſecond, or ſouth, contains 15,000, and its canton 16,469 inhabitants, on a territory of 35 kiliometres, in two communes; the third, or eaſt, includes 13,000, and its canton 16,073 inhabitants, on a territory of 35 kiliometres, in three communes; and the fourth, or weſt, contains 13,000, and its canton 18,319 inhabitants, on a territory of fifteen kiliometres, in three communes. This city was firſt choſen for their habitation by the Nervii, and afterwards occupied by the Vandals, who gave it the name of "Wanda," whence the preſent appellation of Gand, or Ghent, is ſuppoſed to be derived. It was encompaſſed with walls by Odoacer, grand foreſter of Flanders, and has ſince been frequently enlarged, particularly in the year 1397, by order of Philip the Bold, 25th count of Flanders. The inhabitants were always warlike, and often engaged in military conteſts with their own princes, and with their neighbours, which were conducted in many inſtances with ſavage cruelty, and terminated in extenſive and ſanguinary ſlaughter. Ghent was the birth-place of Charles V., of whoſe nativity in their town the inhabitants had little reaſon to boaſt, as he loaded them with frequent and heavy impoſitions, chaſtiſed them with rigour for their occaſional revolts, and ſubjected the magiſtrates and ſeveral of the chief citizens to the moſt humiliating treatment. This conduct on his part inflamed their diſpoſition to revolt, and the conſequence was, that one of the fineſt cities in Europe was reduced to a ſtate of perfect ſolitude. However, it afterwards regained ſome ſmall portion of its ancient ſplendour, and became, at leaſt previouſly to times of recent confuſion, conſiderable. In November 1676, was concluded in this city the famous treaty called the "Treaty of Ghent," conſiſting of 25 articles, and amongſt others ſome of them ſtipulating that the Spaniſh and foreign troops ſhould leave the country, that the provinces of Holland and Zealand ſhould remain united with the others, that the Catholic religion ſhould be maintained, and that the ancient privileges of the country ſhould be ſecure; and this treaty was approved and ratified by Philip II., king of Spain. In 1678 Ghent was taken by Louis XIV., king of France, but reſtored to Spain at the treaty of Nimeguen in the ſame year; and it remained in their poſſeſſion till it was taken by the allies in 1706, after the battle of Ramillies. It was ſeized by the French in 1708, but recaptured by the allies under prince Eugene and the duke of Marlborough, in the ſame year. Ghent was erected into a biſhopric in 1559 by pope Paul IV., at the ſolicitation of Philip II., king of Spain, ſubject to the archbiſhop of Malines. It had, beſides the cathedral, ſix pariſh churches, and many religious houſes: ſome of the ſtreets are broad and well-paved, and the market places ſpacious, in the midſt of one of which is a ſtatue of Charles V., in his imperial habit. Ghent carries on a conſiderable trade in cloth, linen, lace, and ſilk manufactures, and is much aſſiſted, in favourable times, by two navigable canals; one to Sas-de-Ghent, and another to Bruges, Oſtend, &c. The magiſtracy conſiſts of burgomaſters, echevins, and common-council. John, the third ſon of Edward III., king of England, was born in this city, and from this circumſtance called John of Gaunt. In November 1792, the French took poſſeſſion of this city, but evacuated it on the retreat of Dumourier; however, they afterwards regained it in their progreſs through the country: 30 miles S.W. of Antwerp. N. lat. 51° 3′ 15″. E. long. 3° 43′ 20″.

GHER, a town of Africa, in the county of Sugulmeſſa, or Sijilmiſſa, on the Ziz, near mount Atlas; 90 miles N.W. of Sugulmeſſa.

GHERANGOL, a town of Africa, in the country of the Foulahs, on the S. ſide of the river Senegal. N. lat. 16° 40′. W. long. 14°.

GHEREDE, a town of Aſiatic Turkey, in Natolia; 28 miles E. of Boli.

GHERGISTEN Mountains, a chain of montains of Aſia, ſituated on the N. of the country of Candahar, 15 miles N. of Candahar.

GHERGONG, or Kirkanu, a town of Aſam, and capital of the country, on the Degoo, 160 geographical miles nearly E. by N. from Goalpurah. The houſes are conſtructed of wood, and each of them has a garden, or ſome cultivated ground in front, which gives the place a great extent. It is fortified, and has four gates, encompaſſed with a fence of bamboos, and incloſing villages and tilled fields; it is conſtructed of ſtone and earth. The rajah's palace is ſurrounded by cauſeways, planted with bamboos, and the ditch on the outſide is full of water; the palace contains many lofty and ſpacious apartments, particularly a ſaloon 150 cubits long and forty broad, ſupported by 66 pillars of wood at certain intervals. In the town there is a ſmall market, which, however, contains no ſhop-keepers, but the ſellers of betel; as the inhabitants lay up a ſtock of proviſions ſufficient to laſt them a year, and have no occaſion to purchaſe any for daily uſe. N. lat. 35° 30′. E. long. 93° 10′. See Asam.

GHERIAH, a ſea-port of Hindooſtan, on the weſt of Pirate coaſt, in the county of Concan; late the capital and principal port of Angria. It was ſtrongly fortified by the pirate Angria, from whom it was taken by admiral Watſon and colonel Clive, in the year 1756; 80 miles N.N.W. of Goa. N. lat. 16° 37′. E. long. 73° 8′.

GHERKINS. See Guerkins.

GHERMA, or Germa, in *Geography*. See Ghana.

GHERMANSIK, a town of Aſiatic Turkey, in Natolia; 15 miles E. of Scala-Nova.

GHERRI. See Gerri.

GHERUA, a town of Arabia, in the province of Lachſa, or Hadsjar; 45 miles W.N.W. of El Catif.

GHERZE', a town of Africa, in Tripoli; 50 miles S. of Meſurada. N. lat. 31° 28′. E. long. 14° 30′.

GHESILPOUR, a town of Hindooſtan, in the circar of Rantampour; 28 miles S.S.W. of Suiſopour.

GHEUK SHA, *i. e. Blue Water*, a lake of Perſian Armenia, 60 miles long, and 6 broad; 50 miles E.N.E. of Erivan.

GHEUREL, a town of Aſiatic Turkey, in Natolia; 28 miles W.N.W. of Angara.

GHEUTSI, a town of Aſiatic Turkey, in Caramania; 16 miles E. of Cogni.

GHEYSSIQUAS, a tribe of Hottentots, inhabiting a diſtrict of South Africa, bordering on the country of Caffraria. M. Vaillant, being at no great diſtance from Orange river, found ſome of theſe people, who pointed out to him a chain of mountains to the eaſt, which was occupied by their principal tribes, and which ſeparated them from the Caffres, or at leaſt from the Briquas and Bremas, conſidered by them as tribes of Caffres. The chief difference between the Gheyſſiquas and the nations that ſurround them conſiſts in the colour of their ornaments, to which they impart a dazzling whiteneſs by proceſſes peculiar to themſelves. The women are well-made, lively, and prone to laugh or dance; but at the ſame time modeſt and reſerved. The people, in general, are ſaid to be very hoſpitable and generous. The practice of ſemi-caſtration prevails in all their hordes without exception, and they are the only tribe among the Hottentots who adopt it. Different accounts are given by travellers of the reaſon of this ſingular operation. Kolben, ſtating it to conſiſt in the extraction of the left teſticle, repreſents it as a religious ceremony, prevailing among all the Hottentots, but this is not true in fact. Others aſcribe it to a deſire on the part of the Gheyſſiquas to remove every impediment in running, and others again aſſign as its cauſe a wiſh to prevent the too abundant propagation of the ſpecies. But neither of theſe cauſes produces the effect aſcribed to them. Vaillant ſuppoſes that it is a mark of diſtinction, adopted by their anceſtors, when at war with neighbouring nations, by which they might know one another; but this account is no leſs fanciful and improbable than any other. Whatever is the cauſe from which this practice originates, it is performed by the father, commonly at the birth of the child; though it is ſometimes deferred till the child has completed his third year.

GHEZ, a town of Grand Bucharia; 24 miles S.S.E. of Balk. N. lat. 36° 16′. E. long. 65° 40′.

GHEZAN. See Gezan.

GHEZZI Pier Leone, called *Cavalier Ghezzi*, in *Biography*, a painter who was a pupil and imitator of Pietro Cortona. He was ſelected with Luti Treviſani, and other artiſts of the ſame ſtyle, to paint the prophets in St. John Lateran; and executed many other works of leſs conſequence; but he obtained moſt celebrity by his ſkill in caricature, which he freely indulged.

GHIABUNDER, in *Geography*, a town of Bengal; 25 miles S.S.W. of Goragot.

GHIBELINS. See Gibelins.

GHICKERS, an appellation given to thoſe who inhabited the northern and largeſt diviſion of the hilly tract ſituated between the Behut, the Sinde, and Caſhmere, in Hindooſtan, by way of contraſt to the Joudis, who occupied the ſouthern and leaſt diviſion.

GHIDORE, in *Geography*, a province of Bengal, bounded on the N. by Bahar, on the N.E. and E. by Curruckpour, on the S. by Birboom, and on the S.W. by Curruckdeah and Moy. The chief place is Ghidore; which is 70 miles S.E. of Patna. N. lat. 24° 53′. E. long. 86° 23′.

GHIEZ, a fortreſs of Perſia, in the province of Irak, taken by the Afghans in 1723.

GHILAN, or Kilan, ſynonymous with the ancient *Gela*, a province of Weſtern Perſia, bounded on the N. by the provinces of Aderbijan or Aiderbeitzan and Schirvan, on the N.E. by the Caſpian ſea, on the E. by the Caſpian ſea and the province of Mazanderan, on the S. by the Perſian Irak, and on the W. by the provinces of Aderbijan and Curdiſtan; about 200 miles from E. to W., and 150 from N. to S. This is one of the moſt beautiful and fertile provinces of Perſia, producing ſilk, olives, rice, tobacco, and moſt excellent fruits of all kinds, and in ſuch abundance, as not only to ſupply the wants of its inhabitants, but ſufficient to provide for a great part of Perſia and Armenia. The manufactures and ſilk of Ghilan are eſteemed the beſt in Perſia, and have been in ſuch repute for many years, that Raſhd, its capital, is become one of the firſt commercial towns in this part of Aſia. The fineſt ſort is uſually white, and chiefly ſent into the interior cities of Perſia, or ſold to the Turks; the inferior kind is yellow, and principally diſpoſed of to the Ruſſians. Raſhd ſupplies the bordering provinces of Perſia, and the independent neighbouring ſtates, as far as Georgia, with European merchandize, except the goods which are tranſported immediately from Aſtrakan, through Kiſlar and Moſtok, to the neareſt part of Georgia, and of the neighbouring mountains; and thoſe ſent from Shamakee to the Leſgue Tartars, and other independent tribes. In this province are ſeen whole foreſts of mulberry, box, and walnut trees. Every peaſant has a garden to his cottage, planted with orange-trees, citrons, figs, and vines. For a further account of the trade and government of this province, we refer to the articles Caspian *Sea* and Persia. We ſhall here only add, that in the year 1792 Akau, called by Dr. Pallas Aga Mamet, collected an army, and purſued his conqueſts in the vicinity of Ghilan, till at length he had no rival, except Hidaet, khan of Ghilan, whom he forced to fly from Raſht or Raſhd, his place of reſidence, and who was killed near the port of Sinſili. In conſequence of theſe events Akan became monarch of the whole of Weſtern Perſia; and having been made an eunuch in his infancy by order of Nadir Shah, he nominated for his ſucceſſor his nephew Baba Serdar.

GHILDI, a town of Africa, on the Senegal; 30 miles N.W. of Gallam.

GHILON, a town of Curdiſtan; 50 miles S.S.W. of Erbil.

GHINALA, a town and territory of Africa, on the river Rio Grande, near its mouth. N. lat. 11° 15′. W. long. 14° 15′.

GHINIA, in *Botany*, ſo named by Schreber in memory of Luca Ghini, who, in the 16th century, was profeſſor of botany at Bologna and Piſa, in each of which univerſities he greatly improved, if he did not entirely found, the botanic garden, and was the firſt who made the ſtudy of botany an eſſential part of medical education. He publiſhed no book himſelf, but Haller mentions the exiſtence of a manuſcript copy of his lectures, and he communicated many things in correſpondence to the writers of his time. Schreb. 19. Willd. Sp. Pl. v. 1. 114. Mart. Mill. Dict. v. 2. Swartz. Ind. Occ. v. 2. 1087. (Tamonea; Aubl. Guian. 659. Juſſ. 109. Lamarck, Illuſtr. t. 542. Swartz. Prod. 94.)—Claſs and order, *Didynamia Angioſpermia*. Nat. Ord. *Perſonatæ*, Linn. *Vitices*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, tubular, permanent, inferior, its orifice with five pointed ſpreading teeth. *Cor.* of one petal, irregular; tube long, narrow; limb of two lips, the upper one largeſt, roundiſh, concave, aſcending; lower in three deep roundiſh ſegments, the middlemoſt larger, deflexed, emarginate. *Stam.* Filaments four, inſerted into the tube above its baſe, two of them longer than the reſt; anthers each of two ſeparated oblong cells, one of them terminal, fertile in the longer ſtamens only, the other like a little ſcale in the middle of each filament. *Piſt.* Germen roundiſh, ſuperior; ſtyle thread-ſhaped, the length of the tube; ſtigma four-lobed. *Peric.* Drupa turbinate, angular, dry, projecting beyond the permanent calyx. *Nut* angular, of four or five cells. *Seeds* ſolitary.

Eſſ. Ch. Calyx with five ſharp ſpreading teeth. Corolla ringent, two-lipped; the lower lip three-lobed. Nut coated, four-celled, inveſted with the calyx. Seeds ſolitary. Anthers of two diſtant lobes.

Obſ. We think this genus ought to be placed in *Didynamia*, along with *Verbena*, to which it is nearly akin, though only the longer ſtamens appear to be perfect; but this may be variable, and cannot well be determined without repeated examinations of wild ſpecimens.

1. G. *ſpinoſa*. Willd. n. 1. Ait. Hort. Kew. ed. 2. v. 1. 45. (G. verbenacea; Sw. Ind. Occ. v. 2. 1089. Verbena curaſſavica; Linn. Sp. Pl. 28. Veronicæ ſimilis, &c. Herm. Parad. t. 240.)—"Fruit with four thorns. Leaves ſmooth."—Native of ſeveral parts of the Weſt Indies, where Houſton and Swartz have gathered and examined it. This is an annual and rather humble herbaceous plant, with a branched *ſtem*, ovate deeply ſerrated *leaves*, and long looſe ſpikes of ſmall whitiſh *flowers*.

2. G. *mutica*. Willd. n. 2. Sw. Ind. Occ. v. 2. 1090. (Tamonea ſpicata; Aubl. Guian. 660. t. 268.)—"Fruit without thorns. Leaves downy."—Native of Guiana and Cayenne. Much like the former, but with downy *leaves*, and an unarmed *fruit*, and the middle ſegment of the lower lip of the *corolla*, according to Swartz, is emarginate in this, entire in the preceding. Neither of them have much beauty, nor any other qualities to recommend them for cultivation with us in the ſtove, though perhaps they might be planted out for the ſummer, if deſirable, like other tender annuals.

GHINNA, or Ghenne', in *Geography*, a town of Egypt, on the E. ſide of the Nile, oppoſite to Kuft, or Coptos, on the other ſide, and diſtant from Coſſeir, or Koſire, on the Red ſea, about 90 geographical miles. N. lat. 26° 11′. E. long. 32° 45′.

GHINUE, a town of Aſiatic Turkey, in Natolia; 24 miles N.W. of Sinob.

GHIO. See Kemlik.

Ghio, a town of Africa, belonging to the Foulahs, on the Senegal; 12 miles S.W. of Goumel.

GHIR. See Gir.

GHIRGIN. See Guinguin.

GHIRLANDAIO, Domenico, in *Biography*, a painter, of whom Vaſari ſpeaks as being of the firſt rank in his time. His real name was Corradi. He at firſt was employed by his father, in his own profeſſion of goldſmith, at Florence, who obtained the name of Ghirlandaio, by having been the firſt to make little metallic garlands (*Ghirlandi*) for children to wear. Domenico continued to paint, after he had adopted painting as his profeſſion, for the churches and convents in Florence, both in freſco and in oil. He, like other artiſts of the time, introduced into his pictures the portraits of his friends, but gave them more character appertaining to the ſubject, than had hitherto been done there; and he was the firſt who left off gilding in pictures, and attempted to imitate its effects by colours. He was called to Rome by Sixtus IV. to aſſiſt other maſters employed in painting his chapel. His works there were afterwards ſpoiled to make room for thoſe of M. Angelo. He was highly honoured, and employed nobly; but his greateſt glory is, having had the great hero of the art, M. Angelo, for a pupil. He died in 1493, at the age of 44. His brothers, David and Benedetto, finiſhed many of his works, and educated his ſon Ridolfo to the art, who afterwards made great progreſs, and obtained eſteem from Raphael himſelf, who invited him, but not ſucceſsfully, to work in the Vatican. In Ridolfo's pictures, Mr. Fuſeli ſays, "there is ſomething analogous to the genius of Raphael; the compoſition, the vivacity of the face, the choice of colours, ſomething ideal in the uſe of nature, betray ſimilar maxims, with inferior powers." He died in 1560, aged 75.

GHIRNAH, in *Geography*, a river of Hindooſtan, which runs into the Taptee; 36 miles S.W. of Burhanpour.

GHISCIOLA, a town of Italy, in the department of the Upper Po; 15 miles E. of Cremona.

GHISTELLES, a town of France, in the department of the Lys, and chief place of a canton, in the diſtrict of Bruges; 11 miles S.W. of Bruges. The place contains 2500, and the canton 11,404 inhabitants, on a territory of 182½ kiliometres, in 18 communes.

GHIVIRA, a town of Italy, in the department of the Olona; 30 miles N.W. of Milan.

GHIZNI, or Gazna, an ancient empire of Hindooſtan, founded by Abiſtagi, governor of Koraſan, A. D. 960, who revolted from the king of Bucharie. Ghizni conſiſted chiefly of the tract which compoſed the kingdom of Bactria, after the diviſion of Alexander's empire; that is, the countries lying between Parthia and the Indus, and ſouth of the Oxus. The Ghiznian empire, ſubject to the ſame cauſes of decay with other unwieldy ſtates of rapid growth, was, in 1158, forcibly divided; the weſtern, and largeſt part, and which ſtill retained the ancient name of the empire, being ſeized on by the family of the Gaurides, (ſo denominated from Gaur, or Ghor, a province and city lying beyond the Indian Caucaſus), while the provinces contiguous to both ſhores of the Indus, remained to Chuſero, or Cuſroe, who fixed his reſidence at Lahore: and even his poſterity were, in 1184, driven out of their kingdom by the Gaurides. The death of the emperor Mahomed Gori, in 1205, occaſioned a new diviſion of the Ghiznian empire; the Perſian part remaining to Eldoze, and the Indian part to Cuttub, who founded the Patan, or Afghan dynaſty, in Hindooſtan. In 1221 Gengiz Cawn, among his extenſive conqueſts, accompliſhed that of the empire of Ghizni; putting an end to the dynaſty of Charaſm, which then occupied that throne, and driving before him the unfortunate Gelali, ſon of the reigning emperor; who ſwam the Indus to avoid his fury. The ancient empire of Ghizni is nearly comprehended by the kingdom, known at preſent by that of Candahar. See Candahar.

Ghizni, or *Gazna*, a city of Candahar, once the reputed capital of the Ghiznian empire, and placed among the weſtern ſources of the Indus, and not far from the Indian Caucaſus. The poſition of Ghizni is erroneouſly fixed by M. D'Anville in the N.W. extreme of Cabul; whereas it appears to be almoſt in the very heart of that province. It is termed the "Second Medina," on account of the great number of illuſtrious perſons whoſe remains have been interred there. Wonderful ſtories are related concerning its extent and population in ancient times; nevertheleſs, Baber expreſſes his ſurpriſe at its having ever been pitched on for the ſeat of any empire. Ghizini is diſtant about 56½ geographical miles S. by W. from Cabul, about 167½ ſuch miles from Candahar, and about 88 miles from Bamian. N. lat. 33° 35'. E. long. 68° 22'.

GHOBAN. See Goban.

GHOER, a town of Holland, in Overyſſel, on the Rigge; 10 miles N.N.E. of Borkeloe.

GHOR. See Gaur.

GHORAIB, a town of Arabia, in the country of Yemen; 15 miles E. of Iambo.

GHOUP, a mountain of Southern Africa. This, and alſo Nieuweld, are a continuation of the Roggeveld mountain, and join the diviſions bearing the ſame name in the diſtrict of Graaf Reynet. They have lately been deſerted, on account of the number of Booſjeſman Hottentots, who dwell cloſe behind them.

GHOURBUND, a town, and diſtrict of Cabul; 42 miles N.W. of Cabul. N. lat. 34° 55'. E. long 67° 52'.

GHOURI, a town of the kingdom of Balk. N. lat. 35° 40'. E. long. 66° 56'.

GHULE el Aljaib, a town of Arabia Felix; 10 miles N.N.E. of Chamir.

GHULPAIGAN, a town of Perſia, in the province of Irak, taken by the Afghans in 1723; 100 miles N.N.W. of Iſpahan. N. lat. 33° 45'. E. long. 50° 40'.

GHUMISCHKANA, a town of Aſiatic Turkey, in the government of Trebiſond; 50 miles S.S.W. of Trebiſond.

GHUNFUDE, a ſea-port of Arabia, on the Red ſea, belonging to the ſheriff of Mecca. All veſſels which carry coffee to Jidda are compelled to anchor here, and pay a duty; 145 miles S. of Mecca. N. lat. 29° 7'.

GHUNI, one of the ſmaller Cape Verd iſlands, being little more than a rock.

GHURMAN, a town of Perſia, in Segeſtan; 30 miles N.E. of Ferah.

GHYASPOUR, a town of Hindooſtan, in Bahar; 20 miles W.S.W. of Chuprah.

GIA, an Italian adverb, uſed in *Muſic* for already, formerly, *cidevant:* as "Gia maeſtro di cappella del Duomo di Milano," formerly maeſtro di cappella, or compoſer, to the cathedral of Milan.

GIABBAR, in *Geography*, a fortreſs of Aſiatic Turkey, in the province of Diarbekir; 120 miles S.S.W. of Diarbekir.

GIACOMELLI Geminiano, in *Biography*, of Parma, compoſed for the theatres of Venice, between the years 1704 and 1736, ſeven or eight different dramas, written chiefly by Apoſtolo Zeno and Metaſtaſio. He was the ſcholar of Capelli; but adopted a more high and flighty ſtyle, with which the Venetians were much captivated, before they heard the more graceful and expreſſive airs of Vinci and Haſſe.

GIACOMO, St. in *Geography*, a town of Italy; three miles S. of Verona.—Alſo, a town of the Valteline; two miles N.W. of Chiavenna.

Giacomo, *St., Valley of*, a valley of Switzerland, which is part of the county of Chiavenna. It is narrow, and watered by the torrent Lira; contains about 10 pariſhes, is under the juriſdiction of the commiſſary, and poſſeſſes ſeveral important privileges that preſerve the inhabitants from the oppreſſion which their neighbours endure. All cauſes are tried in the valley. The criminal ſtatutes are thoſe of Chiavenna, with this difference, that inſtead of the aſſeſſor, the valley chuſes four perſons, who are always preſent at the examination; and without whoſe concurrence, torture cannot be inflicted, nor ſentence paſſed. The valley has its own code of juriſprudence, and courts independent of the commiſſary, from the deciſion of which an appeal lies to the diet.

The lower part of the valley produces vines and corn; the upper, rye, barley, and paſture, mixed with large groves of fir and pine.

Giacomo Arkadelt, in *Biography*, a Netherlander, and a diſciple of Juſquin, enumerated by Adami among the ſingers and compoſers of the pontifical chapel in the 16th century. He was maeſtro di cappella ſome time to the cardinal of Lorrain, and had acquired great fame by his madrigals, of which he publiſhed at Venice, between the years 1539 and 1575, five books. In one of which is the celebrated madrigal, "Il bianco e dolce Cigno cantando muore," which was in high favour all over Europe.

GIADEN, in *Geography*, a town of Arabia, 60 miles W.S.W. of Mecca.

GIADILA, a town of Arabia, in the province of Nedsjed, 90 miles S.W. of Kariatim.

GIADRI, a town of Albania, on the Drino; eight miles N. of Aleſſio.

GIAGAS of Africa. See Jagas.

GIAGH, or Jehagh, a cycle of twelve years, in uſe among the Turks and Cathayans.

Each year of the giagh bears the name of ſome animal; the firſt that of a mouſe; the ſecond, that of a bullock; the third, of a lynx or leopard; the fourth, of a hare; the fifth, of a crocodile; the ſixth, of a ſerpent; the ſeventh, of a horſe; the eighth, of a ſheep; the ninth, of a monkey; the tenth, of a hen; the eleventh, of a dog; and the twelfth, of a hog.

They alſo divide the day into twelve parts, which they call giaghs, and diſtinguiſh them by the name of the ſame animals. Each giagh contains two of our hours, and is divided into eight *keh*, as many as there are quarters of hours in our day.

GIALAKOVA, in *Geography*, a town of European Turkey, in Romania; 60 miles N.E. of Filippopoli.

GIALLOLINO, in *Natural Hiſtory*. See Naples *Yellow*.

GIAMANI, in *Geography*, a town of Perſia, in the province of Chuſiſtan; 28 miles S.S.W. of Suſter.

GIAMBASH, a town of Aſiatic Turkey, in Natolia; 20 miles S.S.E. of Smyrna.

GIANAH, a town of Perſia, in the province of Kerman; 50 miles E. of Singian.

GIANCAZZO, St. a town of Naples, in the province of Otranto; 12 miles S.W. of Brindiſi.

GIANNONE, Peter, in *Biography*, was born at or near Naples about the year 1680. He was educated for, and practiſed in, the law, but was much more diſtinguiſhed as an hiſtorian. In 1723 he wrote a "Hiſtory of Naples," in four volumes 4to. The ſtyle is pure, but the freedom with which he diſcuſſed ſeveral topics relating to the origin of the papal power gave ſo much offence to the court of Rome, that he was obliged to exile himſelf from his native country. He found an aſylum with the king of Sardinia, who did not, however, dare to avow himſelf his protector, but choſe rather to repreſent his ſituation as that of a priſoner. Giannone died in Piedmont in 1748. Extracts from his hiſtory were afterwards printed in Holland under the title of "Anecdotes Eccleſiaſtiques." His poſthumous works were given to the world in a quarto volume, containing, among other miſcellaneous matter, his profeſſion of faith, and a juſtification of his hiſtory.

GIANOTTI, a performer on the double-baſe in the opera at Paris, from the year 1739 to 1767, who publiſhed, in 1759, a treatiſe built on the principles of Rameau, entitled "Guide du Compoſiteur," the Compoſer's Guide; a work much eſteemed by the followers of Rameau. The author of this tract having been long in the practice of explaining the ſyſtem of the fundamental baſe to his ſcholars, has drawn up his own work in a clear and intelligible manner.

GIANNUTI, in *Geography*, a ſmall iſland in the Mediterranean ſea, near the coaſt of Italy. N. lat. 42° 24'. E. long. 11° 20'.

GIANT, γίγας, a man of extraordinary, enormous ſtature and bulk.

The reality of giants, and of nations of giants, is much controverted among the learned. Travellers, hiſtorians, and relations, both ſacred and profane, furniſh various inſtances of them; a great part of which naturaliſts and antiquaries ſet aſide.

Thoſe among the ancients who ſpeak of giants, as hiſtorians, and affirm there were ſuch beings, are Cæſar, de Bello Gallico, lib. i. Tacitus, de Morib. Germanor. and Annal. lib. ii. Florus, lib. iii. cap. 3 St. Auguſtine, de Civit. Dei. lib. xv cap. 9. and Saxo-Grammaticus, at the end of his preface: among the moderns, Hieron. Magius, Miſcellan. de Gigantibus; Chaſſagonus, de Gigantibus; Kircher, Mund. Subterran. lib. viii. ſect. ii. cap. 4. and ſo many others, that Stephanus, in his notes on Saxo-Grammaticus, affirms, nothing can be more extravagant than to deny or allegorize the authorities we have concerning them.

Dr. Derham obſerves, that though we read of giants before the flood, Gen. vi. 4. and more plainly after it, Numb. [illegible] ly probable the ſize of man has always [illegible]; [illegible] to the [illegible], [illegible] taking them for [illegible]; as to thoſe, [illegible] of a gi- [illegible]

Be this as it will, it is manifeſt, that in both theſe places giants are ſpoken of as rarities and wonders of the age, not of the common ſtature: and ſuch inſtances we have had in all ages. But it is not at all improbable, that the firſt men were of a ſtrength and ſtature ſuperior to thoſe of mankind at preſent, ſince they lived a much longer time; long life being commonly the effect of a ſtrong conſtitution. There are many fabulous relations: ſuch as we take to be that of Theutobocchus, who is ſaid to have been dug up anno 1613, and to have been higher than the trophies, and twenty-ſix feet in height: and no better we ſuppoſe the giants to have been, of whom Ol. Magnus gives an account in his fifth book; ſuch as Harthen and Starchater, among the men; and among the women, "reperta eſt (ſaith he) puella—in capite vulnerata, mortua, induta chlamyde purpurea longitudinis cubitorum 50, latitudinis inter humeros quatuor." Ol. Mag. Hiſt. lib. v. cap. 2.

But, as for the more credible relations of Goliah (whoſe height was ſix cubits and a ſpan, (1 Sam xvii 4.) which, according to biſhop Cumberland, is ſomewhat above eleven feet Engliſh, of Og, king of Baſan, (Deut. iii. 11.) whoſe bed was nine cubits long and four wide, of Maximinus the emperor (who was nine feet high), and others in the reign of Auguſtus and other Roman emperors, of about the ſame height; to which might be added the dimenſions of a ſkeleton, dug up in the place of a Roman camp, near St. Alban's, by an urn inſcribed Marcus Antoninus, of which an account is given by Mr. Cheſelden, who judged, by the dimenſions of the bones, that the perſon was eight feet high, Phil. Tranſ. N° 333; theſe antique examples and relations, we ſay, may be matched, nay outdone, with modern ones; of which we have divers in J. Ludolph. Comment. in Hiſt. Æthiop. lib. ii. cap. 2. ſect. 22. Magius, Conringius, D. Hakewel, and others; the laſt mentioned writer ſpeaks from Nannez, of porters and archers belonging to the emperor of China, fifteen feet high, and of others from Purchas, of ten and twelve feet high, and more. See that learned author's Apol. p. 208.

The exiſtence of a race of men above the common ſtature, on the coaſt of Patagonia in South America, has been the ſubject of diſpute for the two laſt centuries. In one century almoſt all navigators, of every country, affirmed that there were ſuch perſons; and in the next the fact is denied by the greater number, and their predeceſſors are treated as timid or boaſting fabuliſts. The Ynca Garcilaſſo de la Vega, in his hiſtory of Peru, relates, that according to a tradition univerſally received, a number of veſſels or junks came to St. Helena with a company of giants on board, of a ſtature ſo enormous, that the natives of the country were not higher than their knees; that their eyes were as broad as the bottom of a plate, and their limbs proportionably large. But theſe are fables, ſimilar to thoſe relative to the ſame ſubject in other parts of the world. See Giants' *bones*.

Turner, the naturaliſt, reports that he had ſeen, near the river Plata, on the coaſt of Braſil, a race of giants, who went ſtark naked, one of whom was twelve feet high; but he acknowledges that he ſaw no others ſo tall. The ocular witneſſes on the affirmative ſide of the queſtion are, Magellan, Loaiſa, Sarmiento, and Nodal, among the Spaniards; Cavendiſh, Hawkins, and Knivet, among the Engliſh; Sebald, De Noort, Le Maire, and Spilberg, among the Dutch; and among the French, thoſe who went in the expedition from Marſeilles and St Maloes, in the year 1704.

Knivet affirms that he meaſured ſeveral dead bodies, which he found buried at Port Deſire, which were from fourteen to ſixteen ſpans high; and that he had frequently ſeen at Braſil one of the Patagonians, who, though a youth, meaſured no leſs than thirteen ſpans; and that the Engliſh priſoners at Braſil aſſured him, that they had ſeen many men of the ſame gigantic ſtature upon the coaſts of the ſtrait: this account is alſo confirmed by Sebal de Weſt, and Oliver de Noort. Aris

Claſz, a commiſſary on board Le Maire's fleet, declares that he found, in the ſepulchres on the coaſt of Patagonia, the bones of men who were between ten and eleven feet high. Nodal and ſir Richard Hawkins merely relate, that theſe ſavages were a head taller than the inhabitants of Europe, and of ſuch a ſtature, that the people on board their veſſels called them giants.

Thoſe who bear teſtimony to the contrary, are Winter, the Dutch admiral Hermite, Froger in De Gennes's Narrative, and ſir John Narborough. Sir Francis Drake alſo is ſilent with reſpect to the ſtature of the inhabitants of Patagonia; but Winter poſitively affirms, that the accounts of their being giants are falſehoods invented by the Spaniards. Narborough meaſured the ſkulls and the print of the feet of the ſavages on the coaſt of the ſtrait of Magellan, which, he ſays, were of the common ſize: and he had often ſeen companies of them at Port St. Julian, who were neither taller nor bigger than other men. However, it may be obſerved in general, that the greater part of theſe who hold the affirmative in this queſtion, ſpeak of people that inhabited the deſert coaſts of Patagonia to the eaſt and weſt; and that, on the contrary, thoſe who hold the negative, ſpeak of thoſe who inhabit the ſtrait upon the ſides of the utmoſt point of America to the north and ſouth. Frezier relates, not from his own knowledge, but from the teſtimony of eye-witneſſes, that there was, at a conſiderable diſtance within the country from the coaſt of Chili, an Indian nation, called by their neighbours Caucohues, who ſometimes came down to the Spaniſh ſettlements, that were more than nine feet high, and were the ſame race with the Patagonians who live on the eaſtern coaſt. It appears from various relations, that the inhabitants of the two borders of the ſtrait are of the common ſtature, and that the race, diſtinguiſhed by the name of Patagonians, make their conſtant reſidence upon the deſert coaſts, ſcarcely acceſſible to any but themſelves; and when European ſhips frequented the ſtrait, they removed and ſettled in the interior part of the country: however, the current teſtimony of late navigators, particularly commodore Byron, captain Wallis, and captain Carteret, will put an end to the doubts that have been hitherto entertained of the exiſtence of ſuch perſons. Commodore Byron, who viſited the coaſt of Patagonia, in 1764, ſpeaks of the inhabitants as of a gigantic ſtature; but he did not meaſure any of them, and only concluded, by the proportion of their ſtature to his own and that of his companions, that they could not be leſs than ſix and a half, or ſeven feet in height, and proportionably ſtrong and bulky. Captain Wallis had an interview with theſe people in 1766, and found, by meaſuring them, that the ſtature of the greater part of them was from five feet ten inches to ſix feet, though there were ſome who were ſix feet five and ſix feet ſix inches, and one who was ſix feet ſeven inches. Captain Carteret, who attended captain Wallis on this occaſion, confirms the above account in his letter to Dr. Maty. See Phil. Tranſ. vol. lx. art. 2. p. 20, &c. See Hawkeſworth's Voyage, vol. ii. Introd. and p. 28. 154.

Giants, *Rebel*, in *Ancient Mythology*, were the ſons of Terra, or the Earth, by Cœlus, who made war againſt Jupiter and the celeſtial deities, to avenge the defeat of the Titans. Theſe giants are repreſented as of an enormous height and ſize, having a wild and dreadful aſpect, and poſſeſſed of ſtrength proportioned to their bulk: each of them had a hundred hands, and ſerpents inſtead of legs. Being determined to dethrone Jupiter, they reared Mount Oſſa upon Pelion, and Olympus upon Oſſa, and from thence attacked the gods with huge rocks, ſome of which fell into the ſea and became iſlands, and others fell on the earth and formed mountains. Jupiter ſummoned a council of the gods, and being informed that it was neceſſary to obtain the aſſiſtance of ſome mortal, with the advice of Pallas he called up Hercules, and with the aid of this hero, exterminated the giants Enceladus, Polybotes, Alcyon, Porphyrion, the two ſons of Alœus, Ephialtus, Othus, Eurytus, Clytius, Tythyus, Pallas, Hippolitus, Agrius, Thoon, and Typhon, the laſt of whom it was more difficult to vanquiſh than all the others. Jupiter having thus gained a complete victory, caſt the rebels down to Tartarus, where they were to receive the full puniſhment of their enormous crimes: according to the account of ſome of the poets, he buried them alive under Mount Etna and different iſlands.

For the explication of this fable, ſome have ſuppoſed that Jupiter (for whoſe hiſtory, ſee Jupiter) deſtroyed the robbers that infeſted Theſſaly, and that theſe are the pretended giants; for we have already obſerved (in the preceding article) that the appellation "Nephilim," occurring in ſcripture, and tranſlated giants, ſignifies people addicted to all kinds of licentiouſneſs and violence, or robbers and ruffians. Jupiter, when he left Crete to viſit the other parts of Greece, uſually reſided on mount Olympus, where he had probably built a ſtrong citadel. This mount Olympus, highly elevated, was afterwards taken for heaven itſelf, and the moſt ancient poets, eſpecially Homer, ſo deſcribe it. The banditti now mentioned, determined in their attack on that prince, beſiege him in his citadel, which afterwards gave riſe to the fiction of their having attempted to ſcale heaven, and of their having made an aſſault upon it. It is added, that with this view they piled Oſſa upon Pelion, importing, as it is conjectured, that they had fortified theſe two mountains, which are alſo in Theſſaly, and at no great diſtance from Olympus, whither they retired after their excurſions, and kept Jupiter's garriſon in awe. For other particulars, ſee Banier's Mythology, vol. iii. See alſo Titans.

Giants' *Bones*, a name too haſtily given by the vulgar to certain bones and parts of ſkeletons, of an enormous ſize, found in England and other places. Of all the numbers of theſe, which have been publicly ſhewn about as wonders in nature, not one but has proved, on examination, a bone of an elephant, or elſe of a whale, or of ſome other terreſtrial or aquatic animal now perhaps extinct; the firſt, however, is uſually the caſe, as the bones of elephants are much more frequently found buried in the earth than thoſe of the whale.

Sir Hans Sloane mentions a vertebra of the loin of a whale ſent him from Oxfordſhire, where it was dug up under ground, and afterwards uſed as a ſtool to ſit upon, and vulgarly ſuppoſed part of a human back-bone. Now, if the whole ſize of the body had been calculated from this piece, the account would have preſented ſuch a ſize as would have far exceeded all the fabulous ſtories of giants' ſkeletons extant in the world.

Many ſkeletons of this kind have been found which have been called the ſkeletons of giants: ſuch are thoſe of Philoſtratus, which are ſaid to be the bones of men of twelve, twenty, and even thirty cubits high; that found in a mountain of Crete, and mentioned by Plato and Pliny, forty-ſix cubits high; another of ſixty cubits, found near Tangier in Mauritania, mentioned by Plutarch and Strabo, and ſuppoſed to be the ſkeleton of Anteus; the ſkeleton of Pallas, the ſon of Evander, found in Rome, and ſaid to be taller than the walls of that city; another, found in England in 1171, fifty feet long. St. Auſtin alleges, in proof of the exiſtence of giants before the flood, a grinder tooth, which he ſaw on the ſhores of Utica, which was in reality that of an elephant. The tooth in the church of St. Chriſtopher, at Hiſpulia, and the ſhoulder bone of St. Chriſtopher, preſerved in a church at Venice, are of the ſame kind. The tooth preſerved and ſhewn at Antwerp is only the grinder of an elephant; and another, belonging to a ſkeleton which was dug up near Tunis in 1630, was ſent to the learned Pierefc, who took the impreſſion of it in wax, and comparing it with the tooth of an elephant ſhewn near the place, found it to be of the ſame ſhape and ſize. Sir Hans Sloane has given an accurate and learned account of ſeveral other miſtakes on this ſubject, for which we muſt refer to the Philoſ. Tranſact. N° 404. However, Monſ. Le Cat, in a memoir read before the Academy of Sciences at Rouen, recites a number of inſtances, in which ſkeletons, or parts of ſkeletons, of an uncommon magnitude, have been found; theſe have been examined by anatomiſts, he ſays, and have been by them reputed real bones; and hence he infers the exiſtence of giants.

GIANTS *Cauſeway*, a name given in the county of Antrim, on the north coaſt of Ireland, to a vaſt quantity of that kind of baſaltes, (ſee BASALTES,) which ſtands in columns, and runs out a great way into the ſea.

The ignorance of the vulgar as to the nature of this ſtone, has occaſioned this great pile of it to be ſuppoſed artificial and the work of giants, once inhabitants there. But whoever conſiders this amazing ſeries of columns, will be ſoon convinced no human hands could have formed them, and will find an accuracy in their figures greater than could have been expected from the moſt curious hand. The length of the ſeveral columns, and their joints ſo regularly placed in ſeries, and the niceneſs of their articulations, by which no ſpace or vacuity is left between, are wonderful.

This cauſeway forms a kind of mole, or quay, projecting from the baſe of a ſteep promontory ſome hundred feet into the ſea; and the perpendicular columns of which it is formed exhibit an appearance not unlike a ſolid honey-comb. The ſingle columns are irregular priſms of from four to eight ſides; but the pentagonal and hexagonal are by far the moſt numerous, and, when examined, they are found juſt ſuch as muſt neceſſarily be required in the places where they ſtand to fill up between others, ſo as to leave no vacuity. Each of theſe columns is ſeparable into a ſeries of joints, each of which is ſo well fitted to the place, that the joining appears only a crack or crevice in the ſtone: yet theſe are regularly articulated, there being always a convexity on one part, and a ſocket in the other to receive it, ſo that the joints cannot ſlip off from one another; beſides which, the angles of one frequently ſhoot over thoſe of the other, ſo that they are completely locked together, and can rarely be ſeparated without a fracture of ſome of their parts. The depth of the concavity is generally about three or four inches. Theſe hollows are of great uſe to the neighbouring poor, for they make a kind of ſalt pans of them, and thus very eaſily procure themſelves a kind of bay-ſalt in ſummer. They fill theſe little baſons with ſea-water at high tides, and the heat of the ſun and of the ſtone contributing greatly to the evaporation, as well as the ſhallowneſs of the baſon, the whole humidity is found evaporated in the time of four tides, and they take out the ſalt ready for uſe. The length of thoſe joints is various; they are from eight to four and twenty inches long, and for the moſt part longer towards the bottom of the column; they are generally from fifteen to twenty inches in diameter.

The triangular and ſquare columns are fewer in number than the others, but they ſtand principally in the inner part of the large ſeries, and are ſeldom ſeen, unleſs ſearched after by a curious eye.

The regular figure of the ſtone, compoſing this cauſeway, is not more wonderful than its quantity. The whole country for many miles being full of it, and a vaſt maſs running far into the ſea: for, beſides what vulgarly goes by the name of the Giants Cauſeway, which is itſelf of vaſt extent, there are great numbers of the ſame pillars at diſtances in other places.

There are two other ſmaller and imperfect cauſeways to the left hand of the great one, and farther in the ſea, a great number of rocks ſhew themſelves at low water, which appear plainly all to conſiſt of the ſame ſort of columns. In going up the hill from the cauſeway there are found, in different places, a vaſt number of the ſame columns; but theſe do not ſtand erect, but are laid ſlanting upwards in different angles and directions. Beyond this hill, eaſtward, alſo, at ſeveral diſtances, there ſtand a great number of the ſame pillars, placed ſtraight and erect, and in cluſters of different ſizes. Theſe are ſeen ſcattered, as it were, over the ſeveral parts of the hills.

One parcel of them is much admired, and called by the country people the looms of the organs. It ſtands in an elegant form, and faces the bottom of the hill. The columns, of which this cluſter conſiſts, are about fifty in number, and they are ſo nicely put together, that the talleſt ſtand in the middle, and the ſhorter gradually on each ſide of it to the end, ſo that they look like the pipes of a church organ viewed from the front. The talleſt one of all theſe, which ſtands exactly in the centre, is forty feet high, and conſiſts of forty-four diſtinct joints.

What is emphatically called the Giants Cauſeway is, in fact, a ſmall portion of that vaſt baſaltic area, of which the promontories of Bengore and Fairhead conſiſt, and which extends over a great part of the neighbouring country. Theſe two great promontories, which have been examined by Hamilton and lately by Dr. Richardſon, ſtand at the diſtance of eight miles from each other, and are the leading features of the whole coaſt of Antrim. The former of them, ſituated about ſeven miles Weſt of Ballycaſtle, repreſents itſelf at a diſtance, and in profile, as an extenſive headland, running out from the coaſt a conſiderable length into the ſea; but, ſtrictly ſpeaking, it is made up of a number of leſſer capes and bays, the whole of which forms what the ſeamen denominate the headland of Bengore. Theſe capes are compoſed of a variety of different ranges of pillars and a great number of ſtrata, which, from the abruptneſs of the coaſt, are very conſpicuous, and form an unrivalled pile of natural architecture, in which all the neat regularity and elegance of art is united to the wild magnificence of nature. The promontory of Fairhead raiſes its lofty ſummit more than 500 feet above the ſea, forming the eaſtern termination of Ballycaſtle bay. It preſents to view a vaſt compact maſs of rude columnar ſtones, the forms of which are extremely groſs, many of them being near 150 feet in length, and of a coarſe texture. At the baſe of theſe gigantic columns lies a wild waſte of natural ruins, of an enormous ſize, which, in the courſe of ſucceſſive ages, have been tumbled down from their foundation by ſtorms, or ſome more powerful operations of nature. The maſſive bodies have ſometimes withſtood the ſhock of their fall, and often lie in groups and clumps of pillars, reſembling many of the varieties of artificial ruins, and forming a very novel and ſtriking landſcape. Beſides theſe two promontories, there are ſeveral other parts of the county of Antrim which exhibit a ſimilar columnar baſaltic ſtructure. Thus the mountain of Dunmull, between Coleraine and the river Buſh, abounds in ſuch baſalt, particularly at the craigs of Iſlamore, where two different ranges of columns may be diſcovered; they may be ſeen alſo at Dunluce-hill, near the caſtle of Dunluce; in the bed of the river Buſh, near the bridge of Buſh-mills; on the ſummit of the mountain of Croaghmore; in many parts of the high land over Ballintoy; in the iſland of Raghery, oppoſite Ballycaſtle, and various other places, through an extent of coaſt about fifteen miles in length and two in breadth. Beyond this tract, which abounds in perfect pillars, an attentive obſerver will be able to trace the ſame materials and ſtratification in very diſtant parts of the country, as far as the northern ſhore of Loughneagh, and the mountains of the county of Derry; in many places of which imperfect columnar forms may be obſerved; ſo that the great cauſe which generated this ſpecies of ſtone has been exerted through a ſpace of more than forty miles in length and twenty in breadth; that is, through above eight hundred ſquare miles.

Of the different varieties obſervable in the columns that compoſe the Giants Cauſeway and thoſe of the other parts of the coaſt, the following comparative view has been given by Mr. Hamilton. 1. With reſpect to form and magnitude: the pillars of the cauſeway are comparatively ſmall, not very much exceeding one foot in breadth and thirty in length; ſharply defined, neat in their articulation, with convex or concave terminations to each joint. In many of the capes and hills they are of larger ſize, more imperfect and irregular in their figure and articulations, having often flat terminations to their joints. At Fairhead they are of a gigantic magnitude, ſometimes exceeding five feet in breadth and a hundred in length; often apparently deſtitute of joints altogether. 2. With reſpect to ſituation: the pillars of the Giants Cauſeway ſtand on the level of the beach, from whence they may be traced, through all degrees of elevation, to the ſummit of the higheſt grounds in the neighbourhood, as at the old fort of Dunmull, and on the top of Croaghmore, ſix hundred feet at leaſt above the level of the ſea. 3. With reſpect to diſpoſition and arrangement: at the cauſeway, and in moſt other places, they ſtand perpendicular to the horizon; in ſome of the capes, and particularly near Uſhet harbour in the iſle of Raghery, they lie in an oblique poſition; at Doon-point, in the ſame iſland, and along the Ballintoy ſhore, they form a variety of regular curves. 4. With regard to colour and grain: the Giants Cauſeway baſalt is blackiſh, cloſe, and uniform; its varieties of colour are blue, reddiſh, grey; and of grain, all that can be ſuppoſed from extreme fineneſs to the coarſe granulated appearance of a ſtone, which reſembles imperfect granite abounding in cryſtals of ſhorl, chiefly black, though ſometimes of various colours. 5. With reſpect to texture: though the Giants Cauſeway baſalt be in general compact and homogeneous, yet the upper joint of each pillar, where it can with certainty be aſcertained, is always rudely formed and cellular. The groſs pillars alſo, in the capes and mountains frequently abound in theſe air-holes through all their parts, which ſometimes contain fine clay and other apparently foreign bodies: and the irregular baſalt beginning where the pillars ceaſe, or lying over them, is, in general, extremely honey-combed, containing in its cells cryſtals of zeolite, little morſels of fine brown clay, ſometimes very pure ſteatite, and in a few inſtances bits of agate.

The inland pillars, upon the whole, differ from thoſe which run into the ſea, and are called the cauſeway, only in the following particulars; ſome of the inland pillars are much larger than thoſe of the cauſeway, being two feet and a half in diameter, and among theſe there are only found ſuch as have three, four, five, and ſix ſides, none of them having yet been found to have ſeven or eight ſides, as many of thoſe of the cauſeway itſelf have. And, finally theſe inland pillars, though compoſed of as many joints as thoſe of the cauſeway, yet have not that curious articulation of the ball and ſocket, but are only joined by the laying one ſmooth ſurface on another; ſo that a joint of a ſingle column may be ſlipped off from the reſt, by a conſiderable force preſſing againſt it. There is ſomething like this obſervable alſo in ſome of the columns of the cauſeway itſelf; for among the numbers which are jointed by the ball and ſocket, there are ſome which only adhere by being applied ſurface to ſurface. This is found only in a few of the columns, however, and they always ſtand within the cluſters, and are compoſed of leſs than ſeven ſides. In theſe alſo the joint is not made by the application of two horizontal planes, but by ſuch as ſlant, ſo that it looks very like the breaking of an entrochus or aſteria.

The joints, as we ſee the pillars above the ſurface, are uſually as many in number as the pillar is feet high; but they are not regularly each of a foot long, for they are ſhorteſt at the upper part of the columns, and run gradually longer and longer as they approach the baſe. This is obſerved both in the inland columns, and in thoſe of the cauſeway; but though the length of the joints differs, their convexities and hollows are much the ſame in all parts of the column.

There are other baſaltic columns, ſimilar to thoſe above deſcribed, in our own iſland; particularly at Staffa, one of the weſtern iſlands of Scotland; in the mountain of Caderidris, near Dolgelly, in Merionethſhire; where they probably form a group as in other places. Mr. Strange has given an account of two groups of priſmatic baſaltine columns, which he diſcovered in the Venetian ſtate in Italy; one in Monte Roſſo, about ſeven miles nearly ſouth from Padua, and the other in Monte del Diavolo, near San Giovanni Illarime, about ten miles north-weſt of Vicenza. The form of the latter is nearly circular, reſembling that of the Giants' Cauſeway; that of the former approaching more to an oblong or oval figure: the columns of San Giovanni are much about the ſame ſize, and meaſure about a foot in diameter; thoſe of Monte Roſſo are very unequal, ſome being a foot, while others ſcarcely exceed three inches in diameter: thoſe of both theſe Venetian groups manifeſt all the varieties of priſmatic forms obſervable in the Giants' Cauſeway, and other ſuch groups; but they are commonly of five, ſix, or ſeven ſides, and the hexagonal form ſeems moſtly to prevail. The texture of the former ſort is ſolid and uniform; the ſurface ſmooth, and the internal parts of a dark iron-grey colour; thoſe of Monte Roſſo have a rough and knotty ſurface; and, when broken, manifeſt a variegated colour, and unequal texture of parts; reſembling an inferior ſort of granite, of which the mountain is formed, and which ſerves as a baſe for this range of columns. Other groups of articulated baſaltine columns have alſo been obſerved in the province of Velay and Auvergne in France; particularly by M. De Varennes, at Blaud near Langeac, and by M. Deſmarets, near le Mont d'Or; and M. Sage mentions another near St. Alcon, in the ſame province. Kircher has long ago deſcribed a group of the ſame columns near Viterbo in Italy. Mundus Subterran. lib. viii. § i. cap. 9, &c. And Mr. Strange mentions another at Caſtel Nuovo, in the Euganean hills, about four miles ſouth-weſt of that of Monte Roſſo.

For the various controverſies with regard to the origin of theſe baſaltic columns, and of the fletz-trap-rocks in general, ſee TRAP.

GIANTS' *Head*, in *Geography*, a cape on the eaſt coaſt of the iſland of St. Chriſtopher, a little to the eaſt of Ragged Point.

GIAR, a town of Perſia, in the province of Farſiſtan; 70 miles E. of Schiras.

GIAR, *Al.* See DSJAR.

GIAR *Alnahar*, in *Botany*, a name given by Avicenna, Serapion, and the reſt of the Arabian writers, to the potamogeiton of thoſe times. This is tranſlated by ſome the water-ruſh, but that is founded on an error: it is certain that the plant thus called by the Arabians was very different from the potamogeiton of our times. Avicenna tells us, it had flowers reſembling thoſe of the water-lily; and it ſeems either to have been the ſagitta aquatica or water arrow-head, or elſe the butomus, or ſome of the ſmaller ſpecies of nymphæa.

GIARAF, CAPE, in *Geography*, a cape on the coaſt of Tripoli. N. lat. 34°. E. long. 11°.

GIARDINI, FELICE, in *Biography*, in many reſpects the greateſt performer on the violin during the laſt century. He was a native of Piedmont; and when a boy was a choiriſter in the Duomo at Milan, under Paladini, of whom he learned ſinging, the harpſichord, and compoſition; but having previouſly manifeſted a diſpoſition and partiality for the violin, his father recalled him to Turin, in order to receive inſtructions on that inſtrument of the famous Somis. But though his preference of the violin, upon which he ſoon became the greateſt performer in Europe, ſeems a lucky circumſtance, yet he had talents which would have made him a ſuperior harpſichord player, had he continued to practiſe that inſtrument; but he uſed to ſay, that he was perfectly cured of that vanity at Paris, by the performance of Madame de S. Maur, a ſcholar of Rameau, who played in ſuch a manner, as not only made him aſhamed of his own performance, but determined him never to touch the inſtrument again in ſerious practice. He went to Rome early in his life, and afterwards to Naples, where, having obtained a place among ripienos in the opera orcheſtra, he uſed to flouriſh and change paſſages much more frequently than he ought to have done. "However," ſays Giardini, of whom we had this account, "I acquired great reputation among the ignorant for my impertinence; yet one night, during the opera, Jomelli, who had compoſed it, came into the orcheſtra, and ſeating himſelf cloſe by me, I determined to give the maeſtro di cappella a touch of my taſte and execution; and in the ſymphony of the next ſong, which was in a pathetic ſtyle, I gave looſe to my fingers and fancy; for which I was rewarded by the compoſer with a—violent ſlap in the face; which," adds Giardini, "was the beſt leſſon I ever received from a great maſter in my life." Jomelli, after this, was however very kind, in a different way, to this young and wonderful muſician.

Giardini came to England in the ſpring of 1750. His firſt public performance in London, at which we were preſent, was at a benefit concert for old Cuzzoni, who ſung in it with a thin cracked voice, which almoſt frightened out of the little theatre in the Hay-market the ſons of thoſe who had perhaps heard her at the great theatre in the ſame ſtreet, with extacy. But when Giardini played a ſolo and concerto, though there was very little company, the applauſe was ſo loud, long, and furious, as nothing but that beſtowed on Garrick had ever equalled. We had met him the night before at a private concert, with Guadagni and Fraſi, at the houſe of Napthali Franks, eſq. who was himſelf one of the beſt dilettanti performers on the violin at that time; and we were all equally ſurpriſed and delighted with the various powers of Giardini at ſo early a period of his life; when, beſides ſolos of his own compoſition of the moſt brilliant kind, he played ſeveral of Tartini's, in manuſcript, at ſight, and at five or ſix feet diſtance from the notes, as well as if he had never practiſed any thing elſe. His tone; bow; execution; graceful carriage of himſelf and his inſtrument; performing a MS. piece of a young compoſer in the room, he declared that Giardini had ſo improved it as to make it better than he intended, or had imagined it to be in the warm moments of conception; and laſtly, playing variations extempore, during half an hour, upon a new but extraordinary kind of birth-day minuet, which accidentally lay on the harpſichord—all this threw into the utmoſt aſtoniſhment the whole company, who had never been accuſtomed to hear better performers than Feſting, Brown, and Collet! Of his academy, ſcholars, manner of leading at the opera and oratorio, performance in private concerts, compoſitions vocal and inſtrumental, we ſhall ſay nothing here, leſt our praiſe ſhould be too much for others, and too little for ourſelves.

He ſoon got poſſeſſion of all the poſts of honour in this country. He was engaged and careſſed at moſt of the private concerts of the principal nobility, gentry, and foreign miniſters; at the Caſtle and King's-Arms concert in the city; and in 1754, he was placed at the head of the opera band; in which he introduced a new diſcipline, and a new ſtyle of playing, much ſuperior in itſelf, and more congenial with the poetry and muſic of Italy, than the languid manner of his predeceſſor Feſting; who, except one or two ſeaſons, when Veracini was at the head of the orcheſtra, had led the opera band from the time that Caſtrucci was diſmiſſed, till the arrival of Mingotti.

In 1756, on the failure and flight of the *Impreſario* or undertaker of the opera, Vaneſchi, the Mingotti, and Giardini joined their intereſts, and acquired for a while the ſovereignty of the opera kingdom, by which gratification of their ambition, theſe two great performers were ſoon brought to the brink of ruin, as others had been before them.

But though great applauſe was acquired, and appearances were favourable, yet the profits to the managers were ſo far from ſolid, that they found themſelves involved at the end of the ſeaſon in ſuch difficulties, that they were glad to reſign their ſhort-lived honours, and ſhrink into a private ſtation.

Giardini, while in the opera management, beſides arranging paſticcios, ſet ſeveral entire dramas; but though he had ſo great a hand on his inſtrument, ſo much fancy in his cadences and ſolos, yet he had not ſufficient force or variety to ſupply a whole evening's entertainment at the Lyric theatre. Yet after he had reſigned his throne in the orcheſtra, he frequently threw in a ſingle air or rondeau into the operas of other maſters, which was more applauded than all the reſt of the drama; of this kind were the favourite airs of "Voi amanti," and "Ah non ſo perche tu ſei, &c."

In 1762, on Mattei quitting the management of the opera, in ſpite of former miſcarriages, Giardini and Mingotti again reſumed the reins of opera government. But after ſtruggling two years againſt the ſtream, during the decline of Mingotti's favour, and after an inauſpicious ſeaſon, at the end of 1763, Giardini and his partner again abdicated their thrones. From this period, Giardini, always hovering over his former Lyric kingdom, without the power of invading it, or bringing about a reſtoration, was forced to content himſelf with teaching ladies of rank and faſhion to ſing, and the produce of a great annual benefit. He continued here, unrivalled, as a leader, a ſolo player, and a compoſer for his inſtrument, ſtill augmenting the importance of his inſtrument and our national partiality for the taſte of his country, till the admirable productions and great performers of Germany began to form a Teütonic intereſt and Germanic body here, which, before Giardini's departure from London, became very formidable rivals to him and his Roman legion.

At the end of 1784, he went to Italy, and reſided a conſiderable time at Naples, with ſir William Hamilton, one of his firſt ſcholars on the violin after his arrival in England.

Remaining on the continent till the ſummer of 1789, Giardini returned to this country, bringing with him a female pupil and her whole family, attempting a burletta opera at the little theatre in the Haymarket, while the great opera-houſe, which had been burned down, was rebuilding; but his *prima donna* not being approved, their ſpeculation failed, and he had her and her whole family on his hands. During his abſence the public had learned to do without him, and reconciled themſelves to his loſs; his health, hand and eyes were impaired; he was dropſical, his legs were of an enormous ſize, and little of his former ſuperiority on his inſtrument remained, but his fine tone. He compoſed quartets that pleaſed very much, but in which he never played any other part in public than the tenor. The ſtyle of muſic was changed; he printed many of his old compoſitions which uſed to pleaſe; but now could gain neither purchaſers nor hearers, ſo that about the year 1793, he went to Peterſburg with his burletta troop; which ſeems to have pleaſed as little there and at Moſcow, as in London; and he is ſaid to have died in this laſt city in great wretchedneſs and poverty!

But before we try to account for this melancholy termination of ſo brilliant a career, let us endeavour to do juſtice to his profeſſional abilities.

It is the buſineſs of every artiſt to endeavour to arrive at the head of his profeſſion during the age in which he lives, but no one can be expected to aſpire at ſuperiority over all mankind, paſt, preſent, and to come. Homer, our own Shakeſpeare, and Milton, have, perhaps, ſucceeded in that wiſh, if ever they formed it, and Dryden and Pope have gained two out of three of theſe eras. If Giardini has been ſurpaſſed by a few in taſte, expreſſion, and execution, his tone and graceful manner of playing are ſtill unrivalled, nor does any one, of all the admirable and great performers on the violin, ſurpaſs all others ſo much at preſent, as Giardini did, when at his beſt, all the violiniſts in Europe.

That a man with ſuch talents and intellects as art and nature ſcarcely ever allowed to the ſame individual, who might have realized 40 or 50,000*l.*, ſhould, by extravagance, caprice, and a total want of benevolence and rectitude of heart, die a beggar, unfriended and unpitied, is ſcarcely credible! It is painful to probe the private character of ſuch a man; yet it ſhould not be concealed. Truth and morality require it to be recorded. The kings of Egypt uſed to be tried after their deceaſe.

And if young muſicians of great talents, who are prone to deviate from propriety of conduct, ſhould chance to read this article, it may ſerve as a beacon, and remind them of the poſſibility of ſurviving favour and talents, however great, and terminating their exiſtence in miſery and mortification.

A reſpectable profeſſor, who, from Giardini's firſt arrival in England, was conſtantly attached to him, and a ſincere admirer of his talents, his wit, and even the ingenuity of his ſpleen and ſpite; before he quitted this country in 1784, delineated his character in the following manner, a copy of which came lately to our hands, accidentally.

Sketch of the private character of a great muſician.—"There exiſts a man who would rather gain half a crown by ſuperior ſubtilty and cunning, than a guinea by uſual and fair means; who is of ſo difficult a commerce, that the utmoſt circumſpection, attention, and complaiſance, can only prevent an open rupture, but never put him off his guard, or warm his heart with the fainteſt glow of friendſhip; ſo capricious and ſplenetic, that he has had diſagreements and quarrels with all the firſt perſonages, as well as profeſſors of the ſame art, in the nation, with whom he has had any intercourſe; yet ſuch are his talents, and entertaining qualities, that, in a ſhort time, all elſe is forgotten, and thoſe whom he had offended, are as ready to court his acquaintance as ever; though his rank in his profeſſion and great abilities ſhould ſet him above the envy and petulance of indigent inferiority; yet the ſucceſs of any one of his acquaintance is as torturing and intolerable to his mind, as the gout or ſtone could be to his body. He can bear no muſician who does not ſolely depend on his favour, whom he can lift up and put down with a *coup de baguette*, bring into light, or extinguiſh, at pleaſure. He ſeems, himſelf, to deſpiſe all favour from ſuperiors or even equals, yet he is conſtantly at war with favourites of every kind, public and private. His diſpoſition is ſo truly diabolical, that, preferring the evil principle of the Manicheans to the good of the Chriſtians, if it is a matter of indifference to his intereſt, whether he ſhall ſerve or injure an individual, he would always chuſe the latter. He has conſtantly trifled with fortune as well as favour, and having, in the courſe of his life, acquired great ſums, is indigent, and though ſo much courted, has not one friend; with the brighteſt intellects, and the cleareſt head for buſineſs, his temper renders it ſo impoſſible for any enterprize to thrive under his direction, that the moſt favourable and auſpicious beginnings conſtantly ended in enmity and misfortune. He is as inveterate and powerful an enemy to the opera, oratorio, pantheon, and public and private concerts, when they are not under his direction, as an ex-miniſter uſually is to the government; and yet, notwithſtanding the attractions of his performances, abilities as a compoſer, and experience as a manager, ſo much are his tricks and tyranny held in abhorrence by patentees and proprietors, that they would ſhut their ſhops, rather than open them by his aſſiſtance. His intereſt is now as totally annihilated in the nation, as that of the Stuart family, who, whatever convulſions or revolutions were to happen in the ſtate, would never be called into power."

GIARECAN, in *Geography*, a town of Grand Bucharia; 45 miles N. of Veſhgerd.

GIARGA, a town of the iſland of Corſica; nine miles E. of Calvi.

GIARITCHAS, a group of ſmall iſlands, among the Moluccas. N. lat. 0° 3'. E. long. 127° 18'.

GIARMAL, a town of Hungary; 20 miles E.S.E. of Levens.

GIAROLA, in *Ornithology*. See Alauda *italica*.

GIAROLO, a name by which a ſmall bird of the ſnipe kind, remarkable for its white tail, is known in the markets of Italy. Aldrovandus has called it the *cinclus tertius*. See Tringa *ochropus*.

GIARUD, in *Geography*, a town of Perſia, in the province of Kerman; 20 miles W. of Rauand.

GIARURA, a town of the kingdom of Candahar; 25 miles S.W. of Candahar.

GIASAN, a town of Perſia, in the province of Segeſtan; 25 miles N.E. of Kin.

GIAT, a town of France, in the department of the Puy-de-Dôme; 27 miles W. of Clermont.

GIAVENNA, a town of France, in the department of the Po, ſituated at the foot of the Cottian Alps, near the Sangou; ſurrounded with an ancient wall having four gates, and diſtinguiſhed by its agreeable ſituation and ſalubrious air; 15 miles W. of Turin.

GIAUF, Al, a diſtrict of Egypt, in the S.E. part of the Delta.

GIAVI, a town of the iſland of Sardinia; 21 miles E.S.E. of Algeri.

GIAUKIRI, a town of Aſiatic Turkey, in Natolia, anciently "Sigeum," chiefly inhabited by Greeks.

GIAZA, a town of Italy, in the Veroneſe; 14 miles N.N.E. of Verona.

GIB, in *Agriculture*, a ſort of ſtick with a hook at the end, which is ſometimes uſeful in making and repairing hedges, and for various other purpoſes.

Gib, in *Mechanics*. See Crane.

Gibs, or *Tokings*, in *Mining*, are pieces of wood from two to four or more feet long, with a bird's-mouth or notch cut in each end, that are placed as ſtruts between the four upright poles, at the corners of ſquare or rectangular ſhafts, which are ſupported with wood, inſtead of being ginged or bricked.

GIBAU, in *Geography*, a town of Moravia, in the circle of Olmutz; eight miles N.E. of Olmutz.

GIBBAWAYS, an Indian tribe reſiding in Upper Canada, on the E. ſide of Detroit river, oppoſite to fort Gibraltar.

GIBBEN, a town of the duchy of Courland; 32 miles N.E. of Piltyn.

GIBBETHON, in *Scripture Geography*, a city of Dan, allotted to the Levites (Joſh. xxi. 23.); probably the ſame as *Gabbata*; 12 miles from Eleutheropolis. Here they ſhewed the tomb of the prophet Habbakuk.

GIBBON, Edward, in *Biography*, was born at Putney in 1737. His father was a gentleman of fortune, and ſome years member of parliament. The ſubject of this article was a very delicate and ſickly child, inſomuch that his parents had but little hope of rearing him. From nine years of age to twelve, he was under the tuition of Dr. Woodeſon at Kingſton-upon-Thames. Here he acquired the elements of claſſical learning, and he mentions his twelfth year as particularly "propitious to the growth of his intellectual ſtature," becauſe at this period he read a variety of Engliſh books of poetry, romance, hiſtory and travels. "He then went to Weſtminſter ſchool, but his ill ſtate of health prevented him from making a regular progreſs in the ſtudies of the place. For ſeveral years he was chiefly the object of medical care, till at length, and, as it were, very ſuddenly, his conſtitution acquired firmneſs, and his father immediately ſent him, as gentleman-commoner, to Magdalen college, Oxford. He was probably ill prepared to receive the benefits of an univerſity education, and he ſtigmatiſes the fourteen months that he ſpent there as the moſt idle and unprofitable of his whole life. To a total neglect of religious inſtruction he has attributed a very remarkable incident which took place at this time. He had from an early age been addicted to diſputation on topics of divinity. His leiſure from other purſuits induced him to turn his attention to the controverſies between the Papiſts and Proteſtants. His mind was overſet by the arguments of the former, and in 1753 he had an interview with a popiſh prieſt in London, when he ſolemnly abjured the errors of Proteſtantiſm. He immediately wrote an elaborate letter to his father, in which he avowed the change in his ſentiments, and juſtified the meaſure which he had taken. With all the zeal of a new convert he has ſince declared, "I am proud of an honeſt ſacrifice of intereſt to conſcience: I can never bluſh if my tender mind was entangled in the ſophiſtry that ſeduced the acute and manly underſtandings of Chillingworth and Bayle." He was ſent by his father to Lauſanne, and placed with a Calviniſt miniſter, by whoſe judicious efforts, aided by his own ſound reaſon and mature reflections, his faith in the Romiſh articles gradually gave way, and on Chriſtmas day 1754, he received the ſacrament in the Proteſtant church. During the time he ſpent at Lauſanne, he laid the foundation of that knowledge in the languages, and in the art of logic, which enabled him to make ſo conſpicuous a figure in the literary world. To the "Hiſtory of the Decline and Fall of the Roman empire," we have had occaſion frequently to recur for an elucidation of facts, we may therefore be allowed to ſpeak ſomewhat at large of the author of that work. His ruling paſſion, that of reading, completely developed itſelf in Switzerland, and he wanted no excitements to induſtry, from a tutor. Belles lettres, and the hiſtory of man, and the human mind, were his favourite objects of ſtudy; for the mathematics he had no inclination, and what he did not, and perhaps could not purſue, he was ready to condemn, and congratulated himſelf that he eſcaped from them "before his mind was hardened by the habit of rigid demonſtration, ſo deſtructive of the finer feelings of moral evidence." That this view of the effect of mathematical ſtudies was unjuſt, might be proved from a variety of inſtances in which the ableſt mathematicians have been equally celebrated for their fine taſte and excellent judgment in other branches of literature. In the year 1758 he returned from Lauſanne to London, where he was kindly received by his father, and he found in a mother-in-law, a new relative, who in time conciliated his good will and confidence. He now began laying the foundation of a copious library, and ſoon ſet about preparations for appearing before the public as an author. In 1761, he printed his "Eſſai ſur l'Etude de la Litterature," in one volume 12mo. It was a very reſpectable juvenile performance, and was highly praiſed in the foreign journals. At home it obtained but a ſmall ſhare of public notice. While he was compoſing this work, at leaſt before it was publiſhed, he was engaged in the military profeſſion, which was but ill calculated for a perſon of his turn. The peace, in 1763, ſet him free from a commiſſion which he had held in the militia, and he immediately paid a viſit to Paris, and having ſpent ſome months in that capital, he went to Lauſanne, where he paſſed a year in cultivating ſociety, and in collecting materials for a profitable journey into Italy. This he undertook in 1765, and it was, as he ſat muſing amidſt the ruins of the capitol, while the friars were ſinging veſpers in the temple of Jupiter, that the idea of writing his great work, *viz.* "The Hiſtory of the Decline and Fall of this City," ruſhed into his mind. He had, previouſly to this, proceeded ſome way in another intereſting deſign, and compoſed, in the French language, the firſt book of a Hiſtory of the Swiſs liberty; but this, perhaps on account of its ſtyle, was condemned by a literary ſociety of foreigners in London, to whom it was read, and he committed it to the flames. In 1767, he aſſiſted in compiling a critical work, entitled "Memoires Litteraires de la Grande Bretagne," the ſucceſs of which was but trifling. In 1770 he publiſhed, in his native tongue, a pamphlet, entitled "Critical Obſervations on the ſixth book of the Æneid," which was intended as a refutation of Dr. Warburton's hypotheſis concerning the meaning of the deſcent of Æneas; and in the ſame year, by the death of his father, he ſucceeded to an eſtate conſiderably involved, and from the perplexities of which he ſcarcely ever extricated himſelf. His circumſtances were, however, well ſuited to the taſk he had undertaken as an author: for he thought himſelf, that had he been either much poorer or much richer, he ſhould never have accompliſhed it. Leiſure and books were neceſſary on the one hand; on the other, the ſtimulus of a handſome increaſe of property. His acquaintance was large, but he compenſated the hours devoted to them by early riſing and cloſe application. In 1774, he was, through the intereſt of Mr. Eliot, introduced to a ſeat in parliament, which he occupied during eight years, and gave, ſays he, many a ſilent vote in ſupport of the rights, though not, perhaps, the intereſt of the mother country. Early in 1776 the firſt volume of his "Hiſtory" made its appearance; its ſucceſs was very great, and far ſurpaſſed the moſt ſanguine expectations of the author: "The firſt impreſſion," ſays he, "was exhauſted in a few days; a ſecond and a third edition were ſcarcely adequate to the demand, and the bookſeller's property was twice invaded by the pirates of Dublin." It was received with general applauſe, but the praiſes of none were ſo keenly reliſhed by Gibbon, as thoſe of the two celebrated hiſtorians, Hume and Robertſon, who, inſtead of viewing his riſing fame with jealouſy, promoted it with liberal commendation. In the midſt of his triumph, his two chapters, concerning the growth and progreſs of Chriſtianity, raiſed a ſtorm againſt him, which, as he had not foreſeen, he regarded with ſome alarm He was attacked on all ſides, but as he profeſſed to have written only as a hiſtorian, he declined entering the liſts as a controverſialiſt. In one inſtance his fidelity, as an hiſtorian, was attacked; here he felt that he was called on for a "Vindication," in which it was admitted that he ſucceſsfully repelled the principal charges, and returned them on his antagoniſt. It was ſuggeſted, in the two chapters referred to, that the progreſs of Chriſtianity was peculiarly favoured by ſecondary cauſes, and of courſe that its origin was not divine: though this theory had not been deſtitute of advocates among ſincere believers in the truth of the Chriſtian ſyſtem, yet there is little doubt that Gibbon was an unbeliever, and he wrote in this part of his work under the maſk of a friend. His pretenſions were unveiled by many excellent writers, who ranked high in the eſtabliſhed church, and by others who were not in the church, but who were equally alive to the ſpread of ſceptical principles, and active in oppoſing their propagation. After he had reſumed his work, he was ſolicited by miniſters to write an anſwer to the manifeſto of the court of France, on its declaration of hoſtilities. On this occaſion he publiſhed his "Memoire Juſtificatif;" it was written in French, and much admired for its ſtyle and its reaſoning, and was delivered, as a ſtate paper, to the courts of Europe. For this ſervice he was rewarded with the appointment of one of the Lords of Trade, by which a handſome addition was made to his income, and little to his engagements. In 1781 the ſecond and third volumes of his Hiſtory appeared, which ſupported the reputation which he had already acquired. Upon the diſſolution of lord North's miniſtry, the board of Trade was aboliſhed, as occaſioning only an uſeleſs expence to the ſtate. The defalcation in Mr. Gibbon's income no longer permitted him to ſupport the ſame ſtyle of living in his own country, and he removed his reſidence to Lauſanne: here, in an elegant retreat, he finiſhed his Hiſtory, in three other quarto volumes, which were publiſhed in 1788. It was with real regret that he diſmiſſed an occupation, which had given to many years of his life that zeſt which an intereſting object of purſuit can alone impart. He came to England to ſuperintend the printing of his work, and then returned to Lauſanne, to ſpend, as he hoped, the remainder of his days; but the ſtorms of the French revolution, which menaced the quiet and happy regions of Switzerland, gradually looſened his attachment to Lauſanne, and he began to look towards England for a refuge. He regarded the events that were taking place in France with the utmoſt abhorrence, and he either was, from habit, or had become ſo from the occurrences of the times, a decided enemy to every ſpecies of public reform. He avowed his aſſent to Mr. Burke's creed, which he had vindicated in his "Reflections:" "I admire," ſays he, "his eloquence, I approve his politics, I adore his chivalry, and I can almoſt excuſe his reverence for church eſtabliſhments." Mr. Gibbon returned to England in 1793, but after a few months reſidence his attention was forcibly called to the progreſs of a diſeaſe, which had ſubſiſted in a ſmall degree for thirty years, and which now terminated his exiſtence, Jan. 16, 1794. He has characterized himſelf in the following words: "I am endowed with a chearful temper, a moderate ſenſibility, and a natural diſpoſition to repoſe rather than activity; ſome miſchievous appetites and habits have, perhaps, been corrected by philoſophy or time. The love of ſtudy ſupplies each day, each hour, with a perpetual ſource of independent and rational pleaſure." "He was," ſays his biographer, "eaſy in ſociety, and fond of it; he was beloved by his friends, and had, in an eminent degree, the manners and habits of a gentleman. Early indulgence and habit had made the conveniences and elegances of cultured life eſſential to his comfort, and he was not one who could have been content with the conſciouſneſs of mental ſuperiority in an humble ſtate. His great work, which will long be a monument to his fame, is a performance of vaſt and accurate reſearch, and of enlarged and philoſophical thinking: it abounds in ſplendid paſſages, and its ſtyle diſplays a thorough maſtery of the whole compaſs of the Engliſh language." After his death two quarto volumes of his miſcellaneous works were publiſhed by lord Sheffield, containing, among other things, memoirs of his life and writings, compoſed by himſelf; to which the reader is referred for more particulars relating to this celebrated man.

GIBBONS, Orlando, without exception, the beſt compoſer for the church during the reign of king James I. and though not bleſt with longevity, yet, during his ſhort life, he contributed amply to the muſic of the church, which he enriched with numerous compoſitions, that are ſtill freſh and in conſtant uſe among the beſt productions within its pale.

This excellent muſician, a native of Cambridge, was brother of Edward Gibbons, bachelor of Muſic, organiſt of Briſtol, gentleman of the Chapel Royal, and maſter of Mathew Lock; and of Ellis Gibbons, author of two madrigals in "the Triumphs of Oriana," who is ſtiled by Ant. Wood, "the admirable organiſt of Saliſbury." In 1604, at the age of twenty-one, Orlando was appointed organiſt of the Chapel Royal, in the room of Arthur Cock. In 1622, he was honoured at Oxford with a doctor's degree in muſic, at the ſame time as his friend Dr. Heyther, when both were countenanced and favoured with indulgencies in the univerſity in conſequence of letters from the learned Camden, who recommended them with friendly zeal to its notice. According to Ant. Wood, the academical exerciſe in ſix or more parts, performed at this time for Heyther's degree, was compoſed by Orlando Gibbons, "as one or more eminent muſicians then living had ſeveral times told him." So that *grown-gentlemen*, as well as boys, through idleneſs or ignorance, are ſometimes reduced to the humiliating neceſſity of having recourſe to the charity of friends, before they can exhibit an exerciſe.

A manuſcript copy of the exerciſe performed for Dr. Heyther's degree, is ſaid to have been found, ſigned with the name of Orlando Gibbons. It is an anthem for eight voices, taken from the forty-ſeventh pſalm; and appears to be the very ſame compoſition as the anthem of Orlando

Gibbons, to the words "O clap your hands together all ye people." Printed in Boyce's Cath. Muſ. vol. ii. p. 59.

The harmony in Gibbons's ſervice in F, printed by Dr. Boyce, is pure, clear, and grateful; and the melody more accented and flowing than we have found in any choral muſic of equal antiquity.

The two parts in one, of the *Gloria Patri*, though they may be the cauſe of ſome confuſion in the words, diſcover no reſtraint or ſtiffneſs in the melody, which continues to move with the ſame freedom, as if no *canon* had exiſtence. And though the *puriſts*, on account of the confuſion ariſing from all the parts ſinging different words at the ſame time, pronounce the ſtyle, in which his full anthems are compoſed, to be vicious; yet the lovers of fugue, ingenious contrivance, and rich, ſimple, and pleaſing harmony, muſt regard them as admirable productions, *alla Paleſtrina*, a ſtyle in which Tallis and Bird acquired ſo much renown.

Beſides his admirable choral compoſitions, O. Gibbons was author of melodies in two parts to the hymns and ſpiritual ſongs of the church, tranſlated by George Withers, and of ſeveral other works which are mentioned elſewhere. See FANTASIA and PARTHENIA.

Dr. Tudway, in the dedication of the firſt volume of his manuſcript "Collection of the moſt celebrated Services and Anthems uſed in the Church of England," addreſſed to Lord Harley, for whom it was made; after a juſt and warm eulogium on the abilities of Tallis and Bird, ſays that "none of the later compoſers could ever make appear ſo exalted a faculty in compoſitions for the church, except that moſt excellent artiſt, Orlando Gibbons, organiſt and ſervant to king Charles I. whoſe whole ſervice, with ſeveral anthems, are the moſt perfect pieces of church compoſitions which have appeared ſince the time of Tallis and Bird; the air ſo ſolemn, the fugues and other embelliſhments ſo juſt and naturally taken, as muſt warm the heart of any one, who is endued with a ſoul fitted for divine raptures." To this encomium every candid judge of harmony will readily ſubſcribe; but when the doctor tells us, that the celebrated ſervice in F was compoſed by Orlando Gibbons in 1635, he furniſhes no very favourable proof of his knowledge in chronology; as it is recorded on the monument erected to his memory by his widow, that he died ten years before that period. For in 1625, being commanded, *ex officio*, to attend the ſolemnity of the marriage of his royal maſter, Charles I. with the princeſs Henrietta of France, at Canterbury, for which occaſion he had compoſed the muſic, he was ſeized with the ſmall-pox, and dying on Whitſunday, in the ſame year, was buried in that cathedral.

GIBBONS, *Dr.* CHRISTOPHER, was the ſon of Orlando Gibbons, and ſcholar of his uncle Ellis Gibbons, organiſt of Briſtol. He had been honoured with the notice of Charles I. and was of his chapel. At the reſtoration, beſides being appointed principal organiſt of the Chapel Royal, private organiſt to his majeſty, and organiſt of Weſtminſter Abbey, he obtained his doctor's degree in muſic at Oxford, in conſequence of a letter written by his majeſty Charles II. himſelf, in his behalf, which is inſerted by Ant. Wood in the Faſti Oxon, vol. ii. Col. 158; who ſays, that he completed his degree in an act celebrated in St. Mary's church, July 11, 1664.

The compoſitions of this maſter, which were not numerous, ſeem never to have enjoyed a great degree of favour; and though ſome of them are preſerved in the Muſeum collection, they have long ceaſed to be performed in our cathedrals. His abilities on the organ, however, muſt have been conſiderable, to entitle him to the ſtations he filled, at a time when the ſtyle of playing that inſtrument was ſo much more complicated and elaborate than at preſent. Dr. Blow, who, in ſinging and compoſition, was educated by Captain Cook, is ſaid to have been a ſcholar on the organ of Dr. Chriſtopher Gibbons, who died 1676.

Orlando Gibbons had two brothers, Edward and Ellis, the one organiſt of Briſtol, and the other of Saliſbury. Edward was a Cambridge bachelor of muſic, and incorporated at Oxford, 1592. Beſides being organiſt of Briſtol, he was prieſt-vicar, ſub-chanter, and maſter of the choiriſters in that cathedral. He was ſworn a gentleman of the chapel, March 21, 1604, and was the maſter of Matthew Lock. In the Triumphs of Oriana, there are two madrigals, the one in five, and the other in ſix parts, compoſed by Ellis Gibbons. Wood ſtyles him the admired organiſt of Saliſbury. Of Edward Gibbons, it is ſaid, that in the time of the rebellion he aſſiſted king Charles I. with the ſum of one thouſand pounds; for which inſtance of his loyalty, he was afterwards very ſeverely treated by thoſe in power, who deprived him of a conſiderable eſtate, and thruſt him and three grand-children out of his houſe, though he was more than fourſcore years of age.

GIBBOSITY, in *Surgery*. See SPINE, *Curvature of*.

GIBBOUS, in *Aſtronomy*, is uſed in reference to the enlightened parts of the moon, while ſhe is moving from full to the firſt quarter, and from the laſt quarter to full again; for all that time the dark part appears horned, or falcated, and the light one bunched out, convex, or gibbous.

GIBBOUS *fiſh*, *gibboſus piſcis*, in *Ichthyology*, a name given by Mr. Ray to the fiſh called by the Dutch *kromrugh*. It is a ſmooth fiſh without ſcales, its belly is white, its fins and tail black. It grows to a conſiderable ſize, ſometimes to four feet. It is caught all over the Eaſt Indies, near the ſea ſhores, and is very firm, and much eſteemed at table. It has its name from the remarkable riſing of its back, which is like that of the perch, but much higher. Ray's Ichthyolog Append. p. 4.

GIBBY, in *Geography*, a cluſter of ſmall iſlands, in the Eaſt Indian ſea, about twelve leagues in circumference, well inhabited, ſituated on the equator. E. long. 126° 5′.

GIBE', a town of Arabia, in the province of Nedſjed; 130 miles E. N. E. of Hajar.

GIBEAH, in *Scripture Geography*, a city of Benjamin, the birth-place of Saul, the firſt king of Iſrael. (Joſh. xviii. 24 Ezra ii. 26. Nehem. vii. 30.) Gibeah was about two leagues N. from Jeruſalem. In Jerome's time it was entirely deſtroyed.

GIBEL-EL-TOR, a mountain of Paleſtine, anciently called *Mount Tabor*, which ſee.

GIBELET, or GABYLE, a ſea-port of Syria, anciently called "Gabala" and "Gabulon," ſituated on the coaſt of the Mediterranean, at the mouth of the river Jebilee; 12 miles S.S.W. of Tripoli.

GIBELIN, a town of Paleſtine; eight miles E. of Gaza.

GIBELINS, GIBELLINS, *Gibellings*, or *Ghibelins*, a famous faction in Italy, oppoſite to another called the Guelphs.

The Guelphs and Gibelins ravaged and laid waſte Italy for a long ſeries of years: ſo that the hiſtory of that country, for the ſpace of three centuries, is only a detail of their mutual violences and mortal wars.

The Guelphs ſtrenuouſly aſſerted the power of the ſee of Rome, as the Gibelins did the emperor's right of ſovereignty.

We have but a very obſcure account of their origin, and the reaſon of their names: the generality of authors affirm, that they aroſe about the year 1240, upon the emperor Frederic the IId's being excommunicated by pope Gregory IX.

That prince, ſay they, making a tour among the cities of Italy, gave the name Gibelins to ſuch as he found well affected to him; and that of Guelphs to thoſe who adhered to the pope. But as to the reaſon and ſignification of theſe words, there is a deep ſilence; Gibelin might be poſſibly formed of *gebieter, imperator;* whence *gebieteriſch, imperioſe.* Of *gebieter,* the Italians might make, by corruption, Gibelin; ſo that Gibelins, in this light, ſhould be the ſame with Imperiales, or ſuch as followed the emperor's party.

By the way, ſome writers maintain, that the two factions aroſe ten years before; though ſtill under the ſame pope and emperor.

Other hiſtorians relate, that Conrad III. marching into Italy, in the year 1139, againſt the Neapolitans, Roger, count of Naples and Sicily, in order to defend his ſtates, called to his aſſiſtance Guelph duke of Bavaria; and that one day, when the two armies were ready to join in battle, the Bavarians cried out in High Dutch, *hie, Guelph!* or, as others ſay, in Flemiſh, *hier, Guelph!* that is, *here, Guelph!* and that the Imperialiſts anſwered on their ſide, with the words *hie,* or *hier, Gibelin! here, Gibelin!* calling the emperor by the name of the place where he had been bred.

Hornius refers the names to the war in 1140, between Henry the Proud, duke of Bavaria and Saxony, and Conrad III. duke of Suabia; the two princes preparing to engage near the town of Winſberg, the Bavarians began to cry out Guelph, which was the name of duke Henry's brother; and the partiſans of the emperor Weibelingen, which was the name of the place where that prince was born and bred, in the duchy of Wirtemberg, whoſe ſurname he bore: from which Weibelingen the Italians at length formed Gibelin.

This account is confirmed by Martin Cruſius: "Initium Gibelinæ (Wibelinæ à patria Conradi regis) et Welficæ concertationis." Conrad being of Weibelingen, that word, ſays Cruſius, gave riſe to *gibellingue,* and that to *gibelling, Gibelins, Gibellini.*

Platina, on the other hand, aſſures us, that the name Gibelins aroſe from that of a German at Piſtoya; whoſe brother, named Guelph, gave likewiſe his name to the oppoſite faction: the two brethren, it ſeems, bearing an irreconcileable hatred. Others maintain, that the emperor gave the appellation Gibelins to thoſe of his party, from the German word *gipffe',* ſignifying *ridge,* or *top;* becauſe the empire reſted on them, as the rafters of a houſe leans on the ridge, which joins them a-top.

Karus, a learned canon of Straſbourg, in the lives of the emperors of the houſe of Brunſwick, is of the ſecond opinion above related: in a battle, ſays he, between Welff, or Guelff, and Frederic, the army of the firſt crying out, *hie, Welf, hie, Welf!* the ſecond commanded his to cry out *hie, Gibeling! hie, Gibeling!* the name of his birth-place: and the French and Lombards aſking the ſignification of thoſe words, they were anſwered, that by *Welff* was meant the pope's party; and, by *Gibelin,* the emperor's.

Yet others contend, that the word Gibelin is only a ſoftening of the word *gibertin,* or *guibertin;* and that it aroſe from Guipert, an antipope, ſet up by the emperor Henry III. in the year 1080.

Among many other conjectures, Maimbourg, in his Hiſt. de la Decad. de l'Emp. advances another opinion, that the two factions, and their names, aroſe from a quarrel between two very ancient and illuſtrious houſes on the confines of Germany, that of the Henrys of Gibeling, and that of the Guelphs of Adorf. See Machiavel.

It is ſaid by ſome, that the Gibelins, when driven out of Italy long after the year 1229, at which period the conteſt between them and the Guelphs ran very high, and ſettled at Amſterdam, were the inventors of the mercantile practice of re-change, or re-exchange, on bills of exchange, on account of the damages and charges they were put to, and the intereſt of the money of their bills proteſted, which had been given to them for the effects they had been obliged to leave behind them. Anderſon's Hiſt. Commerce, vol. i. p. 110. See GUELPHS.

GIBELLO, in *Geography,* a town of the duchy of Parma, on the right bank of the Po; 16 miles N.W. of Parma. N. lat. 45° 1'. E. long. 10° 7'.

GIBEON, in *Scripture Geography,* the capital city of the Gibeonites, who availed themſelves of the oaths of Joſhua, and of the elders of Iſrael, on an artful repreſentation which they made of their belonging to a remote country. (Joſh. ix.) Joſhua and the elders made an unadviſed league with them; but upon a diſcovery of their miſtake, they ſpared their lives, and condemned them to the ſervile office of carrying wood and water to the tabernacle, and other work of a ſimilar kind, in token of their puſillanimity and duplicity, as ſlaves and captives. In this ſtate of ſervitude they remained till the entire diſperſion of the Jewiſh nation, A.M. 2553. The Gibeonites were deſcended from the Hivites, the old inhabitants of the country, and poſſeſſed four cities, *viz.* Cephira, Beeroth, Kirjath-jearim, and Gibeon, the capital, afterwards given to Benjamin, excepting Kirjath-jearim, which was aſſigned to Judah. The Gibeonites ſubmitted to the burthens impoſed upon them by Joſhua, and continued faithful to the Iſraelites. Nevertheleſs Saul deſtroyed a very great number of them (2 Sam. xxi. 1, 2, 3, &c.); but God, as a puniſhment of his cruelty, in the reign of David, cauſed a great famine, which laſted three years (A. M. 2983. B. C. 1017); and David was informed by the prophets, that this calamity would continue as long as that cruelty, which Saul had exerciſed againſt the Gibeonites, remained unretaliated. The Gibeonites, being aſked what ſatisfaction they required, anſwered, "Seven of Saul's ſons will we put to death, to avenge the blood of our brethren." Accordingly the Gibeonites crucified them in the beginning of ſpring, when, in Paleſtine, the barley-harveſt commenced. From this time we find no mention of the Gibeonites, as forming a ſeparate people. But they were probably included among the "Nethinim," who were public ſlaves appointed for the ſervice of the temple. (1 Chron. ix. 2.)

Gibeon was ſeated on an eminence, as appears by its name, denoting a hill; it was 40 furlongs N. from Jeruſalem, according to Joſephus. It is called "Gabæa" (ſee 2 Sam. v. 25, compared with 1 Chron. xiv. 16.) We find mention of the fountain and pool of Gibeon. (2 Sam. ii. 13.) The tabernacle and altar of burnt offerings, made by Moſes in the wilderneſs, were removed to Gibeon. (1 Chron. xxi. 29, 30.) When Solomon was ſeated on the throne, he went to ſacrifice at Gibeon, becauſe this was the moſt conſiderable of all the high places where ſacrifices were then tolerated, the temple not being yet built. (1 Kings, iii. 4.)

GIBERT, BALTHASAR, in *Biography,* was born at Aix in 1662. He was educated partly at Paris and partly at Soiſſons. At the age of twenty-two he was appointed to teach philoſophy at the college of Beauvais, and in 1688 he obtained the profeſſorſhip of rhetoric in the college of Mazarin at Paris, which office he filled with great reputation more than fifty years. He was a zealous defender of the privileges of the univerſity, of which he was ſeveral times choſen rector. He obtained other preferments connected with the univerſity, but on account of his oppoſition to the revocation of an appeal made by the univerſity againſt the bull Unigenitus, the court, in 1740, exiled him to Auxerre. He died in the following year at the age of ſeventy-nine. He was author of many works, in which are diſplayed much erudition and ſolidity of judgment, but the ſtyle is ſomewhat involved. Among his publications are "De la veritable Eloquence;" "Reflexions ſur la Rhetorique;" "Jugemens des Savans ſur les Auteurs qui ont traitè de la Rhetorique," in three volumes 12mo. Moreri.

GIBERTI, Giammateo, a very learned prelate of the church of Rome, was born at Palermo towards the cloſe of the fifteenth century. He viſited Rome when he was but twelve years of age, where he was diſtinguiſhed for the brilliancy of his talents, and was introduced to pope Leo X. who entertained a great regard for him. He had a thirſt for polite literatute, but was, at an early age, taken from the purſuit, and placed in the ſervice of a perſon of high rank. By pope Clement VII. he was employed in ſome very important legations to the king of France and other potentates. In 1523 he obtained from his patron the government of Tivoli, and in the following year he was created biſhop of Verona: he was not, however, allowed to take poſſeſſion of his ſee, but was kept at Rome as the adviſer and friend of the pope. In 1527 Giberti was given as one of the hoſtages by the pope to the Imperial army, on which occaſion he underwent much ill treatment, and was more than once threatened with a ſhameful death. He was, at length, through the interpoſition of his friend, Cardinal Pompeo Colonna, reſtored to his liberty, and retired to his biſhopric, on which he continued to reſide till his death, except when occaſionally ſummoned to Rome by Paul III. He died in 1543, and his works, which were numerous, have been publiſhed collectively; they chiefly conſiſt of his conſtitutions and regulations for the government of his church, which under his direction became a model of eccleſiaſtical diſcipline. He eradicated many abuſes, and was profuſe in alms to the poor. He was the patron of learned men who reſorted to his palace, among whom was the celebrated poet Flaminio. He printed at his own expence, and under his own eye, ſeveral works of the fathers, and in order to render his editions correct, he entertained ſeveral Greek copyiſts. Moreri.

GIBET, or Gibbet, a machine in manner of a gallows whereon notorious criminals, after execution, are hung in irons, or chains: as ſpectacles, in terrorem.

The word in French, *gibet*, properly denotes what we call *gallows*: it is ſuppoſed to come originally from the Arabic *gibel*, *mount*, *elevation of ground;* by reaſon gibets are uſually placed on hills, or eminences.

GIBLETS, the offals or entrails of a gooſe; including the heart and liver, with the feet, gizzard, &c.

The word is ſuppoſed to be formed of *goblets*, from the French *gobeau*, *mouthful*.

Giblets make a conſiderable article in cookery: they boil giblets, ſtew giblets, make ragouts of giblets, giblet-pies, &c.

GIBLIEN, in *Geography*, a town of Egypt, on the left bank of the Nile; 14 miles N. of Aſna.

GIBLOS, a city on the coaſt of Phœnicia, between Tripoli and Berytus; called alſo *Byblos*, which ſee.

GIBON, a town of the iſland of Cuba; 22 miles N.N.E. of Bayamo.

GIBRALEON, a town of Spain, in the province of Seville, on the river Odiel, with a harbour for ſmall fiſhing veſſels; containing about 150 houſes in two pariſhes, and ſituated about 10 miles from the Atlantic; 44 miles W. of Seville. N. lat. 37° 20′. W. long. 7° 1′.

GIBRALTAR, derived from *Gebel*, an arabic word ſignifying mountain, and *Tarik*, the name of a Mooriſh general, who conquered Spain and diſembarked here in the year 712, is a town of Spain, in the province of Andaluſia, but belonging to Great Britain, ſituated on a rock, at the ſouthern extremity of Europe, and reckoned one of the keys of Spain. This rock forms a promontory from Spain into the ſea, oppoſite another promontory extending from Africa, bounding a narrow ſea, which unites the Atlantic with the Mediterranean, called in Latin "Fretum Herculaneum, or Gaditaneum," and in Engliſh the *Straits of Gibraltar*. The length is about eight leagues, and the breadth, in the narroweſt parts, nearly five. On theſe two promontories are placed the famous mountains of Calpe in Europe, and Abila in Africa, known to the ancients by the name of the pillars of Hercules. From the top of the promontory of Calpe, the eye commands an extent of 40 leagues, two ſeas, and five kingdoms, *viz.* Seville and Granada, in Spain, and Barbary, Fez, and Morocco, in Africa. In endeavouring to trace the town mentioned by Mela, Strabo, and Pliny, under the names of Calpe, Cartheya, Melaria, Belo, and Beſipo, and alſo the promontory of Juno, ſituated from eaſt to weſt on the ſhore of the ſtraits, no veſtige is perceived, except the mountain and ſcite of Cartheya; which latter city paſſed from the poſſeſſion of the Phœnicians to that of the Carthaginians, and is now reduced to a mere heap of ruins, ſcarcely diſcernible in the bay of Gibraltar, where the Carthaginian tower was alſo ſituated. This ground is now occupied by a mean farm. On caſting your eyes over the kingdoms of Granada and Seville, you ſee the lofty ridges of the deſert del Cuervo, as well as the mountains of Hogen and Sanorra, and towards the eaſt, oppoſite to Gibraltar, the new town of Algeziras. In the middle of this incloſure you diſtinguiſh the ruins of Great Cartheya; at a ſhort diſtance, on a little hill, the town of St. Roche is ſituated; on the eaſt you perceive the chain of mountains, called the Sierra de Ronda, abounding in fruits and aromatic plants. Near theſe ſtood the town of Munda, ſo celebrated in Roman hiſtory as the ſcene of the battle between the ſons of Pompey and Auguſtus, when they were diſputing the empire of the world. The objects which bound the horizon on the right are the Sierra Neveda, and the Alpujarras; on which the ſnow lies all the year. The mountains ſupply a number of fountains and rivulets of clear water, forming the ſources of the Xenil and the Darro; rivers which water the city of Granada and give fertility to the rich province of Andaluſia.

The promontory on the European ſide is joined to Spain by an iſthmus, or neck of land, ſo narrow, that from ſome aſpects the rock has the appearance of an iſland. The length of the iſthmus is about 200 paces; acroſs which the Spaniards have drawn a line and fortified it, to prevent the garriſon from having any communication with the country.

The form of the rocky mountain, on which the fortreſs of Gibraltar is built, is oblong; its ſummit is a ſharp craggy ridge, extending nearly from N. to S., almoſt three miles, and in breadth no where exceeding $\frac{3}{4}$ of a mile. The line of its ridge is undulated, and the two extremes are ſomewhat higher than the centre. The ſummit of the Sugar-loaf, which is the higheſt point towards the ſouth, is elevated to the height of 1439 feet; the Rock-mortar, which is the higheſt eminence to the north, is 1350 feet; and the Signal-houſe, which is nearly the central point between theſe two, is 1276 feet above the level of the ſea. The weſtern ſide of the mountain forms a ſeries of rugged ſlopes, interſperſed with abrupt precipices. Its northern extremity is perfectly perpendicular, except towards the N. W., where what are called the Lines intervene, and a narrow paſſage of ground that leads to the iſthmus, and is entirely covered with fortification. The eaſtern ſide of the mountain moſtly conſiſts of a range of precipices; but a bank of ſand, riſing from the Mediterranean in a rapid acclivity, covers a third of its perpendicular height. Its ſouthern extremity falls in a rapid ſlope from the ſummit of the Sugar-loaf into a rocky flat of conſiderable extent, called Windmill Hill. The principal maſs of the mountain rock conſiſts of a grey, denſe marble; the different beds of which preſent to Spain a face of 1350 feet of perpendicular height, in a conical form. Theſe beds, or ſtrata, are of various thickneſs, from 20 to upwards of 40 feet, dipping in a direction from eaſt to weſt, nearly at an angle of 35 degrees. In ſome parts of the ſolid maſs of this rock, we find teſtaceous bodies entirely tranſmuted into the conſtituent matter of the rock, and their interior hollows filled up with calcareous ſpar; but theſe do not occur often in its compoſition, and its beds are not ſeparated by any intermediate ſtrata. This rock is ſuffering a ſlow, but conſtant depoſition; and the uncovered parts of it preſent holes of various ſizes, hollowed out of the ſolid rock, and apparently formed by the attrition of gravel or pebble, ſet in motion by the rapidity of rivers or currents in the ſea; whence it is preſumed, that, however high the ſurface of this rock may now be elevated above the level of the ſea, it has once been the bed of agitated waters. On the weſt ſide of the mountain, towards its baſe, ſtrata occur, which are of a different kind from the mountain rock. (See Major Imrie's mineralogical Deſcription of Gibraltar in the Tranſactions of the Royal Society of Edinburgh, vol. iv.)

The firſt, or higheſt, forms the ſegment of a circle, its convex ſide being towards the mountain, and its ſlope being in that direction. This ſtratum conſiſts of a number of thin beds; the outward one, which is the thinneſt, is in a ſtate of decompoſition, and is mouldering down into a blackiſh-brown or ferruginous coloured earth. The beds below this increaſe progreſſively in breadth to 17 inches, where the ſtratification reſts upon a rock of an argillaceous nature. This laſt bed, which is 17 inches thick, conſiſts of quartz of a blackiſh-blue colour, in the ſepta or cracks of which are found quartz cryſtals, colourleſs and perfectly tranſparent. Theſe cryſtals are compoſed of 18 planes, diſpoſed in hexangular columns, terminated at both extremities by hexangular pyramids. The largeſt ſeen by major Imrie, did not exceed one-fourth of an inch in length; they generally adhere to the rock by the ſides of the column, but are detached without difficulty. Their great degree of tranſparency has obtained for them the name of "Gibraltar diamonds." The rock is completely beſet with batteries, thrown up at all points, where the aſcent could not be rendered completely inacceſſible; ſo that from Europa Point, which advances fartheſt into the ſea on the ſouth ſide, to the higheſt part of the rock, which is that of the north (at about two miles diſtance from the other), there is not a ſingle point, which is not put into a defenſible condition. On the ſide neareſt Spain, the internal fortifications, made ſince the time Gibraltar was beſieged by the combined armies of France and Spain, are aſtoniſhing. Theſe improvements are principally owing to general O'Hara, the late governor; a great number of workmen having been employed about it, for eight years, at an immenſe expence. In order to form ſome idea of the labour expended on theſe fortifications, it will be ſufficient to obſerve, that the excavations effected by the force of gun-powder, in the centre of the mountain, and in the ſolid rock, form vaults of ſuch height and extent, that during a ſiege they are capable of containing the whole garriſon. Theſe caverns, of which the moſt conſiderable is the hall of St. George, communicate with the other batteries, eſtabliſhed along the mountains by a winding road, paſſable on horſe-back. On returning towards Europa Point, as you enter the town, your attention is engaged by conſiderable fortifications, barracks, magazines, and batteries, placed wherever the nature of the ground would admit. On the higheſt point of land the tower of St. George was built, under the directions of general O'Hara, who intended to raiſe it to a ſufficient height for commanding the whole of Cadiz, and obſerving all that paſſed in that port; but the undertaking, being diſapproved by the Britiſh government, was left in an unfiniſhed ſtate. Along the mountain are ſeveral grottos, or natural excavations, the moſt famous of which is that of St. Michael; the height of the entrance being 437½ (varas) yards above the level of the ſea. The cavern below is at leaſt 70 feet, and contains columns of cryſtallizations and ſtalactites, reſembling all the orders of architecture. About 100 paces from its gate is another beautiful cavern, 65 varas ſquare, and the vault 21 varas high. On the right is a ſecond excavation, adorned with caprices of nature ſimilar to thoſe of the former, but ſo regularly diſpoſed, that it has the appearance of a temple. Perhaps this was formerly uſed for conſulting ſome oracle, probably that of Hercules, who was the principal divinity of the place, as well as of the cave in the promontory of Ampeluſia, on the coaſt of Africa. From the entry of this cavern you diſcover the whole of the bay of Gibraltar, two leagues acroſs from eaſt to weſt, and three from north to ſouth. You alſo command a view of the country-houſes, the flower and kitchen gardens, which the inhabitants have formed one above the other, on the ſide of the mountain, up to the royal road, and the public walk, extending for about half a mile from the town of Gibraltar to the new town on the ſouth. The Engliſh have ſpared no pains in covering the rock with trees and flowers, in ſupporting the earth with walls and props, in cutting a number of roads through the ſolid rock, and in making them paſſable on horſe-back and in carriages up to the very ſummit. They have even ſome artificial meadows for their flocks. From the grotto of St. Michael, ſituated on the ſouthern part of the mountain, at an almoſt equal diſtance, the Signal tower and the Sugar loaf, the entrance of which is 5000 feet above the level of the ſea, you diſcover the magazines, the batteries, the new town; on the ſouth, the marine hoſpital, which is a handſome and convenient building. The view extends over a number of country-houſes, to ſome of which beautiful gardens are attached; in time theſe new buildings will form a town as conſiderable as that of Gibraltar. Near theſe are eight magnificent ciſterns, large enough to contain 40,000 tons of water, and bomb-proof; they receive all the water which flows down the ſide of the mountain, previouſly purified in coppers erected for the purpoſe. On the ſouth ſide you perceive a number of mountains, called Tarfes; and near them formerly ſtood a very ancient tower, with a ciſtern and well. In a cave not far diſtant ſeveral ſtones have been found with human bones above the common ſize, ſo ſtrongly incruſted in them as to form one ſolid maſs. (See *Foſſile* Bones.) From Europa Point to the gate on the land-ſide are ſeveral moles, which facilitate the unloading of ſhips, and enable them to caſt anchor in ſecurity. Before you arrive at the ſouth gate you obſerve a handſome, large, ſquare, ſurrounded with trees, now called the Field of Mars, formerly the Red Sand; of ſuch a ſize, that the 6000 men, uſually compoſing the garriſon, can perform their manœuvres without inconvenience. Here the guard always muſters, and on Sundays and holidays they make it the grand parade.

The prevailing forms of religion in this promontory are the Catholic, that of the church of England, and the Jewiſh, each of which has its own burying ground, among the ſandy earth of the mountain.

The town of Gibraltar is on the weſt ſide at the foot of the mountain; it is large, well built, fortified with ſtrong walls, baſtions, and works to cover them; a large fort protects and maſks the mole, built in the form of a bridge, 300 feet long; a church is built near it; and on the land ſide is another mole, which covers the part fortified by a fort with a tower, and two or three breaſt-works, thrown up in front. On entering the town by the ſouth gate, you perceive on the left an edifice, containing the library of the officers of the garriſon; conſiſting chiefly of the works of modern authors. The governor's houſe is built on the ground formerly occupied by the convent of Franciſcans; to which is attached a beautiful garden, which, on Thurſday and Sunday evenings, during the ſummer, is the promenade of the officers of the garriſon and inhabitants of the city. The principal ſtreet into which you enter on leaving the governor's houſe, is the reſidence of the merchants, and on the right is the Catholic chapel, rebuilt in an excellent ſtyle of architecture; this ſtreet extends almoſt through the whole length of the city, being more than half a mile long, and on each ſide it has handſome flat pavements, and a number of ſhops from one end to the other. All the houſes are built in the Engliſh ſtyle, with ſmall doors, flat roofs, and enormous bow windows, behind which the prime goods of all ſorts are expoſed to ſale. The inhabitants are chiefly military; the commerce with Africa is neither certain nor regular; and although the contraband trade with Spain, both in money and goods, is one of the principal branches of trade, that cannot be ſufficient (ſays La Borde) to indemnify England for a million and a half of piaſtres, which on an average it coſts annually to maintain this point in the Mediterranean, where in other reſpects the duties collected are very ſmall. This place is advantageouſly ſituated for victualling the fleets, and the protection of the coaſt of Africa, from whence the Engliſh procure their corn, and as a place of refuge for their privateers and ſloops of war. The port is a key to the Mediterranean and to the Atlantic; conſuls from all the ſtates of Europe and North America uſually reſide there. The Americans, as well as the Swedes, Danes, and Dutch, in time of peace, carry on a direct commerce with Gibraltar, by ſupplying themſelves with the articles they want, and leaving in exchange ſnuff, cod, pitch, and tar, maſts, rum, maize, rice, flour, ſugar, pepper, ginger, cotton, aniſeed, and the other articles of commerce, which they procure from Aſia, Africa, and Europe. The coaſts of Granada, Seville, and Catalonia, furniſh wine, and Africa wax and freſh meat in great quantities; they alſo import from Spain brandy, raiſins, almonds, oranges, lemons, ſilks, ſalt, &c. which the veſſels from the north carry back in exchange. Gibraltar contains altogether 9000 inhabitants, including eight regiments, amounting to 6000 men; ſo that this place is rather a military colony than a commercial eſtabliſhment. The population of Gibraltar extends one mile to the ſouth, and nearly as much towards the top of the mountain; and if we may judge from the new buildings lately erected, it is certainly increaſing. All the houſes are painted black on the outſide, with white borders or ledges, ſhewing the number of ſtories, which are generally two or three. This mode is well ſuited to a country where the reflection of the ſun is ſo violent. The police is well conducted; no beggars are to be found here; the ſtreets are preſerved clean and ſalubrious; and though they are all well lighted at night, no one is allowed to walk without a lanthorn, and a permiſſion from the general; ſentinels requiring anſwers to their challenges being ſtationed in the town, as well as patroles and watchmen. All forms of religion are tolerated without inconvenience, and the number of Jews, who live here more ſecurely than in any other part of Europe, is very conſiderable. Gibraltar has a theatre, which, though ſmall, is well laid out and adorned with taſte. For want of regular actors, the officers of the garriſon perform, during the greater part of the year, a number of Engliſh plays.

On the oppoſite ſide of the ſtraits of Gibraltar is the town of Ceuta. The traveller, who wiſhes to croſs over into Africa, may take advantage of the N.W. winds, and of the ſmall veſſels which are continually paſſing and repaſſing.

The origin and foundation of this town are loſt in the obſcurity of time. It is certain, however, that the Phœnicians, the Egyptians, and other ancient people, landed at Gibraltar; and the name of the pillars of Hercules, by which this place was known, is nothing more than a tradition preſerved among the Phœnicians, who peopled this coaſt, and brought their gods and religious worſhip with them. But it is not known whether the ſtraits or columns exiſted in the remoteſt antiquity, and if the inſcription "non plus ultra" meant that nothing was more wonderful than the ſeparation of the two continents, or, as is more probable, that no one had dared to navigate beyond this point. However this be, it is probable that the firſt navigators of the Mediterranean landed at Gibraltar, or its environs. This opinion is ſupported by the authority of Pomponius Mela, who, being born at Cadiz, may be ſuppoſed to feel more intereſt than others in whatever related to this coaſt. The Moors ſeized on Gibraltar in the eighth century, and held it without interruption till the fourteenth, when, in the year 1310, it was taken from them by Perez de Guzman; but they retook it in the year 1332, and held it till the year 1462, when it was retaken by the Spaniards, and it has continued in the hands of the Chriſtians from that time. The Engliſh took it from the Spaniards during the war of the ſucceſſion in Spain; the fort ſurrendered to the united fleet of England and Holland under ſir George Rook, in 1704; and the allies took poſſeſſion of it in the name of Charles III. The place was ceded to the Engliſh by the treaties of Utrecht and Seville; it was beſieged at ſeveral times without ſucceſs. Since the Engliſh have been maſters of the place it has been ſo much improved and ſtrengthened, as probably to bid defiance to the utmoſt efforts of an enemy. In the courſe of the American war, the Spaniards again beſieged it; but their memorable attack with floating batteries of upwards of 200 cannon, in ſhips of all ſizes, terminated only in diſappointment, in the deſtruction of the ſhips and men employed, and in the immortal honour of the brave defenders: 16 miles N. of Ceuta, 70 S. of Seville. N. lat. 36° 4′ 44″. W. long. 5° 19′ 46″.

GIBRALTAR, an ancient town of South America, in the government of Caraccas, and province of Venezuela, ſituated on the E. coaſt of the lake Maracaybo. The country in its vicinity is well watered with rivers, and furniſhes cocoa of the beſt quality, and very large cedars. The beſt Spaniſh tobacco is produced here, called Tobago de Maraſaibo, from which is made the valuable ſnuff, vulgarly called "Mackaba" ſnuff. The air is very inſalubrious in the rainy ſeaſon, and therefore the merchants and planters retire at that time to Maracaybo, or Merida; 100 miles S.S.E. of Maracaybo. N. lat. 10° 4′ W. long. 67° 36′.

GIBRALTAR *Point*, is the weſtern extremity of a ſandbank, in Upper Canada, which forms the harbour of York, and upon which block-houſes are erected for its defence. There is another place of this name on the ſide of lake Memphramagog, in the town of Bolton, in Upper Canada.

GIBRIN, a town of Syria; 10 miles S.E. of Aleppo.

GIBSON, RICHARD, in *Biography*, the Dwarf, was placed by a lady at Mortlake, to whom he was page, with Francis de Clyne to learn to paint, both in water and in oil; but he informed himſelf more by ſtudying the works of Lely, and gained conſiderable reputation.

GIBSON, EDWARD, in *Biography*, was born at Bampton, in Weſtmoreland, in the year 1669. He received the early part of his education at the free-ſchool in his native town, and at the age of ſeventeen he was ſent to Queen's college, Oxford. In 1691 he was admitted to the degree of B. A., and in the ſame year, having already applied himſelf moſt diligently to the ſtudy of the northern languages, he publiſhed a new edition of William Drummond's Polemo-Middiana, and James V. of Scotland's Cantilena Ruſtica, quarto, illuſtrated with notes. In 1692, he gave a tranſlation in the Latin language, together with the original, of the "Chronicon Saxonicum;" likewiſe a work entitled "Librorum Manuſcriptorum in duabus inſignibus Bibliothecis, altera Dugdaliana Oxonii, Catalogus," with a dedication to Dr. Tenniſon, afterwards archbiſhop of Canterbury, which proved the foundation of the author's ſubſequent fortune under the auſpices of that prelate. He next publiſhed a correct edition of Quintilian "De arte Oratoria;" and a new edition of Somner's treatiſe on the Roman ports and forts in Kent. In 1694 Mr. Gibſon commenced A.M., and ſhortly afterwards was elected fellow of his college, and admitted into deacon's and prieſt's orders. In 1695 he publiſhed an Engliſh tranſlation of "Camden's Britannia." This work was patronized by lord Somers, who offered Mr. Gibſon a living in the iſle of Thanet, which he declined, on account of ill-health, and in the following year he was appointed librarian at Lambeth, by the archbiſhop, Dr. Tenniſon, who received him into his family, and who appointed him morning preacher at Lambeth church. His publications about this period were, "Vita Thomæ Bodleii, Equitis Aurati," together with "Hiſtoria Bibliothecæ Bodleianæ:" alſo, "Reliquiæ Spelmannianæ; being the poſthumous works of ſir Henry Spelman, relating to the Laws and Antiquities of England, together with the Life of the Author." He was now appointed domeſtic chaplain to the archbiſhop, through whoſe means he obtained the lectureſhip of St. Martin's in the Fields, and was preſented to the rectory of Stiſted in Eſſex. His promotion in the church went on rapidly, but it did not render him indifferent to the cauſe of literature, and in 1713 he publiſhed his celebrated work, entitled "Codex Juris Eccleſiaſtici Anglicani; or the ſtatutes, conſtitution, canons, rubricks, and articles of the church of England, methodically digeſted under their proper Heads, &c." The ſcheme of church power vindicated in this volume was excepted againſt, not only by diſſenters, but by the ſoundeſt and moſt conſtitutional lawyers within the pale of the church; who maintained that the principles and claims advanced in it would be ſufficient, if acted upon, in their utmoſt extent, to eſtabliſh a ſacerdotal empire, which muſt draw all power to itſelf, and render the civil magiſtrate its miniſter and dependent. In 1715 our author, who had taken his degree of D.D., was conſecrated biſhop of Lincoln, and in 1723 he was tranſlated to the ſee of London. In this ſituation, on account of the weak health of Dr. Wake, then archbiſhop of Canterbury, almoſt every thing relating to the affairs of the church was confided to him. His great zeal for the eſtabliſhed religion, and his oppoſition to the diſſenters, who were endeavouring to obtain the repeal of the Corporation and Teſt acts, leſſened him in the eſtimation of the prime miniſter, ſir Robert Walpole; and he was, about the ſame time, rendered obnoxious to men in power, by ſeveral attacks on the principles in his "Codex," which the authors contended were inimical to the civil conſtitution of this country, and favourable to a ſpirit of intolerance and perſecution. Of theſe attacks, one of the moſt able was conducted by the recorder of Briſtol, afterwards Mr. Juſtice Foſter, at the deſire of lord Hardwicke, lord chief-juſtice of the court of king's bench. Biſhop Gibſon's conſtitution was naturally ſtrong and vigorous, but he exerciſed it with almoſt inceſſant labours, ſo that, at length, it might be ſaid to be fairly worn out by his ſtudies and exertions. For ſome time before he died, he became ſenſible that his end was approaching, and in 1748 he breathed his laſt at Bath, being in his ſeventy-ninth year. Beſides the works already enumerated, the biſhop was author of ſeveral others, highly eſteemed by the learned. He wrote and publiſhed many paſtoral letters, addreſſed to the clergy and laity of his dioceſe, intended to oppoſe the growth of infidelity and enthuſiaſm: ſome viſitation charges, occaſional ſermons, and ſmall tracts againſt the prevailing vices of the age. Theſe ſmaller pieces have been frequently reprinted, and it is ſaid that the biſhop received more real ſatisfaction on account of the repeated demand for his practical works, than from the honours conferred on him by his larger and more learned treatiſes. He poſſeſſed the ſocial principles in an eminent degree, and his beneficence and charity were very extenſively, though privately, exerciſed. An inſtance of liberality is recorded, which redounds greatly to his honour: Dr. Crow had left him by his will 2500*l.* which biſhop Gibſon freely gave to Dr. Crow's own relations, who were in indigent circumſtances. Biog. Brit.

GID, or GIDDY, in *Rural Economy*, a morbid condition occurring in ſheep and ſome other animals, in which there is a conſtant vertigo or turning round. The affection is generally conſidered as a kind of hydrocephalus, or encyſted collection of watery matter in the head, between the dura and pia mater.

It has, however, been ſuggeſted by ſome as depending upon a worm or maggot under the horn on either ſide of the head; in ſupport of which Mr. Collins has been informed of cows having the diſeaſe, and being cured by having a perforation made near the horn, and the worm or maggot taken out; but this is no doubt another ſort of diſorder.

Some farmers conſider this complaint as the moſt common among ſheep that are richly fed, and know it by the name of the *ſturdy evil*, the cure being attempted by the uſe of ſmall bleeding and aſſafœtida; and in order to guard againſt a relapſe, the ſheep ſhould be put into a hilly or elevated paſture.

Among the graziers in the county of Lincoln the diſeaſe is known by the terms *ſturdy*, and *bladder on the brain*, and in its remedy a ſort of trepanning proceſs is had recourſe to, by which great numbers of ſheep are ſuppoſed to be ſaved. The perſon who performs the operation raiſes the ſcalp with a ſtrong hooked knife juſt over the part affected, to the extent of about half a crown piece, after which, nearly the ſame extent of the ſkull-bone is elevated, letting it hang as by a hinge on one ſide; then by means of a quill, cut ſlanting to a point, in the form of a ſpear, and hacked on each ſide, the bladder is ſought for and brought out whole, the bone being immediately put down again, and covered with a plaſter.

The South Down ſheep farmers, when the animals are affected in this way, ſay they are *pateriſh*.

Various other modes of cure have been propoſed, but they do not ſeem worthy of much attention. See SHEEP.

GIDDA, in *Ancient Geography*, See JIDDA.

GIDDATOOR, in *Geography*, a town of Hindooſtan, in the circar of Cicacole; 16 miles S.W. of Coſſimcotta.

GIDDINESS, in *Medicine*, a ſenſation as if the objects ſurrounding the perſon were in a ſtate of circumgyration, or whirling motion, accompanied with an inability to maintain the erect poſture, or to move forward in a ſtraight line: in technical language this is denominated *Vertigo*; which ſee.

GIDDRI, in *Geography*, a town of Albania; 8 miles N. of Aleſſio.

GIDEA, a river of Sweden, which riſes in the Lappmark of Aſele, and traverſing Angermanland, runs into the gulf of Bothnia. N. lat. 16° 20′. E. long. 18° 54′.

GIDELI, a town of Candahar; 50 miles S.E. of Cabul.

GIDID, a town of Africa, in Dar-fûr, nearly S.E. and about 22 miles from Cobbé, on the road from Cobbé to Ril. This town has a competent ſupply of water; and yet the Fukkara, who poſſeſs it, are ſuppoſed to be ſo deſtitute of hoſpitality, that they will hardly furniſh a traveller ſufficient to allay his thirſt. In this town are many houſes, and ſome of them belong to merchants who derive their origin from the eaſtward.—Alſo, a town of Nubia; 35 miles S. of Gerri.

GIDI-SHEHRI, a town of Aſiatic Turkey, in Natolia; 8 miles S. of Beiſheh[illegible].

GIDOLA, a town of [illegible]ſſia, in the government of Wiburg; 20 miles N. of Wiburg.

GIECH, a town of Germany, in the biſhopric of Bamberg; 7 miles N. of Bamberg.

GIEDKULISZKI, a town of Samogitia; 24 miles S. of Roſienne.

GIEDROYCE, a town of Lithuania, in the palatinate of Wilna; 24 miles N.N.W. of Wilna.

GIEDUNGEN, a town of Norway, in the dioceſe of Chriſtianſtadt; 18 miles N.W. of Stavanger.

GIEGUZIN, a town of Lithuania; 15 miles S. of Wilkomiers.

GIEK, in *Botany*, the Ceylon name of a ſmall fruit, deſcribed by Gærtner v. 2. 486. t. 180, of which nothing more is known. The nucleus is ſingularly pitted, like a *Rubus*, but if the figure be in all points correct, it cannot be a grain of the fruit of that genus. The internal parts, which were decayed, might have aſcertained ſomething deciſive, eſpecially the ſituation of the embryo.

GIELLUM, in *Geography*, a town of Norway, in the dioceſe of Aggerhuus; 53 miles N. of Chriſtiania.

GIEN, a town of France, and principal place of a diſtrict, in the department of the Loiret, ſeated on the Loire; 32 miles S.E. of Orleans. The place contains 5117, and the canton 11,366 inhabitants, on a territory of 410 kiliometres, in 11 communes. N. lat. 48° 45′. E. long. 10° 13′.

GIENÉ. See KENÉ.

GIENSOR, a town of Africa; 10 miles S. of Tripoli.

GIER, a river of France, which runs into the Rhône, 12 miles below Lyons.

GIERACE, a town of Naples, in Calabria Ultra, the ſee of a biſhop, ſuffragan of Reggio; containing 13 churches, and 4 monaſteries. Near it are ſome ſulphureous baths; 34 miles N. of Reggio. N. lat. 38° 6′. E. long. 16° 30′.—Alſo, a town of Sicily, in the valley of Demona; 30 miles S.W. of Miſtretta. N. lat. 37° 48′. E. long. 14° 22′.

GIERANONY, a town of Lithuania, in the palatinate of Wilna; 20 miles N.E. of Lida.

GIERGA, a town of Bengal; 48 miles S.E. of Doeſa.

GIESIM, a town of Nubia, between Sennaar and Abyſſinia; 100 miles E.S.E. of Sennaar. N. lat. 13° 16′. E. long. 35° 15′.

GIESSEN, a ſtrong town of Germany, in the principality of Upper Heſſe, ſituated in a fertile country, on the Lahn. It is defended by a good citadel and arſenal. An univerſity was founded here in the year 1605; 36 miles N.E. of Mentz. N. lat. 50° 35′. E. long. 8 43′.

GIEZIN, a town of Samogitia; 22 miles E.S.E. of Roſienne.

GIFFÆ, a term in *Surgery*, ſignifying ſwellings behind the ears.

GIFFEN, HUBERT, in *Biography*, a lawyer and philologiſt, was a native of Gueldres in France. He ſtudied at different univerſities, as thoſe at Louvain, Paris, and Orleans, and in 1567 he took his degrees in the law. He went to Venice in the train of the French ambaſſador, and from thence to Germany, and taught philoſophy and juriſprudence at Straſburg, Altdorf, and Ingolſtadt. He was educated in the principles of Proteſtantiſm, which he renounced for the Catholic religion previouſly to his being invited to the imperial court, where the emperor Rodolph beſtowed upon him ſome important offices. Being ſent into Bohemia, he died at Prague in the year 1604, being about ſeventy years of age. His principal works are "Comment. de Imp. Juſtiano:" "Index Hiſt. Rerum Romanorum;" and notes and comments upon Ariſtotle's politics, ethics; alſo upon Lucretius. Moreri. Bayle.

GIFFT-MEHL, the name given by the German chemiſts and metallurgiſts to the firſt appearance of arſenic, or the grey flowers ariſing from the roaſting of cobalt, and ſticking to the long wooden funnel, which they carry from the furnaces.

The word gifft-mehl is German, and ſignifies poiſonous meal or flour.

GIFHORN, in *Geography*, a town of Germany, in the principality of Luneburg-Zell, ſeated on the Allier; 19 miles E. of Zell.

GIFONI, a town of Naples, in Principato Citra; 7 miles E. N. E. of Salerno.

GIFT, or GRANT, in *Law*, a method of transferring perſonal property, anſwering in ſome meaſure to the conveyances of real eſtates. Gifts and grants are thus to be diſtinguiſhed from each other, that *gifts* are always gratuitous, whereas *grants* are upon ſome conſideration or equivalent. With regard to their ſubject-matter, they may be divided into gifts or grants of chatttels *real*, and gifts or grants of chattels *perſonal*. Under the former claſs may be included all leaſes for years of land, aſſignments, and ſurrenders of theſe leaſes; and all the other methods of conveying an eſtate leſs than freehold; though theſe very ſeldom carry the outward appearance of a gift, however freely beſtowed; being uſually expreſſed to be made in conſideration of blood, or natural affection, or of five or ten ſhillings nominally paid to the grantor; and in caſe of leaſes, always reſerving a rent, though it be but a pepper-corn:—any of which conſiderations will, in the eye of the law, convert the gift, if executed, into a grant; if not executed, into a contract.

Grants or gifts of chattels *perſonal* are the act of transferring the right and the poſſeſſion of them; whereby one man renounces, and another man immediately acquires, all title and intereſt therein: which may be done either in writing or by word of mouth, atteſted by ſufficient evidence (Park. § 57.), of which the delivery of poſſeſſion is the ſtrongeſt and the moſt eſſential. But this conveyance, when merely voluntary, is ſomewhat ſuſpicious; and is uſually conſtrued to be fraudulent, if creditors or others become ſufferers thereby. And, particularly, by ſtatute 3 Hen. VII. c. 4. all deeds of gift of goods, made in truſt to the uſe of the donor, ſhall be void; becauſe otherwiſe perſons might be tempted to commit treaſon or felony, without danger of forfeiture; and the creditors of the donor might alſo be defrauded of their right. And by ſtatute 13 Eliz. c. 5. every grant or gift of chattels, as well as lands, with an intent to defraud creditors or others (3 Rep. 82), ſhall be void, as againſt ſuch perſons to whom ſuch fraud would be prejudicial: but, as againſt the grantor himſelf, ſhall ſtand good and effectual; and all perſons partakers in, or privy to, ſuch fraudulent grants, ſhall forfeit the whole value of the goods, one moiety to the king, and another moiety to the party grieved; and alſo, upon conviction, ſhall ſuffer impriſonment for half a year.

A true and proper gift or grant is always accompanied with delivery of poſſeſſion, and takes effect immediately; as if A. gives to B. 100*l.* or a flock of ſheep, and puts him in poſſeſſion of them directly, it is then a gift executed in the donee; and it is not in the donor's power to retract it, though he did it without any conſideration or recompence (Jenk. 109.): unleſs it be prejudicial to creditors; or the donor were under any legal incapacity, as infancy, coverture, dureſs, or the like; or if he were drawn in, circumvented, or impoſed upon by falſe pretences, ebriety, or ſurprize. But if the gift does not take effect, by delivery of immediate poſſeſſion, it is then not properly a gift, but a contract; and this a man cannot be compelled to perform, but upon good and ſufficient conſideration. See CONTRACT.

The conveyance by *gift*, "donatio," is properly applied to the creation of an eſtate-tail, as feoffment is to an eſtate in fee, and leaſe to that of an eſtate for life or years. It differs in nothing from a feoffment, but in the nature of the eſtate paſſing by it; for the operative words of conveyance in this caſe are *do* or *dedi* (Weſt. Symbol. 256.); and gifts in tail are equally imperfect without livery of ſeiſin, as feoffments in fee-ſimple. (Litt. § 59.) See FEOFFMENT. This is the only diſtinction which Littleton ſeems to take, when he ſays (§ 57), "it is to be underſtood, that there is feoffor and feoffee, donor and donee, leſſor and leſſee;" *viz.* feoffor is applied to a feoffment in fee-ſimple, donor to a gift in tail, and leſſor to a leaſe for life, or for years, or at will. In common acceptation gifts are frequently confounded with grants. (See GRANT.) Blackſt. Com. B. ii.

GIFT-*day*, in *Rural Economy*, is a term implying a boon-day, or a day's work given from the tenant to the lord, or from neighbour to neighbour.

GIFTS, *New Year's*. See STRÆNÆ.

GIG, FISH. See FISH-*gig*.

GIGA, *Ital.* GIGUE, *Fr.* a jig, the name of a gay dance, and of its tune. The Cruſca Dict. defines this word from Dante, par. 14. *ſtrumento muſicale di corde;* a muſical inſtrument with ſtrings. The Cruſca, likewiſe, ſays, that it is an inſtrumental movement, ſo called.—Walther's derivation from Geige, *Germ.* a violin, or fiddle, comprehends both the tune and the inſtrument upon which, originally, it was moſt frequently played. The time of the *ggia*, or jig, is always quick, and in triplets of $\frac{6}{8}$, $\frac{9}{8}$, or $\frac{12}{8}$. Corelli's jigs were long in favour; but, being in the ſame time as moſt of our old country-dances, they are almoſt all become vulgar, except the *gighe* in his 5th ſolo, and 11th ſonata, op. ii^{da}.

Rouſſeau ſays that *gigues* are now wholly out of faſhion in Italy and France; but the movement is only improved by new and more elegant paſſages: for, whatever is played quick, in triplets of 6, 9, or 12 quavers in a bar, is ſtill a *giga*, or jig.

GIGAIA, GIGHA, *Gia*, or *Gigo*, in *Geography*, one of the ſmaller weſtern iſlands of Scotland, about 7 miles long and 2½ broad, partly rocky and partly arable, ſituated in N. lat. 55° 36'. W. long. 5° 43', and ſeparated from the peninſula of Cantyre, or Kintyre, by a channel 3½ miles broad. There are no trees in this iſland; but oaks are ſometimes dug up in the moraſſes. Near its centre is Dun-clifs, a high ſteep rock, flat at top, which appears to have been a ſtrong fortification. At Kilchattan is a rude column, 16 feet high, 4 broad, and 8 inches thick, and near it is a cairn. On the weſtern ſhore, which is bold and rocky, there are two remarkable caves; and on the S. coaſt is a ſubterraneous paſſage 133 feet in length. Between the projecting points and ſunk rocks on the E. coaſt are creeks, in which veſſels may be ſafely moored. This iſland contains 592 inhabitants.

About 1½ mile S. from Gigha, is the iſland Caray, or Cara, near a mile long and half a mile broad, containing 22 inhabitants. The ſhores are every where high and rocky, except at the N. E. end, where is the only landing place. The Mull of Cara, at the S. end, is a perpendicular rock 167 feet high. At the N. E. end, the ſoil is a mixture of ſhells, ſand, and common mould; the reſt of the iſland, at the ſurface, is a ſtratum of peat earth. Between Gigha and Cara is Gigulum, a ſmall uninhabited iſland.

GIGANTES, a cluſter of ſmall iſlands among the Philippines, N. W. of Sibu. N. lat. 11° 42'. E. long. 123° 20'.

GIGANTIC. See GIANT.

GIGANTIC *Order*, in *Architecture*, a name given by Scamozzi and others to the Tuſcan order.

GIGANTOMACHIA, the battle of the giants againſt the fabulous gods of the ancient heathens. See GIANT.

The word is Greek, γιγαντομαχια, formed of γιγας, γιγαντος, *giant;* and μαχη, *combat*, of μαχομαι, *pugno, I fight.*

Several of the poets have compoſed gigantomachias: that of Scarron is the fineſt of all his pieces.

GIGANTOPHONTES, is a name given to Minerva, on account of the aſſiſtance which ſhe gave to Jupiter in his conteſt with the giants.

GIGAY, in *Geography*, a ſmall iſland of the Hebrides, on the E. coaſt of Barray, yielding tolerable paſture, but difficult of acceſs.

GIGERI. See JIJEL.

GIGERIÆ, a term uſed by ſome writers to expreſs the offals of poultry of any kind, including the inteſtines, extremities, and whatever elſe is thrown away before the dreſſing. See GIBLETS.

GIGG, GIGA, or *Jig*, in *Muſic* and *Dancing*. See GIGA.

GIGGS, among *Farriers*, ſmall bladders or bliſters on the inſide of a horſe's lips. They muſt be laid open, and cleanſed with ſalt and vinegar, or alum-water.

GIGGE, in the *Manufacture of Flax*, denotes a hole made in the earth, where fire is made to dry the flax laid over it.

GIGGEO, ANTHONY, in *Biography*, a learned Italian, who flouriſhed in the early part of the ſeventeenth century, and was admitted to the degree of doctor by the Ambroſian college at Milan. He was author of many learned works, but that on which his reputation is chiefly eſtabliſhed, was entitled "Theſaurus Linguæ Arabicæ, ſeu Lexicon Arabico-Latinum;" publiſhed in four volumes folio, in 1632. As a recompence for the learning and induſtry which it exhibited, pope Urban VIII. nominated the author to an honourable poſt in a college at Rome; but he died before he could enter upon its functions, or enjoy its emoluments. Gen. Biog.

GIGLIO, or ISOLE DEL GIGLIO, in *Geography*, a ſmall iſland in the Mediterranean, near the coaſt of Italy, anciently called *Ægilum*, or *Igilum*. N. lat. 42° 28′. E. long. 10° 53′.

GIGMILLS, a kind of fulling mills, for fulling and burling of woollen cloth, prohibited, anno 5 and 6 Ed. VI. c. 22.

GIGNEE, in *Geography*, a town of France, in the department of the Herault, and chief place of a canton, in the diſtrict of Lodéve, ſeated on the Herault; 10 miles S. E. of Lodéve. The place contains 2785, and the canton 13,632 inhabitants, on a territory of 290 kiliometres, in 21 communes. N. lat. 43° 39′. E. long. 3° 38′.

GIGNY, a town of France, in the department of the Jura, on the Surain; 7 miles S. W. of Orgelet.

GIGO. See GIGAIA.

GIGOT, in the *Manege*, a branch after the form of a gigot, or leg, is a branch, the lower part of which is round, and called in French *gargouille*.

GIHON, in *Geography*. See JIHON and AMU.

GIHON, in *Scripture Geography*, a fountain, weſt of Jeruſalem, where Solomon was anointed king by Zadok and Nathan. The upper channel of Gihon was ordered, by Hezekiah, to be conveyed into Jeruſalem, for the advantage of the waters; 1 Kings, i. 33. 2 Chron. xxxiii. 30.—Alſo, the name of one of the four rivers, whoſe ſources were in Paradiſe, Gen. ii. 13. The Arabians believed this to be the Oxus, a river which riſes in the mountains of Imaus, and runs from eaſt to weſt; and after winding much, returns, and diſcharges itſelf into the Caſpian ſea, weſtward. This river ſeparates the provinces of the Turks and Perſians. Modern geographers call the Oxus, *Amu;* which ſee. The Arabians name it Gehon, and Neher-Balkh, the river of Balk, becauſe it paſſes through that city. Calvin, Scaliger, and others, think that Gihon is the moſt weſtern channel of the two made by the Tigris and Euphrates, when, after their conflux, they ſeparate again to enter the ſea. Others again maintain that Piſon is the weſtern channel, and that Gihon is the eaſtern. This is the opinion of Bochart and Huetius. (See EDEN.) Others ſuppoſe the Gihon to be the *Araxes;* which ſee.

GIJON, *Jixa* of the Romans, a conſiderable ſea-port town of Spain, in Aſturias, formerly the capital of this province, with an old caſtle, containing about 800 families, 18 miles N. of Oviedo. This inſecure port, conſtructed and maintained at a great expence, is reſorted to by the Engliſh for filberts and cheſnuts. N. lat. 43° 32′. W. long. 5° 42′.

GIKRI, a town of Hindooſtan, in the circar of Nagore; 15 miles S. E. of Catchwara.

GIL, *Iſland of*, an iſland of the North Pacific ocean, ſo called by ſignor Caamano, about 14 miles long and 6 broad, between Princeſs Royal's iſland and Pitt's Archipelago.

GILA, a river of New Mexico. See COLORADO.

GILACAN, a ſmall iſland in the North Pacific ocean, N. of the Catanduanes. N. lat. 14° 26′. E. long. 124° 27′.

GILARZA, a town of the iſland of Sardinia; 15 miles S. E. of Boſa.

GILATTELKE, a town of Tranſilvania, 14 miles N. of Clauſenburg.

GILBERGA, a town of Sweden, in Warmeland; 24 miles W. of Carlſtadt.

GILBERT, HUMPHREY, in *Biography*, deſcended from an ancient family in Devonſhire, was born about the year 1539. His mother, after becoming a widow, married Mr. Raleigh, by whom ſhe had ſir Walter; of courſe, Humphrey Gilbert and ſir Walter were half brothers, and, as we ſhall ſee, both became diſtinguiſhed in the annals of their country. The ſubject of the preſent article was educated at Eton, and from thence was ſent to Oxford to complete his ſtudies. He ſoon exhibited a turn of mind better adapted to an active than a literary life. He was early introduced to the court of Elizabeth, and there acquired that ardour of loyalty which ſeemed to be the ruling paſſion of thoſe who approached the queen. His firſt expedition as a warrior was at Havre, in 1563, after which he was ſent over to Ireland, to aſſiſt in quelling the diſorders in that country, and roſe to the chief command in the province of Munſter. In 1570 he received the honour of knighthood as a reward for his ſervices. In the following year ſir Humphrey Gilbert ſerved, as a burgeſs, in parliament, for Plymouth; and in 1572 he ſailed with a reinforcement to colonel Morgan, then acting in Flanders. He, about this period, became anxious for the advancement of maritime diſcovery, and the improvement and extenſion of trade and commerce; with theſe views, in 1576, he publiſhed "A Diſcourſe, to prove a paſſage by the north-weſt to the Eaſt Indies." He probably deſigned to make attempts for the diſcovery of this paſſage, but an anterior project was that of ſettling ſome of the countries in the northern part of the New World. In 1578 he obtained a patent from the crown for making ſettlements in the unoccupied lands of North America, and fitted out an expedition with which he ſailed for Newfoundland, where he continued a ſhort time, and returned without having effected any thing of importance. He, however, perſiſted in his deſign, and in 1583, in company with his brother, ſir Walter Raleigh, returned to Newfoundland, and took poſſeſſion, in the queen's name, of the harbour of St. John, and granted leaſes of the circumjacent country to thoſe of his company who choſe to take them. He carried out with him a Saxon miner, in hopes, no doubt, of finding gold, more than ſufficient to repay them for all their trouble and labour. This man pretended to have diſcovered a rich ſilver mine on the coaſt, and dug up ſome ore, which ſatisfied ſir Humphrey that the means of wealth were within their reach. He now fully expected that he could obtain from the queen the loan of ten thouſand pounds, to enable them to proſecute their diſcoveries, but his voyage was truly diſaſtrous; the largeſt ſhip was loſt in a ſtorm, with all the crew except twelve men, and the miner and the ore periſhed at the ſame time. He himſelf had fortunately gone on board a ſmall ſloop, for the purpoſe of exploring the coaſt. After this he refuſed to ſhift his ſtation to his larger remaining veſſel, being reſolved not to deſert the little crew with whom he had encountered ſo many dangers. He ſteered homeward, in the midſt of a tempeſtuous ſea, and on the ninth of September, when his ſmall bark was in the utmoſt danger of foundering, he was ſeen, by the crew of the other ſhip, ſitting in the ſtern of the veſſel, with a book in his hand, and he was heard to cry out, "Courage, my lads! we are as near heaven at ſea as at land." About midnight the bark was ſwallowed up by the ocean; the gallant knight and all his men periſhed with her. Though ſir Humphrey Gilbert did not effect a ſettlement at Newfoundland, yet the project

ject was ſoon after realized under his patent, ſo far as to be of great advantage to the fiſhery from this country. Biog. Brit.

Gilbert, or **Gilberd**, **William**, a phyſician, was born, in the year 1540, at Colcheſter, of which borough his father had been recorder. After ſtudying ſome time at Cambridge, he travelled abroad for farther improvement in thoſe branches of ſcience to which he was particularly addicted; and took the degree of doctor of phyſic in ſome foreign univerſity. He returned to his own country with a high character for philoſophical and chemical knowledge, and was made a member of the College of Phyſicians in London, where he ſettled about the year 1573. He practiſed with ſo much reputation and ſucceſs, that he at length became firſt phyſician to queen Elizabeth, in which office he continued during the life of that princeſs. The vacancies from the duties of his profeſſion he employed in the purſuit of philoſophical experiments, particularly relative to the magnet, and in theſe he was aſſiſted by a penſion from queen Elizabeth. We are informed of no other circumſtances concerning the life of this learned man, who died, unmarried, November 20, 1603, aged 63, and was buried in his native place, where a handſome monument was erected to his memory by his brothers. He left all his books, globes, mathematical inſtruments, and cabinet of minerals, to the College of Phyſicians. His picture, which repreſents him as of a tall ſtature and chearful countenance, is in the gallery over the ſchools at Oxford.

The capital work of Dr. Gilbert, entitled "De Magnete, Magneticiſque Corporibus et de Magno Magnete Tellure, Phyſiologia nova, plurimis et argumentis et experimentis demonſtrata," was firſt publiſhed at London in 1600, and has been reprinted in Germany. This is not only the earlieſt complete ſyſtem of magnetiſm, but alſo one of the firſt ſpecimens of a philoſophical ſyſtem built upon experiments, after the manner ſo much inſiſted on afterwards by the great lord Bacon. Aikin, Biog. Mem. of Med. Eloy.

Gilbert, **John**, the ſon of Mr. Thomas Gilbert, a gentleman poſſeſſing an eſtate of about 300*l.* a year, was born in the year 1724. His eldeſt brother had a liberal education, with a view to the bar, and became afterwards a member of parliament for Newcaſtle and Litchfield; but the ſubject of this article had only ſuch inſtruction as the obſcure village of Farley, in the neighbourhood of his father's houſe, could afford. At the age of twelve or thirteen years, he was bound apprentice to Mr. Bolton, father of the well-known and juſtly celebrated Matthew Bolton, of Soho, near Birmingham; between whom and Mr. Gilbert an intimacy ſubſiſted, as long as the latter lived. At the age of 19 he loſt his father; and as he died poſſeſſed of extenſive lime-works, they required attention. Accordingly Mr. Gilbert, in order to undertake the ſuperintendence of them, quitted his connection with Mr. Bolton, who very reluctantly parted with him, and devoted himſelf to the management of his own family concerns. Notwithſtanding the diſadvantages under which Mr. G. had laboured in early life, he poſſeſſed talents, which, matured by age and experience, could not fail of recommending him to notice. But the moſt remarkable circumſtance in the hiſtory of this ingenious perſon, and that indeed which has induced us to give a brief account of him, was his introduction to the duke of Bridgewater, at the time when he was projecting improvements of his collieries, in the neighbourhood of Mancheſter. Mr. Gilbert's brother was then ſteward to the duke; and deſired him to inſpect and examine his Grace's collieries at Worſley. After viewing the works, it immediately occurred to him, that if the coals on that part of the duke's eſtate could be brought to market in ſuch a populous town as Mancheſter, and for the ſupply of the numerous works in its vicinity, the colliery, which, in the ſtate it was at the time of his inſpection, yielded little profit, would become extremely valuable. It is ſaid, that he ſecluded himſelf altogether from company for two days, at the Bull inn at Mancheſter, to conſider how this might be done by water-carriage, as that by land was very expenſive, and, on account of the badneſs of the roads, very inconvenient, and almoſt impracticable. Having digeſted his ſcheme, he communicated it to the duke, who was no leſs ſtruck with the propoſition ſuggeſted by Mr. G. than the projector himſelf. Accordingly the work was ſoon after began. Mr. G.'s name has ſeldom occurred in connection with this very important and lucrative undertaking; and as he preceded Mr. Brindley in this buſineſs, of which we have ample and ſatisfactory evidence, we thought that juſtice required a candid and impartial ſtatement of the caſe. Mr. G. was ſo fortunate, in the proſecution of this work, as to find lime upon the duke's eſtate, which muſt otherwiſe have been brought by land from Buxton, at the diſtance of near 30 miles; and in a work of this great extent, this was no inconſiderable ſaving. The tunnel was entirely executed, as well as planned, by Mr. G.; who, being acquainted with Mr. Brindley as a neighbour, and knowing him to be a very ingenious and excellent mill-wright, engaged his aſſiſtance in the conduct and completion of this arduous undertaking, and introduced him to the duke for this purpoſe. The duke was ſo well ſatisfied with his agent and projector, that at firſt they lived together for two or three months in the year, and for ſeveral of the laſt years of Mr. Gilbert's life, he ſpent half his time with him. In June, 1757, he removed with his family to Worſley, that he might, with greater convenience, attend the proſecution of the buſineſs he had undertaken. As a farther evidence of the duke's regard for Mr. G. we may here add, that he gave his ſon, who was educated for the church, the ſecond beſt preferment at his diſpoſal, to the amount of about 1200*l.* per annum. We might mention many other concerns in which Mr. G. was engaged, and in which he had an opportunity of manifeſting his ſkill and judgment, in the conduct of canals, mines, and other improvements relating to rural economy. We ſhall merely add, that he is ſaid to have been the firſt perſon who ſuggeſted the uſe of gun-powder in obtaining rock-ſalt. Mr. G. was probably ſo modeſt and unaſſuming, that he did not, during his life-time, lay claim to the honour which belonged to him, with reſpect to the duke of Bridgewater's canals and collieries; and we have introduced his name into the Cyclopædia, in order to do him juſtice, without meaning to detract from the merit of his coadjutor and ſucceſſor, Mr. Brindley, to whom we have already paid ample and deſerved reſpect under his biographical article. Mr. Gilbert's general character commanded the eſteem of all who knew him, and his death, even after a prolonged life of about 73 years, which happened at Worſley, on the 4th of Auguſt, 1797, was, without doubt, regretted by his friends, and eſpecially by the noble duke, who was in the houſe at the time.

Gilbert's *Iſland*, in *Geography*, an iſland near the S.W. coaſt of Terra del Fuego. N. lat. 55° 13′. W. long. 71° 7′.

Gilbert's *Town*, a town of America, in the ſtate of Virginia, ſeated on the Shenando, 30 miles N. of Charlotteſville.

GILBERTINES, in *Eccleſiaſtical Hiſtory*, an order of religious, thus called from St. Gilbert, of Sempringham, in the county of Lincoln, who founded the ſame about the year 1148: the monks of which obſerved the rule of St. Auguſtine, and were accounted canons; and the nuns that of St. Benedict.

The founder of this order erected a double monaſtery, or rather two different ones, contiguous to each other, the one for men, the other for women, but parted by a very high wall.

St. Gilbert himſelf founded thirteen monaſteries of this order, *viz.* four for men alone, and nine for men and women together, which had in them ſeven hundred brethren, and fifteen hundred ſiſters. At the diſſolution there were about twenty-five houſes of this order in England and Wales.

GILBERTUS Anglicus, in *Biography*, the firſt practical writer on medicine, whom this country produced, is placed by Bale, (who calls him *Gilbertus Legleus*, and ſays he was phyſician to Hubert, archbiſhop of Canterbury,) in the reign of king John, about the year 1210. But Leland, without ſtating the grounds of his opinion, makes him more modern. Dr. Freind obſerves, that it is obvious, from the work by which he is principally known, (a "Compendium of Phyſic,") that he muſt have lived ſeveral years later in the thirteenth century, very probably in the beginning of the reign of Edward I.: "For he quotes Averrhöes," Dr. Freind remarks, "who reached to the cloſe of the twelfth century; and whoſe works could not have been tranſlated ſo early, and indeed were not tranſlated till the middle, at leaſt, of the thirteenth, as Bacon, a good voucher, informs us: and the mention he makes of a book, "de Speculis," which, without doubt, is that written by Bacon, and what he tranſcribes from Theodorick, concerning a leproſy, evidently ſhews that he lived low in this century, &c." (Hiſt. of Phyſic, vol. ii. p. 267.) According to Leland, he maintained a high character for his knowledge in philoſophy and phyſic, which he had acquired by great ſtudy and much travelling; and he was very ſucceſsful in his practice. His writings are principally compiled from thoſe of the Arabian phyſicians, like the works of his contemporaries in other nations; ſometimes, indeed, he tranſcribes whole chapters word for word, eſpecially from Rhazes. He is repreſented as the firſt Engliſh phyſician who ventured to expoſe the abſurd practices of the ſuperſtitious monks, who at that time engroſſed much of the treatment of diſeaſes, and is ſaid to have contraſted with them the methods recommended by the ancients. The principal work of Gilbert, entitled "Compendium Medicinæ tam morborum univerſalium quam particularium," was corrected by Michael Capella, and printed at Lyons in 1510; and afterwards at Geneva, in 1608, under the title of "Laurea Anglicana, ſeu Compendium totius Medicinæ." His other treatiſes were, "De viribus Aquarum:" "De Re Herbaria:" "Theſaurus Pauperum:" and "De tuenda valetudine." Eloy. Dict. Hiſt. Freind, loc. cit.

GILBING, in *Geography*, a town of Pruſſia, in Ermeland; 12 miles W. of Allenſtein.

GILBOA, in *Scripture Geography*, a mountain of Paleſtine, celebrated on account of the defeat and death of Saul, and his ſon Jonathan. (1 Sam. xxxi. 1, 2, 3.). Euſebius and Jerom place this mountain ſix miles from Bethſan, otherwiſe Scythopolis.

GILD, or Guild, originally ſignifies a fraternity, or company.

The word is formed from the Saxon *gildan*, *to pay*, becauſe every man was *gildare*, *i. e.* to pay ſomething towards the charge and ſupport of the company. Hence alſo our Guildhall, *q. d.* the hall of the ſociety or fraternity, where they meet, and make orders and laws among themſelves.

The origin of gilds, or guilds, is thus related: it being a law among the Saxons, that every freeman of fourteen years old ſhould find ſureties to keep the peace, or be committed; certain neighbours, conſiſting of ten families, entered into an aſſociation, and became bound for each other, either to produce him who committed an offence, or to make ſatisfaction to the injured party: that they might the better do this, they raiſed a ſum of money among themſelves, which they put into a common ſtock; and when one of their pledges had committed an offence, and was fled, then the other nine made ſatisfaction out of this ſtock, by payment of money, according to the offence.

Becauſe this aſſociation conſiſted of ten families, it was called a *decennary*; and from hence came out later kinds of fraternities.

But, as to the preciſe time when theſe guilds had their origin in England, there is nothing of certainty to be found; ſince they were in uſe long before any formal licence was granted them for ſuch meetings.

It ſeems to have been about the cloſe of the eleventh century, ſays Anderſon, in his Hiſtory of Commerce, vol. i. p. 70. that merchant-guilds, or fraternities, which were afterwards ſtyled corporations, came firſt into general uſe in many parts of Europe. Mr. Madox, in his Firma Burgi, chap. i. § 9. thinks, they were hardly known to our Saxon progenitors, and that they might be probably brought into England by the Normans; although they do not ſeem to have been very numerous in thoſe days. The French and Normans might probably borrow them from the free cities of Italy, where trade and manufactures were much earlier propagated, and where poſſibly ſuch communities were firſt in uſe. See Charters *of Community*, City, and Corporation.

Edward the Third, in the fourteenth year of his reign, granted licence to the men of Coventry to erect a merchant's gild and fraternity, of brethren and ſiſters, with a maſter, or warden; and that they might found chauntries, beſtow alms, do other works of piety, and conſtitute ordinances touching the ſame.

So Henry the Fourth, in his reign, granted a licence to found a gild of the Holy Croſs, at Stratford-upon-Avon.

Gild, in the royal boroughs of Scotland, is ſtill uſed for a company of merchants, who are freemen of the borough.

Every royal borough has a dean of gild, who is the next magiſtrate below the bailiff. He judges of controverſies among men concerning trade; diſputes between inhabitants touching buildings, lights, watercourſes, and other nuiſances; calls courts, at which his brethren of the gild are bound to attend; manages the common ſtock of the gild; and amerces, and collects fines.

Gild, or *Geld*, according to Camden, alſo ſignifies a tribute, or tax. See Geld.

Gild, according to Crompton, alſo ſignifies an amercement. As in foot-geld, which he interprets a preſtation within the foreſt.

Hence, to be quit of all manner of gild, is to be diſcharged of all manner of preſtations to be made for gathering ſheaves of corn, lamb, and wool, to the uſe of foreſters.

Gild, or *Geld*, is alſo uſed among our ancient writers for a compenſation, or mulct, for a fault committed. See Ungeld.

Hence, *weregeld* is the price of a man; *orfgeld* is the price of cattle; *angeld*, the ſingle value of a thing; *twigeld*, the double value, &c.

There are divers other words which end with *geld*, and ſhew the ſeveral kinds of payments; as *danegeld*, *vadgeld*, *ſenegeld*, *horngeld*, *ſotgeld*, *penigeld*, &c. which ſee.

Gild, or *Guild rents*, are rents payable to the crown by any gild, or fraternity; or ſuch rents as formerly belonged to religious gilds, and came to the crown at the general diſſolution: being ordered for ſale by the ſtat. 22 Car. II.

GILDABLE, or Geldable, denotes a perſon tributary, that is, liable to pay tax, or tribute.

Camden, dividing Suffolk into three parts, calls the firſt gildable, becauſe liable to tax; from which the two other parts were exempt, becauſe eccleſiæ donatæ.

Gildable is alſo explained in an ancient MS. to be that land or lordſhip which is *ſub diſtrictione curiæ vicecom.*

GILDAS, in *Biography*, ſurnamed the *Wiſe*, a Britiſh monk, and the moſt ancient Britiſh writer now extant, was born in the year 520. He is known among many authors by the name of Badonius, by which he is diſtinguiſhed from Gildas Albanius, who is ſaid to have lived at an earlier period. His ſurname Badonius is derived from a memorable victory gained by the Britons over the Saxons, at the hill of Badon, now Bath, about the time of his birth. Having been carefully educated according to the manners of the times he became monk of Bangor, where he diligently applied himſelf to the learning of that period, and particularly to the ſtudy of the ſcriptures, with a view of qualifying himſelf for the duties of a public preacher. He is ſaid to have viſited Ireland at the requeſt of Americus, afterwards king of the country, where he diſtinguiſhed himſelf by his zeal and ſucceſs in converting Pagans, confuting the hereſies of the age, eſtabliſhing monaſteries, and in reforming the corrupt ſtate of principles and manners which had become prevalent among the Chriſtians in that iſland. Upon his return to his native country he viſited the monaſtery of Lhancarvan, lately founded by a pious nobleman of South Wales, and endeavoured, by all the means in his power, to engage other perſons, eminent for rank and fortune, to follow his example. He ſpent ſome time in the northern parts of Britain; viſited France and Italy, and then returned home, where he acquired a high reputation as a moſt indefatigable preacher who never heſitated to cenſure the prevailing vices of the age. He is ſuppoſed to have died at the abbey of Bangor in the year 590; though, according to ſome writers, this event happened at Glaſtonbury, full twenty years prior to this. The chief work of this author is; "Epiſtola de Excidio Britanniæ, et Caſtigatione Ordinis Eccleſiaſtici," containing lamentations over the miſeries and almoſt total ruin of his countrymen, and very ſevere reproofs of the corruption and profligacy of manners in which all ranks were ſharers, and of which he drew a moſt alarming picture. This curious remain of Britiſh eccleſiaſtical antiquities was firſt printed by Polydore Virgil in 1525, from an imperfect copy. It was afterwards publiſhed in 1568 by John Joſſeline from another, and a more perfect manuſcript copy, but the beſt edition was publiſhed by Dr. Thomas Gale, in the firſt volume of his "Hiſtoriæ Britannicæ, Saxonicæ, &c." Gildas wrote ſeveral "Letters," of which there are numerous fragments in an old collection of canons preſerved among the MSS. in the Cottonian library. Other pieces have been aſcribed to him, but theſe are conſidered by the beſt judges, as not really his, among them is the "Hiſtoria de Geſtis Britonum." Moreri.

Gildas-*des-Bois*, *St.* in *Geography*, a town of France, in the department of the Lower Loire, and chief place of a canton, in the diſtrict of Savenay. The place contains 859, and the canton 5527 inhabitants, on a territory of 235 kiliometres, in five communes.

GILDER. See Guilder.

GILDHALDA Teutonicorum was uſed for the fraternity of Eaſterling merchants in London; called alſo the *ſtillyard.*

GILD-HALL, *q. d. Gildæ aula*, the chief hall in the city of London. See Guild-*hall.*

GILD-MERCHANT, *Gilda Mercatoria*, was a certain privilege, or liberty, granted to merchants, whereby they were enabled, among other things, to hold certain pleas of land within their own precincts.

King John granted *gildam mercatoriam* to the burgeſſes of Nottingham.

It is held, that if the king grants to a ſet of men to have "gildam mercatoriam," a mercantile meeting or aſſembly, this is alone ſufficient to incorporate and eſtabliſh them for ever. 10 Rep. 30. 1 Roll. Abr. 513.

GILDING, or Guilding, the art, or act, of ſpreading or covering certain ſubſtances with gold, either in leaf or powder, or in amalgam with quickſilver. See an account of theſe preparaſions of gold under Gold.

The art of gilding was not unknown among the ancients, though it never arrived among them at the perfection to which the moderns have carried it. For this purpoſe the gold was beat into plates, with which the walls of apartments, diſhes, and other veſſels were covered. In early ages theſe plates were thick, ſo that this mode of gilding was very expenſive. (See the proceſs employed for gilding, in this manner, the horns of the ram brought by Neſtor, as an offering to Minerva, in Homer's Odyſſey, l. iii. v. 492.) In proceſs of time, however, the expence was much leſſened, becauſe the art was diſcovered of making theſe plates thinner, and of laying them on with a ſize.

Pliny aſſures us, that the firſt gilding ſeen at Rome was after the deſtruction of Carthage, under the cenſorſhip of Lucius Mummius, when they began to gild the ceilings of their temples and palaces; the Capitol being the firſt place on which this enrichment was beſtowed. But he adds, that luxury advanced on them ſo haſtily, that in a little time you might ſee all, even private and poor perſons, gild the very walls, vaults, &c. of their houſes. "When we cover our houſes with gold," ſays Seneca, (Epiſt. 115.) "what elſe do we than rejoice in deception? for we know, that coarſe wood is concealed under that gold." We need not doubt but that they had the ſame method with us, of beating gold, and reducing it into leaves; though, it ſhould ſeem, they did not carry it to the ſame height; if it be true, which Pliny relates, that they only made ſeven hundred and fifty leaves, four fingers ſquare, of a whole ounce. Indeed, he adds, that they could make more; that the thickeſt were called *bracteæ Prænestinæ*, on account of a ſtatue of the goddeſs Fortune at Præneſte, gilt with ſuch leaves; and that thoſe of the thinner ſort were called *bracteæ quæſtoriæ.*

The modern gilders alſo make uſe of gold leaves of divers thickneſſes; but there are ſome ſo fine, that a thouſand do not weigh above four or five drachms. The thickeſt leaves are uſed for gilding on iron, and other metals; and the thinneſt on wood. But we have another advantage above the ancients, in the manner of uſing and applying the gold: the ſecret of painting in oil, diſcovered of late ages, furniſhes us with means of gilding works that ſhall endure all the injuries of time and weather, which to the ancients was impracticable. They had no way to lay the gold on bodies that would not endure the fire but with whites of eggs, or ſize; neither of which will endure the water: ſo that they could only gild ſuch places as were ſheltered from the moiſture of the weather.

The Greeks called the compoſition on which they applied their gilding on wood, *leucophæum*, or *leucophorum*;

which is deſcribed as a ſort of glutinous compound earth, ſerving, in all probability, to make the gold ſtick, and bear poliſhing. But as to the particulars of this earth, its colour, ingredients, &c. the antiquaries and naturaliſts are not agreed.

There are ſeveral methods of gilding in uſe among us: viz. *gilding on an oily ſize; gilding on a water ſize; gilding by the fire*, which is peculiar to metals; *gilding of books*, &c.

We may diſtinguiſh, in general, two kinds of gilding, one with, and the other without, the application of heat. The firſt method is practiſed on thoſe ſubſtances, ſuch as wood, paper, leather, ſilk, lacquered and japanned ware, &c. which would be injured, and even deſtroyed at the temperature requiſite for the other ſort of gilding, which is employed on ſubſtances that are not liable to alteration by expoſure to a moderate heat, ſuch as metals, and ſometimes glaſs and porcelain.

There are two methods of gilding on wood, *viz.* oil-gilding, and burniſhed gilding.

Gilding *in oil, or an oily ſize*, is performed by cementing the gold to the ground by means of fat oil. Linſeed oil may be prepared for this purpoſe, by putting ſuch a quantity of it into a broad veſſel as may cover the bottom about an inch deep, and adding to it as much water as will riſe ſix inches or more above the bottom. Let the veſſel be expoſed to the ſun and rain, and the contents be occaſionally ſtirred for five or ſix weeks, till the oil appear of the conſiſtence of treacle. Then ſeparate the oil from the water, and place it in a long bottle, or ſeparating-funnel, uſed by the chemiſts, in ſuch heat as will render it perfectly fluid; pour off the clear part, and ſtrain the remainder through a funnel, and the whole will be fit for uſe. The water helps to clear and bleach the oil, and improve it in other reſpects.

In order to prepare the wood for gilding, it muſt firſt be covered or primed with two or three coatings of boiled linſeed oil and white lead, in order to fill up the pores, and conceal the irregularities of the ſurface, occaſioned by the veins in the wood. If greater nicety and perfection in the work be required, the wood ſhould be firſt rubbed with fiſh-ſkin, and then with Dutch ruſhes.

When the priming is dry, the next operation is that of ſizing the work, or laying upon it, by means of a bruſh, or a large pencil, a thin coat of gold ſize; care being taken that the bruſh or pencil be made to paſs into all the cavities and projecting parts, if the ſubject be carved. This gold ſize is prepared by grinding calcined red ochre with a due proportion of the fat, or thickeſt drying oil that can be procured, (the older the better); and this ſize, in order to fit it for working more freely, is to be mixed, previouſly to its being uſed, with a ſmall quantity of oil of turpentine, till it acquires a proper conſiſtence. Sometimes the work is ſized with fat oil, and the japanner's gold ſize (ſee Gold *Size*), ground alſo with ochre. If a high degree of perfection be required, the work ſhould be ſized a ſecond time, and ſome add a third ſizing, before the gold is laid on. In order to aſcertain its fitneſs for this purpoſe, it is touched with the finger; and if it feel ſomewhat adheſive or clammy, or, as the gilders call it, "tacky," but not ſo as to be brought off by the finger, it is in a fit ſtate for gilding. But if it be ſo clammy as to daub, or come off on being touched, it is not ſufficiently dry; or, if it has no clammineſs or ſticking quality, it is too dry, and muſt be ſized over again before it is gilt. When the gold ſize is good, it will be ſufficiently dry in about twelve hours for the application of the gold. In this proceſs, when the ſurface is ſufficiently large and plain to contain them, the gold leaves may be laid on entire, either by means of a ſquirrel's tail, or immediately from the paper which originally contained them, which laſt method, practiſed by thoſe who have acquired the neceſſary dexterity, is the ſimpleſt and moſt expeditious, as well as the beſt, for the perfection of the work. The leaves, being laid on the proper parts of the work, muſt be ſettled to the ground, by gently compreſſing thoſe, which ſeem to want it, with the ſquirrel's tail on a cotton ball; and if any part of the gold has flown off, or has been diſplaced, ſo as to leave any ſpot uncovered, a piece of another leaf, of a correſponding ſize and figure, muſt be laid upon it. When the parts are too ſmall to admit of laying on whole leaves, or when vacancies are left, after laying on whole leaves, which require to be covered with the ſlips or fragments of leaves, thoſe that are to be uſed are turned from the paper upon a cuſhion. (See Gilding *Cuſhion* and Cushion.) They are then cut into ſlips, of a proper ſize, by a blunt pallet-knife (ſee Gilding *Knife*); and each ſlip is taken up on the point of a fine bruſh, or by an inſtrument called the "tip," (ſee Gilding *Tip*,) which, being moiſtened by breathing upon it, will take up the leaves, or any fragments of them from the cuſhion. When theſe are thus applied to the parts of the work that were to be covered, they are gently preſſed down by the cotton ball, till they lie every where evenly upon the ground; and the gold will immediately adhere to the ſticky ſurface of the ſize. Where the work is very hollow, and ſmall pieces are wanted to cover parts that lie deep, they may be taken up, by the tip already mentioned, or the point of a fitch pencil, firſt breathed upon, and thus conveyed to, and ſettled in, their proper places. The whole of the work, being thus covered, ſhould be ſuffered to remain till it be dry, and it may then be bruſhed over by a camel's hair pencil, or ſoft hog's hair bruſh, in order to clear away any looſe particles of the gold leaf. If, after bruſhing, any defective parts appear, ſuch parts muſt be again ſized; and treated as before. The ſquirrel's tail uſed in gilding is cut ſhort, and ſometimes ſpread in the fan-faſhion, by means of a piece of wood formed like a pencil-ſtick, but broad at both ends, and ſplit to receive the tail; but it will equally ſerve in its own form, when the hair is cut to a proper length. The cotton ſhould alſo be formed into a ball, by tying it up in a piece of fine linen rag; for if it be uſed without the rag, the fibres adhere to the gold ſize, and embarraſs the work.

This ſort of gilding is chiefly uſed for domes, and the roofs of churches, courts, banqueting-houſes, &c. and for figures of plaſter, lead, &c. that are to ſtand expoſed to the weather.

This oil-gilding is the moſt ſimple and eaſy, leaſt expenſive, and moſt durable, as it will not be readily injured when expoſed to the open air; and it may be alſo cleaned with a little warm water and a ſoft bruſh; but, as it cannot be burniſhed, it wants the high luſtre which is produced by the method we ſhall next deſcribe.

Gilding, *Burniſhed*, or *in Diſtemper*, or *on Water-ſize*, is that kind of gilding which is generally uſed for picture frames, mouldings, ſtucco, and ſuch wooden works as are ſheltered from the weather, and not ſubject to dampneſs. In order to prepare the wood for this ſort of gilding, thoſe parts that admit of it ſhould be firſt well rubbed with fiſh-ſkin, and then with Dutch ruſhes. It ſhould then be carefully covered with ſtrong ſize, made of ſhreds, &c. of white leather, ſuch as that uſed by glovers, or clippings of parchment boiled in water, in the proportion of about a pound of the ſhreds or clippings, to ſix quarts of water, to the conſiſtence of a jelly, and then ſtrained through flannel while hot. When this coating is dry, eight or ten more muſt be applied, conſiſting of the ſame ſize, mixed with fine plaſter of Paris, or waſhed chalk, or powdered whiting; which mixture muſt be made by melting the ſize, and ſtrewing the whiting, &c. gradually into it, ſtirring them well together, that they may be thoroughly incorporated. This is laid on with a ſtiff bruſh, and oftener or ſeldomer repeated, according to the nature of the work; for pieces of ſculpture, ſeven or eight layers ſuffice: for flat, or ſmooth works, they uſe ten or twelve. In the latter caſe they are applied by drawing the bruſh or pencil over the work: in the former, by dabbing it ſmartly on, that the ſize may enter all the dents of the carving.

After the laſt coat is laid on, and before it be quite dry, a bruſh pencil, dipped in water, ſhould be paſſed over the whole, to ſmooth it, and take away any inequalities that may have been formed; and when it is dry, the parts that admit of it ſhould be again bruſhed over till they are perfectly even. The work ſhould then be repaired, by freeing all the cavities from the priming: after which a water poliſh ſhould be given to the parts deſigned to be burniſhed, by rubbing them gently with a fine linen rag moiſtened with water.

When the whole work is become quite dry, a moderately thick layer muſt be applied, compoſed of ſize and bole, or yellow ochre. Doſſie, in the Handmaid to the Arts, gives the following recipe for the ſimpleſt compoſitions, uſed as the proper cement or gilding ſize in this kind of gilding: "Take any quantity of bole armeniac, and add ſome water to it, that it may ſoak till it grow ſoft. Levigate it then on the ſtone, but not with more water than will prevent its being of a ſtiff conſiſtence, and add to it a little purified ſuet or tallow ſcraped; and grind them together. When this is wanted for uſe, dilute it to the conſiſtence of cream, by parchment or glovers' ſize, mixed with double its quantity of water, and made warm. Some melt the ſuet or tallow, and mix it previouſly with five or ſix times its weight of chalk before it is put to the bole, to facilitate their commixture, to which in this wet ſtate they are ſomewhat repugnant. It is alſo ſometimes practiſed to put ſoap ſuds to the bole; which will contribute to its uniting with the tallow." (See GOLD *Size*.) Let this compoſition be diluted with warm ſize mixed with two-thirds of water, and let it be ſpread with a bruſh over the whole of the work, and then ſuffered to dry; and then let the ſame mixture be applied in the ſame manner, at leaſt once more. After the laſt coat, it ſhould be rubbed in the parts to be burniſhed with a ſoft cloth, till it be perfectly even. Some add a little vermilion to the gilding ſize, and others colour the work, if carved, before it be laid on, with yellow and the glovers' ſize; to which a little vermilion, or red lead, ſhould be added. This laſt method is deſigned to give the appearance of gilding to the deeper and obſcure parts of the carving, where the gold cannot, or is not thought neceſſary to be laid on. But this practice is much diſuſed; and inſtead of it ſuch parts of the work are coloured after gilding; which operation is called "Matting."

The work being thus prepared ſhould be ſet in a poſition ſomewhat declining from the operator; who, having at hand a cup of clean water, and ſome hair pencils, moiſtens a part of the work, and then applies the gold leaf to the part ſo moiſtened in the manner already directed under the article *Oil*-GILDING, till it be completely covered, or till it be too dry to take the gold. This will immediately adhere on being preſſed with the cotton ball. The operator proceeds to moiſten the next part of the work, and apply the gold as before, repeating the operation till the whole is completed. If, in examining the work, any parts ſhould appear to need being repaired, they ſhould be moiſtened as before, and covered with the gold; but care ſhould be taken that no part be miſſed in the firſt operation, as it is not ſo eaſily mended as in oil-gilding: nor ſhould any drops of water be ſuffered to fall on the perfect part of the gilding, as the gold is very apt to turn black in this ſtate. The work being thus far gilt, when dry, and fit for the purpoſe, which it will uſually be in about twenty-four hours, remains, either to be burniſhed, or matted.

The proper period for this purpoſe can only be aſcertained by experience, and varies at different ſeaſons. The mode of diſtinguiſhing the fitneſs of the work to take the burniſh, is to try two or three particular parts at a diſtance from each other; and if theſe take the poliſh well, the whole may be concluded to be in a fit ſtate. But if the gold peel off, or be diſordered by the rubbing, the work muſt be deemed not ſufficiently dry; and if the gold bear the rubbing well, and yet receives the poliſh ſlowly, it is a proof of its being too dry, which ſhould be prevented by watching the proper time. For the work, when too dry, both requires much more labour to burniſh it, and fails at laſt of taking ſo fine a poliſh.

To burniſh it, is to ſmooth and poliſh it with a burniſher, which is uſually a dog's or wolf's tooth, or a blood-ſtone, an agate, or a pebble, or ſomething elſe very ſmooth, fitted in a handle for that purpoſe.

To mat, is to give it a light lick in the places not burniſhed, with a pencil dipped in ſize, wherein a little vermilion ſometimes has been mixed. This helps to preſerve it, and prevent its flawing, when handled. Or, it is to cover the hollow parts with a colour the neareſt in appearance to gold.

Some recommend for this purpoſe red lead, with a little vermilion ground with the white of an egg; but yellow ochre, or Dutch pink, with red lead, would better anſwer the end; or the *terra di Sienna*, very ſlightly burnt, or mixed with a little red lead, would have a much better effect, and be more durable than any other mixture ſo near the colour of gold in ſhade. Iſinglaſs ſize will likewiſe ſupply the place of the whites of eggs. This operation of matting ſuperſedes the neceſſity of yellowing, which is intended to give the appearance of gilding to the deeper and obſcure parts of the carving where the gold cannot, nor is thought neceſſary to be laid on.

The laſt thing is to apply a vermeil, or lacquer, in all the little lines and cavities; and to ſtop and amend any little faults with ſhell-gold.

The compoſition here called *vermeil*, is made of gum gutta, vermilion, and a little of ſome ruddy brown colour, ground together with Venice varniſh and oil of turpentine. Some gilders, in lieu of this, content themſelves with fine lacca, or dragon's-blood, with gum-water.

Sometimes, inſtead of burniſhing the gold, they burniſh the ground or compoſition laid on laſt before it; and content themſelves afterwards to waſh the part over with ſize. This method is chiefly practiſed for the hands, face, and other nudities in relievo; which, by this means, do not appear ſo very brilliant as the parts burniſhed; though much more ſo than the parts perfectly flat, or matted.

To gild a work, and yet preſerve white grounds, they apply a layer of Spaniſh white mixed with a weak fiſh-glue, on all the parts of the ground whereon the yellow, or the layer next under the gold, might run.

GILDING, *Japanners*, is performed by means of gold powder, or imitations of it, cemented to the ground by a kind of gold ſize: for the method of preparing which, ſee GOLD-*ſize*. This kind of gilding may be practiſed on almoſt any ſubſtance whatever, whether wood, metal, leather, or paper; nor is there any preparation neceſſary, beſides making the ſurface on which the ſize is to be laid, even, and perfectly clean. Then ſpread the japanner's ſize, mixed with a due proportion of oil of turpentine and vermilion, with a bruſh over the work, if the whole ſurface is to be gilt; or draw with it, by means of a pencil, the proper figure deſired, avoiding carefully any other parts; when it is almoſt dry, ſo as to be capable, by its clammineſs, of receiving the gold, dip a piece of waſh-leather wrapped round the finger in the gold powder, deſcribed under *Shell*-GOLD, and rub it lightly over the ſized work; or ſpread the powder with a ſoft camel's hair pencil; and with a camel's hair bruſh clear away the looſe powder, after the gilded ſurface is dry. When leaf gold is uſed, the method of ſizing muſt be the ſame as for the powders; but great care is neceſſary in laying them on, while the ſize is in a proper ſtate of dryneſs.

There is a *falſe kind* of gilding, in which a colour of gold is given by painting and varniſhes, without employing gold. Thus a very fine golden colour is given to braſs and to ſilver, by applying on theſe metals a gold coloured varniſh, which, being tranſparent, ſhews all the brilliancy of the metals underneath. Many ornaments of braſs are varniſhed in this manner, which is called *gold lacquering*, to diſtinguiſh them from thoſe that are really gilt. Silver leaves, thus varniſhed, are put upon leather, which is then called gilt leather; and many picture-frames have no other than this counterfeit gilding, which may be diſcovered by waſhing it with a little rectified ſpirit of wine; for the ſpirit will diſſolve the varniſh, and leave the ſilver leaf of its own whiteneſs. For plain picture frames, thick tin-foil may be uſed inſtead of ſilver; the tin leaf fixed on with glue is to be burniſhed, then poliſhed with emery and a fine linen cloth, and afterwards with putty applied in the ſame manner; being then lacquered over with the varniſh five or ſix times, it looks like burniſhed gold. (See LACQUERING.) Among the falſe gildings may alſo be reckoned thoſe which are made with thin leaves of copper or braſs, called Dutch leaf. In this manner are made all the kinds of what is called gilt paper. See GILDING *of Paper*.

GILDING *of Books*. There are various methods, with reſpect to the cement uſed, by which the edges of books or paper may be gilt. Strong gum-water or iſinglaſs ſize, or glover's-ſize may be employed; but as the gum-water, and weaker ſizes are apt to run beyond the edge, and thus cauſe the leaves to ſtick together, iſinglaſs, melted with the addition of ſome common proof ſpirit of wine, and a ſixth part of honey or ſugar-candy is much to be preferred; to which muſt be added a third of bole armeniac well powdered.

The following compoſition may be uſed for this purpoſe: Take bole armeniac, and ſugar-candy well powdered; mix them with the whites of eggs, beaten to an oily conſiſtence; and the cement will be fit for uſe. In applying any of theſe cements, the paper, in quires or in books, ſhould be well cut and poliſhed on the edges to be gilt; and well ſcrewed down by a preſs; in this ſtate it is to be bruſhed over, firſt with a little of the cement without the ſugar-candy or the bole; and when that is dry, either with the cement above given, or any other ſolution of gum or ſize with the proper proportion of the bole; after which it may be ſuffered to dry; and then water-poliſhed, by rubbing it with a fine linen rag ſlightly moiſtened. It is then fit for receiving the gold, provided it be moiſtened at that time; and the leaves may be then laid on, being cut according to the breadth which they are to cover, and preſſed cloſely down by a cotton ball; and after the gilding is thoroughly dry and firm, it may be poliſhed. See BOOK-*binding*, and GILDING *of Paper*.

GILDING *on china-ware*. The gold is very much valued on china-ware, and would be much more ſo, were it not that it is very liable to loſe its luſtre, and to rub off. The Chineſe have at preſent a method of preventing both theſe accidents, in a great meaſure, by means of a ſort of poliſhing, which they give it after it is laid on. They prepare for this purpoſe a fine piece of agate, which they poliſh on one ſurface in as perfect a manner as poſſible. With this they rub over the gold, as it lies on the porcelain, ſeveral times, when it firſt comes from the baking. This gives the gold a luſtre which it would not otherwiſe have, and fixes it down to the ware in ſuch a manner, that it cannot eaſily be got off. The principal miſchief to which gold thus laid on is ſubject, is the tarniſhing, or growing dull; this is remedied by the ſame ſort of means. They wet the veſſel, upon which they would revive the luſtre of the gold, in common clean water; and while it is wet, they rub it with the ſame poliſhed agate, adding a little fair water at times to keep it moiſt. If the gold has not been well laid on at firſt, this may poſſibly raiſe it or take it off in ſome places; but if it was originally put on with the help of this ſtone, as all the gold on porcelain now is, the rubbing it with it a ſecond time never gives it any ſcratches, but recovers its priſtine luſtre and beauty. It muſt be obſerved, that the rubbing with this ſtone muſt be all done one way, both in the firſt laying on the gold, and in the brightening of it up afterwards. This may ſerve as a method for us as well as the Chineſe, not only to recover the beauty of our tarniſhed gilt china-ware, but alſo to lay gold upon ſome of our home manufactures of this kind. Obſerv. ſur les Coutûmes de l'Aſie. See PORCELAIN.

GILDING *on enamel and glaſs*, is performed by burning or annealing, *i. e.* by producing a coheſion of the gold with the glaſs or enamel, by the intermediation of a flux, or by producing the like effect without any. In both theſe methods, the gold is made to adhere to the enamel or glaſs, in conſequence of the fuſion or approach to that ſtate, either of the flux uſed, or of the body of the enamel or glaſs itſelf, by which the gold is cemented to ſuch body. The flux, when any is uſed, may be either ſimple glaſs of borax, or any of the preparations of fluxes powdered (ſee FLUX); and the gold is uſed, either in the form of leaf gold, or in that of powder made mechanically, or by precipitation. (See GOLD *powder*.) When leaf gold is employed without any flux, the enamel or glaſs may be moiſtened with a very weak ſolution of gum arabic, and again dried. After being thus prepared, it ſhould be breathed upon till it becomes a little adheſive or ſticky, and then laid upon a ſufficient number of leaves of gold: when the gold is thus united to the enamel or glaſs by the cementing quality of the gum arabic, the work is ready for burning. If a flux be uſed, it ſhould be finely levigated, tempered with a very weak ſolution of gum arabic, and very thinly ſpread on the part of the work to be gilded: and when the gum water is almoſt dry, the leaf gold ſhould be laid on that part thus prepared for it, which is then in a ſtate proper for burning. In the preſent practice, the *aurum fulminans*, or precipitation of gold by alkaline ſalts, is made by thoſe who gild glaſs in the greateſt perfection; and the volatile alkali is employed for the precipitation by the chemiſt, who prepares it for this purpoſe. But when this kind of precipitate is choſen, the uſe of any flux muſt be avoided, and a very conſiderable degree of heat applied. The manner of uſing the precipitate powders of gold, the *aurum fulminans* excepted, as well as the leaf gold, may be varied, by adding to it or omitting any flux; but in what way ſoever the powder is uſed, it is to be tempered with the oil of ſpike, and worked as the enamel colours; and the quantity of flux, when any is uſed, may be a third of the weight of the gold. In caſes where the glaſs is very hard, or where the opportunity of a ſtrong heat cannot be conveniently obtained, the expedient of uſing a flux in the following manner may be adopted with great advantage. Grind glaſs of borax to a fine powder; and having tempered it with oil of ſpike, lay it on the glaſs where the gilding is to be made; then burn the glaſs with a degree of heat, that will cauſe the borax to run; and when it is cold, apply the precipitate or leaf gold, and burn it again, as in other caſes. After the work is burnt, if it be intended to be burniſhed, a proper luſtre may be given to it, by rubbing the gilded part with a dog's tooth, or with a fine agate, or iron burniſhers. Handmaid to the Arts, vol. i. p. 374, &c. See *Ruby* Glass.

Gold may be laid upon white earthen-ware or glaſs, by drawing your deſign, upon the veſſel to be gilt, with japanners' gold ſize, moiſtening the ſize, as you find neceſſary, with oil of turpentine. Set the work in a clean place to dry for about an hour, and then place it ſo near the fire that you could but juſt bear the heat of it with your hand for a few ſeconds. Let it remain there till it feels quite tacky or clammy: then, having procured a cuſhion and ſome leaf-gold, cut it into ſlips of the proper ſize, and lay it on with a little cotton-wool. When the gold is all on, put the work into an oven to be baked for two or three hours.

Drinking glaſſes, with gilt edges, have been much admired in this country; the beſt of theſe are brought from Germany: thoſe that are made in England, though equal in beauty to the foreign, being greatly inferior in the durability of the gilding. Dr. Lewis made ſeveral experiments with a view of diſcovering this art; from which he concludes, that the gold is cemented to them by means of an intervening matter, which will adhere to glaſs ſo as not eaſily to be rubbed off. He tried maſtich, and other reſinous bodies rubbed warm on the glaſs, and ſeveral ſpirituous varniſhes: but none of theſe were found to adhere ſufficiently to the glaſs. He recommends to the trial of the artiſts in this way the harder oil varniſhes: and glaſſes have been ſince prepared in England, probably on the principles which he has pointed out, with as durable gilding as thoſe brought from Bohemia and Thuringia.

M. Zeigler, in a German tranſlation of the "Commercium Philoſophico-Technicum," deſcribes a varniſh for this purpoſe, with the method of uſing it, which appeared from his experiments to be the beſt. This varniſh is prepared by boiling fine tranſparent amber, reduced to powder, in a braſs veſſel, to the cover of which a valve is fitted, with as much drying oil as will juſt cover it; and by diluting the above ſolution with four or five times its quantity of oil of turpentine. This varniſh may be made to dry ſooner, and acquires greater firmneſs by grinding it with a little white lead, or rather with a mixture of white lead and minium. It is to be applied very thin on the glaſs, and the gold leaf laid lightly on the varniſhed part; when the varniſh is thoroughly hardened, the gold may be burniſhed, by laying a piece of ſmooth paper between the tooth or ſteel burniſher, and the gold. This gilding, M. Zeigler obſerves, is durable, and of a fine luſtre. Com. Phil. Techn. p. 65, and 614.

Gilding *of figures and letters on paper*, and for the embelliſhment of manuſcripts, is performed with ſhell-gold, tempered with gum-water; or the characters may be drawn with a milky ſolution of gum-ammoniacum made in water, and gold-leaf applied upon them when almoſt dry, or if all or any part of them is become quite dry, they may be again ſufficiently moiſtened for receiving the gold by breathing on them. Letters raiſed from the ſurface of paper or parchment, in the manner of emboſſed work, ſuch as are ſeen on ancient manuſcripts, may be formed either by friction on a proper body with a ſolid piece of gold, or by leaf gold. The former method is practiſed by tempering pulverized cryſtal with ſtrong gum-water, and with this paſte forming the letters; when they are dry, they are rubbed with a piece of ſolid gold, as in poliſhing, and the letters will appear as if gilt with burniſhed gold. The letters are formed with an emboſſed figure, either of the ſeparate letters, or of whole words, cut in ſteel; and each letter of theſe ſtamps, when they are uſed, is anointed evenly with a feather dipped in oil. Then fill theſe concave letters with the above paſte, and ſtrike the ſtamps in a perpendicular direction on the paper or vellum, laid over ſome ſheets of paper.

When the emboſſed letters are formed with leaf gold, the following, or a ſimilar compoſition muſt be uſed. Thicken beaten whites of eggs with as much vermilion as is neceſſary to give them the conſiſtence of paſte; uſe the ſtamps as before; and when the letters are dry, moiſten them by a ſmall pencil with ſtrong gum-water: and when this is almoſt dry, cover the letters with leaf gold, preſſing it cloſe to every part of them with cotton or ſoft leather; after the gilding is dry, poliſh it with proper burniſhers. Com. Phil. Techn. p. 64. and Handmaid to the Arts, p. 450, &c.

Gilding *of live-fiſh*, as craw-fiſh, carps, &c. may be performed without injuring the fiſh, by means of a cement; which Mr. Hooke, in his poſthumous papers, directs to be prepared in the following manner: Put ſome Burgundy pitch into a new earthen pot, and warm the veſſel till it receives ſo much of the pitch as will ſtick round it; then ſtrew ſome finely powdered amber over the pitch when growing cold; add a mixture of three pounds of linſeed oil, and one of oil of turpentine: cover the veſſel, and boil the contained ingredients over a gentle fire; grind the mixture as it is wanted, with ſo much pumice-ſtone in fine powder as will reduce it to the conſiſtence of paint. When the fiſh has been wiped dry, this mixture is ſpread upon it, and the gold leaf laid over it, and gently preſſed down; after which, the fiſh may be immediately put into water, and the cement will harden, and be in no danger of falling off.

Gilding *on leather*. See Lacquering.

Gilding *of metals* may be done by cleaning the ſurface of the metal, and applying gold leaves to it, which, by means of rubbing with a poliſhed blood-ſtone, and a certain degree of heat, are made to adhere perfectly well. In this manner ſilver leaf is fixed and burniſhed upon braſs, in making French plate; and ſometimes alſo gold leaf is burniſhed upon copper and upon iron. For this purpoſe, the metal, being previouſly poliſhed and quite clean, is heated to about the temperature of melted lead, and covered with a double layer of gold leaf; then a blood-ſtone burniſher, applied gently at firſt, and gradually increaſing the preſſure, will cauſe the ſurfaces of gold and copper to touch each other in almoſt every point, and then adhere with a force proportioned to the completeneſs of the contact. The firſt layer being thus burniſhed, a ſecond is made to adhere in the ſame manner, and ſometimes a third, if the gilding is intended to be very ſolid. This method of gilding is tedious, and is ſubject to the almoſt impoſſibility of uſing a ſufficient preſſure without injuring the evenneſs of the gilded ſurface. In caſes where theſe objections do not apply, there cannot be a more effectual mode of gilding, as we perceive in the manufacture of gilt ſilver and copper wire. The bar, before it is committed to the wire-drawer, is plated with gold, by having ſeveral leaves of gold ſucceſſively burniſhed down upon it, and being then ſubjected to the ſtrong compreſſion that takes place in wire-drawing, the gold and the other metal become ſo perfectly united, as to form, in a manner, one ſubſtance. See Gold *Wire*.

Some metals, and particularly ſilver, may be gilt in the following manner: dip pieces of linen in the ſolution of gold by aqua regia, and then burn them to aſhes; rub theſe aſhes on the ſurface of the ſilver, well cleanſed from any unctuous matter, with a wet linen rag, dipped in ſalt water, and the particles of gold contained in them will thus be applied to the ſilver, and adhere to it, without the application of heat, or intervention of any other body. Burniſh the ſilver with a blood-ſtone, till it acquires the colour of gold. Moſt gilt ornaments on fans, ſnuff-boxes, and other toys of much ſhew and little value, are nothing but ſilver gilt in this manner. Beckmann (Hiſt. of Inventions, vol. i.) ſuggeſts, that this method of gilding, ſometimes called dry, and ſometimes cold gilding, is a German invention; and that foreigners, at leaſt the Engliſh, were firſt made acquainted with it about the end of the 17th century; for Robert Southwell deſcribes it in the Phil. Tranſ. for 1698, and ſays, that it was known to very few goldſmiths in Germany. See Gilding *of Metals by the fire*.

Gilding *on paper*, *parchment*, and *vellum*. There are various methods uſed for this purpoſe, according to the ſeveral ends which the gilding is deſigned to anſwer. But for the moſt part, ſize, properly ſo called, and gum-water, are uſed as the cements, and the powders are more generally employed than the leaf gold. See the three firſt articles in Gilding.

The gilding proper to be uſed with water-colours may be either with the leaf-gold or powder; the leaf-gold may be laid on the deſigned ground by means either of gum-water, or iſinglaſs ſize; obſerving, that the gum-water or ſize be of the weaker kind, and laid ſparingly on the ground, and that proper time be allowed for it to be dry; and then the gold is applied to it, as in the articles above recited; and it may be poliſhed, if neceſſary, by the dog's tooth, or other kind of burniſher. In gilding larger ſurfaces, it will be found uſeful to colour the ground with the gall-ſtone; and when colours are to be laid on the gilding, the gall of any beaſt bruſhed over the gold will adapt it for receiving the colours. When the gold powders are uſed along with paintings in water-colours, they are previouſly formed into ſhell-gold. The gilding proper for the coloured paper uſed in binding books, and for other ſuch purpoſes, is performed much in the ſame manner: only that the gum-water and ſize may be much ſtronger, and that they are generally conveyed to the ground by means of a wooden plate or print, or by an engraved roller, which make an impreſſion of the intended figure or deſign. In this kind of gilding, the japanner's goldſize may be alſo commodiouſly employed; and this ſhould be always uſed when the emboſſed appearance is wanted in the greateſt degree; and for this purpoſe it ſhould be thickened with yellow ochre, mixed with as much red-lead as the proper working of the print will admit. Inſtead of the genuine leaf-gold, or gold powder, the German powder, formed of the leaves called Dutch gold, is commonly uſed in this kind of gilding. The edges of books or paper are gilt in the manner directed under the article Book-*binding* and Gilding *of books*.

Gilding *on Thread and Wire*. See Gold-*thread*, and Gold-*wire*.

Gilding *on Wood*. See the three firſt articles in Gilding.

Gilding *on Metals by the Fire*. There are two ways of gilding by fire; *viz*. that with liquid gold, and that with leaf gold. For the latter, ſee Gilding *of Metals*, ſupra.

The former, technically called "water-gilding," is performed with gold amalgamated with mercury, in the proportion of about ſix or eight parts of mercury to one of gold.

In order to this operation, they heat ſome pure quickſilver in a clean crucible, and, when it is nearly boiling, put about a ſixth of its weight of fine gold in thin plates heated red-hot, and ſtir them gently about, till the gold be found melted and incorporated into a maſs with the mercury. It is then allowed to cool; and when cold, it is to be put in a piece of ſoft leather; and by gradual preſſure, the fluid part of the amalgam, conſiſting almoſt wholly of mercury, may be forced through the pores of the leather, while the gold, combined with about twice its weight of mercury, will remain behind, forming a yellowiſh ſilvery maſs, of the conſiſtence of ſoft butter. This, after having been bruiſed in a mortar, or ſhaken in a ſtrong phial with repeated portions of ſalt and water, till the water ceaſes to be fouled by it, is fit for uſe, and may be kept for any length of time, without injury, in a corked phial. It is of indiſpenſible importance that the materials of this amalgam ſhould be perfectly pure; and therefore, the mercury employed in the preparation of it ſhould be procured from the diſtillation of the red precipitate (nitrous red oxyd of mercury), either alone, or mixed with a little charcoal powder.

When ſilver is the metal to be gilt, it is prepared for the operation by ſoaking it in warm dilute muriatic acid, ſo that the ſurface may be rendered perfectly clean; it is next waſhed in clean water, which ſhould be two or three times changed, in order to free it from the whole of the acid; and being afterwards dried, and made moderately warm, a little gold-amalgam, alſo warm, is to be evenly ſpread upon the ſilver, to which it will immediately adhere. In applying the amalgam, the operator uſes a little knife, or a bruſh made of braſs wire, for the purpoſe; and giving the work a gentle heat before the fire, he dabs or ſpreads the amalgam with the bruſh farther and more evenly upon it.

Thus far advanced, the metal is ſet over the fire, upon a grate, or in a ſort of cage, under which is a pan of charcoal, yielding a heat juſt ſufficient for evaporating the mercury; by which means the mercury is raiſed in fumes, and leaves the gold alone adhering to the work; in proportion as the mercury, evaporating and flying off, diſcovers places where gold is wanting, they take care to ſupply them, by adding new pieces of amalgam with the knife or bruſh.

If a thicker gilding be required than can reſult from ſo much of the amalgam as is applied at once, the metal, after the firſt quantity has left its gold fixed on the ſurface, has more of the amalgam ſpread upon it. After the evaporation of the mercury from this, another quantity may be applied in the ſame manner. When the mercury is evaporated, ſo that the ſurface becomes uniformly of a pale yellow colour, the metal is made to undergo other operations, by which its colour and luſtre are heightened. For this purpoſe, it is firſt rubbed with a ſcratch bruſh, compoſed of fine braſs wire, till its ſurface is made clean and ſmooth, but the pale yellow colour ſtill remains; then it is covered over with a compoſition called gilding wax, and again expoſed to the fire till the wax be burnt off; and this application is repeated till the gold appears of a proper colour. This gilding wax is compoſed of bees' wax, mixed with the following ſubſtances;

viz. red ochre, verdigris, green vitriol, or alum. Thus the colour of the gilding is heightened by a perfect diſſipation of ſome mercury remaining after the former operation. The gilt ſurface is then covered over with a ſaline compoſition, conſiſting of equal quantities of nitre, ſal ammoniac, green vitriol, and verdigris, finely powdered, and mixed up into a paſte with water or urine; or, this is uſed inſtead of the gilding wax. The piece of metal thus covered is heated till the mixture ſmokes, and quenched in water or urine. This effect ſeems to be produced by the acid of nitre, which is diſengaged by the vitriolic acid of the alum, or other vitriolic ſalt, during the expoſure to heat, acting upon any particles of copper which may happen to lie on the gilded ſurface. If the colour of the gilding be not ſufficiently heightened by the firſt application, a ſucceeding one will complete the deſired effect. Some artiſts think they give an additional luſtre to their gilt work, by dipping it in a liquor prepared by boiling ſome yellow materials, as ſulphur, orpiment, or turmeric. The only advantage of this operation is, that a part of the yellow matter remains in ſome of the hollows of the carved work, in which the gilding is apt to be more imperfect, and to which it gives a rich and ſolid appearance.

Copper, and the alloys formed by its combinations with zinc, are gilded much in the ſame manner as ſilver; but their affinity for mercury being conſiderably leſs than that of ſilver, it is not eaſy to produce a complete adheſion of the amalgam of gold to the burniſhed ſurface of theſe metals by the ſame means, and with the ſame evenneſs as in the former caſe. Advantage is here taken of the nitric acid for facilitating the adheſion of the copper and mercury in the following manner. The piece of copper, *e. g.* a button, is firſt cleaned by ſteeping it in acid and ſubſequent waſhing, and it is then burniſhed in a lathe, or by other means: after this, it is dipped in a neutralized ſolution of nitrat of mercury, and in a few ſeconds, on account of the ſtrong affinity of nitric acid for copper, the mercurial ſalt is decompoſed. The copper takes the place of the mercury, and at the ſame time the mercury is depoſited in the metallic ſtate, on the ſurface of the copper, covering it entirely, and ſtrongly adhering to it. The gold amalgam is now applied, and the reſt of the proceſs is the ſame with that which has been already deſcribed. Thus a given quantity of gold may be made to cover a larger ſurface than in any other way of gilding on metals; five grains of gold completely gilding both the upper and under ſurfaces of 144 copper buttons, each of them an inch in diameter. (Phil. Mag. ix. 20.)

Iron cannot be gilt by amalgamation, unleſs it be previouſly coated with copper, by dipping it in a ſolution of blue vitriol, or rubbed with the vitriol itſelf a little moiſtened. Iron may alſo receive a golden coat from a ſaturated ſolution of gold in aqua regia, mixed with ſpirit of wine; becauſe the iron, having a greater affinity for the acid, precipitates the gold from it.

In the gilding of iron, or rather ſteel, by means of an amalgam, peculiar difficulties occur. If recourſe be had to the method of ſimple burniſhing down, the heat requiſite for this purpoſe will, in many caſes, bring the temper of the ſteel too low; on ſuch occaſions the mode already deſcribed of gilding copper is ſometimes practiſed: that is, the parts of the ſteel to be gilded are pencilled over with nitrat of mercury, by which they are covered with a ſlightly adhering coating of mercury; then the amalgam is applied, and the gilding finiſhed in the uſual way. The objections to this proceſs are, firſt, that a conſiderable heat is required, though inferior to that requiſite for burniſhing down; and, ſecondly, that even with all poſſible care, the gilding is apt to be rough and to ſcale off. A very conſiderable improvement on this method is to trace the figure of the gilding on the ſteel firſt of all with a bruſh charged with a ſtrong ſolution of ſulphated copper, in conſequence of which a pretty thick plate of this metal is depoſited on the ſteel to which it may be made to adhere with conſiderable firmneſs by means of the burniſher; thus the gilding is, in part, performed upon the copper.

A new method of gold gilding upon ſteel has lately been publiſhed (ſee Phil. Mag. xi. p. 144), poſſeſſing many advantages over the others, and capable of ultimately attaining a very high degree of perfection. This method depends upon the well-known fact, that if ſulphuric ether and nitro-muriat of gold are mixed together, the ether will, by degrees, ſeparate from the acid nearly the whole of the gold, and retain it for ſome time in ſolution in nearly a metallic ſtate. If ether, thus charged with gold, is ſpread, by means of a pen or fine bruſh, on the ſurface of highly poliſhed ſteel, the ether preſently evaporates, leaving the gold behind in cloſe contact with the ſteel, and the adheſion is conſiderably improved by the ſubſequent application of the burniſher. The dearneſs, and eſpecially the rapid volatility of ether, are objections of ſome moment, but may be got over by uſing the beſt oil of turpentine inſtead of the ether, which has nearly the ſame efficacy in decompoſing the nitro-muriat of gold, and is both cheaper, and not ſo very quickly evaporable.

On the ſubject of gilding by amalgamation, Dr. Lewis has the following remarks: "There are two principal inconveniencies in this buſineſs; one, that the workmen are expoſed to the fumes of the mercury, and generally, ſooner or later, have their health greatly impaired by them; the other, the loſs of the mercury; for though part of it is ſaid to be detained in the cavities made in the chimnies for that purpoſe, yet the greateſt part of it is loſt. From ſome trials I have made, it appeared that both theſe inconveniencies, particularly the firſt and moſt conſiderable one, might be in a good meaſure avoided, by means of a furnace of a due conſtruction."

If the communication of a furnace with its chimney, inſtead of being over the fire, is made under the grate, the aſh-pit door, or other apertures beneath the grate, cloſed, and the mouth of the furnace left open, the current of air, which otherwiſe would have entered beneath, enters now at the top, and paſſing down through the grate to the chimney, carries with it completely both the vapour of the fuel, and the fumes of ſuch matters as are placed upon it. The back part of the furnace ſhould be raiſed a little higher above the fire than the fore-part, and an iron plate laid over it, that the air may enter only at the front, where the workman ſtands, who will be thus effectually ſecured from the fumes, and from being incommoded by the heat, and at the ſame time have full liberty of introducing, inſpecting, and removing the work.

If ſuch a furnace is made of ſtrong forged (not milled) iron plate, it will be ſufficiently durable. The upper end of the chimney may reach above a foot and a half higher than the level of the fire; over this is to be placed a larger tube, leaving an interval of an inch, or more, all round between it and the chimney, and reaching to the height of ten or twelve feet; the higher the better. The external air, paſſing up between the chimney and the outer pipe, prevents the latter from being much heated, ſo that the mercurial fumes will condenſe againſt its ſides into running quickſilver, which falling down to the bottom, is there catched in a hollow rim, formed by turning inwards a portion of the lower part, and conveyed by a pipe at one ſide into a proper receiver.

Another method is mentioned by authors of gilding upon metals, and alſo upon earthen-ware and glaſs; which is, to fuſe gold with regulus of antimony, to pulverize this maſs, and ſpread the powder upon the piece to be gilt; afterwards to expoſe it to ſuch a fire that the regulus may be evaporated while the gold remains fixed. But Dr. Lewis mentions the following inconveniencies to which this method is ſubject: the powder does not adhere to the piece, and cannot be equally ſpread; part of the gold is diſſipated along with the regulus; glaſs is fuſible with the heat neceſſary for the evaporation of regulus of antimony; and copper is liable to be corroded by the regulus, and to have its ſurface rendered uneven. Lewis's Com. Phil. Techn. p. 77, &c. p. 81. 88. and 108. Macquer's Dict. Chem. Eng. edit. 1777; and Aikin's Dict. of Chemiſtry, art. GILDING.

GILDING *Cuſhion*, is formed by a few folds of flannel, or a quantity of tow or wool, ſecured on a piece of wood of any ſize from eight to fourteen inches ſquare by a light covering of leather, and faſtened tight round the edges. The ſurface ſhould be perfectly flat and even, and it is uſually furniſhed with a handle. See CUSHION.

GILDING *Knife*, a ſlip of the hollow Spaniſh cane, cut up to a ſmooth and ſharp edge, with a good penknife: this cane knife cuts the gold leaf better than one of ſteel, as it is apt to ſtick to this laſt. This knife may in all reſpects be the ſame as thoſe uſed in painting, called "pallet knives;" the blade of which may be four or ſix inches long, and ſomewhat more than half an inch in breadth, with a proportionable handle.

GILDING *Pallet*, a flat piece of wood, about three inches long, and an inch broad, covered with a piece of fine woollen cloth.

By breathing upon this pallet, to moiſten the cloth a little, and then clapping it gently down upon the gold leaf, this may be raiſed from the cuſhion, and conveyed to the work to be gilded.

GILDING *Tip*, a tool made by faſtening the long hairs of a ſquirrel's tail between two cards, and uſed for taking up the gold leaf after it is cut, and applying it to the article to be gilded.

GILDING *Wax*. See GILDING of *Metals*.

GILDO, in *Biography*, a powerful lord in Mauritania, ſerved the emperor Theodoſius, in his brother's revolt in 373, with ſo much fidelity, that he was raiſed to the chief command in Africa. During the reigns of Arcadius and Honorius he maintained a kind of independence, and ruled, at his pleaſure, the provinces under his command, which he oppreſſed by every ſpecies of tyranny. In the diſſenſions between the eaſtern and weſtern empires, he was perſuaded by the miniſter Eutropius to acknowledge Arcadius: for this he was condemned as a public enemy by the Roman ſenate. About the ſame time a deadly quarrel had ariſen between Gildo and his younger brother Maſcezel, in which the latter had taken refuge in the court of Honorius. Gildo, with a brutality that can never be ſufficiently execrated, ſatiated his diſappointed vengeance upon the two children of his brother, whom he barbarouſly murdered. Maſcezel, anxious for revenge, landed a body of troops in Africa, and encamped in the face of a numerous army of Moors collected by Gildo. Theſe, intimidated by the ſuperior diſcipline of the Europeans, fled almoſt without a blow. Gildo eſcaped to the ſea-ſhore, where he embarked for a foreign country, but, being driven back by adverſe winds, he was ſeized by the inhabitants and thrown into a dungeon. There a voluntary death ſaved him from the cruel fate, which his conſcience told him he might expect from his injured brother. The revolt of Gildo, ſays the hiſtorian, was conſidered as an event of ſo much importance to the empire, that the poet Claudian made the "Gildonic war" the ſubject of one of his panegyrics, to the honour of Stilicho, who was the commander in it, againſt the ſubject of this article. Gibbon. Univer. Hiſt.

GILEAD, *Balm of*. See BALSAM.

GILEAD, *Falſe Balm of*, in *Botany*. See DRACOCEPHALUM.

GILEAD, in *Scripture Geography*, mountains of Paleſtine, which lay E. of Jordan, and ſeparated the lands of Ammon, Moab, Reuben, Gad, and Manaſſeh from Arabia Deſerta. According to Euſebius mount Gilead reached from Libanus northward to the kingdom of the Amorites, which was ceded to the tribe of Reuben; ſo that it muſt have extended above 70 leagues from north to ſouth. This mountain, or rather chain of hills, was much celebrated for its excellent balm. Jer. viii. 22. xlvi. 11. li. 8. Gen. xxxvii. 25. See BALSAM. Gilead derived its name from Gael-haed, *q. d.* the heap of witneſs, in reference to the heap of ſtones raiſed as a monument of the covenant between Jacob and Laban. Gen. xxxi 21.

GILES, in *Biography*, a learned Italian prelate, and cardinal of the ſixteenth century, diſtinguiſhed himſelf by the progreſs which he made in different branches of literature; and was appointed profeſſor of philoſophy, and then of theology, in his order, that of the hermits of Auguſtine. In 1507, he was raiſed to the poſt of general of his order, and was employed by pope Julius II. to open the council aſſembled at the Lateran in the year 1512; and, in 1517, was ſent legate into Germany by Leo X., on which occaſion he was promoted to the office of cardinal. After this he was ſent into Spain, and employed in many difficult negociations. He was nominated biſhop of ſeveral important ſees at different periods, and alſo patriarch of Conſtantinople. He died at Rome in 1532, and left behind him a very high character for learning. He was, during his life, perpetually conſulted in difficulties that occurred to the literati in the Oriental as well as the Latin and Greek languages. He was the author of many works that bear teſtimony to his reputation, among theſe are, Remarks on the early Chapters of the Book of Geneſis, Commentaries on ſome of the Pſalms of David; Dialogues, Epiſtles, Poems, &c. In the third volume of "Ampliſſima Collectio veterum Monumentorum," many letters of this prelate and his correſpondents are inſerted, which contain numerous facts as well relating to his own hiſtory, as to that of the period in which he flouriſhed. Moreri.

GILFORD, in *Geography*, a ſmall poſt and market town of the county of Down, Ireland. The river Bann runs through the centre of it, over which there is a very handſome bridge, highly ornamented with hewn ſtone, of twenty-two arches. It is a handſome neat town, and the country about it is highly improved; the houſes are good, and chiefly inhabited by wealthy and reputable linen-drapers. The linen trade is carried on very extenſively here, and the cloth is as remarkable for the fineneſs of its texture, as the river is for giving it an excellent bleach. Nothing can exceed in beauty the vale from Banbridge to Moyallen through Gilford, on the borders of the Bann, for a continuance of ſix miles; the river in delightful meanders, the riſing grounds ſurrounding it adorned with woods, and the bottoms variegated with bleach-greens, afford views the moſt beautiful and pictureſque. Gilford is 62¼ miles N. from Dublin, and 11 miles from Armagh.

GILGAL, in *Scripture Geography*, a celebrated place, W. of Jordan, where the Iſraelites encamped after their paſſage of this river, and where a conſiderable city, famous for many events, was afterwards built. It was about a league from Jordan and from Jericho.

GILGE, in *Geography*, a town of Pruſſia, in the circle of

Samland ; 28 miles N.W. of Konigſberg.—Alſo, a river of Pruſſia, which branches off from the Memel about 7 miles below Tilſit, and runs into the Curiſch Haff, N. lat. 55° 10'. E. long. 21° 24'.

GILGEN, ST. a town of Auſtria, 10 miles N. W. of Efferding.—Alſo, a town of Stiria ; 5 miles N.N.E. of Marburg.

GILGENEAU, a town of Pruſſia, in Oberland ; 15 miles N.N.W. of Seldau.

GILGENBURG, a town of Pruſſia, in Oberland ; 60 miles E. of Culm. N. lat. 53° 17'. E. long. 19° 57.

GILGUL HAMMETHIN, a Hebrew phraſe, literally ſignifying the *rolling of the dead.* To conceive the uſe of this expreſſion it is to be obſerved, that the Jews have a tradition that, at the coming of the Meſſiah, no Iſraelite ſhall riſe any where but in the Holy Land. What, then, ſhall *become* of all the faithful interred in other parts ? Shall *they* periſh, and remain in the ſtate of death ?

No, ſay the Jewiſh doctors ; but God will dig them ſubterraneous canals, or cavities, through which they ſhall roll from their tombs to the Holy Land ; and, when they are arrived there, God will blow on them, and raiſe them again.

This imaginary paſſage of the carcaſes, or aſhes, of the Jews from their tombs to the Holy Land, by rolling underground, is what they call *gilgul hammethin*, the rolling of the dead.

GILIBERTIA, in *Botany*, named by Prof^{r}. Gmelin of Gottingen in his faulty edition of the Syſt. Nat. of Linnæus, v. 2. 682, in honour of John Emanuel Gilibert, author of a Flora Lithuanica, printed in 1781, octavo, which was ſuppreſſed by authority of the government of Poland, on account of its alleged imperfections, but which was reprinted by its author afterwards at Lyons, where he alſo edited various works of Linnæus.—Willd. Sp. Pl. v. 2. 551. (Quiviſia ; Cavan. Diſſ. 367. Juſſ. 264. Lamarck. Illuſtr. t. 302.)—Claſs and order, *Decandria Monogynia.* Nat. Ord. *Tribilatæ*, Linn. *Meliæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-ſhaped, with four or five teeth, permanent. *Cor.* Petals four or five, ovate, obtuſe. Nectary of one leaf, cup-ſhaped, ſhorter than the petals, embracing the germen, with ten marginal teeth. *Stam.* Filaments none ; anthers eight or ten, ovate, erect, ſeſſile on the teeth of the nectary. *Piſt.* Germen ſuperior, globoſe, furrowed, ſhorter than the nectary ; ſtyle ſimple, riſing above the nectary ; ſtigma globoſe, thick, furrowed. *Peric.* Capſule ovate, coriaceous, ſplitting half way down into four acute recurved valves, with longitudinal central partitions, ſeparating it into four cells. *Seeds* one or two in each cell, ovate, ſmooth, affixed to the columella.

Eſſ. Ch. Calyx with four or five teeth. Petals four or five. Nectary cup-ſhaped, bearing the anthers on its margin. Capſule ovate, of four cells. Seeds moſtly ſolitary.

1. G. *decandra.* (Quiviſia decandra ; Cav. n. 531. t. 211.) —Leaves alternate, elliptic-lanceolate, undivided. Flowers five-cleft, decandrous, racemoſe.—Gathered by Commerſon in the iſland of Mauritius. An evergreen ſhrub, with numerous, alternate, zig-zag *branches. Leaves* alternate, ſtalked, an inch or inch and half long, elliptic-lanceolate, entire, more or leſs acute, ſmooth, with one rib and many tranſverſe veins, without ſtipulas. *Flowers* from five to nine in each axillary cluſter, with downy ſtalks and calyx. *Petals* white, elliptical, thrice as long as the calyx, ſilky at the back, each about a quarter of an inch in length. *Nectary* white, about half as long. The habit of the ſhrub and aſpect of the flowers, reſemble a *Limonia.*

2. G. *heterophylla.* (Quiviſia ovata ; Cav. n. 532. t. 212 ; and Qu. heterophylla ; n. 533. t. 213.)—Leaves obovate ; undivided, ſinuated, or pinnatifid. Flowers four-cleft, octandrous, ſomewhat umbellate.—Gathered by Commerſon in the iſlands of Bourbon and Mauritius. The *leaves* are rather ſmaller than in the laſt, and remarkable for their variety of ſhapes, being either obovate and blunt, or ſomewhat pointed, and either undivided, or more or leſs ſlightly waved or ſinuated, or deeply and accurately pinnatifid like an oak-leaf ; all theſe varieties are found on the ſame ſpecimen, nor can we ſeparate *Quiviſia ovata*, though all the leaves of one plant happened to be undivided, for the original ſpecimens accord in every other particular. The *flowers* are much ſmaller than in the firſt ſpecies, and grow from two to four together in rather an umbel, than a cluſter. *Capſule* the ſize of a pea, pointed, ſlightly ſilky

3. G. *oppoſitifolia.* (Quiviſia oppoſitifolia ; Cav. n. 534. t. 214.)—Leaves oppoſite, elliptical, undivided. Flowers ſomewhat umbellate.—Native of the Mauritius. *Leaves* broadly elliptical, obtuſe, uniform, two inches long, all nearly oppoſite, as well as the branches. We have not ſeen the *flowers.* The *fruit* is rather umbellate than racemoſe, the ſize of a large pea, furrowed, depreſſed, clothed with ſhining tawny down, and opening into four or five parts on the ſame branch.

4. G. *rutilans.*—Leaves alternate, ovate, pointed, undivided. Flowers ſomewhat racemoſe.—Gathered by Commerſon in the Mauritius with the former, but not deſcribed by Cavanilles or Willdenow. The *leaves* are almoſt as large as the laſt, but more pointed, often oblique, and always alternate. *Branches* zig-zag. *Cluſters* ſhort, racemoſe, though appearing like little umbels, about the length of the footſtalks, each of from three to ſix flowers, their ſtalks very ſlightly downy *Petals* ſilky at the back, a line long. *Fruit* of four cells, globoſe, four-furrowed, the ſize of a pea, clothed with ſhort, denſe, rigid, golden-coloured pubeſcence.

Commerſon, the only botaniſt who has gathered any ſpecies of this genus, ſeems to have intended naming the decandrous ones *Baretia*, and the octandrous *Ababella*, but they cannot be ſeparated on any botanical principle whatever. All go by the name of *Bois de Quivi* among the French in the iſlands of Mauritius and Bourbon, whence Cavanilles contrived his barbarous name *Quiviſia.* Of their qualities or uſes nothing is mentioned. The names of *Baretia* and *Ababella* were both intended to commemorate a young woman, who, being deſirous of ſailing round the world, put on men's cloaths, and engaged herſelf as a ſailor, her real ſex being concealed from all on board, except Commerſon, to whom ſhe devoted herſelf, paſſing as his ſervant. At length, on the arrival of the ſhip at Otaheite, the more intelligent natives diſcovered the ſecret which had eſcaped the penetration of her companions, to their no ſmall aſtoniſhment. Commerſon contrived the word *bonafidia* as a ſpecific name, to expreſs her fidelity. The Otaheitans, had they underſtood Latin, would probably have invented a better.

GILIMER, or GELIMAR, in *Biography*, laſt king of the Vandals in Africa, a deſcendant of Genſeric, ſucceeded to the throne of his depoſed couſin Hilderic. The emperor Juſtinian joined the cauſe of the dethroned ſovereign, and determined do annex the African provinces once more to the Roman tominions. Beliſarius was choſen to execute the deſign, who failed in 533. Zano, the brother of Gilimer, was, at this time, engaged in the conqueſt of Sardinia, by which circumſtance the force of the Vandals was divided, while a conſiderable party at home ſtill adhered to the late king Hilderic. Gilimer aſſembled his troops to reſiſt the invader, but being defeated with great ſlaughter he was glad to retire to the Numidian deſerts, having firſt exerciſed the tyrant's policy, by commanding the execution of Hilderic and his captive friends. Carthage ſubmitted to the victorious Beliſarius; but Gilimer collected his ſcattered forces, and being joined by Zano, who had returned from Sardinia, a ſecond action enſued, in which Zano loſt his life, and Gilimer again retreated. The loſs of the African provinces ſucceeded, and the defeated king was forced to take refuge in the inacceſſible mountains of the interior of Numidia. Even here, he was ſurrounded by a part of the Roman army under Pharus, and reduced to the utmoſt diſtreſs, which to him was peculiarly afflictive by its contraſt with the luxury and effeminacy in which he had been accuſtomed to live. So deplorable was his ſituation, that he is reported to have applied to Pharus for a lyre, a ſponge, and a loaf of bread: the firſt he ſaid was to ſooth his ſorrows; the ſecond to dry up his tears: the third he aſked as an humble delicacy, of which he had not taſted for a long time. His diſtreſſes at length obliged him to ſubmit to the conqueror; he deſcended from the mountains, and followed Beliſarius to Conſtantinople, marching in the train of his triumph; on which occaſion, he ſuffered neither tear nor ſigh to eſcape, but frequently exclaimed, in the language of Solomon, "Vanity of vanities, all is vanity!" The emperor received him with reſpect, and ſhewed him much attention and kindneſs: he would have raiſed the fallen monarch to the dignity of patrician, could he have been perſuaded to renounce the Arian doctrine, in which he had been educated. He was put in poſſeſſion of a large eſtate in Galatia, where, in the boſom of his family, he ended his days in peace. The extinction of the Vandal kingdom in the perſon of Gilimer is to be dated from the year 534. Gibbon. Univer. Hiſt.

GILION, in *Geography*, an iſland in the Eaſt-Indian ſea, about 36 miles in circumference. S. lat. 7° 6′. E. long. 114° 37′.

GILIS, St., a town of France, in the department of the Scheldt, and chief place of a canton, in the diſtrict of Termonde. The place contains 3228, and the canton 16,770 inhabitants, on a territory of 95 kiliometres, in ſix communes.

GILITZSTAIN, a town of the duchy of Carinthia; 10 miles E.N E. of St. Veit.

GILL, in *Agriculture*, a term ſometimes applied provincially to the pair of wheels and frame on which timber is conveyed.

Gill, John, in *Biography*, was born at Kettering, in Northamptonſhire, in 1697, and diſcovering, when very young, an uncommon capacity for learning, his father, who was a diſſenter of the Baptiſt perſuaſion, ſent him to a grammar-ſchool in the neighbourhood, where he ſoon outſtript his companions in claſſical attainments. When he was but eleven years of age he had read ſeveral of the common ſchool books in Latin, and made a conſiderable proficiency in the Greek. Owing to the narrow circumſtances of his parents he was put to buſineſs, but he did not fail to improve his leiſure moments by an attention to claſſical literature, ſo that by the time when he had attained his nineteenth year he had read all the Greek and Latin authors that had fallen in his way, and had diligently ſtudied logic, rhetoric, moral and natural philoſophy. He had likewiſe ſtudied Hebrew ſo as to be able to read the Old Teſtament in the original with pleaſure. In 1716 he was baptized, and ſoon after commenced preaching in private. He now removed to Higham Ferrers to proſecute a regular courſe of ſtudies under Mr. Davis, a man of conſiderable learning, and paſtor of a baptiſt church in that place. His ſtay here was ſhort, and after about a year he returned to his native town, and became aſſiſtant preacher to the congregation there; and in 1719 he received and accepted an invitation to become paſtor of a baptiſt congregation in Southwark. The duties of this ſituation he diſcharged with great fidelity and uſefulneſs more than half a century. He died in 1771 in the ſeventy-fourth year of his age. His ſentiments in religion were ſtrictly Calviniſtic; and his moral conduct was unimpeachable and truly exemplary. He was author of many works, particularly of "An Expoſition of the Old and New Teſtament;" in nine volumes folio: "A body of Divinity," in three volumes 4to.; "A Supplement to Mr. Whiſton's Eſſay towards reſtoring the true text of the Old Teſtament." In the year 1748, when he had publiſhed the third volume of his "Expoſition of the New Teſtament," the degree of doctor of divinity was conferred upon him by the univerſity of Aberdeen without his ſolicitation or knowledge: information of the fact was communicated to him by two of the learned profeſſors, who declared that his diploma was preſented to him, "on account of his great knowledge of the ſcriptures, of the oriental languages, and of Jewiſh antiquities, of his learned defence of the ſcriptures againſt Deiſts and infidels, and the reputation gained by his other works." Dr. Gill had, indeed, from the time of his ſettling in the metropolis, paid a moſt unwearied attention to the oriental languages: he had ſtudied the writings of the fathers, eccleſiaſtical hiſtory, the accounts of the rites and cuſtoms of the eaſtern nations, all which he knew were adapted to enrich his ſtores of biblical learning, and to qualify him for the duties of his profeſſion. Gen. Biog.

Gill, in *Botany*. See Glechoma.

Gill, in *Geography*, a townſhip of America, in the ſtate of Maſſachuſetts and county of Hampſhire, ſituated on the W. bank of Connecticut river, 90 miles from Boſton; containing 700 inhabitants.

Gill, or *Beck*, is a name in ſeveral Engliſh counties for a brook, rivulet, or ſmall ſtream of water.

Gill, a meaſure of ale or beer, is 1-4th of an ale pint = 8 8125 cubic Engliſh inches = 1.220779 wine gills = .0169084 cubic links.

Gill of wine, cyder, oil, &c. = 1-4th of a wine pint = 7.21875 cubic Engliſh inches = .8191490 ale gills = .0145307 cubic links.

Gill, Scotch meaſure, = 1-4th of a mutchkin = 1-16th of a Scotch pint, the cubic content of which varies much in different places. See *Scotch* Pint.

GILLAROO, Trout. See Trout.

GILLEM's Bay, in *Geography*, a bay on the S. coaſt of the iſland of St. Chriſtopher; two miles W. of Baſſeterre.

GILLE-LE-VICOMTE, St, a town of France, in the department of the North Coaſts; ſix miles N.N.E. of Guingamp.

GILLES-LES-BOUCHERIES, St, a town of France, in the department of the Gard, and chief place of a canton, in the diſtrict of Nimes; 10 miles S S.E. of Nimes. The place contains 5374, and the canton 6557 inhabitants, on a territory of 180 kiliometres, in two communes.

GILLES-SUR-VIC, St., a town of France, in the department of the Vendée, and chief place of a canton, in the diſtrict of Les Sables-d'Olonne; 13 miles N N.W. of this latter town. The place contains 780, and the canton 12,335 inhabitants, on a territory of 432½ kiliometres, in 17 communes.

GILLES, Peter, in *Biography*, was born at Albi in 1490, and became diſtinguiſhed as a ſcholar and traveller. Having acquired an extenſive knowledge of the learned languages and the philoſophy of the times, he ſet out on his travels with a view of making obſervations in natural hiſtory and antiquities. On his return he was introduced to the notice of George d'Armagnac, biſhop of Rhodes, who engaged him to compoſe his book "De Vi et Natura Animalium." This work, which conſiſted of extracts from Ælian and others, with obſervations of his own, he dedicated to Francis I., who ſent him to travel in the Levant, but without furniſhing him with proper ſupplies, ſo that he was reduced to great diſtreſs, and was obliged to enliſt in the troops of the ſultan Soliman II. for ſubſiſtence. He left Conſtantinople in 1550 and went to Rome, where he died 1555. He was author of two geographical works, "De Boſphoro Thracio," and "De Topographia Conſtantinopoleos," which are eſteemed for their learning; and alſo of ſome tranſlations from the Greek. Moreri.

GILLESAY, or GILLSAY, in *Geography*, one of the ſmaller Hebrides, between Lewis and North Uiſt. N. lat. 57° 45'. W. long. 6° 59'.

GILLESAY *Point*, a cape on the S.W. coaſt of the iſland of Celebes. S. lat. 5° 15'. E. long. 119° 48'.

GILLESKAAL, a town of Norway, in the dioceſe of Drontheim; 240 miles N. of Drontheim.

GILLETTE, a town of France, in the department of the Maritime Alps, and chief place of a canton, in the diſtrict of Puget-Theniers. The place contains 646, and the canton 1712 inhabitants, on a territory of 105 kiliometres, in four communes.

GILLIAN, GUISLAIN, or *Ghiſlain, St.*, a town of France, in the department of Jemmappe, ſituated on the river Haiſne and ſurrounded by marſhes, and deriving its name from a celebrated abbey founded in the year 651 by Guiſlain, the friend of St. Amand. Having been ſucceſſively in the poſſeſſion of the Dutch, the French, and the Spaniards, and of the allies, it was taken by the French in 1792. St. Gillian was called the key of Mons, and is diſtant three miles W. of it.

GILLIFREE. See JILLIFREE.

GILLINGHAM, a pariſh in the hundred of Chatham and Gillingham, Kent, England; is ſeated on the river Medway at the diſtance of two miles from the town of Chatham, and 32 from London. It contains 715 houſes and 4133 inhabitants, the greater part of whom are immediately or indirectly employed in the buſineſs connected with the neighbouring dock-yards. This village, though now deprived of its conſequence by the increaſe of Chatham, was formerly of much note. In the time of queen Elizabeth here were four quays, and twenty-ſeven ſhips and boats; the largeſt of theſe, however, was only twenty tons. The archbiſhops of Canterbury formerly had a palace here; one of whom, John Strafford, in the tenth year of Edward IIId's reign, obtained a charter for a weekly market, and an annual fair to continue eight days; but theſe have been long diſcontinued. William of Gillingham was a native of this place. He was a monk of Canterbury, in the time of king Richard II., and wrote a hiſtory of Britain; alſo one of his own monaſtery. Haſted's Hiſtory of Kent, vol. iv. 8vo.

GILLORI, an iſland on the coaſt of Weſt Florida, divided from Dauphin iſland by a very narrow channel, through which a boat cannot paſs without ſome difficulty; and between Gillori and the main land, on the weſt ſide of Mobile bay, there is a chain of ſmall iſlands and oyſter ſhells, through which is a paſſage of four feet, called "Paſſe au Heron."

GILLS, BRANCHIÆ, in *Ichthyology*. See FISH, *Organs of Reſpiration.*

GILLS, *Leaf of the.* See FOLIUM *branchiarum.*

GILLY-FLOWER, in *Gardening*, the common name of a fine fragrant flowery plant, common in gardens, &c. See DIANTHUS.

GILLY-FLOWER, *Queen's.* See HESPERIS.

GILLY-FLOWER, *Stock.* See CHEIRANTHUS.

GILLY-*Lough*, in *Geography*, a lake of Ireland, in the county of Sligo; and on the river by which its waters are diſcharged into the ſea ſtands the town of Sligo. This lake exhibits that variety of charming proſpects which bold hills, wooded lawns, and large iſlands clothed with verdure and crowned with trees, united with a great extent of water, cannot fail to produce. Beaufort.

GILMANTOWN, a poſt-town of America, in Strafford county, New Hampſhire, S.W. of lake Winnipiſcogee, and 52 miles N.W. of Portſmouth; incorporated in 1727, and containing 3752 inhabitants.

GILMARQUEY, a town of Hindooſtan, in Dowlatabad; 13 miles N.E. of Nander.

GILOH, or GELO, in *Scripture Geography*, a town of Paleſtine, ſituated in the mountains of the tribe of Judah. Joſh. xv. 51.

GILOLO, in *Geography*, one of the Molucca iſlands, in the Eaſt-Indian ocean, of conſiderable extent, and in its irregular form reſembling *Celebes*, which ſee. Its length is about 230 Britiſh miles, and the breadth of each limb ſeldom above 40. The ſhores are low; but the interior riſes to high peaks, perhaps of granite. This iſland is ſaid to have been once governed by one ſovereign, a ſheref from Mecca; but the ſultans of Ternate and Tidore now ſeem to ſhare it between them, the former poſſeſſing the northern part with Mortay, Bakian, Motir, and ſome Celebeſian iſlands, and part of Papua; while the ſultan of Tidore holds the ſouthern part with Myſol, and ſome other iſles. One of the chief towns is Tatanay, ſituated on a point or promontory of the eaſtern limb, faced with precipices, ſo as to be acceſſible only by ladders. Gilolo abounds with oxen, buffaloes, goats, deer, and wild hogs; but the ſheep are few. The bread-fruit and ſago-tree are common; and, in ſpite of the Dutch extermination, there are probably cloves and nutmegs. The natives are induſtrious, particularly in weaving; but their exertions are ſuppreſſed by Batavian jealouſy. The equinoctial runs through the ſouthern part of the iſland. E. long. 128°.

GILP LOCH, in Argyleſhire, Scotland, is a kind of gulf branching from Loch Fine on its W. ſide, which is navigable for veſſels to the entrance of the Crinan canal, through which they paſs to Loch Crinan, and the Iriſh ſea. See CANAL.

GILPIN, BERNARD, in *Biography*, was born at Kentmire, in Weſtmoreland, in the year 1517. He was deſtined by his parents for the church, and educated with that view. At ſixteen years of age he was entered at Queen's college, Oxford, where he became diſtinguiſhed for the diligence with which he applied to his academical ſtudies. He was led to think for himſelf, and freely, by the writings of Eraſmus; and as he determined to apply himſelf to the ſtudy of theology, he ſet about acquiring a thorough knowledge of the Greek and Hebrew languages, in order that he might inveſtigate the ſcriptures in their original tongues. In 1539 he took his degree of B.A., and in 1541 that of M.A., and about the ſame time he was elected fellow of his college, and admitted into holy orders. Shortly after he was invited to become a member of cardinal Wolſey's new foundation at Chriſt-church, which he accepted. Here he continued his former ſtudies, but it does not appear that his courſe of reading had produced any doubts in his mind reſpecting the popular religion, for he even entered into a vindication of the Catholic doctrines in a diſpute with Hooper, afterwards biſhop of Wincheſter. The diſcuſſion was however favourable to his improvement and candour, as it afforded him the opportunity of diſcovering that his own opinions were not ſo well ſupported by ſcripture as he imagined. Upon the acceſſion of Edward VI., Peter Martyr was ſent, under the patronage of that prince, to Oxford to read divinity lectures, a duty which he performed in a ſtrain to which that univerſity had been but little accuſtomed. He attacked many eſtabliſhed doctrines, which had been long regarded as the truth, and the only truth. Gilpin was looked up to, as capable of defending the eſtabliſhed doctrines in oppoſition to modern innovations, but his faith was ſhaken, and he choſe to remain an unprejudiced ſpectator, ready to embrace whatever ſhould appear the truth, after deliberately weighing the arguments which the diſcuſſion might provoke. At length, however, he conſented to enter the liſts with Peter, and the diſpute ended in the conviction of Gilpin that there were great corruptions in popery, and that there was need of a total reformation. He continued at Oxford till he was thirty-five, and took his bachelor's degree in divinity. In 1552 he was preſented with a living in Durham, but before he went to reſide there, he was appointed to preach before his majeſty at Greenwich. The king was not preſent, but Gilpin's diſcourſe was a ſerious and very hoſtile attack on the prevailing avarice and corruption of the age; he ſpared neither the court, clergy, magiſtrates, nor gentry. The freedom which he made uſe of at this time recommended him to the notice of many perſons of the firſt rank, particularly of ſir William Cecil, afterwards lord Burleigh, who obtained for him a general licence for preaching. While Mr. Gilpin was in London, he frequently viſited his uncle Tonſtal, biſhop of Durham, at that time a priſoner in the Tower, under a ſentence of miſpriſion of treaſon. When Mr. Gilpin was ſettled in the country, he felt many doubts how to proceed in the inſtruction of his people; he had not made up his own mind on many important doctrines, and therefore felt but ill qualified to teach others, or indeed to guard them from the prevailing errors. He accordingly reſigned his living, and determined, at the advice of Tonſtal, to ſpend ſome time abroad. He had now an opportunity of re-examining all his opinions; he began to have juſt notions of the doctrines of the reformed; ſaw things in a clearer light, and felt a ſatisfaction in the change that he had made, to which he had hitherto been a ſtranger. On the death of king Edward, Tonſtal was releaſed and reinſtated in his biſhopric; he immediately offered his nephew a good living, which was reſpectfully refuſed on conſcientious principles. He returned from the continent in the year 1556, and immediately viſited biſhop Tonſtal, who received him with great friendſhip, and preſented him with the archdeaconry of Durham, to which he annexed the living of Eaſington. He now repaired to his pariſh, determined to do what good he was able in reproving vice, and encouraging virtue. His zeal and aſſiduity in the good work of reformation made him many enemies, and the cry of hereſy was continually ſounded againſt him, but by the ſkilful management of his uncle, the charge, though formally and publicly brought, was diſmiſſed. After this, he reſigned his preferment in the church, and became domeſtic chaplain to the biſhop. Mr. Gilpin did not remain long without a benefice, but was inducted to the living of Houghton-le-Spring, and upon his arrival at the place, people crowded to him from all quarters, perceiving that he was a teacher very different from thoſe to whom they had been accuſtomed, and by his truly affectionate treatment of them, he quickly gained their confidence, reſpect, and attachment. The biſhop was ſtill anxious for the advancement of his nephew, and preſented to him a vacant prebend in the cathedral of Durham, which Mr. Gilpin modeſtly, but firmly declined, and told the prelate, "that by his bounty he had already more wealth than, he was afraid, he could give a good account of, and he hoped his lordſhip would rather beſtow this preferment on one by whom it was more wanted." A freſh ſet of articles of impeachment were drawn up and preſented againſt him, and he was again protected by his uncle, but from this period the biſhop's favour to him manifeſtly declined, and he ſtruck him out of his will. He was exceedingly concerned to have in any way offended ſo good a benefactor, but he could not compromiſe the matter; he was bound to ſatisfy his conſcience, and Tonſtal was vexed that he ſhould carry his piety and zeal to what he thought an exceſs. The malice of Mr. Gilpin's enemies was not ſatisfied with the loſs which he had experienced in his uncle's eſteem; they accuſed him before the ſavage Bonner, who, in the moment of his frantic zeal, declared that he would bring him to the ſtake in a fortnight. Gilpin refuſed to liſten to the entreaties and interceſſions of his friends by leaving the country, but was prepared to ſuffer for the truth, as he had been zealous in propagating it. He accordingly waited with great compoſure for the arrival of the biſhop's meſſengers. He was apprehended, but fortunately, before he could reach London, an account of the Queen's death met them on the road, an event not more favourable to our worthy paſtor, than important for the country at large. The merciless ſavage might now gnaſh his teeth, but he could no longer inflict the venom of his malignity upon the unoffending reformers. Gilpin, thus almoſt miraculouſly delivered, returned to Houghton through crowds of people, who regarded him as a father, and who expreſſed their utmoſt joy, and offered up their thanks to Almighty God for his deliverance. Mr. Gilpin was ſoon nominated to the biſhopric of Carliſle, which he declined, giving as a reaſon, that in this dioceſe he had many friends and acquaintance, of whom he did not think very highly, and that he muſt connive at many irregularities, or draw upon himſelf ſo much hatred as to prevent his uſefulneſs. In 1561 he was offered the provoſtſhip of Queen's college, Oxford, which he likewiſe declined; contenting himſelf with the living of Houghton, the duties of which he performed in the moſt exemplary manner. He employed much of his time in endeavouring to improve the minds of the younger part of his pariſh, ſuffering none to grow up in an ignorance of their duty, but urging all to intermix religion with labour, and amidſt the cares of this life to have a conſtant regard to the next. He was aſſiduous in preventing lawſuits among his pariſhioners, and his hall was frequently thronged with people of his own or neighbouring pariſhes, who came to ſettle their differences. He had a tender concern for all under affliction, and was a much readier viſitant at the houſe of mourning than at the houſe of feaſting. To ſtrangers and travellers there was always a generous welcome at the houſe of Mr. Gilpin, and he could ſuit himſelf to perſons of all ranks in life. Once he received an unexpected viſit from lord Burleigh, and the reception of the noble ſtranger was ſo liberal, that his lordſhip was accuſtomed to ſay, that he could not have expected more at Lambeth. When the great ſtateſman left his hoſt, and had travelled about a mile from his reſidence, he turned his horſe to take one more view of the place in which he had experienced ſo much content, and having kept his eye fixed ſome time, he exclaimed, "*There* is the enjoyment of life, indeed! Who can blame that man for not accepting a biſhopric! What does he want, or what can he poſſeſs to make him greater or happier, or more uſeful to mankind." Mr. Gilpin's labours extended beyond his own pariſh; he every year viſited divers neglected pariſhes in Northumberland, Yorkſhire, Cheſhire, Weſtmoreland, and Cumberland; and that his own flock might not ſuffer, he was at the expence of a conſtant aſſiſtant. In all his journies he did not fail to viſit the gaols and places of confinement; and by his labours and affectionate manner of behaviour, he is ſaid to have reformed many abandoned perſons in thoſe abodes of human miſery. He had ſet places and times for preaching in the different parts of the country, which were as regularly attended as the aſſize towns of a circuit. If he came to a place in which there was a church, he made uſe of it; if not, of barns, or any other large building, where great crowds of perſons were ſure to attend him, ſome for his inſtructions, more, perhaps, to partake of his bounty; but in his diſcourſes he had a ſort of enthuſiaſtic warmth, which rouſed many to a ſenſe of religion who had never thought of any thing ſerious before. The dangers and fatigues attending this employment were, in his eſtimation, abundantly compenſated by the advantages which he hoped would accrue from them to his uninſtructed fellow-creatures. He did not ſpare the rich; and in a diſcourſe before the biſhop of Durham, who had already conceived a prejudice againſt him, he ſpoke with ſo much freedom, that his beſt friends dreaded the reſult; they rebuked him for giving the prelate a handle againſt him, to which he replied, "If the diſcourſe ſhould do the good he intended by it, he was regardleſs of the conſequences to himſelf." He then waited on the prelate, who ſaid, "Sir, I propoſe to wait upon you home myſelf." When they arrived at the rectory, and entered the houſe, the biſhop turned ſuddenly round, and graſped him eagerly by the hand, ſaying, "Father Gilpin, I know you are fitter to be biſhop of Durham, than I am to be parſon of this church of yours. I aſk forgiveneſs for paſt injuries. Forgive me, father, I know you have enemies, but while I live biſhop of Durham, none of them ſhall cauſe you any further trouble." Upon queen Elizabeth's recommending the eſtabliſhmentof free-ſchools, Mr. Gilpin undertook to build and endow one, a deſign which he immediately put in execution. This ſchool was no ſooner opened than it began to flouriſh; and there was ſo great a reſort of young people to it, that in a little time the town was ſcarcely able to accommodate them. He procured able maſters from Oxford, and took every method to encourage thoſe of his pupils who were moſt diligent in their ſtudies. In the latter part of his life Mr. Gilpin went through his various duties with much difficulty: his health was impaired, and his conſtitution broken down by the great fatigues which he had undergone for many years. In addition to his infirmities, he met with an accident which had nearly proved fatal to him, and from the effects of which he never perfectly recovered. As he was croſſing the market-place at Durham, he was thrown down, and almoſt trampled to death by an ox. After a long and tedious confinement, he was able to get out, but continued lame as long as he lived. He died in 1583, in the 66th year of his age. Such were the life and labours of Bernard Gilpin, who, for his exemplary piety, laborious virtue, and unbounded benevolence, deſerves to have his name tranſmitted to poſterity with reſpect and reverence, and who obtained, and moſt deſervedly among his contemporaries, the title of the Northern Apoſtle. By his unwearied application he had amaſſed a great ſtock of knowledge, and was indeed ignorant of no part of learning at that time in eſteem. He had given more than common attention to the ſtudy of the dead languages, to hiſtory and divinity; he is ſaid to have excelled in poetry, but he expended little time in the purſuit of any thing that was foreign to his profeſſion. His temper was naturally warm, but, by degrees, he ſucceeded in obtaining an entire command of himſelf. His diſpoſition was ſerious, yet, among his particular friends, he was cheerful and even facetious. His ſeverity had no other object but himſelf: to others he was mild, candid, and indulgent. Biog. Brit.

Gilpin, Sawrey, who lately practiſed horſe painting with ſo much ſucceſs, was born at Carliſle in 1733, from whence, after having acquired ſome reliſh for the art from his father, who was a captain in the army, he came to London, and was articled to a ſhip-painter. His firſt intereſting works were compoſed of ſome market groups which ſtruck his eye from his window. Soon after he went to Newmarket, being encouraged by the late William, duke of Cumberland, where he executed many compoſitions which might have vied with Hogarth in point of character. In the duke's ſtud he acquired that knowledge of the horſe, which he has diſplayed with ſuch ſuperior ſpirit and beauty, and when we ſee with what felicity he applied it to the higher departments of the art, to hiſtoric compoſitions in the triumph of Camillus, the election of Darius, the ſtory of Phaeton, we muſt lament that ſuch talents ſhould have been drawn aſide to the meaner employment of horſe-portrait-painting, which occupied too much of his valuable life.

His drawings of animals, in pencil and water-colours, diſplay a degree of taſte and ſkill ſeldom attained. As a man he was equally eſteemed for probity of character and ſimplicity of manner, and, as a member of the Royal Academy, he added honour to the inſtitution. Fuſeli's Pilkington.

GILSON, in *Geography*, a townſhip of America, in Cheſhire county, New Hampſhire, containing 484 inhabitants; ſituated on the E. ſide of Aſhuelot river, and joining Keene on the ſouth.

GILT, in *Rural Economy*, a term ſignifying a young female pig, whether in an open or ſpayed ſtate.

Gilt-*Head*, in *Ichthyology*. See Aurata and Sparus.

GIMAR, in *Geography*, a town of the iſland of Cuba; 6 miles E. of Havannah.

GIMBLET, in *Carpentry*, a ſmall boring tool, which enters the wood with a ſcrew; the part above is cylindrical, both inſide and out: its uſe is to make a way for nails, in order to drive more eaſily, or to prevent the wood from ſplitting.

GIMBLETING, in *Sea Language*, is applied to the anchor, to denote the action of turning it round by the ſtock, ſo that the motion of the ſtock appears ſimilar to that of the handle of a gimblet, when it is employed to turn the wire.

GIMBOLS, denote the braſs-rings by which the ſea-compaſs is ſuſpended in its box that uſually ſtands in the binacle.

GIMESCH, in *Geography*, a town and caſtle of Hungary; 10 miles W. of Bukans.

GIMIGLIANO, a town of Naples, in Calabria Ultra; 10 miles E. of Nicaſtro.

GIMMER, a town of Africa, in Dar-fûr; 40 miles N.N.W. of Cobbé.

Gimmer *Hog*, in *Rural Economy*, a name applied to a female ſheep of the firſt year.

Gimmer *Lamb*, a term applied to a female lamb.

GIMONT, in *Geography*, a town of France, in the department of the Gers, and chief place of a canton, in the diſtrict of Auch; 12 miles E. of Auch. The place contains 2300, and the canton 8413 inhabitants, on a territory of 230 kiliometres, in 13 communes.

GIMZO, in *Scripture Geography*, a city of Judah, which the Philiſtines took from Ahaz. 2 Chron. xxviii. 18.

GIN, in *Geography*, a town of China, of the third rank, in Pe-tcheli; 10 miles S.E. of Chun-te.

Gin, formed probably by corruption from *engine*, in *Artillery* and *Mechanics*, is a machine for raiſing great weights, compoſed of three long legs, two of which are kept at a proper diſtance by means of two iron or wooden bars fixed to one of the legs by means of a bolt at one end, and by the other end to the other leg with a bolt and key, ſo that it may be put on or off at pleaſure. At three feet from the bottom is a roller moving in cheeks, that are faſtened to theſe poles by two iron bands and two iron bolts. The three legs of this machine are joined together with an iron bolt, about which they move; to this bolt is fixed an iron half ring to hook on the windlaſs, containing two braſs pullies. When the gin ſtands upright, and its legs are at a proper diſtance, one end of the cable is fixed to the dolphins of a gun or mortar with another windlaſs, containing likewiſe two braſs pullies, and the other paſſes through the pullies and round the roller, which is turned round by means of handſpikes paſſing through the holes in the ends of the roller: while a man holds the cable tight, the gin is raiſed to ſuch a height as to admit a carriage being put under it.

The gin is uſed in loading a timber-carriage with timber; it conſiſts of an acute triangular frame, in the lower part of which is a roll or windlaſs: at the apex is a ſet of pullies, and a hole to receive the top of a ſtrong pole, which is ſet up oppoſite the triangular frame, which by this means forms a ſort of tripod (or triangle, as it is commonly called among workmen) ſtanding acroſs a tree to be raiſed and loaded: the gin-rope is then reeved through a moveable block of pullies, faſtened by a chain to the tree, through that in the top of the gin and round the roll; and then, by means of hand-ſpikes or levers uſed to the roll, the tree is drawn up to a ſufficient height for the timber-carriage to be paſſed under it. Long trees are raiſed at one end firſt, and two of the wheels of the timber carriage are paſſed under them; when the other ends are raiſed in like manner, and the other two wheels (which are made to ſeparate for this purpoſe) are paſſed under them, and then are joined to the other wheels by the long adjuſtable pole with which the carriage is furniſhed. See Timber-*Carriage*.

An erect axis or drum, turned by the force of horſes walking in a circle, and uſed for raiſing coals and other weights, is alſo called a gin; the buckets being attached to the oppoſite ends of a rope, which paſſes round the drum, and which is drawn by means of its adheſion to the drum. One of the buckets deſcends empty, while the other is drawn up full; and when the motions of the buckets are to be changed, the horſes are turned, or the wheels are made to impel the axis in a contrary direction, when any other moving power is employed.

For ſhallow mines or ſhafts, theſe are worked by horſes, and are called horſe-gins; and in deep mines thus worked, it is uſual to have two levers projecting from the ſhaft, ſo as to employ two horſes, and even four in ſome caſes, with a boy to each pair, or ſingle horſe, to ſtop and turn them, ſo as to draw from the other ſide of the lever, as often as a corve or baſket arrives at the top of the ſhafth. See the article Coal.

The increaſing depth of the pits, and demand for coals at Newcaſtle, occaſioned Mr. Smeaton, the engineer, to be applied to in the year 1777, by the proprietors of Long Benton colliery, to contrive them a mode of drawing more expeditiouſly, and larger baſkets of coals than the horſe-gins then in uſe, and he accordingly erected for them a water-gin, the ſupply for which was raiſed by the ſteam-engines employed at the pits. Since the above period, ſmall ſteam-engines, called wimſeys in many places, have been applied to the winding of coals, and other minerals, and have already ſuperſeded all other modes of drawing at the large collieries; theſe ſeveral modes of drawing or winding we ſhall deſcribe particularly in the article Winding-*Engine*.

Gin, in *Mining*, horſe-gin, or coal-gin, is a machine uſed for drawing buckets or corves of earth or minerals up a mine-ſhaft or tunnel-pipe of a canal: it conſiſts of a large vertical drum or barrel, on which a rope winds, which is conducted to pullies over the ſhaft; and uſually as one bucket or corve deſcends another aſcends. See the preceding article and *Mine* Winding *Engine*.

Gin-*driver*, is the man or boy who attends the gin-horſe and turns him, when a full bucket or corve has arrived at the top of the mine-ſhaft.

GINAIRI, in *Geography*, a town of Africa, in Kumbo.

GINANNIA, in *Botany*, ſo called by Scopoli and Schreber in memory of Count Joſeph Ginanni, a native of Ravenna, whoſe poſthumous works in Italian, compoſing two folio volumes, with above 90 plates, were publiſhed at Venice in 1755. They chiefly relate to the marine productions of the Adriatic, as corals, fuci, a few ſhells, &c. but are perhaps not too ſeverely characterized by Linnæus, in a letter to Gerard, as "of no manner of uſe." The author was recommended to the ſtudy of natural hiſtory by his friend Valiſneri, as a cure for hypochondriacal diſorders, but this is hardly a ſufficient reaſon for the publication of his book. Haller appears to have ſeen the firſt volume only. Schreb. 271. Mart. Mill. Dict. v. 2. (Paloue; Aubl. Guian. 365. t. 141. Palovea; Juſſ. 351. Brownea pauciflora; Willd. Sp. Pl. v. 3. 716.) See Brownea, to which genus we are perſuaded this plant is rightly referred by Willdenow at the ſuggeſtion of Schreber, Addend, 829. The *ſtem* is ſhrubby, 15 feet high, branched, the branches alternate, ſtraight or declining. *Leaves* ſimple, alternate, nearly ſeſſile, ovate, entire, pointed, ſmooth and ſhining. *Stipulas* minute, acute. *Flowers* terminal, few, red, large, and handſome, their ſhort ſtalks enveloped in large concave imbricated *bracteas*. *Legume* reddiſh, linear, compreſſed, three inches long, ſomewhat like that of *Cercis ſiliquaſtrum*. Native of the foreſts of Guiana, flowering in February, and bearing fruit in May.

GINASSERVIS, in *Geography*, a town of France, in the department of the Var, and chief place of a canton, in the diſtrict of Brignolles; nine miles N.W. of Barjols. The place contains 782, and the canton 8000 inhabitants, on a territory of 302½ kiliometres, in ſix communes.

GINDARUS, in *Ancient Geography*, a town of Aſia, in Syria, ſituated on a mountain, E. of the gulf of Iſſicus.

GINDELI, in *Geography*, a town of Candahar, on the Behat; 48 miles E.S.E. of Cabul.

GINDERE, a town of Ceylon; five miles N. of Point de Galle.

GINERCA, a town of the iſland of Corſica, ſituated in a ſmall bay to which it gives name; 13 miles S. of Calvi.

GINESTAS, a town of France, in the department of the Aude, and chief place of a canton, in the diſtrict of Narbonne; ſeven miles N.W. of Narbonne. The place contains 501, and the canton 6753 inhabitants, on a territory of 167½ kiliometres, in 15 communes.

GINETO, St. a town of Naples, in Calabria Citra; 16 miles N.W. of Biſignano.

GINETTA, Genetta, or *Genet*, in *Zoology*, the Viverra *genetta* of Linnæus, which ſee.

GINGEE, in *Geography*, a town and fortreſs of Hindooſtan, in the Carnatic, once the capital of a kingdom of the ſame name, ſituated on a mountain and defended by three caſtles; 33 geographical miles from Pondicherry and 23 from Trinomaly. N. lat. 12° 16′. E long. 79° 36′.

GINGER, in *Botany*. See AMOMUM.

GINGER, *Zingiber*, in the *Materia Medica*, &c. Ginger is either black or white. In Jamaica this plant attains its full height and flowers about Auguſt or September, and fades about the cloſe of the year. When the ſtalks are entirely withered, the roots are in a proper ſtate for digging, which is generally performed in the months of January and February. After being dug, they are picked, cleanſed, and gradually ſeethed, or ſcalded in boiling water: they are then ſpread out, and expoſed every day to the ſun till ſufficiently dried; and after being divided into parcels of about 100lb. weight each, they are packed in bags for the market: this is called the "black ginger." "White ginger" is the root of the ſame plant, but inſtead of ſcalding the roots, by which they acquire the dark appearance of the former, each root is picked, ſcraped, ſeparately waſhed, and afterwards dried with great care: by this operation more than double expence is incurred, and the market price is proportionably greater. Black ginger is ſaid by Jacquin to loſe part of its eſſential oil by being thus immerſed in boiling water; and on this account it is leſs uſeful for medical and other purpoſes than the white, which is always good when perfectly ſound and free from worm-holes: but that imported from the Eaſt Indies is ſtronger than any we have from Jamaica.

This warm aromatic root appears, ſays Lewis, to be much leſs liable to heat the conſtitution than might be expected from the penetrating heat and pungency of its taſte, and the fixedneſs of its active principles. But Dr. Cullen is of opinion, that there is no real foundation for this remark. It gives part of its virtue to water, and the whole to rectified ſpirit, tinging the latter of a deep, and the former of a pale yellow colour. This latter property it poſſeſſes in ſo conſiderable a degree, that if a watery infuſion of this root be boiled down to a thick conſiſtence, diſſolved afreſh in a large quantity of water, and ſtrongly boiled down again, the heat and pungency of the root remain, but with little or nothing of its ſmell. It is uſed medically as an antiſpaſmodic and carminative. The caſes in which it is more immediately ſerviceable are flatulent colics, debility and laxity of the ſtomach and inteſtines, and in torpid and phlegmatic conſtitutions to excite briſker vaſcular action. It is ſeldom given but in combination with other ingredients. In the Pharmacopœias it is directed to be adminiſtered under the form of a ſyrup and tincture; it is alſo preſcribed as a condiment, and as a ſubſidiary ingredient in many compoſitions. The ſyrup of ginger is prepared by macerating two ounces of the ginger root ſliced in a pint of boiling water for twenty-four hours, and then ſtraining, and adding two pounds of refined ſugar, as in other ſyrups. The tincture of ginger is formed by macerating two ounces of ginger root ſliced in two pints of proof ſpirit for 14 days, and then ſtraining the liquor. The dietetic qualities and uſes of ginger are well known; and it is employed under various forms.

It is not uncommon to candy the root, when green, with ſugar and honey; having firſt ſteeped it ſome time in water, to take away part of its acrimony, and to diſpoſe it to let go the outer ſkin. This candied ginger, brought from abroad, is moderately aromatic. They alſo make a marmalade of it, and dry cakes.

The northern people make great uſe of this confection, as holding it ſovereign againſt the ſcurvy. The Indians eat the root, when green, by way of ſallad, firſt chopping it ſmall, mixing it with other herbs, and ſeaſoning it with oil and vinegar.

Ginger may be preſerved by waſhing it, and laying it to ſteep for ten or twelve days in white wine and water, ſtirring them every day; then boil a pound of roots with two quarts of white wine, and about a pint of lemon juice, for a quarter of an hour; then add two pounds and a half of fine ſugar, and boil it to a ſyrup, ſcumming it as it riſes; ſet it by till the next day in a glazed pan; then boil it for half an hour, and repeat this boiling at the ſame interval till the ginger is clear. Put it into glaſſes, and cover them with paper, and it will afford a fine ſweetmeat for the winter. A wine is made of ginger, which is a pleaſant and ſalubrious beverage.

GINGER, in *Geography*, one of the ſmaller Virgin iſles in the Weſt Indies; 10 miles S.S.W. of Virgin Gorda. N. lat. 18° 5′. W. long. 62° 53′.—Alſo, a town of Egypt, on the E. branch of the Nile, oppoſite to Manſorah.

GINGERBREAD, a richer kind of bread; the flavour and taſte of which are heightened and improved with ſpices, and particularly ginger; whence the name.

There are various forms and preparations of gingerbread: we ſhall content ourſelves with the following receipt, which is well recommended.

Into a pound of almonds, blanched and pounded, grate a penny white loaf; ſift and beat them together; to the mixture add an ounce of ginger, ſcraped fine; and liquorice, and anniſeed in powder, of each a quarter of an ounce; pour in two or three ſpoonfuls of roſe-water, and make the whole into a paſte, with half a pound of ſugar: mould and roll it, print it, and dry it in a ſtove. Others make it of treacle, citron, lemon, and orange-peel, with candied ginger, coriander, and caraway-ſeeds, mixed up with as much flour as will make it into a paſte.

GINGERO, or LENDERO, in *Geography*, a kingdom of Africa, ſituated on the S.W. of Abyſſinia. N. lat. 6°. E. long. about 35°.

GINGHAM, a town on the north coaſt of Sumatra. N. lat. 5° 10′. E. long. 96° 10′.

GINGIDIUM, in *Botany*, a name adopted by Forſter, Nov. Gen. t. 21, for an umbelliferous plant, found on the hills of New Zealand, which he himſelf ſuſpected to be a *Liguſticum*, and which has been ſo conſidered by following botaniſts. It is *Liguſticum Gingidium* of Willd. Sp. Pl. v. 1. 1428. See LIGUSTICUM.

The γιγγίδιον of Dioſcorides appears to be likewiſe of this natural order, but the ſpecies can ſcarcely be determined with certainty. Dr. Sibthorp ſuppoſed it might be *Daucus Gingidium* of Linnæus, merely from the coincidence of the names, for it agrees better with *D. Viſnaga*, *Ammi Viſnaga*, Prod. Fl. Græc. n. 650; not that any thing can be gathered, from the deſcription of Dioſcorides, to quote him, in ſuch a caſe, with any propriety. He ſays it is "by ſome called *Lepidium*, and grows very abundantly in Cilicia (now Caramania) and Syria. It is a little herb, like wild carrot, but more ſlender and more bitter, with a whitiſh and bitteriſh root." This will be found to accord equally well with many plants of thoſe countries. Matthiolus, miſled, as it ſeems, either by a Latin verſion, or by the opinion of thoſe who take the σταφυλινος of Dioſcorides for the *Paſtinaca*, or Parſnip, whereas it is evidently by the deſcription a *Daucus*, or Carrot, took for the γιγγίδιον a Syrian plant, firſt deſcribed by himſelf, and which indeed is ſmaller and ſlenderer than the Parſnip, though larger and broader than the Carrot. Hence he cenſures thoſe who have taken the Chervil, *Scandix Cerefolium*, for the herb in queſtion, though they really appear to be more in the right than himſelf. However this may be, the plant of Matthiolus is the *Daucus Gingidium* of Linnæus, as well as his *D. lucidus*;

Linnæus having in the firſt inſtance defined it from the wooden cut of Matthiolus, and in the latter deſcribed it from a ſpecimen in the Upſal garden. The hiſtory of this miſtake is given at length, by the writer of the preſent article in the Tranſactions of the Linnæan Society, v. 9. 131.

GINGING, in *Mining*, ſteining or ſtaining, ſignifies the lining of a mine-ſhaft with ſtones or bricks for its ſupport. Shallow ſhafts, where the meaſures are adapted to ſtand, are ſunk firſt, and the lining of them with ſtone, or ginging, is begun from the bottom and carried up at once to the top: but in ſinking deep ſhafts, after as great a depth is done at once as the nature of the meaſures will permit, a further depth is ſunk in the bottom, beginning firſt withinſide the ginging, and continuing the ſhaft of that diminiſhed diameter for 12 or 18 inches, according to the ſoundneſs of the meaſures in that place, when it is gradually enlarged to the full ſize as the ſinking proceeds, and ſunk ſome yards lower, until upon reaching a bed of ſtone, or as great a depth as is judged ſafe, according to the nature of the ſinking, the ginging is begun, and carried up to where the diminiſhing of the ſhafts begins; when the ſame is picked out to admit the ſucceſſive courſes of ſtone or bricks, as high as is judged ſafe, then the removal of the remainder of the ſupport for the firſt ginging is commenced, by cutting out a piece, wide enough to admit of one or two courſes of ſtone or bricks, being built up like a pier, which is firmly keyed or underpinned to the ginging above by means of tile-ſheds or thin ſlate if neceſſary: a ſimilar piece is then cut out and underpinned on the oppoſite ſide of the ſhaft, and then another between each of theſe, and ſo on, until the ginging of the lower and upper part is entirely joined all round the ſhafts.

The ſhaft is then deepened withinſide the laſt ginging, and ſunk, firſt narrow and then of its proper width, as far as is judged ſafe, when a new ginging is begun, and carried up, and joined to that previouſly finiſhed, as above deſcribed. Solid ſtone-beds or permanent rocks, which are met with in ſinking, are not ginged, but the ſhaft is ſunk through ſuch rocks, of the ſame diameter as the inſide of the ginging, which ſtands upon their top and is pinned up beneath their bottoms.

GINGIVA, in *Anatomy*, the gum; a hard ſort of fleſh, inveſting the alveoli, or ſockets, of the teeth. See *Gums* under Cranium.

GINGLARUS, in the *Ancient Muſic*, a ſmall Egyptian flute, which, according to Jul. Pollux, was proper for a ſimple melody, perhaps from having but few holes

GINGLYMOID, in *Anatomy*, from γιγγλυμος, *a hinge*, and ειδος, *form*; a term applied to certain joints of the body. See Diarthrosis.

GINGLYMUS. See Diarthrosis.

GINGO, Gingoux, or *Gingoup*, in *Geography*, a town of the Valais; 10 miles W. of Aigle.

GINGRA, in *Antiquity*, a kind of dance uſed at funerals.

GINGRAS, or Gingros, in the *Ancient Muſic*, a dance performed to the ſound of flutes.

GINGRINA, in *Antiquity*, a name given to a ſmall kind of flute fit for beginners.

GINGROS, and Gingrias, *Muſical Inſtruments of the Ancients.* The Phœnicians, according to Athenæus, had flutes of only a palm in length, which produced acute, but plaintive ſounds. The Carians made uſe of them in their funerals: perhaps by Carians the Phœnicians are meant here, as in Corinna and Bathyllides. Thoſe flutes derive their names from the lamentations of the Phœnicians at the death of Adonis, whom they called *Gingras*. Encycl. Suppl.

GINHEIM, in *Geography*, a town of Germany, in the county of Hanau Munzenberg; 11 miles W. of Hanau.

GIN-HOA, a town of China, of the third rank, in Quang-tong; 22 miles N. of Chao-tcheou.

GIN-HOAI, a town of China, of the third rank, in Se-tchuen; 32 miles S. of Tche-li-leou.

GINIPALIAGARUM, a town of Hindooſtan; 25 miles E. of Calicut.

GINKGO, in *Botany*, Linn. Mant. 313. Kæmpf. Amoen. 811. t. 813.—The Japaneſe name of a tree, as large as a Walnut-tree, with leaves reſembling an *Adiantum*. The male flowers are in catkins, the female ſolitary, on ſtalks, producing a drupa, whoſe nut reſembles that of a *Piſtacia*, with a white, ſomewhat aſtringent, kernel, which is eaten in Japan, being ſuppoſed to aſſiſt digeſtion. This tree is hardy in our gardens, ſometimes bearing catkins, but no fruit. The late Mr. Gordon ſent a living plant to Linnæus, who mentions it in an appendix by the above appellation, not being able either to define the genus, or to name it properly, till he knew the fructification. Mr. Saliſbury having with great aſſiduity determined its eſſential characters, it was dedicated to him, by Dr. Smith in the Tranſ. of the Linn. Soc. v. 3. 330, and his botanical merits will ever juſtify the appropriation. See Salisburia.

GIN-KIA-CENTZE, in *Geography*, a town of Chineſe Tartary. N. lat. 41° 45′. E. long. 123° 29′.

GIN-KIEOU, a town of China, of the third rank, in Pe-tcheli; 17 miles N. of Ho-kien.

GINLIA, a town of Naples, in Abruzzo Ultra; 12 miles N. E. of Teramo.

GINNANI, Francis, in *Biography*, was born at Ravenna in 1716. He was educated in his father's houſe, and at the age of fourteen was placed at Parma, as page to the duke of Antony Farneſe. The duties of this ſituation did not prevent him from purſuing his ſtudies, and he was particularly attentive to natural hiſtory, under the direction of his uncle Joſeph Ginnani, who was well known for his reſearches into marine productions. He devoted himſelf to a retired and ſtudious life, and was the inventor of divers agricultural inſtruments and other machines, uſeful as well as curious. His writings, which relate to almoſt all the departments of natural hiſtory, obtained for him an admiſſion into the learned ſocieties of London, Paris, Bern, and Perugia, and he held a literary correſpondence with many of the moſt eminent natural philoſophers of the age. In private life he was courteous, modeſt, and benevolent, and he was particularly obſervant of the duties of religion. He died at the age of forty. His principal work was a treatiſe on the diſeaſes of corn, with obſervations on the cauſes and remedies. He publiſhed an account of the natural productions in the muſeum of Ravenna, and he greatly intereſted himſelf in the inſtitution of the ſociety of that town. He left behind him ſome manuſcripts, among which was a "Natural and Civil Hiſtory of the Pine Foreſts of Ravenna." Gen Biog.

GINNIS, in *Geography*, a town of Turkiſh Armenia; 21 miles W. N. W. of Erzerum.

GINNISH, a town of Hindooſtan, in Guzerat; 36 miles S. of Amedabad.

GINONDAYAN, a town on the E. coaſt of the iſland of Leyta. N. lat. 10° 27′. E. long. 125° 10′.

GINORIA, in *Botany*, was named by Jacquin, to commemorate a patron of ſcience and of himſelf, the marquis Charles Ginori, governor of Leghorn, who was extremely liberal in ſupporting a botanic garden at Florence. Linn. Gen. 240. Schreb. 323. Jacq. Amer. 148. Willd. Sp. Pl. v. 2. 871. Mart. Mill. Dict. v. 2. Lamarck Dict.

v. 2. 712. Juſſ. 331. Claſs and order, *Dodecandria Monogynia.* Nat. Ord. *Calycanthemæ*, Linn. *Salicariæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf: tube bell-ſhaped; limb ſix-cleft: ſegments lanceolate, ſpreading, coloured, permanent. *Cor.* Petals ſix, roundiſh, ſpreading, longer than the calyx, with long claws inſerted into the neck of the calyx. *Stam.* Filaments 12, awl-ſhaped, the length of the calyx and inſerted into it; anthers kidney-ſhaped. *Piſt.* Germen roundiſh, depreſſed; ſtyle awl-ſhaped, as long as the corolla, not deciduous; ſtigma obtuſe. *Peric.* Capſule roundiſh, depreſſed, ſhining, coloured, with about four furrows and four valves, of one cell, gaping at the top. *Seeds* numerous, minute; receptacle roundiſh, large.

Eſſ. Ch. Calyx ſix-cleft. Petals ſix. Capſule of one cell, with four valves, coloured, with many ſeeds.

1. G. *americana.* Linn. Sp. Pl. 642. Jacq. Amer. t. 91.—Native of the rocky and gravelly banks of rivers in the iſland of Cuba. This beautiful ſhrub has much of the aſpect of a myrtle, and bears its flowers and ripe fruit in December. It riſes erect to the height of three or four feet, and its *branches* are round, ſmooth, and woody. *Leaves* lanceolate, entire, ſmooth, ſpreading, on ſhort footſtalks, oppoſite, an inch and half long, numerous. *Stalks* ſingle-flowered, ſlender, axillary and terminal. *Flowers* inodorous, with a reddiſh calyx, blue corolla, and dark-red capſule, containing a moſt beautiful berry. *Seeds* whitiſh. The capſule remains entire for ſome time after the ſeed is ſhed, together with the calyx and part of the ſtyle. The natives call this plant *Roſa del rio*, or river Roſe.—It has never been introduced into the gardens of Europe, nor have we even ſeen a dried ſpecimen.

GIN-PIN, in *Geography*, a town of China, of the third rank, in Chan-tong; 17 miles N. E. of Tong-chang.

GIN-SENG, or NIN-SENG, in *Botany*. See PINAX.

GIN-SENG, in the *Materia Medica*, is one of the principal medicines of the Chineſe and Tartars; and their moſt eminent phyſicians have written many volumes concerning its virtues.

It is known among them by divers other names, expreſſing only *ſpirit*, or *the pure ſpirit of the earth; the plant that gives immortality*, &c. It makes, in effect, the whole materia medica for the people of condition, but is too precious for the populace.

All the writers of the Chineſe affairs make mention of the gin-ſeng: as Martinius, in his Atlas; F. Kircher in his China Illuſtrata; F. Tachard, in his Voyages; and F. Le Comte, in his Memoirs.

And yet we knew but very little of this plant before F. Jartoux, a Jeſuit, and miſſionary in China; who, being employed, by order of the emperor, in making a map of Tartary, in the year 1709, had an opportunity of ſeeing it growing in a village about four leagues from the kingdom of Corea, inhabited by Tartars, called *Calca-Tatze.*

That father took this opportunity to make a draught of the plant, and give an accurate deſcription of it, with its virtues and manner of preparing it. The gin-ſeng, according to his deſcription and drawing, has a white root, ſomewhat knotty, about thrice the thickneſs of the ſtem, and which grows tapering to the end; at a few inches from the head it frequently parts into two branches, which gives it ſome reſemblance of a man, whoſe thighs the branches repreſent; and it is hence it takes the denomination gin-ſeng, which ſignifies a figure of a man.

It is hard to ſay, why the Chineſe ſhould call it gin-ſeng, a word which ſignified *figure* or *repreſentation of a man:* neither that father, nor any he enquired of, could ever find, that it bore more reſemblance to the figure of a man than is ordinarily ſeen among other roots. The Tartars, with more reaſon, call it *orhota*, that is, the firſt of plants. It grows to the height of about eighteen inches.

The plant dies away every year: the number of its years may be known by the number of ſtalks it has ſhot forth, of which there always remains ſome mark.

Thoſe who gather the gin-ſeng preſerve only the root; and all they can get of it in ten or fifteen days time they bury together, in ſome place under ground; then they take care to waſh it well, and ſcour it with a bruſh; then dip it in ſcalding water, and prepare it in the fumes of a ſort of yellow millet, which gives it part of its colour. The millet is put in a veſſel, with a little water, and boiled over a gentle fire; the roots are laid over the veſſel, upon ſmall tranſverſe pieces of wood, being firſt covered with a linen cloth, or ſome other veſſel placed over them.

They may alſo be dried in the ſun, or by the fire; but then, though they retain their virtue well enough, they have not that yellow colour which the Chineſe ſo much admire When the roots are dried, they muſt be kept cloſe in ſome very dry place; otherwiſe they are in danger of corrupting, or of being eaten by worms.

As to the place where this root grows, it is between the thirty-ninth and forty-ſeventh degree of north latitude, and between the tenth and twentieth degree of eaſt longitude, reckoning from the meridian of Pekin. Here is found a long tract of mountains, which thick foreſts, that cover and encompaſs them, render almoſt impaſſable: it is upon the declivities of theſe mountains, and in theſe thick foreſts, upon the banks of torrents, or about the roots of trees, and amidſt a thouſand other different ſorts of plants, that the gin-ſeng is found: it is not to be met with in plains, valleys, marſhes, the bottoms of rivulets, or in places too much expoſed and open

If the foreſt takes fire and be conſumed, this plant does not appear till two or three years after; it alſo lies hid from the ſun as much as poſſible, which ſhews that heat is an enemy to it.

The places where the gin-ſeng grows are, on every ſide, ſeparated from the province of Quang-tong by a barrier of wooden ſtakes, which encompaſſes this whole province, and about which guards continually patrol, to hinder the Chineſe from going out and looking after this root.

Yet, however vigilant they are, greedineſs after gain incites the Chineſe to lurk about privately in theſe deſerts, ſometimes to the number of two or three thouſand, at the hazard of loſing their liberty, and all the fruits of their labour, if they are taken either as they go out of or come into the province.

The emperor, in order that the Tartars ſhould reap all the advantage that is to be made of this plant, rather than the Chineſe, gave orders, in 1709, to ten thouſand Tartars, to go and gather all they could find of the gin-ſeng, upon condition that each perſon ſhould give him two ounces of the beſt, and that the reſt ſhould be paid for, weight for weight, in pure ſilver.

It was computed, that, by this means, the emperor would get this year above twenty thouſand Chineſe pounds of it, which would not coſt him above one-fourth part of its value.

We met, by chance, ſays F. Jartoux, with ſome of theſe Tartars, in the midſt of thoſe frightful deſerts; and their mandarins, who were not far out of the way, came, one after another, and offered us oxen for our ſubſiſtence, according to the commands they had received from the emperor.

This army of herbaliſts obſerved the following order: after they had divided a certain tract of land among their ſeveral companies, each company, to the number of a hundred perſons, ſpread itſelf out in a right line, to a certain fixed place, every ten of them keeping at a diſtance from the reſt.

Then they ſearched carefully for the plant, going on leiſurely in the ſame order; and in this manner, in a certain number of days, they run over the whole ſpace of ground appointed them.

When the time was expired, the mandarins, who were encamped in their tents in ſuch places as were proper for the ſubſiſtence of their horſes, ſent to view each troop, to give them freſh orders, and to inform themſelves if their number was complete.

If any one of them was wanting, as it often happened, either by wandering out of the way, or being attacked by wild beaſts, they always looked for him a day or two, and then returned again to their labour as before.

Gin-ſeng was formerly ſuppoſed to grow only in Chineſe Tartary, affecting mountainous ſituations, ſhaded by cloſe woods, but it has now been long known that this plant is alſo a native of North America, whence M. Sarraſin tranſmitted ſpecimens of it to Paris in the year 1704; and the gin-ſeng ſince diſcovered in Canada, Pennſylvania, and Virginia, by Lafiteau, Kalm, Bartram, and others, has been found to correſpond exactly with the Tartarian ſpecies, and its roots are now regularly purchaſed by the Chineſe, who conſider them to be the ſame with thoſe of eaſtern growth, which are known to undergo a certain preparation above-mentioned, by which they aſſume a ſomewhat different appearance. This plant was firſt introduced into England in 1740 by that induſtrious naturaliſt, Peter Collinſon. The dried root of gin-ſeng, as it is imported here, is ſcarcely as thick as the little finger, about three or four inches long, frequently forked, tranſverſely wrinkled, of a horny texture, and both internally and externally of a yellowiſh white colour. To the taſte, ſays Lewis (Mat. Med.), it diſcovers a mucilaginous ſweetneſs, approaching to that of liquorice, accompanied with ſome degree of bitteriſhneſs, and a ſlight aromatic warmth, with little or no ſmell. It is far ſweeter, and of a more grateful ſmell, than the roots of fennel, to which it has by ſome been ſuppoſed ſimilar; and differs likewiſe remarkably from thoſe roots, in the nature and pharmaceutic properties of its active principles: the ſweet matter of the gin-ſeng being procured entire in the watery as well as the ſpirituous extract, whereas that of fennel-roots is deſtroyed or diſſipated in the inſpiſſation of the watery tincture. The ſlight aromatic impregnation of the gin-ſeng is likewiſe in good meaſure retained in the watery extract, and perfectly in the ſpirituous.

The gin-ſeng, we have obſerved, is an ingredient in moſt of the medicines which the Chineſe phyſicians preſcribe to the better ſort of patients: they affirm, that it is a ſovereign remedy for all weakneſſes occaſioned by exceſſive fatigues, either of body or mind; that it attenuates and carries off pituitous humours; cures weakneſs of the lungs and the pleuriſy; ſtops vomitings; ſtrengthens the ſtomach, and helps the appetite; diſperſes fumes or vapours; fortifies the breaſt; is a remedy for ſhort and weak breathing; ſtrengthens the vital ſpirits, and is good againſt dizzineſs of the head and dimneſs of ſight; and that it prolongs life to extreme old age. Nobody can imagine, that the Chineſe and Tartars would ſet ſo high a value upon this root, if it did not conſtantly produce a good effect: thoſe that are in health often make uſe of it to render themſelves more vigorous and ſtrong. And I am perſuaded, adds father Jartoux, above-mentioned, it would prove an excellent medicine in the hands of any European who underſtands pharmacy, if he had but a ſufficient quantity of it to make ſuch trials as are neceſſary to examine the nature of it chemically, and to apply it in a proper quantity, according to the nature of the diſeaſe for which it may be beneficial.

It is certain, that it ſubtilizes, increaſes the motion of, and warms the blood, that it helps digeſtion, and invigorates in a very ſenſible manner.

After I had deſigned the root, he goes on, I obſerved the ſtate of my pulſe, and then took half of a root, raw as it was, and unprepared; in an hour after I found my pulſe much fuller and quicker; I had an appetite, and perceived myſelf much more vigorous, and could bear labour better and eaſier than before. Four days after, finding myſelf ſo fatigued and weary, that I could ſcarcely ſit on horſeback, a mandarin, who was in company with us, perceiving it, gave me one of theſe roots; I took half of it immediately, and an hour after I was not in the leaſt ſenſible of any wearineſs. I have often made uſe of it ſince, and always with the ſame ſucceſs. I have obſerved alſo, that the green leaves, and eſpecially the fibrous part of them, chewed, would produce nearly the ſame effect. The Tartars often bring people the leaves of gin-ſeng inſtead of tea: and I always find myſelf ſo well afterwards, that I ſhould readily prefer them before the beſt tea; their decoction is of a grateful colour, and, when one has taken it twice or thrice, its taſte and ſmell become very agreeable.

As for the root, it is neceſſary to boil it a little more than tea, to allow time for extracting its virtue, as is practiſed by the Chineſe, when they give it to ſick perſons; on which occaſion they ſeldom uſe more than the fifth part of an ounce of the dried root.

To prepare the root for exhibition they cut it into thin ſlices, and put it into an earthen pot well glazed, with about half a pint of water: the pot is to be well covered, and ſet to boil over a gentle fire; and, when the water is conſumed to the quantity of a cupful, a little ſugar is to be mixed with it, and to be drank; immediately after this, as much more water is to be put to the remainder, and to be boiled as before, to extract all the juice, and what remains of the ſpirituous part of the root.

Theſe two doſes are to be taken, the one in the morning, and the other in the evening. Phil. Tranſ. N° 337, or Abridg. vol. iv. part ii. p. 314, &c.

Gin-ſeng has been conſidered by the Chineſe as a powerful aphrodiſiac; but a fact to the contrary is alleged by Dr. Cullen in his Mat. Med. v. ii. p. 261. Highly as the virtues of this root have been extolled by the Chineſe, and by others, upon their authority, we know of no proofs, ſays Dr. Woodville (Med. Bot.), of its efficacy in Europe, and from its ſenſible qualities, we judge it to poſſeſs very little power as a medicine. It is recommended in decoction, *viz.* a dram of the root to be long boiled in a ſufficient quantity of water for one doſe; but it has been omitted in the laſt edition of the London Pharmacopœia.

GIO, in *Geography*, a cape of Scotland, on the N. coaſt of the iſland Shapinſka.

Gio, *St.*, a town of Italy, in Friuli; 11 miles W. of Palma la Nuova.

Gio *di Fiore*, *St.*, a town of Naples, in Calabria Citra; 16 miles W.S.W. of Umbriatico.

Gio *in Pelago*, *St.*, an iſland in the gulf of Venice, near the coaſt of Iſtria. N. lat. 45° 15′. E. long. 13° 49′.

GIOAR, in the *Materia Medica* of the ancient Arabians, a word a word applied to ſeveral different ſubſtances, and ſometimes uſed as the diſtinct names of them; ſometimes only as an epithet to them. It is generally uſed by Avicenna as a name for arſenic, ſometimes for antimony; and in Serapion, we often find it ſtanding for any of the mineral poiſons. The original meaning of the word is no more than what the Greeks expreſſed by the word ουσια, *ſubſtance;* but it became applied to ſeveral things moſt eminent in their way; as to arſenic, the moſt fatal of poiſons; to antimony, ſuppoſed at that time the moſt valuable of medicines; and to pearls, as the moſt valuable of gems.

GIOBAR, in *Geography,* a town of Aſiatic Turkey, in the province of Diarbekir; 20 miles N.W. of Tecrit.

GIOCONDO, Fran. Giovanni, in *Biography,* who flouriſhed in the ſixteenth century, was a native of Verona, where he taught the learned languages for a ſubſiſtence. Among his pupils was the celebrated Julius Cæſar Scaliger. He afterwards became a monk, and was claimed as a brother both by the Dominicans and Franciſcans. He was extremely learned in mathematics, and contributed much to the revival of claſſical learning, by the collection of ancient monuments and manuſcripts. He preſented to Lorenzo de Medici a collection of ancient inſcriptions which he had compiled in Rome. Giocondo was ſome time at the court of the emperor Maximilian. He viſited France, and was employed to build two bridges over the Seine. After this he obtained the title of Architect-royal in France. The time of his death has not been aſcertained: it is ſuppoſed he did not ſurvive, very long, the year 1521, as he calls himſelf an old man, eight years before this, in the dedication of a work to Juliano de Medici. He materially ſerved the cauſe of literature by ſeveral works, which did him much credit as a writer, as they likewiſe extended his fame as an artiſt. He publiſhed an edition of Pliny's epiſtles, and gave a correct edition of Vitruvius, illuſtrated with figures, which he dedicated to pope Julius II. He took a part in editing many other works of the ancients, and was the firſt perſon who gave a deſign of Cæſar's bridge over the Rhine. In 1506 he wrote four diſſertations, addreſſed to the magiſtracy of Venice, concerning the waters of that city. He was employed with Raphael and San Gallo in ſuperintending the erection of St. Peter's. His laſt work was, probably, the rebuilding of the ſtone bridge of Verona. Gen. Biog.

GIOFAR, Al, in *Geography,* a town of Arabia; 8 miles S.S.E. of Rabogh.

GIOGI, a town of Tranſilvania, ſituated near the Maros; 14 miles S.W. of Millenbach.

GIOJA, or Giova, Flavio, in *Biography,* was born at Paſitano, near Amalfi, in the kingdom of Naples, about the year 1300. Little is known of the hiſtory of his life, except that he is thought to have been the diſcoverer of the directive power of the magnet, by which it diſpoſes its poles along the meridian of every place, or nearly ſo, and to have applied this important fact to the purpoſes of navigation, under the form of a compaſs. As a proof that this inſtrument was the invention of a ſubject of the king of Naples, who was a junior branch of the royal family of France, it is ſaid he marked the north point with a fleur-de-lis, by which it is diſtinguiſhed by the people of every country. As a memorial of this diſcovery, the territory of Principato, in which Gioja was born, bears, for its arms, a compaſs. It muſt not, however, be concealed, that the French and the Engliſh have claimed for themſelves the honour: and many authors of reputation have given it to the Chineſe, who are reported to have known its uſe long before their intercourſe with Europeans, and that the ſecret was brought to Italy by Marco Polo. Moreri. See the article Compass.

Gioia, in *Geography,* a town of Naples, in the province of Bari; 14 miles S.S.W. of Converſano.—Alſo, a town of Naples, in Abruzzo Ultra; 7 miles S.E. of Celano.—Alſo, a town of Naples, in Calabria Ultra; 7 miles S. of Nicotera.

GIOMELU, a body of the ſpahis, or horſe, in the ſervice of the grand ſignior.

GIONI Piano, *St.* in *Geography,* a town of Naples, in Capitanata; 8 miles S.S.W. of Leſina.

GIORASH, a town of Arabia, in Yemen; 60 miles N.W. of Saade.

GIORDANI, Vital, in *Biography,* was born at Bitonto, a town belonging to the kingdom of Naples, in 1633. He was intended for the church, but deſerted the ſtudies neceſſary for that profeſſion, and married when he had no means of providing for the ſupport of a family. After this he led an idle life, quarrelled with his relations, murdered his brother, and fought for ſafety by leaving his country. He entered as a common ſoldier on board the galleys, which pope Innocent X. ſent againſt the Turks in the Levant. He was preſent in ſeveral actions, and gave abundant proofs of his courage and heroiſm. His talents led him to promotion and he was made purſer, a ſituation which obliged him to improve himſelf in arithmetic, of which he ſcarcely knew the elements. What his duty required him to learn, his inclination led him to purſue with pleaſure and delight; he became an able mathematician, and was at length choſen profeſſor of mathematics to Chriſtina, queen of Sweden. Lewis XIV. appointed him profeſſor of the ſame branch of ſcience in the Academy of Sculpture and Painting. This was in 1666, and in 1672 pope Clement X. made him his engineer, and profeſſor at the College of Wiſdom. By his great prudence, regularity, and temperance, he redeemed his character, and died in his 78th year. His principal works are "Euclide Reſtituto," 1686, folio. "Fundamentum Doctrinæ Motus Gravium," and "Ad Hyacinthum Chriſtophorum Epiſtola." Moreri.

GIORDANO, Luca, an hiſtorical painter, born at Naples in 1629. His father was an artiſt of no great repute, who, fancying his ſon Luca had an inclination to painting, employed him very early in the practice of the art; by which means he acquired an uncommon facility of handling the pencil, and ſucceeded in imitating the works of great maſters. By this, when very young, he gained for his parents conſiderable wealth; and ſo eager was his father to make advantage of his ingenuity, that he ſcarcely allowed the youth time to eat his meals, but was continually urging him to purſue his labours by repeating ſo inceſſantly Luca fa preſto, *(Luca make haſte,)* that fa preſto became his nick-name among his companions.

His firſt maſter of any note was Joſeph de Ribera, called Spagnoletto; to whoſe ſtyle he, for a time, ſo much adhered, as to puzzle the moſt diſcerning critics. From Naples he removed to Rome, where he induſtriouſly ſtudied the noble remains of antiquity, and the works of eminent maſters in the art. He fixed himſelf unhappily with Pietro Cortona, by which it is probable his brilliant imagination was taught to expand itſelf in a more imperfect and trifling manner than it was originally capable of entertaining. His ready hand, and the freedom, boldneſs, and preciſion of his touch, was exactly what Cortona required, and with him he wrought on many noble works in freſco; and was ſo incredibly expeditious in that way, that he could diſpatch as much work in a day, as any other painter could in a week.

His imagination was exceedingly fertile; and this, with the readineſs of his hand, and the conſequent abundance of his productions, ſoon ſpread his fame over Europe. The king of Spain (Charles II.) deſiring to ſee him paint, and to have the Eſcurial adorned by his hand, invited him there, ordering him to be paid 1500 ducats de Plata for the voyage, and allowing him to freight the ſhip that brought him over duty free. He alſo made him groom of the bed-chamber, honouring him with a golden key, but diſpenſing with his attendance, that he might be more his own maſter.

Velaſco ſays, "that it is impoſſible to expreſs the number and beauty of his compoſitions in Madrid, Toledo, and at the Eſcurial: and that he employed only two years to paint ten arched cielings of the church and ſtaircaſe of that palace. He was exceedingly induſtrious, generally painting ſix or ſeven hours every day; and being highly favoured by the king, became exceedingly rich. It was in 1692 he firſt arrived at Madrid, and did not return to Italy till 1702, when he accompanied Philip V. to Naples, and in 1704 died there.

Previouſly to his going into Spain he had executed numerous works in Rome, Genoa, Milan, and other places; and had produced a vaſt number of pictures in imitation of Titian, Tintoret, Giorgione, &c. &c. which are extremely correct, and exhibit the amazing power of his memory, and the verſatility of his genius. The extraordinary facility of painting which he poſſeſſed, enabled him to work with great ſucceſs in freſco, as well as in oil. This very facility is, however, the cauſe that Giordano's works will never be regarded as ſtandards in the art of painting. Too great a degree of freedom is an enemy to grandeur of ſtyle, and the perſon who poſſeſſes it is apt to be too eaſily ſatisfied with his productions; and indulging himſelf in the pleaſure afforded by the freſhneſs and clearneſs of colour and effect produced by it, is unwilling to diſturb it in order to render the parts more poſitively correct; and thus, though ever agreeable, yet works wrought in this manner are too often flimſy and weak in their effect on the mind. This is the character of Luca Giordano, who, though a great maſter in the art, ranks only in a ſecond or third rate. One of his moſt conſiderable productions is the altar-piece of the church of the Aſcenſion at Naples, repreſenting the fall of Lucifer. And in the Durazzo Polau at Genoa, is a fine picture of Seneca dying in the Bath; of which, alſo, there is a duplicate in the gallery at Dreſden.

GIORGIEV, in *Geography*, a town of Walachia, on the N. ſide of the Danube; 40 miles S.W. of Buchareſt. In June 1771, the Ruſſians defeated the Turks near this town, killing 5000 of them, and taking 180 pieces of cannon, with artillery and baggage for 30,000 men. N. lat. 43° 38'. E. long. 25° 18'.

GIORGIO ANTONIOTTO, in *Biography*, an Italian writer on muſic, who, having been a conſiderable time in England, had a work entitled "L'Arte Armonica," tranſlated into Engliſh, which he publiſhed in two vols. folio, by ſubſcription, under the title of "A Treatiſe on the Compoſition of Muſic," in three books, with an Introduction on the Hiſtory and Progreſs of Muſic from its beginning to this time, written in Italian by Giorgio Antoniotto, and tranſlated into Engliſh, 1760, printed by Johnſon, Cheapſide.

We had at this time no well digeſted, clear, and ample treatiſe of compoſition in our language. Morley's treatiſe was become ſcarce, obſolete, and totally defective in every thing that concerns modern muſic. We had indeed Malcolm's treatiſe publiſhed in 1721, and that of Dr. Pepuſch in 1731. The firſt is dark and awkwardly written; the ſecond, though excellent as far as it goes, has ſome prejudices of the old ſchool, which were totally abandoned in 1760, and it is too conciſe in many particulars to enlighten or ſatisfy the doubts of young ſtudents in many eſſential points, which were now neceſſary to be explained, and which in the year 1731 had no exiſtence. Geminiani's "Guida Armonica," ſo long expected, and publiſhed about the year 1746, puzzled the cauſe, and diſappointed every reader. Much therefore was expected, even by profeſſors, from a work in two vols. folio, written by a learned Italian, and nearly half the liſt of ſubſcribers conſiſted of the names of the principal compoſers and organiſts of the time.

We had a miſerable tranſlation of Rameau's treatiſe, written originally in a muſical technica, totally different from that to which we were accuſtomed, which, with the ungrammatical and bad Engliſh into which the reſt was tranſlated, threw every one who attempted to read it into deſpair.

The ſonatas and concertos of Corelli, publiſhed in ſcore by Dr. Pepuſch, and the works of Handel and Geminiani, for thoſe who took the trouble to ſcore them, were excellent leſſons of counterpoint, if they had been properly ſtudied. But it is aſtoniſhing how long even great performers on inſtruments remain in utter ignorance of compoſition. Jack James, Magnus, and Kilway, though admirable organiſts, never attempted compoſition, and if they had, after a certain time, they would never have been ſure of their ground, but even in making a baſe to a minuet or country dance would have diſcovered to real judges, that they were not regular bred contrapuntiſts.

Signor Antoniotto, we believe, was a perfect judge of the mechanical rules of harmony; but his method is not clear and intelligible to a ſtudent out of the reach of a maſter. His introduction, and hiſtorical account of the progreſs of muſic from the ſyſtem of the Greeks to the preſent time, will amuſe, though not accurately inſtruct, curious readers.

He aſcribes to Guido the invention of harmony, and to John de Muris the invention of muſical characters, as had been long done by others, who, truſting to tradition, had never ſeen the Micrologus of Guido, nor the Compendium of John de Muris, by which it has been lately proved, that the laws of harmony were unknown to Guido, and that de Muris himſelf aſſigns the invention of muſical characters to Magiſter Franco, who flouriſhed 1047, near 300 years before John de Muris was born. (See FRANCO and DE MURIS.) So much for ſig. Antoniotto's hiſtorical part.

When he comes to practical muſic, his definitions are ſo far from clear to readers in the firſt ſtages of counterpoint, that they multiply the ſtudent's doubts. His plates have *primâ facie* ſo ſcientific an appearance as to frighten a *principiante* as much as teaching geometry or algebra would do. His examples of notation are methodically ſtated; but the joining the old and modern characters in the ſame table will confuſe the ſtudent's ideas. He begins with three characters no longer in uſe, and the ſemibreve, now the firſt and longeſt note, ranks only as the fourth.

His general ſcale and ſyſtem of intervals will terrify a young ſtudent by the manner in which it is repreſented; his ſyſtem of harmonic combinations the ſame. Plates 14 and 15 of tranſpoſed ſcales are clear and uſeful, as are the ſcales in the ſeveral clefs.

The règle de l'octave ſeems unknown to the author, and his plain counterpoint is written entirely on a ſeries of ſevenths to baſes riſing or falling by fourths and fifths totally without modulation. No inſtructions are given for the uſe of diſcords, but in examples *a due cori* he gives diſcords indiſcriminately to every note, without informing the ſtudent when and where to uſe them, or ſpeaking of *accented* or *unaccented* parts of a bar.

At plates 48 and 49 the anſwers to ſhort examples of fugue and imitation are clear and ingenious; but no inſtructions are given for melody throughout the work. And muſical compoſition conſiſting of the union of melody and harmony, it ſeems, at leaſt, to have merited a definition. He might have told the ſtudent that it conſiſts of a pleaſing ſeries of ſingle notes of various lengths, arranged with grace, divided into equal meaſure by bars, phraſed and governed by rhythm.

At pl. 49, ex. vii. there are *ſuſpicions* of fifths in abundance between the ſecond and third lines, unnoticed by the author.

Page 106, vol. i. the author very juſtly cenſures vocal fugues and canons, in which the ſeveral voices are ſinging different words and ſyllables at the ſame time; but Rouſſeau had done this before, in his "Lettre ſur la Muſique Françoiſe," 1751. His examples of fugue and canon, which he allows to have an admirable effect in inſtrumental muſic, are few and artleſs. No other examples are given of melody than chords broken into very common paſſages as variations. Nor of harmony or melody do we find more than two or three examples in triple time, and thoſe of a very common and unmeaning ſort.

We remember that the public was much diſappointed by this work, which was ſilently put on the ſhelf, and has ſcarcely ever been mentioned ſince its publication.

GIORGIO GANDINI, a painter, ſurnamed *del Grano*. He was of Parma, and, if we believe Orlandi, not merely one of Correggio's ſchool, but a pupil, whoſe works the maſter himſelf retouched. The principal picture in St. Michele, erroneouſly aſcribed to Lelio Orſi, is claimed for him by P. Zapata; a performance, though in parts capriciouſly conceived, of an impaſto, a relief, a ſweetneſs of colour and pencil, to confer honour on the beſt of that ſchool. The eſteem in which he was held by his fellow-citizens may be conceived, from the commiſſion which they unanimouſly conferred on him after the deceaſe of Correggio; *viz.* to paint the Tribune of the Duomo. Death prevented him from the execution of it, and the commiſſion fell to a third, to Giralomo Mazzuolo, though not yet ripe for an enterprize of ſuch magnitude. Fuſeli's Pilkington.

GIORGIO, *St.*, in *Geography*, a town of Naples, in Calabria Ultra; 17 miles S.E. of Nicotera.—Alſo, a town of the iſland of Leſina; 44 miles E. of Leſina.—Alſo, a town of France, in the department of the Po; ſix miles N.W. of Chivaſſo.—Alſo, a town of Naples, in the province of Otranto; four miles E. of Tarento.—Alſo, a town of Naples, in the ſame province; three miles N.N.W. of Nardo.—Alſo, a town of Naples, in the province of Principato Ultra; three miles S.E. of Benevento.—Alſo, a town of Italy; 10 miles N.W. of Verona.—Alſo, a town of Italy, in the department of the Reno; 11 miles N. of Bologna.

GIORGIONE DA CASTEL FRANCESCO, or GIORGIO BARBARELLI, in *Biography*, was a painter of moſt uncommon talents, who diſputes the rank of head of the Venetian ſchool with Titian. He was born at Caſtel-Franco in 1477, and acquired the name of Giorgione as well from his ſuperior mode of feeling in art, as from the beauty and elegance of his perſon and manner. He at firſt became a ſcholar of Giovanni Bellini, but ſoon ſhook off the minuteneſs and trifling labour of that ſchool, and ſubſtituted breadth and fulneſs of handling and effect. Vaſari obſerves, that Giorgione, having ſeen ſome works of Lionardo da Vinci, wherein the grand ſtyle of chiaroſcuro was effected, was ſtruck by them, and endeavoured in future to imitate that character in his own pictures. If this be true, which is doubted by ſome, he, in adopting that ſtyle, did not ſcruple to vary it, to ſuit his own more pleaſing taſte; and certainly differs exceedingly from it in line, as much as in colour and effect. The former confines the eye almoſt to a ſingle point, the latter diffuſes the lights and ſhades; and though art be apparent, ſtill nature more truly predominates.

He painted in freſco with great vigour and beauty, but little of his labour in that way now remains. He was engaged to paint the bridge of the Rialto in Venice, where he almoſt altogether reſided; Vaſari, while he praiſes the beauty of the colours and execution, condemns the work, as wanting ſubjects. Many of his oil pictures are in this country, and they cannot be too much extolled for their excellence in character of colour, or fulneſs and freedom of handling: with a rich impaſto, and a ſoftneſs in the roundings, that render them delightfully pleaſing to contemplate. One large picture of a Holy Family is in poſſeſſion of the marquis of Stafford, which is highly laboured as to effect. But, perhaps the moſt perfect work of his in this country, is a ſmall picture in the collection of the earl of Carliſle, a portrait of Gaſton de Foix, with a ſervant putting on his armour. We are not acquainted with any picture that has more truth or beauty of colour, and ſtyle of character to recommend it. His portraits, in general, have every excellence required in that intereſting branch of the art, and he may be juſtly ſtyled the father of portrait painting, as ſince handed down to us by Titian, Vandyke, and ſir Joſhua Reynolds; the three great luminaries that have at different periods ſucceeded him. It is told of him, that having a diſpute concerning the ſuperiority of ſculpture or painting; and it being argued, that ſculpture had the advantage, becauſe the figures it produces may be ſeen all around; he took the adverſe ſide, maintaining, that the neceſſity of moving, in order to ſee the different ſides, deprived it of its ſuperiority; whereas the whole figure might be viewed at one glance, in a minute. To prove his poſition, he painted a figure, and ſurrounded it with mirrors, in which all the various parts were exhibited, and obtained great applauſe for his ingenuity. He died of the plague, at the early age of 34, in the year 1511.

GIORGY, ST. in *Geography*, a town of Sclavonia; 16 miles N.N.W. of Verovitza.

GIORNICO, called by the Germans *Irnis*, a town of Switzerland, in the Levantine valley, famous for the victory which 600 Swiſs gained, in 1478, over the troops of the duke of Milan, amounting to 15,000 men; a victory which inſured to the Swiſs an honourable and advantageous peace. In the vicinity of this town, there are many vineyards, and the walnut and cheſnut trees are of a very large ſize, ſome of them being not leſs than 30 feet in girth; 13 miles N. of Bellinzona.

GIOSTAH, a town of Africa, in the country of Moſambique, at the bottom of a bay not far from Soſala.

GIOTTO, in *Biography*, a painter, conſpicuous among thoſe who revived the knowledge of the art in the 13th century. His father was a labourer, who lived at Veſpignano, near Florence, and whoſe name was Bondoni; but he gave the name of Giotto to his ſon, who was born in 1276, and whom, at an early age, he placed with ſome ſhepherds to aſſiſt in tending their flocks. Whilſt engaged in this employment, he was found by Cimabue drawing a ſheep in the ſand with ſo much ingenuity, that that painter was induced to aſk him of his father, that he might teach him the art of painting. In a ſhort time he not only learned to imitate his maſter, but alſo to paint from nature; and, throwing off the dry Gothic manner which reigned till then, endeavoured to give the actual imitation of nature. He ſoon became far ſuperior to his maſter, and arrived at a degree of art which, in grace at leaſt, was not excelled before Maſſaccio. M. Fuſeli, in his laſt edition of Pilkington's Dictionary, obſerves, that "it is not eaſy to account for the rapidity of his progreſs, unleſs we aſcribe it to the ſtudy of the antique, with which he might have become acquainted at Florence, and afterwards at Rome; and as we know that he was likewiſe a ſculptor, and that models of his exiſted at the time of Lorenzo Ghiberti; this conjecture becomes highly probable, when we conſider the character of his heads, the ſquareneſs of his forms, the broad and majeſtic folds of his draperies, with the grave and decorous attitudes of his figures."

Being contemporary with Dante, it is to him we owe the portrait of that illuſtrious poet, and alſo thoſe of many other perſons of that period famed for their birth and talents. The great work now remaining, though in a ruined ſtate, which teſtifies moſt fully the juſt ground on which he earned the fame he receives, is at Aſſiſi, in the church of St. Franciſco, where, in 32 pictures, he has repreſented the various actions of that ſaint in the courſe of his life.

They, together with many other pictures in the ſame place, are in freſco, and have ever been eſteemed of ſupreme excellence for expreſſion and beauty of compoſition, and for the grace and truth of actions, and proportions of the figures.

His fame reached the ears of pope Benedict IX. who ſent for him to Rome, and employed him in the Vatican, and in St. Peter's. Clement V. took him to Avignon, where, and in other places in France, he painted many pictures in freſco, and thence drew great riches; returning to Florence in 1316. He afterwards painted in moſt of the principal cities of Italy, but more particularly at Florence, where his works were ſtudied by ſucceeding artiſts, and highly applauded even by Michael Angelo Buonarotti. He died in 1336, aged 60, having enjoyed a life of fame and eſteem; and honoured by admiſſion to the citizenſhip of Florence, as a reward for the honour his great talents conferred upon his country.

GIOVAIN, in *Geography*, a town of Perſia, in the province of Kerman; 57 miles E. of Sirgian.—Alſo, a town of Perſia, in the province of Farſiſtan; 10 miles N. of Schiras.—Alſo, a town of Perſia, in the province of Segeſtan; 55 miles W.N.W. of Zareng.

GIOVANA, a town of the republic of Lucca; ſeven miles N. of Lucca. N. lat. 44°. E. long. 10° 40′.

GIOVANI Ansani, in *Biography*, a celebrated Italian opera ſinger, with a tenor voice. His firſt appearance on the ſtage was at the theatre royal at Copenhagen, where he remained three years. In 1772, we ſaw and heard him at Hamburgh, and in 1773 he went to Amſterdam, where, as well as at Hamburgh, he only ſung at concerts, there being no opera eſtabliſhed in thoſe cities at that time. In 1775 and 1776, he ſung at Turin with the Agujari. In 1777 at Naples with Rubinelli.

In 1779 he arrived in England, where he found Roncaglia, whoſe bounded abilities excited an ambition in the tenor ſinger to take the *pas* of the ſoprano. Anſani had one of the beſt tenor voices we had ever heard on our opera ſtage. It was ſweet, powerful, even, and of great compaſs and volubility. Nor could any defect be juſtly aſcribed to it, except perhaps a little want of variety, ſpirit, and animation, in ſinging allegros, to diſtinguiſh joy from ſorrow. For there was a natural melancholy and pathos in his tones on all occaſions, which rendered his performance ſomewhat monotonous. He was of ſuch a diſcontented and irritable diſpoſition, that "trifles light as air" occaſioned perturbation. He and Roncaglia had been at variance in Italy, and here their enmity broke out anew, with double violence. Sacchini, with whom Anſani contrived to quarrel, took ſides in the diſpute between him and Roncaglia, and from the tenor ſinger's pride, impatience, and irreconcileable diſpoſition, he was in a perpetual warfare during the two ſeaſons he remained in this country.

His figure and countenance on the ſtage were good; he was tall, thin, and had the look of a perſon of high rank. He told us, we believe with great truth, that he was *ſempre in guai*, always in vexation. He was huſband to the Maccherini, who came hither as firſt woman of the ſerious opera, without a voice. If ever ſhe *had* a voice, ſhe had loſt it before her arrival in this country. We never could receive any pleaſure from her performance; every note, feeble as it was, ſhe ſqueezed out with ſuch difficulty, and with a look ſo croſs and miſerable, that after her firſt exhibition we never wiſhed more either to hear or ſee the Signora Maccherini, who was ſo proper a match for her huſband in ſweetneſs of diſpoſition, that in Italy, when employed in the ſame theatre, if one happened to be applauded more than the other, they have been known *mutually* to employ perſons to hiſs the ſucceſsful rival. The Maccherini is ſaid to have been once a very agreeable ſinger, and a conſiderable favourite on the continent during her bloom; but ſoon after her firſt appearance ſhe ran away with an Engliſh nobleman, from the theatre in Florence, in her ſtage dreſs during the middle of the performance.

GIOVANNI da San Giovanni, a painter whoſe real name was Gio. Mannozzi. He was one of the beſt Italian artiſts in freſco. Poſſeſſing a vivid imagination and a ready hand, his works are numerous, and adorn many of the churches and palaces of Rome and Florence. He did not begin to paint till he was 18 years old, his ſucceſs is therefore the more extraordinary. The genius he was endowed with being of an irregular nature, he frequently took great liberties in his deſigns; but his freſco-paintings at Florence ſhew how well, when he pleaſed, he could reſtrain the improper exuberancies of his imagination. He died in 1636, aged 46.

Giovanni, *St.* in *Geography*, a town of Naples, in Capitanata; ſix miles N.E. of Aſcoli.—Alſo, a town of the duchy of Carniola; two miles N.W. of Duino.—Alſo, a town of Italy; 19 miles N. of Bergamo.—Alſo, a town of Iſtria; nine miles N.E. of Pola.—Alſo, a town of Naples, in Abruzzo Ultra; 13 miles S. of Celano.—Alſo, a town of Naples, in Baſilicata; 17 miles S.W. of Matera.—Alſo, a town of Italy, in the duchy of Piacenza; ſix miles W. of Piacenza.—Alſo, a town of Etruria; 18 miles S.E. of Florence.

Giovanni, *St.* or *St. John*, an iſland in the Mediterranean. N. lat. 36° 27′. E. long. 26° 24′.

Giovanni *Rotondo*, *St.* a town of Naples, in Capitanata; 10 miles N.W. of Manfredonia.

GIOVAR, a town of Perſia, in the province of Farſiſtan; 55 miles S.S.W. of Schiras.

GIOVELLINO, a town of Corſica; 25 miles E. of Corte.

GIOVENAZZO, a town of Naples, in the province of Bari, ſituated near the ſea, the ſee of a biſhop; containing four churches, four convents, and defended by a caſtle; eight miles W. of Bari. N. lat. 41° 17′. E. long. 16° 42′.

GIOVI, a town of Etruria, on the Chieno; five miles N. of Arezzo.

GIPPING, a river of England, in Suffolk, which joins the Orwell, and falls with it into the Stour.

GIPSIES. See Egyptians; under which article the reader will find an account of their ſuppoſed origin, migrations, and character, and of the treatment they have undergone in ſeveral countries in which they have appeared. We ſhall here add, that Muratori, in his "Antichita Italiane," ſuggeſts, that it was not before the year 1480 that this ſingular race of people iſſued from their concealments, pretending that Egypt was their native country, and that they were deprived of their ſettlements by a king of Hungary. Nothwithſtanding the geographical abſurdity of this aſſertion, it was readily credited by the ignorant vulgar. It appears probable, according to this writer, that they drew their origin from Walachia, or the neighbouring countries, as they are ſtill found in great numbers in Hungary, Servia, Bulgaria, and Macedonia. Whether they were expelled from their native dens, or left them ſpontaneouſly, and we may add, whatever was the country from which they migrated, it is certain that about this period they began to appear in the weſtern provinces, and by their fraudulent arts were able to gain a footing there, though by nature ever addicted to a vagabond life. They were neither cultivators of the ſoil, nor artiſans, but found an inexhauſtible ſupply of their neceſſities in theft, rapine, and deceit. Although their mode of life was not unknown to the Italians, their infamous practices were tolerated, becauſe they made the ſimple people believe, that a penance was impoſed upon them of wandering about for ſeven years; and ſtill more, becauſe they pretended to the gift of divination and foretelling future events. An opinion long prevailed, that they were forbidden to remain longer than three days in one place, and that they had a privilege from the pope of providing themſelves with neceſſary food wherever they ſhould be. The time in which theſe "Zingani," or "Zingari," as they were called, firſt made their appearance in Italy, may be collected from the "Miſcella Bologneſe," publiſhed in the 18th volume of the "Rerum Italicarum." Hence we learn, "that on July the 18th, 1422, there came to Bologna a duke of Egypt, named duke Andrew, together with men, women, and children of his country, in number about 100. They had a decree from the king of Hungary, who was emperor, authorizing them to rob wherever they ſhould go for the ſpace of ſeven years, without being amenable to juſtice. When they arrived at Bologna, they lodged within and without the Porta di Galliera, and ſlept under porticoes, except the duke, who was lodged at the king's hotel. They remained here 15 days, during which time many perſons viſited them, on account of the duke's wife, who underſtood divination, and could tell what was to be a perſon's fortune, what was his preſent condition, how many children he was to have, if a woman was good or bad, and the like. In many things ſhe ſpoke the truth; and when people went to have their fortunes told, few eſcaped without having their pockets picked, or, if women, their cloaths ſtripped of their ornaments. Their women went, by ſix or eight together, through the city, entering the houſes of the citizens and prating with them, at the ſame time filching what they could lay their hands on. They alſo went into the ſhops, pretending to buy ſomething, whilſt ſome of the party were employed in pilfering." Italy did not ſuffice for this crew, which was gradually augmented by acceſſions from the men and women of the countries through which they paſſed. Krantz, in his hiſtory of Saxony, writes, that they began to be ſeen in that country in the year 1417, and he gives a lively deſcription of their cuſtoms and cheats, under the name of "Zigeni," or "Zigeuni." Aventine alſo mentions their arrival in Bavaria, and their mal-practices in 1411. They ſpread in like manner through Flanders and France, in which country they were called "Egyptians" and "Bohemians," and in Spain they were named "Gittanos." They are alſo found in the Turkiſh dominions. Although they have been frequently baniſhed from various diſtricts, and ſevere edicts have been iſſued againſt them, they ſtill contrive to keep up the race, and carry on their trade of petty pillage and deception.

GIR, or Ghir, in *Geography*, a river of Africa, which Ptolemy delineates as equal in length to the Nigir, the courſe of each being probably about 1000 Britiſh miles; but running from eaſt to weſt, till it be loſt in the ſame lake, marſh, or deſert, as the *Nigir*, which ſee. The Arabian geographer Edriſi ſeems to indicate the Gir, when he ſpeaks of the Nile of the Negroes, as running to the weſt, and loſt in an inland ſea, in which was the iſle Ulil. Some have ſuppoſed the Gir of Ptolemy to be the river of Bornou, or Wed-al-Gazel, which joining another conſiderable river, flowing from Kuku, diſcharges itſelf into the Nubia Palus, or Kauga, and it is ſo delineated in Rennell's map; but others apprehend, ſeemingly with better reaſon, that the Gir of Ptolemy is the Bahr Kulla of Browne, in his hiſtory of Africa. This river, the Nilus Nigrorum, as well as the Nile of Egypt, have their ſource in the mountains of Kumri, which Browne lays down in N. lat. 7°. The banks of the river Kulla, according to this ingenious traveller's information, abound with pimento trees, and the ferry-boats are partly managed by poles, partly by a double oar. The trees are ſo vigorous, from the quantity of water and deep clay, that canoes are hollowed ſo large as to contain ten perſons. Ptolemy ſeems to have confounded the Nigir with the Gir, which laſt river he clearly deduces from mountains in the S.E., ſo as to correſpond with the Bahr Kulla, though he be a ſtranger to its remote ſource. This river is repreſented by Ptolemy as receiving two tributary ſtreams from two lakes; and among other cities on its bank is a metropolis called Gira. The termination of the Gir is not a little obſcure, but it ſeems to be delineated, as paſſing under a chain of hills, on the N. of the Lybia Palus, or central lake of Africa, and afterwards joining the Nigir in its courſe to the weſt. The Panagra of Ptolemy, between the Gir and the Nigir, may be the Wangara of the Arabs; and his Lybia Palus, which forms the termination of the Nigir eaſtward, ſeems to be meant, as Rennell obſerves, either for the largeſt of the lakes, or for the lakes of that country (of which there are ſeveral) collectively. From an accurate examination of Edriſi, who wrote in Sicily in the 12th century, and who, from his minute attention to eaſtern Africa, has been called the Nubian geographer, it will appear, that while the Nile of the Negroes, which he ſays runs to the weſt, has been miſtaken for the Nigir, he really knew nothing of that river; and his Nile of the Negroes is the Gir of Ptolemy, terminating in an inland lake, in which was the iſland of Ulil, one day's ſail from the mouth of the river; and in which iſland another Arabian geographer places the capital city of all Soudan. Beyond this lake and iſland, Edriſi appears to have had no knowledge of central Africa; all the regions and towns he mentions ſeeming to belong to the Gir, his Nile of the Negroes, running to the N.W.; and from his account it would appear that Wangara is the Delta of the Gir.

Gir, in *Botany*, a ſpecies of graſs growing plentifully near Ras el Feel, on the borders of Abyſſinia. It begins, ſays Mr. Bruce, to ſhoot in the end of April, and ſpeedily advances to its full height of about three feet four inches. It is ripe in the beginning of May, and decays naturally ſoon afterwards. This ſpecies of graſs was one of the acquiſitions of our author's travels. It was not before known in Europe, nor when he publiſhed his work had the ſeed produced a plant any where but in the garden of the late French king.

GIRA, in *Geography*, a town of Perſia, in the province of Mazanderan; 18 miles S. of Sari.

GIRA, in *Ancient Geography*, a metropolis of Libya interior, ſeated on the river Gir. Ptol. See GIR.

GIRAFFE, in *Zoology*. See CAMELOPARDALIS.

GIRAGLIA, in *Geography*, a ſmall iſland near the N. coaſt of Corſica; 23 miles N. of Baſtia. N. lat. 43° 1′. E. long. 9° 35′.

GIRALDI, GIGLIO GREGORIO, in *Biography*, one of the moſt learned men of his time, was born at Ferrara in the year 1489. He purſued his ſtudies at his native place, and having attained to conſiderable eminence in the languages, he was choſen by the counteſs Rangone as preceptor to her ſon Hercules, afterwards a cardinal. He accompanied the counteſs to Rome during the pontificate of Leo X, and had apartments aſſigned him at the Vatican. He appears to have been employed in the inſtruction of other young perſons in polite literature, and continued at [illegible] He enjoyed but a tender portion of health, and at the ſack of Rome he loſt [illegible] his property, and even his books. This was in the year 15[illegible]7, when, having loſt his friend and patron the cardinal Rangone, he was obliged to leave the capital. In his diſtreſs, which was very ſevere, he went to Bologna, and thence to Mirandola, where he met with a very kind friend in Gianfranceſco Pico. This patron was murdered in 1533, and Giraldi with great difficulty eſcaped to Ferrara with his life. His poverty was now extreme, but he was not without friends, by whoſe liberality, eſpecially that of the ducheſs Renata, he was enabled to lay up a ſtore for the future. He died, after a life of much torture, in the year 1552. So varied was his life, and ſevere his afflictions, that towards the cloſe of life he complained that he had always to combat againſt three enemies, Nature, Fortune, and Injuſtice. His great work was entitled "Syntagma de Diis Gentium." This is the firſt treatiſe in which mythology is diſcuſſed in a truly learned manner, and it is a treatiſe which exhibits the vaſt extent of the author's reading, and for which the learned world is under very great obligations. He was author of ſeveral other treatiſes, "On the Muſes;" "The life of Hercules;" "Explications of the Pythagorical Symbols," and other ancient enigmas: "A Treatiſe of Years and Months, with Greek and Latin Calendars, and thirty Dialogues on ſubjects of Erudition." He gave "A Hiſtory of the Greek and Latin Poets," and of "The Poets of his own Time." He was a conſiderable Latin poet, and it is thought a ſenſe of his own misfortunes induced him to write two ſmall pieces againſt ingratitude, entitled "Progymnaſmata adverſus litteras et litteratos." Moreri.

GIRALDUS, SILVESTER, CAMBRENSIS, one of the moſt learned and eloquent divines of his time, was born near Pembroke, in South Wales, 1145. Among his numerous works that have been preſerved, printed and manuſcript, we ſhall here only advert to an extraordinary paſſage relative to muſic, in his "Cambriæ Deſcriptio, cap. XIII." which has been lately quoted by muſical writers, and on which great ſtreſs has been laid by Eximeno (Dubbio ſopra il ſaggio fond. prat. di contrap. di P. Martini) and by Mr. Ed. Jones, Muſ. Relics of the Welſh Bards.

After all the enquiries that we have made concerning the origin and antiquity of counterpoint, or muſic in parts, the paſſage to which we allude ſurpriſed us extremely. Many eccleſiaſtical hiſtorians tell us that the organ was firſt admitted into the church at Rome by pope Vitalian, 666, the ſame pontiff who two years after ſent ſingers into Kent, to finiſh the work which Auſtin, the firſt Roman miſſionary, had begun. In 680, according to Bede, John, the præcentor of St. Peter's in Rome, was ſent over by pope Agatho to inſtruct the monks of Weremouth in the manner of performing the ritual, who opened ſchools there and in other places of the kingdom of Northumberland for teaching muſic.

This may, perhaps, reconcile to probability ſome part of the following account, which Giraldus Cambrenſis gives of the peculiar manner of ſinging that was practiſed by the Welſh, and the inhabitants of the north of England, about the end of the twelfth century.

"The Britons," ſays he, "do not ſing in uniſon, like the inhabitants of other countries; but in many different parts. So that when a company of ſingers among the common people meets to ſing, as is uſual in this country, as many different parts are heard as there are performers, who all at length unite in conſonance, with organic ſweetneſs. In the northern parts of Great Britain, beyond the Humber, on the borders of Yorkſhire, the inhabitants uſe the ſame kind of ſymphonious harmony; except that they only ſing in two parts, the one murmuring in the baſe, and the other warbling in the acute or treble. Nor do theſe two nations practiſe this kind of ſinging ſo much by art as habit, which has rendered it ſo natural to them, that neither in Wales, where they ſing in many parts, nor in the north of England, where they ſing in two parts, is a ſimple melody ever well ſung. And, what is ſtill more wonderful, their children, as ſoon as they attempt uſing their voices, ſing in the ſame manner. But as not *all* the Engliſh ſing in this manner, but thoſe only of the north, I believe they had this art at firſt, like their language, from the Danes and Norwegians, who uſed frequently to invade and to occupy, for a long time together, thoſe parts of the iſland."

This extraordinary paſſage requires a comment. And firſt, it may be neceſſary, before we reaſon upon the circumſtances it contains, to be certain of their authenticity. Giraldus Cambrenſis is indeed an author who has been often ſuppoſed inaccurate and fabulous; and the glaring improbabilities in the above account, with the manifeſt ignorance of the ſubject in queſtion, by no means contribute to augment his credibility. For whoever is acquainted with the laws of counterpoint, or with the firſt difficulties attending the practice of ſinging in parts, can have no exalted idea of the harmony of an untaught crowd, *turba canentium*, or ſuppoſe it to be much better than the diſſonant pæans of a good-humoured mob; in which the parts would be as various as the pitch of voices of which their chorus was compoſed. But how all theſe united at laſt in the conſonance of organic melody, and the ſoft ſweetneſs of B mollis, will long remain an impenetrable ſecret:

"As true no meaning puzzles more than wit."

With reſpect to what he aſſerts of the people in Northumberland ſinging in two parts, it is more reconcileable to probability, from the circumſtances juſt mentioned, of the cultivation of muſic in that part of the world under Roman maſters, who may probably have firſt brought over the art of diſcant, or double ſinging, which the newly invented organ had ſuggeſted, by the facility it afforded of ſounding two or more notes at a time; which art, when practiſed by voices, was thence called *organum, organizare*. But as to what Giraldus ſays of children naturally ſinging in this manner as ſoon as they were out of the cradle, the reader will afford it what degree of weight he pleaſes; but for our own part, we muſt own that it is not yet admitted into our muſical creed.

GIRAN, in *Geography*, a town of Algiers, anciently called *Arina*; 45 miles S.E. of Oran.

GIRANA, a town of Abyſſinia; 60 miles N.W. of Gondar. N. lat. 13°. E. long. 36° 37′.

GIRANDOLE, a large kind of branched candleſtick. See Branch and Jesse.

GIRAPIATRA, in *Geography*, a town of the iſland of Candy; 16 miles S.W. of Settia.

GIRAR, a fortreſs of Hindooſtan, in Malwa; 40 miles S.W. of Chanderee. N. lat. 24° 23′. E. long. 79° 18′.

GIRARD, Gabriel, in *Biography*, a diſtinguiſhed member of the French academy, known as the author of a work entitled "Synonymes François," the object of which is to prove that the French words, uſually accounted ſynonymous, have, almoſt all, certain ſhades of difference, which, in correct ſpeech, ſhould prevent them from being uſed indifferently. No grammatical work was ever better received by the public, and it was the opinion of Voltaire that it will ſubſiſt as long as the language. This work has been imitated in Engliſh, in one entitled "The difference between words eſteemed ſynonymous in the Engliſh language, and the proper choice of them determined," in two vols. 12mo. 1766. The abbè Girard alſo wrote a French grammar, entitled "Principes de la Langue Françoiſe," which has much merit in its plan and theory, but is thought very defective in point of ſtyle.

GIRARDON, Francis, an eminent ſculptor, intended by his father, who was a founder, for the profeſſion of the law. His inclination for the fine arts could not be controlled, and he was educated as an artiſt. He was brought up at Troyes, but having acquired much reputation and practice there, he went to Paris to improve his taſte and judgment under the ſculptor Anguier. His performances obtained for him a high degree of reputation; he was noticed by the king, and by him ſent with a liberal penſion to Rome. In 1657 he was admitted into the academy, and was patronized by Le Brun. Girardon is reckoned to have had more correctneſs than invention; and he is ſaid to have modelled with more facility than he worked in marble. His principal works are, four figures compoſing the group of the baths of Apollo, and the rape of Proſerpine in the gardens of Verſailles; the equeſtrian ſtatue of Lewis XIV. and the mauſoleum of cardinal Richelieu, in the church of the Sorbonne. He cultivated the friendſhip of the fine writers of the age, ſeveral of whom have done honour to his merits and memory. He was nominated to the chancellorſhip of the academy in 1695. After having adorned the capital and many other parts of the kingdom with a number of works, and riſen to the very head of his profeſſion, he died in 1715 at the age of eighty-five. Moreri.

GIRBÉ, in *Geography*, a town of Egypt, on the right bank of the Nile; 26 miles N. of Syené.

GIRBEH, a river of Switzerland, which runs into the Aar, two miles S. of Berne.

GIRCH, a river of North Wales, which runs into the ſea, near Pwllhely, Caernarvonſhire.

GIRCHSBECK, a town of the duchy of Holſtein; ſix miles W.S.W. of Oldeſlohe.

GIRCZENI, a town of Moldavia; 30 miles N.N.E. of Galatz.

GIRDERS, or Girding *beams*, in *Carpentry*, are thoſe large beams thrown acroſs a room, in order to ſhorten the bearing of the joiſts.

When the bearing is not very great, the girder conſiſts of a ſingle beam; when it is more than common, the baulk, or piece of wood out of which the girder is made, is ſawn down the middle, and the two pieces are reverſed and bolted. In great bearings the girder is framed like the principals of a roof, for the conſtruction of which we refer our reader to the article Carpentry, and *Naked* Flooring.

No girder ought to be leſs than ten inches in the wall, nor ought they, or any principal beam, to be placed over an aperture. They ought to be of the moſt hearty wood, and as free of knots as poſſible, for knots deſtroy the continuity of the fibres, and conſequently impair the ſtrength.

GIRDING-GIRT, in *Sea Language*. The ſeamen ſay a ſhip is *girt*, or hath a *girding-girt*, when her cable is ſo tight or ſtrained, that upon the running of the tide ſhe cannot go over it with her ſtern part, but will lie acroſs the tides.

GIRDLE, Cingulus, or *Zona*, a belt or band of leather, or other matter tied about the loins, to keep the part more firm and tight.

It was anciently the cuſtom for bankrupts, and other inſolvent debtors, to put off and ſurrender their girdle in open court. The reaſon was, that our anceſtors uſed to carry all the neceſſary utenſils, as purſe, keys, &c. tied to the girdle; whence the girdle became a ſymbol of the eſtate. Hiſtory relates, that the widow of Philip I. duke of Burgundy, renounced her right of ſucceſſion by putting off her girdle upon the duke's tomb. Accordingly the girdle amongſt the ancients was uſed for a purſe. Our Saviour forbids his apoſtles to carry money in their girdles, Matt. x. 9. Haggai, i. 6. Horace ſays, that he who has loſt his girdle (his money) is ready for any thing. "Ibit eó quo vis, qui zonam perdidit." Hor. Ep. l. ii. c. 1. The Romans always wore a girdle to tuck up the tunica, when they had occaſion to do any thing; this cuſtom was ſo general, that ſuch as went without girdles, and let their gowns hang looſe, were reputed idle, diſſolute perſons.

Girdle, *Maidens'* or *Virgins'*. It was the cuſtom among the Greeks and Romans for the huſband to untie his wife's girdle. Homer, lib. xi. of his Odyſſey, calls the girdle *παρθενιην ζωνην*, *maid's girdle*. Feſtus relates, that it was made of ſheep's wool, and that the huſband untied it in bed: he adds, that it was tied in the Herculanean knot; and that the huſband untied it, as a happy preſage of his having as many children as Hercules, who, at his death, left ſeventy behind him.

The poets attribute to Venus a particular kind of girdle, called *ceſtus*, to which they annexed a faculty of inſpiring the paſſion of love.

Girdle, *Quickſilver*, in *Medicine*, is a ſort of girdle ſmeared over with mercury, or having mercury incloſed within it.

It is made of leather, linen, cloth, cotton, ſtuff, or the like; and the mercury is prepared or killed various ways; as with faſting ſpittle, fat, or the like.

It is applied as a topical medicine about the waiſt, ſometimes with good effect; but frequently it proves dangerous, principally in weak conſtitutions, and thoſe ſubject to convulſions. Its intention is, the cure of the itch, driving away vermin, killing lice, &c.

Girdle, *Queen's*, is an ancient duty or tax, raiſed at Paris every three years, at the rate of three deniers upon each muid of wine, and ſix for each queue: it was intended for the maintenance of the queen's houſhold: afterwards they augmented and extended it to other commodities, as coals, &c.

Vigenere ſuppoſes it to have been originally thus called, becauſe the girdle anciently ſerved for a purſe; but he adds, that a like tax had been raiſed in Perſia, and under the ſame name, above two thouſand years ago; as appears from Plato, in his Alcibiades, Cicero, Athenæus, &c.

Girdle, *Chriſtians of the.* Motavackel, tenth caliph of the family of the Abaſſides, enjoined the Chriſtians and Jews, in the year of the Hegira 235, of Jeſus Chriſt 856, to wear a large leathern girdle, as a badge of their profeſſion; which they wear to this day throughout the Eaſt: from which time the Chriſtians of Aſia, and particularly thoſe of Syria and Meſopotamia, who are almoſt all Neſtorians or Jacobites, have been called "Chriſtians of the girdle."

Girdle, *Order of the,* the order of Cordeliers. See Cord and Cordelier.

Girdle, in *Architecture.* See Cincture.

Girdle, among *Jewellers,* the line which encompaſſes the ſtone parallel to the horizon; or, which determines the greateſt horizontal expanſion of the ſtones.

Girdle *Wheel,* a ſmall ſpinning-wheel, made for hanging to a woman's girdle or apron-ſtring, ſo that ſhe may ſpin with it though walking about.

Girdle, in *Mining,* is the name uſed in Cumberland, and ſome other counties, to denote the uncertain ſtrata, or chance beds, of ſtone and different ſubſtances that are met with in ſome diſtricts; which, inſtead of occupying the whole ſpace, of the ſame or nearly an equal thickneſs throughout, are only local, preſerving, however, conſtantly the ſame relative ſituation to the other ſtrata, wherever they appear; that is, they are peculiar to particular places in the ſeries of ſtrata, and ſeem, according to the numerous enquiries and obſervations which Mr. Farey, ſen. has made on theſe anomalous maſſes in the ſtratification, to be lenticular in their ſhape, always ending inſenſibly or with ſharp-edges on all ſides, like extremely flattened nodules; and, except in ſhape and ſize, and their rarity, he conjectures that they differ nothing from the nodules which are ſo very common in particular ſtrata, as of iron-ſtone in the binds and ſhales of moſt coal-fields, and in the grit-ſtones of ſome; thoſe of pyrites in many coal-ſeams, ſome of the nodules of flint in the upper chalk ſtrata, &c. &c. Particular ſtrata in the Britiſh ſeries are found to be ſubject to theſe chance beds, or ſtrata, within their maſs; ſome of which large nodular maſſes aſſume a confuſedly cryſtallized ſtructure, and ſeem to occaſion large hills and even mountainous tracts, as Charnwood Foreſt, in Leiceſterſhire, whoſe ſienite and ſlate, &c. have been referred, by the gentleman named above, to the anomalous maſſes of the red-ground or marle ſtrata. See Philoſophical Magazine, vol. xxxi. page 40.

GIRDLENESS, in *Geography,* a cape on the E. coaſt of Scotland. N. lat. 57° 4'. W. long. 2° 2'.

GIRELLI, Aguilar, in *Biography,* a female opera ſinger, who arrived here the ſame ſeaſon as Millier, in 1772. Her ſtyle of ſinging was good, but her voice was in decay, and her intonation frequently falſe, when ſhe arrived here; however, it was eaſy to imagine from what remained, that ſhe had been better. She remained here only one ſeaſon, and was ſucceeded by Miſs Cecilia Davies.

GIREST, in *Geography,* a town of Perſia, in Kerman; 100 miles E.N.E. of Gomron.

GIRET, a town of Perſia, in Mazanderan; 30 miles S. of Fehrabad.

GIRGASHITES, in *Scripture Geography.* See Gergasenes.

GIRGE, the capital of Upper Egypt, and the reſidence of the Bey, ſituated about 400 yards from the left bank of the Nile. This town is about a league in circumference, and has ſeveral moſques, bazars, and public ſquares; but it has no remarkable buildings nor ancient edifices, whence ſome have inferred that it is a modern building more eſpecially as Abulfeda does not mention it. The Bey lives in great ſtate, and continues in office three or four years, according to the pleaſure of the divan at Cairo. His ſoldiers commit innumerable outrages. The Copts are not allowed to have churches in that town; and therefore when they would join in divine ſervice, they are obliged to go to a convent ſituated on the other ſide of the Nile. The Franciſcans, who have a convent here, paſs for phyſicians, but they are frequently expoſed to danger from the inſolence of the Janizaries, the moſt refractory of whom are ſent hither from Cairo; 160 miles N. of Syené. N. lat. 26° 30'. E. long. 31° 52'.

GIRGENTI, or Agrigenti, a town of Sicily, near the S. coaſt of the valley of Mazara, erected near the ruins of the ancient *Agrigentum* (which ſee), and occupying only the ground on which the citadel of the ancient city ſtood; the ſee of a biſhop, ſituated on the river St. Blaiſe, about three miles from the ſea; 47 miles S. of Palermo. N. lat. 37° 22'. E. long. 13° 33'. Its ſituation on a mountain renders almoſt all the ſtreets impaſſable, not only for carriages but even for mules. The population of Girgenti falls far ſhort of that of the ancient Agrigentum, which Empedocles reckons at 800,000; whereas at preſent, reckoning the city, properly ſo called, which was the ancient caſtle, the ſuburb of Camico, and that built by Henry and Conſtance in the 12th century, it is reduced to 15,000 perſons, generally poor and of a melancholy appearance. The nobility here are poor, and live in great privacy; the merchants, wholly taken up with their own affairs, ſee nobody but at the exchange; without ſociety and without amuſements, every body is, or appears to be, gloomy and devout. The port of Girgenti, very different from the mole of the ancient Agrigentum, which was at the mouth of the Acragas, and of which not a ſingle trace is left, is ſubject to the ſame inconvenience with that of the harbours of Apulia and Calabria, which is that of being liable to be filled up equally by two oppoſite winds, *viz.* the ſouth-eaſterly and north-weſterly. The two piers erected to remedy this inconvenience having been found inſufficient, the government has been obliged, as at Cortona, to employ galley-ſlaves for emptying and cleanſing the entrance of this port; nor can their laborious work be abandoned on account of the importance of this harbour in the exportation of commodities from all the ſouthern part of Sicily; and the ſhelter it affords to the Neapolitan veſſels in the ſeas moſt expoſed to the Barbary corſairs, being almoſt within ſight of Africa. Near the mole are the admirable magazines of the "Caricatoria," the richeſt in Sicily, conſiſting of caverns or ciſterns cut out of the rock, in which the corn is preſerved without the leaſt injury. Theſe magazines belong to the king, and ſecure the ſubſiſtence of the iſland. Foreign merchants reſort hither to purchaſe the ſurplus, after reſerving enough for the home conſumption. The king is accountable for the corn lodged there, and the proprietors have only a ſmall ſum to pay for ſtore-houſe rent.

GIRGITES, a name uſed by ſome chemical writers for a ſort of white ſtones found in rivers, of which they make a peculiarly ſtrong lime. The ſtones are of the ſparry kind, worn into roundneſs by the motion of the water; and they have their name girgites, from the word *gir,* uſed by the chemiſts for lime.

GIRGITZA, in *Geography,* a town of Walachia; 40 miles N.N.E. of Buchareſt. N. lat. 45° 1'. E. long. 26° 19'.

GIRIA, a town of the iſland of Cephalonia; 16 miles W. of Cephalonia.

GIRKIN, among *Gardeners.* See Guerkin.

GIRLE, or Gyrle, among *Sportſmen,* denotes the roe-buck in its ſecond year.

GIRMANO, in *Geography*, a town of Pruſſia, in Samland; 25 miles N.W. of Konigſberg.

GIROMAGNY, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the diſtrict of Befort. The place contains 1700, and the canton 9572 inhabitants, on a territory of 150 kiliometres, in 19 communes.

GIRON DE LOYASA, GARCIAS, in *Biography*, a learned Spaniſh prelate, who flouriſhed towards the cloſe of the 16th century, was born at Talavera. In the courſe of his ſtudies he had paid a marked attention to philoſophy and theology; to hiſtory and the councils, with which he became intimately converſant. He lived in a retired way as a canon, till his uncle reſigned to him the archdeaconry of Guadalajar, which is one of the dignitaries belonging to the church of that city. In 1585, Philip II., king of Spain, ſent for him to court, made him maſter of the royal chapel and almoner; and likewiſe entruſted to his care the education of his ſon Philip, infant of Spain. In 1596, Cardinal Albert aſſumed the government of the Low Countries, and appointed Giron his vicar-general over the archbiſhopric of Toledo; to which valuable ſee he was himſelf afterwards preferred. He died in 1599, and his death has been imputed to the chagrin which he felt for the neglect ſhewn him by his pupil, who had lately ſucceeded to the throne. He was author of a valuable collection of Spaniſh councils, under the title of "Collectio Conciliorum Hiſpaniæ, cum Notis et Emendationibus." Moreri.

GIRON, in *Geography*, town of Africa, on the Ivory coaſt.—Alſo, a town of S. America, in the province of Quito; 25 miles S. of Cuença.

GIRON, or *Guiron*, in *Heraldry*, denotes a triangular figure having a long ſharp point, not unlike a wedge, terminating in the centre of the eſcutcheon.

The word is French, and literally ſignifies the *geremium* or *lap*; becauſe, in ſitting, the knees being ſuppoſed ſomewhat aſunder, the two thighs, together with a line imagined to paſs from one knee to the other, form a figure ſomewhat ſimilar to this.

When a coat has ſix, eight, or ten of theſe girons, meeting or centering in the middle of the coat, it is ſaid to be *girroné* or *gironny*.

GIRONDE, in *Geography*, a river of France, formed by the union of the Garonne and Dordogne; 12 miles N. of Bourdeaux, which runs into the Atlantic, after a courſe of about 27 miles N. N. W.

GIRONDE, one of the nine departments of the ſouth-weſt, or Garonne region of France, deriving its name from the river Gironde. It is a maritime department, compoſed of a portion of Guienne, in N. lat. 44° 40′, and bounded on the N. E. by the department of the Lower Charente, on the E. by the departments of the Dordogne and Lot and Garonne, on the S. by the department of the Landes, and on the W. by the ſea. Its capital is Bourdeaux. This department contains 11,270 kiliometres, or about 537 ſquare leagues, and 519,685 inhabitants, and is divided into ſix diſtricts; *viz.* Blaye, comprehending 4 cantons, 61 communes, and 52,026 inhabitants; Libourne, including 9 cantons, 143 communes, and 102,576 inhabitants; La Reole, comprehending 6 cantons, 118 communes, and 53,705 inhabitants; Bazas, containing 7 cantons, 68 communes, and 47,549 inhabitants; Bourdeaux, comprehending 18 cantons, 153 communes, and 233,021 inhabitants; and Leſparre, containing 4 cantons, 37 communes, and 30,808 inhabitants. Its contributions amount to 5,853,053 francs, and the expences for adminiſtration, juſtice, and public inſtruction to 533,643 francs. The ſoil of this department is various: the eaſt and north-eaſt diſtricts are the moſt fertile. In the valley between Agen and Bourdeaux, the ſoil, though light, is of an excellent quality. The weſt and ſouth-weſt tracts are ſandy, marſhy, and barren, or indifferently fruitful. The products of the ſoil are grain, hemp, delicious wine and fruits, paſtures, conſiderable foreſts of pines, ſtone quarries, mineral ſprings, &c.

GIRONELLA, a town of Spain, in Catalonia; 7 miles E. N. E. of Solſona.

GIRONNE. See GERONA.

GIRONS, ST. a town of France, and principal place of a diſtrict, in the department of the Arriége; 21 miles W. of Taraſcon. N. lat. 42° 59′. E. long. 1° 13′. The place contains 2504, and the canton 14,983 inhabitants, on a territory of 287½ kiliometres, in 16 communes.

GIROST, a town of Perſia, in the province of Kerman; 125 miles S. of Sirjian.

GIRROCK, in *Ichthyology*, the common Engliſh name of the fiſh called the *Lacertus*, a large ſpecies of gar-fiſh, caught in the Mediterranean and Engliſh ſeas.

GIRRONNÉ, GIRONY, in *Heraldry*, is when a ſhield or coat is divided into ſeveral girons, which are alternately colour and metal.

When there are eight pieces, or girons, it is abſolutely ſaid to be *girronné*: when there are more, or fewer, the number is to be expreſſed: *girronné* of four, of fourteen, &c.

Some, inſtead of *girronné*, ſay, *parti*, *coupé*, *tranché*, and *taillé*, becauſe the girons are formed by ſuch diviſions of the field. Four girons form a ſaltier, and eight a croſs.

GIRT, in meaſuring timber, is uſed for the circumference of a tree. See *Coggleſhall's* SLIDING *rule* and DENDROMETER.

Some call the fourth part of the circumference the girt, and ſuppoſe the ſquare of this equal to the area of the ſection of the tree.

GIRT, in *Architecture*, the ſame with fillet. See FILLET.

GIRT, *girdle*, in *Sea Language*. See GIRDING-*girt*.

GIRT-*line* is a rope paſſing through a ſingle block, on the head of the lower maſts, to hoiſt up the rigging thereof: this is the firſt rope employed to rig a ſhip, and by means of this all the reſt are drawn up and fixed; after which it is removed till the ſhip is to be unrigged.

GIRTHS *of a Saddle*, the long ſtraps, made of a canvas ſtuff called girth-web, which being buckled under the horſe's belly, ſerve to fix the ſaddle.

GIRTIN, THOMAS, in *Biography*, a draftſman of uncommon capacity, who lately adorned our days, and if he had not been cut off by an early death, would probably have exhibited unrivalled talents in the peculiar branch of the art he adopted. He was born in 1775, and was one of thoſe who have contributed to raiſe almoſt a new ſpecies of art by the uſe of water-colours in landſcape painting. He drew with a ready hand, in a ſtyle entirely his own, and with great taſte and effect; though not always with a ſtrict adherence to truth. He died of conſumption, brought on by irregularity, at the early age of 27.

GIRU, in *Geography*, a town of Perſia, in the province of Mazanderan; 5 miles E. of Fehrabad.

GIRVAN, a ſea-port of Scotland, in the county of Ayr, ſituated at the mouth of the river Girvan, which riſes in the N. E. part of the county, and runs into the ſea a little below the town. It has a commodious harbour, capable of great improvement. The chief employment of this town, which is a burgh of barony, governed by bailies and counſellors, annually elected, is weaving of cotton and woollen cloths. In 1801 the number of inhabitants was 2260, of whom 1360 were employed in trade and manufactures. The neighbourhood abounds with limeſtone and coal; 21 miles S. S. W. of Ayr. N. lat. 55° 18′. W. long. 4° 44′.

GISARMS, or GUISARMES, in our *Old Writers*, an halbert or hand-ax: it comes from the Latin *lis arma*, becauſe it wounds on both ſides. Shene. "Eſt armorum genus longo manubrio et porrecta cuſpide." It is mentioned in the ſtatute 13 Edw. I. cap. 6.

GISBOROUGH, in *Geography*, a market town and pariſh in the North Riding of the county of York, is ſeated near the mouth of the river Tees, 8 miles from Stokeſley, and 248 from London. By the population returns, printed by order of parliament in 1801, this pariſh contained 383 houſes and 1719 inhabitants. In the time of king James I. ſome alum mines were diſcovered here, and were worked for ſeveral years with great ſucceſs. The bay at the mouth of the Tees forms a commodious harbour. In this town was formerly a ſpacious monaſtery, of which ſome conſiderable ruins remain. Here are a weekly market on Friday, and five annual fairs.

GISCALA, in *Scripture Geography*, a town of the tribe of Aſher, in Lower Galilee; S. E. of Jotapa.

GISEKIA, in *Botany*, named by Linnæus in honour of his pupil Dr. Paul Dietrick Giſeke, profeſſor of Natural Hiſtory at Hamburgh, and editor of the *Prælectiones in Ordines Naturales Plantarum*, compiled from his own notes and thoſe of Fabricius, taken from the mouth of Linnæus, and publiſhed by his leave. Linn. Mant. 554. Schreb. 207. Willd. Sp. Pl. v. 1. 1547. Mart. Mill. Dict. v. 2. Juſſ. 315. Lamarck Illuſtr. t. 221. (Kolreutera; Murr. Comm. Nov. Goett. v. 3. 67. t. 2. f. 1.)—Claſs and order, *Pentandria Pentagynia*. Nat. Ord. *Succulentæ*, Linn. *Portulaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of five ovate, concave, obtuſe, permanent leaves, with membranous edges. *Cor.* none. *Stam.* Filaments five, ſhort, awl-ſhaped, ovate at the baſe; anthers roundiſh. *Piſt.* Germen ſuperior, roundiſh, retuſe, deeply five-lobed; ſtyles five, ſhort, recurved; ſtigmas obtuſe. *Peric.* Capſules five, roundiſh, ſlightly compreſſed, rough, obtuſe, cloſe together, each of one cell. *Seeds* ſolitary, ovate, ſmooth.

Spec. Ch. Calyx of five leaves. Corolla none. Capſules five, approximated, roundiſh, ſingle-ſeeded.

1. G. *pharnacioides.* Linn. Mant. 562. Native of the Eaſt-Indies. A ſmooth annual herb, with the aſpect of an *Illecebrum* or *Pharnaceum*. The *ſtems* are proſtrate, a foot or two in length, furrowed along their upper ſide, alternately branched. *Leaves* oppoſite, ſtalked, obovate, entire, light green, rather fleſhy. *Flowers* ſmall, green, in little axillary umbels. *Fruit* blackiſh. On the ſhort axillary branches, the leaves, as Juſſieu well obſerves, are oppoſite. No other ſpecies has been diſcovered.

GISELO, in *Geography*, an iſland on the E. ſide of the gulf of Bothnia. N. lat. 61° 40′. E. long. 21° 22′.

GISGI, a town of Tranſilvania, near the Maros; 14 miles S. W. of Millenbach.

GISHI, a town of Georgia, in the province of Kaket; 115 miles S. E. of Teflis.

GISHUBEL, a town of Bohemia, in the circle of Konigingratz; 20 miles E. N. E. of Konigingratz.

GISING, a town and caſtle of Hungary; 14 miles S. W. of Steinam-Anger.

GISIO, a town of Sweden, in Angermannland, on the Gidea; 16 miles W. of Nordmalling.

GISLAVY, a town of Sweden, in the province of Smaland; 40 miles S. W. of Jonkioping.

GISON, or GHISON, in the *Jewiſh Antiquities*, a little wall about breaſt high, made round the temple properly ſo called, and the altar of burnt ſacrifices, to keep the people at a diſtance. Joſephus, in his Book of Antiquities, makes it to be three cubits high; and but one, in his Hiſtory of the Jewiſh war. Joſ. Antiq. lib. viii. cap. 2. p. 262. et de Bello Jud. lib. vi. p. 918. Calm. Dict. Bibl.

GISORS, in *Geography*, a town of France, in the department of the Eure, and chief place of a canton, in the diſtrict of Les Andelys; 27 miles N. E. of Evreux. The place contains 3500, and the canton 9496 inhabitants, on a territory of 147½ kiliometres, in 23 communes. N. lat. 49° 17′. E. long. 1° 50′.

GISSINGHEIM, a town of Germany, in the county of Wertheim; 15 miles S. of Wertheim.

GISTAIN, a town of Spain, in Arragon, ſituated on a brook in the Pyrenées, on the confines of France, having in its vicinity mines of cobalt; 15 miles N. of Ainſa.

GISTO, a ſmall iſland in the Adriatic. N. lat. 44° 36′. E. long. 14° 51′.

GISUND, a town of Norway, in the dioceſe of Drontheim; 44 miles N. W. of Drontheim.

GITHAGO, in *Botany*, a name uſed by ſome authors, particularly by Pliny, for the lolium or darnel-graſs.

GITI, in *Geography*, a town of Thibet; 234 miles N. E. of Delhi. N. lat. 32° 10′. E. long. 79° 36′.

GITPOUR, a town of Mocaumpour; 47 miles S. W. of Mocaumpour.

GITSCHIN, a town of Bohemia, in the circle of Konigingratz; 22 miles N. W. of Konigingratz. N. lat. 50° 23′. E. long. 15° 20′.

GITTITH. This word occurs frequently in the Pſalms, and is generally tranſlated *wine-preſſes*. The conjectures of interpreters are various concerning this word gittith. Some think it ſignifies a ſort of muſical inſtrument; others, that the Pſalms, with this title, were ſung after the vintage; laſtly, others, that the hymns of this kind were invented in the city of Gath. Calmet is rather of opinion, that it was given to the claſs of young women, or ſongſtreſſes of Gath, to be ſung by them. (Pſ. viii. 1. lxxxi. 1. lxxxiv. 1.) Dr. Hammond thinks that the Pſalms, with this title, were all ſet to the ſame tune, and made on Goliah the Gittite.

GIVA, in *Geography*, a town of Aſiatic Turkey, in Natolia; 32 miles S. E. of Milets.

GIVANIROTONDO, a town of Naples, in Capitanata; 9 miles W. of Monte St. Angelo.

GIUDEL, a ſmall iſland, near the ſouth coaſt of Sardinia. N. lat. 39° 1′. E. long. 9° 3′.

GIUDUCCA, LA, or ZUECCA, one of the iſlands adjoining to the city of Venice, which is ſaid to owe its name to the Jews, who formerly reſided there. It contains 10 churches, 4 monaſteries, and as many nunneries.

GIVEN, DATUM, a term very frequently uſed in *Mathematics*, ſignifying a thing which is ſuppoſed to be known.

Thus, if a magnitude be known, or we can find another equal to it, we ſay, it is a given magnitude, or that ſuch a thing is given in magnitude.

If the poſition of any thing be ſuppoſed as known, we ſay, given in poſition.

Thus, if a circle be actually deſcribed on a plane, its centre is given in poſition, its circumference given in magnitude, and the circle is given both in poſition and magnitude.

A circle may be given in magnitude only; as when only its diameter is given, and the circle not actually deſcribed.

If the kind or ſpecies of any figure be given, they ſay, given in ſpecie. If a ratio between any two quantities is known, they are ſaid to be given in proportion. See DATA.

GIVET, in *Geography*, a town of France, in the department of the Ardennes, and chief place of a canton, in the diſtrict of Rocroy; 15 miles N. E. of Rocroy. N. lat. 50° 7′.

E. long. 4° 51′. The place contains 3533, and the canton 8445 inhabitants, on a territory of 130 kiliometres, in 20 communes.

GIUF, La, a diſtrict of Arabia, in the province of Nedsjed; E. of mount Ramleah.

GIULA, a town of Hungary, ſituated on the river Keres; 52 miles N. N. W. of Temeſwar. N. lat. 46° 35′. E. long. 20° 55′.

GIULAB, a town of Aſiatic Turkey, in the government of Diarbekir; 18 miles N. N. E. of Ourfa.

GIULENEI, a ſmall iſland in the Caſpian ſea; 130 miles S. of Aſtrachan. N. lat. 44° 15′. E. long. 47° 49′.

GIULIA Nuova, a town of Naples, in Abruzzo Ultra, on the coaſt of the Adriatic; 12 miles E. N. E. of Teramo.

Giulia, *St.* a town of France, in the department of the Stura; 12 miles S.S.W. of Acqui.

GIULIANO, St. a mountain of Etruria, near Piſa, at the foot of which are warm baths, known in the time of Pliny.—Alſo, a town of Naples, in Capitanata; 9 miles W.S.W. of Dragonera.—Alſo, a town of Naples, in the county of Moliſe; 13 miles S.S.E. of Moliſe.—Alſo, a town of Naples, in the province of Otranto; 17 miles S.S.W. of Brindiſi.—Alſo, a town of Italy, in the department of the Olona; 7 miles S.E. of Milan.

GIVORS, a town of France, in the department of the Rhone, and chief place of a canton, in the diſtrict of Lyons; 12 miles S. of Lyons. The place contains 3200, and the canton 10,590 inhabitants, on a territory of 90 kiliometres, in 10 communes.

GIVRY, a town of France, in the department of the Saone and Loire, and chief place of a canton, in the diſtrict of Chalons-ſur-Saone; 4 miles W. of it. N. lat. 46° 47′. E. long. 4° 50′. The place contains 2582, and the canton 11,405 inhabitants, on a territory of 132½ kiliometres, in 13 communes.

GIUSEPPE Aprile. See Tenducci.

Giuseppe Arena, in *Biography*, an able compoſer of Naples, whoſe ſtyle had much of the brilliancy of that ſchool. In 1741 he ſet the ſerious drama of Tigrane, written by Goldoni, to muſic, for the great theatre of St. John Chryſoſtom, at Venice, which eſtabliſhed his character.

GIUSMARK, in *Geography*, a town of Curdiſtan; 80 miles S.S.E. of Betlis.

GIUSTENDIL, a town of European Turkey, in Bulgaria; 24 miles S. of Sophia.

GIUSTINELLI, in *Biography*, a ſecond-rate Italian ſinger in ſoprano, arrived here, in 1762, with De Amicis and her family, as firſt ſerious man in the burletta operas. He had a good voice, and ſufficient merit to ſupply the place of ſecond man on our ſtage, in the ſerious operas, for ſeveral years after.

GIUSTINIANI, Augustin, was born at Genoa in 1470, was educated for the church, and in 1514 was made biſhop of Nebbio in Corſica. He publiſhed, in 1516, a Pſalter in four languages, *viz.* the Hebrew, Greek, Arabic, and Chaldee, with interpretations: this was the firſt of the Polyglott editions of the books of ſcripture. After this, he was invited by Francis I. to Paris, and appointed to the profeſſorſhip of the Oriental languages in that univerſity, an office which he held about five years. During this period he received a penſion from the crown, and was enabled to collect a very choice library, which he afterwards preſented to the republic of Genoa. In the year 1536, in paſſing by ſea to his biſhopric, he was loſt with his ſhip. This prelate reviſed and edited the treatiſe written by Porchetti, entitled "Victoria adverſus impios Judæos." Some time after his death, were publiſhed his "Annals of the Republic of Genoa," from the foundation of the city, to the year 1528: this work is highly eſteemed for its information, and for the veracity of the facts. Moreri.

Giustiniani, Bernard, a Venetian nobleman, born in 1408, was educated under the moſt learned perſons of his time, and obtained a high celebrity for his own knowledge and eloquence. He was employed on ſeveral honourable occaſions by the republic. In 1451 he was appointed to receive the emperor Frederic III. when he paſſed through the Venetian territories. He was afterwards ſelected as a fit perſon to be ſent on embaſſies to Ferdinand, king of Naples, to ſeveral of the popes, and to Lewis XI. king of France, who honoured him with knighthood. In 1467 he was made captain commandant of Padua, and admitted to almoſt all the honours of the ſtate, and finally procurator of St. Mark. He died in 1489. He was author of many works: as public orations: the life of his uncle "The bleſſed Lorenzo Giuſtiniani;" three pieces on the life, the tranſlation, and the appearance of St. Mark: a verſion of the book of Socrates to Nicocles: ſome Latin letters of his father Leonardo; and the ancient hiſtory of Venice, written in Latin. This laſt was tranſlated into Italian by Lodov. Domenichi. It was the work of his old age, but is highly eſteemed, becauſe the authorities are drawn from the beſt ſources, and the author rejects the fables handed down by ſome other writers. Moreri.

GIZE', Gizah, or *Jiza*, in *Geography*, a conſiderable town of Egypt, extending along the weſt bank of the Nile, on the other ſide of the iſland of Roudda, or Raonda, with reſpect to Cairo; 3 miles S. W. of Cairo. This town was fortified by Iſmail Bey, who alſo built a palace there, completed and ſince inhabited by Murad Bey, who has eſtabliſhed a cannon foundery. Here is alſo a manufacture of ſal ammoniac. The walls of Gizé are of great extent, and have only one gate to the country; they are ten feet high, three feet thick, and have ſix half-moons; but are only fit to reſiſt cavalry, the original intention in raiſing them. Murad Bey has ſuffered the iron-work about the loop-holes to be plundered or ruined. The palace is in the ſouthern quarter of the city, cloſe to the water; it has numerous apartments for the Mamlûks, and every convenience for eaſe or luxury. Murad Bey has, of late years, thought it neceſſary to inſtitute a marine; having purchaſed ſome veſſels of the Europeans, and built three or four others. The largeſt of theſe veſſels carries 24 guns: thoſe that are occaſionally moored before Gizé cannot be navigated hence, except during the time of the Nile's increaſe. The mariners are chiefly Greeks of the Archipelago. Not far ſouth of Gizé is "Geziret-el-dahab," a ſmall iſland, which Diodorus Siculus denominated "Venus Aurea." N. E. of the city are gardens, and ſome ſpacious houſes, occupied by the affluent and great, who occaſionally leave the city to amuſe themſelves in this retreat; and they have there an open ſpace where the Mamlûks perform their military evolutions, and exerciſe their horſes. The ground under the mountains to the eaſt is filled with tombs. The mountain is of white ſand and calcareous ſtone, and deſtitute of verdure. The numerous date-trees by which Gizé is ſurrounded, interſperſed with the lofty turrets of the moſques, and the river, whoſe waves waſh the very foundation of the houſes, give it, at a diſtance, a very pleaſing aſpect. Dr. Shaw is of opinion, that the ancient Memphis ſtood on the ſcite of Gizé; but this is diſputed by Savary and others. (See Memphis.) This is the neareſt ſpot, ſays Sonnini, to the moſt valuable monuments which ancient Egypt has left behind of her glory and her power. The neareſt pyramids are at the diſtance of three leagues, and they are indiſcriminately called the "Pillars of Memphis," or the "Pillars of Gizé." This town was taken from the French by the Britiſh in June, 1801. Browne's Travels in Africa; Savary's Letters on Egypt, vol. i. Sonnini's Travels in Upper and Lower Egypt.

GIZIGINSKAIA, a gulf at the N. W. extremity of the Peninſkoi ſea, extending about 50 miles in length, and 16 in breadth. N. lat. 67° to 68°. E. long. 160° 14'.

GIZZARD *of* BIRDS. See *Anatomy of* BIRDS.

GIZZIELLO, GIOACHINO, CONTI, in *Biography*, one of the greateſt Italian ſingers of the laſt century, arrived in England in 1736, as Handel's firſt ſinger, at the time that he had quitted the Royal Academy in the Haymarket, upon a quarrel with Seneſino, and ſet up for himſelf at the new theatre in Covent Garden. The nobility and gentry who ſeem to have abetted Seneſino, engaged for the opera in the Haymarket Porpora as a compoſer, and Farinelli, Cuzzoni, and a complete company of vocal and inſtrumental performers to oppoſe him. Handel, May 5th, opened his ſummer campaign with the revival of "Ariodante," an opera of the preceding year.

The next day the following eulogium on his new ſinger was inſerted in the Daily Poſt: "laſt night Signor Gioachino Conti Gizziello, who made his firſt appearance in the opera of "Ariodante," met with an uncommon reception; and in juſtice both to his voice and judgment, he may be truly eſteemed one of the beſt performers in this kingdom." Neither his friends nor the friends of Handel could venture to ſay more, while Farinelli was in the kingdom. Conti was at this time a young ſinger, more of promiſing, than mature abilities; and ſo modeſt and diffident, that when he firſt heard Farinelli, at a private rehearſal, he burſt into tears, and fainted away with deſpondency. He had his cognomen of Gizziello from his maſter Gizzi, once an eminent ſtage ſinger, who, in his old age, became an excellent maſter.

The next opera in which Conti appeared, was "Atalanta," compoſed as an epithalamium on the marriage of his royal highneſs Frederic prince of Wales, with her ſerene highneſs the princeſs of Saxe-Gotha.

The ſongs in "Atalanta," which Handel compoſed expreſsly for his new ſinger, Conti, ſeem, upon examination, to have been written in his new, graceful, and pathetic ſtyle of ſinging. The baſs and accompaniments, too, are of a modern caſt, and, except the cloſes and two or three of the diviſions, the whole ſeems of the preſent age.

Handel, never till now, had a firſt man to write for with ſo high a ſoprano voice. Nicolini, Seneſino, and Cereſtini, were all contraltos. There was often dignity and ſpirit in their ſtyle; but Conti had delicacy and tenderneſs, with the accumulated refinements of near thirty years, from the time of Handel's firſt tour to Italy. We think it is not difficult to diſcover, particularly in the firſt act, that in compoſing Conti's part in this opera, he modelled his melody to the ſchool of his new ſinger. Indeed, Handel was always remarkably judicious in writing to the taſte and talents of his performers in diſplaying excellence, and covering imperfections.

While Conti was his firſt male ſinger, and the Strada his firſt woman, he revived his opera of "Alcina and Faramond," and compoſed his part in the opera of "Arminio," expreſsly to diſplay his peculiar talents; in the airs of which it ſeems as if Handel had more baſſes and accompaniments in iterated notes, than in any preceding work.

He was advancing rapidly in the modern ſtyle of opera ſongs when he quitted the ſtage, and retreated back to a more ſolemn and ſolid ſtyle for the church.

It is chiefly in writing for Conti and Anibali that the conformity to a different ſtyle from his own appears.

DOMENICO ANNIBALI, who ſhould have had an article in the letter A, had he been remembered, ſhall be characterized here, in apology for the omiſſion. His firſt air in the opera of "Arminio," in which he performed with Conti and the Strada, diſcovers his voice to have been a contralto, which Handel gave him an opportunity to diſplay by a ſwell, *ad libitum*, at the beginning; but no peculiar taſte, expreſſion, or powers of execution, appear in his part; his bravura air in the ſecond act, *Sì cadrò*, contains only common and eaſy paſſages. His abilities during his ſtay in England ſeem to have made no deep impreſſion, as we never remember him to have been mentioned by thoſe who conſtantly attended the operas of thoſe times, and were rapturiſts in ſpeaking of the pleaſure which they had received from ſingers of the firſt claſs. But to return to Conti, who, after he quitted England, ſtudied with ſuch diligence, that being engaged at Madrid to ſing in the operas under the direction of Farinelli, he turned the tables on that wonderful ſinger, in whom it has been ſaid, that he excited envy by his new and refined taſte and pathos.

He was one of the conſtellation of great ſingers which the king of Portugal had aſſembled together in 1755.

There were, according to Paccheirotte's account, Eliſi, Manzoli, Caffarelli, Gizziello, Veroli, Babbi, Luciani, Raaf, Raina, and Guadagni. No females were then allowed to appear on the opera ſtage in Portugal. Gizziello, narrowly eſcaping with his life during the dreadful earthquake which happened at Liſbon that year, was impreſſed with ſuch a religious turn by that tremendous calamity, that he retreated to a monaſtery, where he ended his days. It was ſoon after this event, that Guadagni ſhut himſelf up in the ſame convent not ſo much for ſpiritual conſolation as muſical counſel; which he ſo effectually obtained from the friendſhip of Gizziello, that from a young and wild ſinger of the ſecond and third claſs, he became, in many reſpects, the firſt ſinger of his time.

GLABALK, in *Geography*, a town of France, in the department of the Dyle, and chief place of a canton, in the diſtrict of Louvain. The place contains 239, and the canton 6771 inhabitants, on a territory of 120 kiliometres, in 19 communes.

GLABELLA, in *Anatomy*, from *glaber*, *ſmooth*; the ſpace between the two eye-brows, which is ordinarily not covered with hairs.

GLABER, in *Biography*, a Benedictine monk, who flouriſhed in the 11th century, and who has rendered his name memorable by a "Chronicle or Hiſtory of France," written in the Latin language. It conſiſts of five books, of which the firſt relates to the events of the monarchy previouſly to Hugh Capet, and the four ſubſequent ones to thoſe following it, as far down as the year 1046. This work is defective as a compoſition, and, at the ſame time, full of fabulous ſtories, yet it contains much valuable information relative to thoſe remote ages. He was author of a life of William, abbot of St. Benignus at Dijon. Moreri.

GLABRARIA, in *Botany*, ſo denominated by Linnæus, on account of the ſmooth, ſhining, ſilky appearance of its wood. Linn. Mant. 156. Schreb. 515. Willd. Sp. Pl. v. 3. 1433. Mart. Mill. Dict. v. 2. Juſſ. 433. Lamark, Illuſtr. t. 640. Claſs and order, *Monadelphia Polyandria*. Nat. Ord. "uncertain; perhaps akin to *Styrax*." Juſſ. Rather *Malvaceæ*, near *Durio*.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular half as long as the corolla, cut half way down into five equal, obtuſe, broadiſh teeth. *Cor.* Petals five, lanceolate, obtuſe, equal. Nectary ſurrounding the germen, and conſiſting of five awl-ſhaped, erect, coloured bodies, the length of the calyx. *Stam.* Filaments thirty, capillary, the length of the calyx, united by their baſe into five parcels of ſix filaments each, ranged alternately with the nectaries; anthers kidney-ſhaped. *Piſt.* Germen ſuperior, nearly globular, four-lobed; ſtyle thread-ſhaped, as long as the ſtamens; ſtigma ſimple. *Peric.* according to Rumphius, a mucilaginous *drupa,* of one cell, containing a hard oval *nut.*

Eſſ. Ch. Calyx tubular, five-cleft. Petals five. Nectary of five briſtles, alternate with the parcels of ſtamens. Style one. Stamens thirty, in five parcels. Drupa.

1. G. *terſa.* Linn. Mant. 276. (Lignum læve minus; Rumph. Amb. v. 3. 71. t. 44.) Native of the lofty and cloſe woods of Amboyna. Rumphius deſcribes and figures two kinds of his *Lignum læve,* very ſimilar to each other, nor does it appear on what authority Linnæus adopted one as a ſynonym in preference to the other. The ſpecimens in his herbarium have ſlender leafy *branches,* with a ſmooth greyiſh bark. *Leaves* alternate, on ſhort thick ſtalks, ovato-lanceolate, pointed, entire, three or four inches long, veiny; ſmooth and ſhining above; pale grey beneath, as if hoary, but they are rather clothed with a ſilvery ſcaly ſkin, minutely dotted all over, which ſoon leaves the rib and veins. *Stipulas* none. *Flower-ſtalks* axillary and terminal, branched irregularly, the partial ones ſomewhat umbellate, all clothed, as well as the calyx, with minute umbilicated ruſty ſcales, exactly like thoſe on the leaves and ſtalks of the *Durio;* ſee that article. The *flowers* are ſmall. *Fruit,* according to Rumphius, an aromatic black *drupa,* the ſize of a pea, ſtanding on the permanent calyx.

If the *Durio* belongs to *Malvaceæ,* we are perſuaded this genus muſt likewiſe be placed in that order, but otherwiſe we ſhould have had no ſuch idea, nor does the fruit confirm it. The light fibrous ſilky nature of the wood, which while wet is cloſe, but has large fiſſures when expoſed to the ſun, favours our ſuppoſition.

GLACIALIS, Icy, of *glacies, ice,* ſomething relating to ice; and particularly a place that abounds in ice.

Thus we ſay, the *Mare Glaciale,* or *Congelatum,* that is, the Icy or Frozen ſea; called alſo the Chronian or Sarmatian ſea.

GLACIERS, a denomination applied to large ſheets or fields of ice among the Alps, and which are numerous in Switzerland and Savoy. Of theſe there are five, that ſtretch towards the plain of Chamouny, and unite at the foot of Mont Blanc; they are called Tacona, Boſſons, Montanvert, Argentiere, and Tour. The origin of theſe glaciers, extending into fields of corn and paſture, and lying, without being melted, in a ſituation where the heat of the ſun is powerful enough to bring vegetation to maturity, is a very curious ſubject of inveſtigation. Mr. Coxe has given us an abſtract of the theory of Gruner, with regard to their formation, and other particulars reſpecting them, confirmed and amended by that able naturaliſt Sauſſure; which appears, upon the whole, to be the moſt ſimple and natural. If a perſon, ſays this intereſting traveller, could be conveyed to ſuch an elevation as to embrace, at one view, the Alps of Switzerland, Savoy, and Dauphiné, he would behold a vaſt chaos of mountains, interſected by numerous vallies, and compoſed of many parallel chains, the higheſt occupying the centre, and the others gradually diminiſhing in proportion to their diſtance. The moſt elevated, or central chain, would appear briſtled with pointed rocks, and covered, even in ſummer, with ice and ſnow, in all parts that are not perpendicular. On each ſide of this chain he would diſcover deep vallies clothed with verdure, peopled with innumerable villages, and watered by many rivers. In conſidering theſe objects with greater attention, he would remark, that the central chain is compoſed of elevated peaks and diverging ridges, whoſe ſummits are overſpread with ſnow; that the declivities of the peaks and ridges, excepting thoſe parts that are extremely ſteep, are covered with ſnow and ice, and that the intermediate depths and ſpaces between are filled with immenſe fields of ice, terminating in thoſe cultivated vallies which border the great chain. In purſuing this general ſurvey, and moreover obſerving that the branches moſt contiguous to the central chain would preſent the ſame phenomena, only in a leſſer degree; the glaciers would be obviouſly divided into two ſorts; the firſt occupying the deep vallies ſituated in the boſom of the Alps, and termed by the natives "Vallées de Glace," diſtinguiſhed by Mr. Coxe by the name of "Lower Glaciers;" the ſecond, which clothe ſummits and ſides of the mountains, are denominated "Upper Glaciers." The former are much the moſt conſiderable in extent and depth. Some ſtretch ſeveral leagues; that of Des Bois in particular is more than 15 miles long, and above three in its greateſt breadth. Theſe lower glaciers do not communicate with one another, and few of them are parallel to the central chain. They moſtly ſtretch in a tranſverſe direction, being bordered at the higher extremity by inacceſſible rocks, and on the other extending into the cultivated vallies. Sauſſure found the general depth of the ice in the glacier des Bois from 80 to 100 feet; but there is reaſon to believe that its thickneſs in ſome places exceeds even 600 feet. Theſe immenſe fields of ice uſually reſt on an inclined plane; being puſhed forwards by the preſſure of their own weight, and weakly ſupported by the rugged rocks beneath, they are interſected by large tranſverſe chaſms, and preſent the appearance of walls, pyramids, and other fantaſtic ſhapes, obſerved at all heights and in all ſituations, wherever the declivity exceeds 30 or 40 degrees. But in thoſe parts, where the plane on which they reſt is nearly horizontal, or gently inclined, the ſurface of the ice is nearly uniform; the chaſms are few and narrow, and they are croſſed without much difficulty. The ſurface of the ice is leſs ſlippery than that of ponds or rivers; it is rough and granulated, and only dangerous to thoſe who paſs it in ſteep deſcents. It is not tranſparent, is very porous, and full of ſmall bubbles, and is of courſe leſs compact than common ice. Its perfect reſemblance to the congelation of ſnow impregnated with water, in opacity, roughneſs, and the number as well as ſmallneſs of the air-bubbles, led Sauſſure to conceive the following ſimple and natural theory concerning the formation of the glaciers. An immenſe quantity of ſnow continually accumulates in the elevated vallies encloſed within the Alps, as well from that which falls from the clouds during nine months in the year, as from the maſſes inceſſantly rolling from the ſteep ſides of the circumjacent mountains. Part of this ſnow, not diſſolved during ſummer, impregnated with rain and ſnow-water, is frozen during winter, and forms that opaque and porous ice of which the "Lower Glaciers" are compoſed. The "Upper Glaciers" may be ſubdivided into thoſe which cover the ſummits, and thoſe which extend along the ſides of the Alps. The former owe their origin to the ſnow that falls at all ſeaſons of the year, and which remains nearly in its primitive ſtate, being congealed into a hard ſubſtance, and not converted into ice. The ſubſtance which clothes the ſides of the Alps is neither pure ſnow, like that of the ſummits, nor ice which forms the Lower Glaciers, but an aſſemblage of both. It contains leſs ſnow than the ſummits, becauſe the ſummer heat has more power to diſſolve it, and becauſe the liquefied ſnow deſcending from above, the maſs abſorbs a larger quantity of water. It contains more ſnow than the Lower Glaciers, becauſe the diſſolution of the ſnow is comparatively leſs. Hence the ice is even more porous, opaque, leſs compact than that of the Lower Glaciers, and of ſo doubtful a texture, as renders it, in many parts, difficult to decide, whether it may be called ice or frozen ſnow. In a word, there is a regular gradation from the ſnow on the ſummits to the ice of the Lower Glaciers, formed by the intermediate mixture, which becomes more compact and leſs porous in proportion as it approaches the Lower Glaciers, until it unites and aſſimilates with them. And it is evident, that the greater or leſſer degree of denſity is derived from the greater or leſſer quantity of water, with which the maſs is impregnated.

It has been a conteſted point among naturaliſts, whether the glaciers are in a ſtate of increaſe or diminution. The following obſervations may be alleged in proof of the latter alternative. In 1785, the inferior glacier of Grindelwald was diminiſhed at leaſt 400 yards ſince the year 1776; in the valley of Chamouny, the glaciers called "les murailles de glace," from their reſemblance to walls, and which riſe in very thick, ſolid, parallel ranges to a height of 150, or, as ſome ſay, 400 feet above their real baſe, and forming the border of the glacier of Boſſon, no longer exiſted, and young trees had ſhot up in the parts which were then covered by the glaciers of Montanvert. The advocates for the increaſe of the glaciers, notwithſtanding theſe facts, applicable, as they ſay, to the lower regions, aſſert, both from theory and obſervation, that more ſnow falls, and more ice is annually formed in the Alps than can be annually diſſolved. From theory they argue, that the cold occaſioned by the maſs of ice already formed ought to augment it ſtill further: and from experience they deduce, that within the remembrance of the preſent generation, many mountains have been covered, many paſtures and habitations invaded, and many paſſages irrecoverably obſtructed by the ice. In reply to the argument from theory it is maintained, that the cauſes which lead to the diminution of the ice are no leſs powerful than the augmentation of the cold, which is ſuppoſed to occaſion its indefinite increaſe. Theſe cauſes are principally rain and ſleet in the leſs elevated regions, evaporation, deſcent of the ſnow and ice, both precipitous and gradual, heat of the atmoſphere, and mean temperature of the earth, which is always above the freezing point, as is evident from the heat of the ſprings which iſſue from the bowels of the earth. With regard to the argument derived from experience, it is thought ſufficient to obſerve, that while the facts that prove the progreſs of the ice are admitted, it by no means ſeems to follow, that its maſs is perpetually increaſing. For the advocates of this opinion, while they ſcrupulouſly enumerate the places which have been invaded by the ice, do not take notice of thoſe parts, no leſs numerous, from which the ice has receded. Upon the whole we have reaſon to conclude, that if the collection of ice and ſnow gains in ſome places, it is diminiſhed in others, and that, upon an average, the aggregate quantity is nearly the ſame. Coxe's Travels in Switzerland, vol. ii.

GLACIES MARIÆ. See SPECULARIS *Lapis*.

GLACIS, in *Building*, an eaſy inſenſible ſlope or declivity. The deſcent or inclination of the glacis is leſs ſteep than that of the talut. In gardening a deſcent ſometimes begins in talut, and ends in glacis.

The glacis of the corniche is an eaſy imperceptible ſlope in the cymatium of the corniche, to promote the deſcent and draining off of the rain-water.

GLACIS, in *Fortification*, is particularly uſed for that of the counterſcarp, being a ſloping bank, which reaches from the parapet of the counterſcarp, or covert-way, to the level ſide of the field, at the diſtance of about twenty fathom.

The conſtruction of the covert-way and glacis is more diſtinctly illuſtrated in *Plate* V. *Fortification*, *fig.* 6. When the body of the place, and all the neceſſary out-works are conſtructed, lines are drawn parallel to the outermoſt counterſcarps of the ditches, at ſix toiſes diſtant from it; and the ſpace *m n m n*, included between that line and the counterſcarp, will be the covert-way required. If lines are drawn parallel to the lines which terminate the covert-way, and the places of arms *m*, *m*, &c. at twenty toiſes diſtant from them, the ſpace *x x x* between theſe lines will be the glacis. A, in this figure, repreſents the arrow; B, the detached redoubt; *v*, *v*, the traverſes; *z*, *z*, the ſally-ports. When the ground is low, and water to be found, there is often a ditch of about ten or twelve toiſes made round the glacis; beyond which there is a ſecond covert-way of four toiſes, with traverſes and places of arms, and a ſecond glacis from fifteen to eighteen toiſes broad. Muller's Fort p. 42. See *Military* CONSTRUCTION.

GLADBACK, or GLADBACH, in *Geography*, a town of Germany, in the circle of Weſtphalia, and duchy of Juliers; 16 miles N. of Juliers. N. lat. 51° 14′. E. long. 6° 15′.

GLADDON, or GLADWIN, the name of a plant, otherwiſe called ſpurge-wort.

GLADE, in *Agriculture*, *Gardening*, &c. a viſta, or open and light paſſage made through a thick wood, grove, or the like, by lopping off the branches of trees along the way.

GLADE, in *Zoology*. See GLEAD.

GLADENBACH, in *Geography*, a town of Germany, in the principality of Upper Heſſe; 12 miles N. of Gieſſen.

GLADIATORS, in *Antiquity*, perſons who were retained to fight ordinarily in the arena, for the entertainment of the people.

The gladiators were uſually ſlaves, and condemned criminals, who fought from neceſſity; though, ſometimes, freemen made profeſſion of this practice, like our prize-fighters, for a livelihood. After a ſlave had ſerved on the arena three years, he was diſmiſſed.

The Romans borrowed this cruel diverſion from the Aſiatics: ſome ſuppoſe that there was policy in this practice, the frequent combats of gladiators tending to accuſtom the people to deſpiſe danger and death.

The origin of ſuch combats ſeems to be as follows: From the earlieſt times with which we have any acquaintance with profane hiſtory, it had been the cuſtom to ſacrifice captives, or priſoners of war, to the manes of the great men who had died in the engagement; thus Achilles, in the Iliad, lib. xxiii. ſacrifices twelve young Trojans to the manes of Patroclus; and in Virgil, lib. xi. ver. 81. Æneas ſends captives to Evander, to be ſacrificed at the funeral of his ſon Pallas.

In courſe of time they came alſo to ſacrifice ſlaves at the funerals of all perſons of condition; this was even eſteemed a neceſſary part of the ceremony; but, as it would have appeared barbarous to have maſſacred them like beaſts, they were appointed to fight with each other, and endeavour to ſave their own lives by killing their adverſaries. This ſeemed ſomewhat leſs inhuman, becauſe there was a poſſibility of avoiding death by an exertion of ſkill and courage.

This occaſioned the profeſſion of gladiator to become an art; hence aroſe maſters of arms, and men learned to fight and exerciſe this art.

Theſe maſters, whom the Latins called *laniſtæ*, bought ſlaves to be trained up to this cruel trade, whom they afterwards ſold to ſuch as had occaſion to preſent the people with ſo horrible a ſhow.

They were at firſt performed near the ſepulchre of the deceaſed, or about the funeral pile, but were afterwards removed to the circus and amphitheatres, and became ordinary amuſements. See Bustuarii.

The firſt ſhow of gladiators, called *munus gladiatorum*, was exhibited at Rome, according to Valerius Maximus, by M. and D. Brutus, upon the death of their father, in the year of the city 488; though Livy (ix. 40.) ſpeaks of it in the 444th year of Rome, as practiſed among the Campanians. On the exhibition by M. and D. Brutus, there were probably only three pairs of gladiators: in the year of Rome 537, the three ſons of M Emilius Lepidus the augur, who had been three times conſul, entertained the people with the cruel pleaſure of ſeeing twenty-two gladiators fight in the forum; and the ſhow continued three days. In the year of Rome 547, the firſt Africanus diverted his army at New Carthage with a ſhow of gladiators, which he exhibited in honour of his father and uncle, who had begun the reduction of Spain. In the 552d year the ſons of M. Valerius Lævinus exhibited 25 pairs of gladiators; and in 569, 70, and in 578, 74 fought on the like occaſion. In proceſs of time, the Romans became ſo fond of theſe bloody entertainments, that not only the heir of any great and rich citizen lately deceaſed, but all the principal magiſtrates, preſented the people with ſhows of this nature, to procure their affection. The ædiles, pretors, conſuls, and, above all, the candidates for offices, made their court to the people, by entertaining them frequently with theſe fights: and the prieſts were ſometimes the exhibitors of the barbarous ſhows; for we meet with the *ludi pontificales* in Suetonius, Auguſt cap. 44. and with the *ludi ſacerdotales*, in Pliny, Epiſt. lib. vii. As for the emperors, it was ſo much their intereſt to ingratiate themſelves with the populace, that they obliged them with combats of gladiators almoſt upon all occaſions, and as theſe increaſed, the number of combatants increaſed likewiſe. Accordingly, Julius Cæſar, in his ædileſhip, diverted the people with three hundred and twenty couple. Gordian, before he was emperor, gave theſe ſhows twelve times in a year. In ſome of theſe there were 500 pairs of gladiators, and never leſs than 50.

Germanicus and Claudius, both ſons of Druſus, gave combats of gladiators in honour of their father. Nero's and Domitian's combats of gladiators are noticed in the ſequel of this article. Otho employed 2000 gladiators in the war againſt Vitellius (A.D. 69), and Vitellius hired gladiators to fight in all the ſtreets of Rome for the amuſement of the people. The inhuman fights of gladiators, though long authorized by cuſtom, afforded no pleaſure to Veſpaſian. Titus, however, exhibited a ſhow of gladiators, wild beaſts, and repreſentations of ſea-fights, which laſted a hundred days; and Trajan continued a ſolemnity of this nature for a hundred and twenty-three days, during which time he brought out ten thouſand gladiators. And Adrian, on his firſt viſit to Rome, after his promotion to the empire, gave combats of gladiators for ſix days ſucceſſively. Before this time, under the republic, the number of gladiators was ſo great, that when the conſpiracy of Catiline broke out, the ſenate ordered them to be diſperſed into the garriſon and ſecured, leſt they ſhould have joined the diſaffected party. See Gladiators' *War*.

Theſe ſports were become ſo common, and their conſequences, in a variety of reſpects, ſo dangerous, that Cicero preferred a law, that no perſon ſhould exhibit a ſhow of gladiators within two years before he appeared candidate for any office. Julius Cæſar ordered, that only a certain number of men of this profeſſion ſhould be in Rome at a time. Auguſtus decreed, that only two ſhows of gladiators ſhould be preſented in a year, and never above ſixty couple of combatants in a ſhow. And Tiberius provided by an order of ſenate that no perſon ſhould have the privilege of gratifying the people with ſuch a ſolemnity, unleſs he was worth four-hundred thouſand ſeſterces. They were alſo conſiderably regulated by Nerva.

The emperor Claudius reſtrained them to certain occaſions; but he ſoon afterwards annulled what he decreed, and private perſons began to exhibit them at pleaſure, as uſual: and ſome carried the brutal ſatisfaction ſo far, as to have them at their ordinary feaſts.

And not ſlaves only, but other perſons, would hire themſelves to this infamous office.

The maſter of the gladiators made them all firſt ſwear, that they would fight to death; and if they failed, they were put to death, either by fire, or ſwords, clubs, whips, or the like.

It was a crime for the wretches to complain when they were wounded, or aſk for death, or ſeek to avoid it, when overcome; but it was uſual for the emperor, or the people, to grant them life, when they gave no ſigns of fear, but waited the fatal ſtroke with courage and intrepidity: Auguſtus even decreed, that it ſhould always be granted them. But fear and want of ſpirit were very rare on occaſions of this kind; inſomuch, that Cicero more than once propoſes the principle of honour which actuated the gladiators as an admirable model of courage and conſtancy; by which he intended to animate himſelf and others, to ſuffer every thing for the preſervation of liberty and the defence of the commonwealth. (Tuſc. ii. 41. Philip. ii. 35.)

From ſlaves and freedmen, the inhuman ſport at length ſpread to people of rank and condition; ſo that Auguſtus was obliged to iſſue a public edict, that none of the ſenatorian order ſhould become gladiators; and ſoon after he laid the ſame reſtraint on the knights; nevertheleſs, Nero is related to have brought upwards of four hundred ſenators, and ſix hundred Roman knights upon the arena; though Lipſius takes both thoſe numbers to be falſified, and, not without reaſon, reduces them to forty ſenators, and ſixty knights. Not only ſenators, but even women of quality, fought in public in ſome of Nero's combats of gladiators. On occaſion of the triumph of Probus, A. D. 281, about fourſcore gladiators, together with near 600 others, exhibited the moſt deſperate courage, for the inhuman ſports of the amphitheatre. Diſdaining to ſhed their blood for the amuſement of the populace, they killed their keepers, broke from the place of their confinement, and filled the ſtreets of Rome with blood and confuſion. After an obſtinate reſiſtance, they were overpowered and cut in pieces by the regular forces; but they obtained at leaſt an honourable death, and the ſatisfaction of a juſt revenge (Zoſimus, l. i. p. 66.); yet Domitian, that other monſter of cruelty, refined upon Nero, exhibiting combats of women in the night-time.

Before Rome was become the capital of the known world, Antiochus Epiphanes, king of Syria, in imitation of the Romans, had introduced the combats of gladiators in his dominions. It is remarkable, however, that the Athenians, who were naturally beneficent and humane, never admitted bloody ſhows into their city: and when it was propoſed to eſtabliſh combats of gladiators there, in order not to give place in that reſpect to the Corinthians, "Firſt throw down," exclaimed an Athenian in the midſt of the aſſembly, whoſe name was Demonax, a famous philoſopher, who flouriſhed in the reign of Marcus Aurelius, "the altar which our forefathers above a thouſand years ago erected to Mercy."

Some Pagan emperors, lamenting the ſad effects of this ſavage cuſtom, endeavoured, as we have already ſeen, to moderate it. With this view Marcus Aurelius retrenched the enormous expences employed in theſe combats, and would not ſuffer the gladiators to fight with each other, except with very blunt ſwords, like foils; ſo that they might ſhew their addreſs, without any danger of being killed. But the honour of ſuppreſſing theſe combats was reſerved for Chriſtianity; and it coſt many efforts and much time to effect this purpoſe: ſo rooted was the evil, and ſo much had it eſtabliſhed itſelf by the long preſcription of many ages, and the opinion of the world, that theſe combats were acceptable to the gods, to whom, for that reaſon, they offered the blood of gladiators lately ſhed, by way of ſacrifice, as ſeveral of the Chriſtian fathers obſerve.

Conſtantine the Great is ſaid to have firſt prohibited the combats of gladiators in the Eaſt; at leaſt, he forbad thoſe who were condemned to death for their crimes to be employed; there being an order ſtill extant to the præfectus prætorii, rather to ſend them to work in the mines in lieu thereof; it is dated at Berytus, in Phœnicia, the 1ſt of October, 325.

But, notwithſtanding this edict, which condemned the art and amuſement of ſhedding human blood, the benevolent law expreſſed the wiſhes of the prince, without reforming an inveterate abuſe, which degraded a civilized nation below the condition of ſavage cannibals. Several hundred, perhaps ſeveral thouſand, victims were annually ſlaughtered in the great cities of the empire; and the month of December, more peculiarly devoted to the combats of gladiators, ſtill exhibited to the eyes of the human people a grateful ſpectacle of blood and cruelty. Amidſt the general joy of the victory at Pollentia, gained by the emperor Honorius, Prudentius, a Chriſtian poet, exhorted the emperor to extirpate, by his authority, the horrid cuſtom which had ſo long reſiſted the voice of humanity and religion. The pathetic repreſentations of Prudentius were leſs effectual than the generous boldneſs of Telemachus, an Aſiatic monk, whoſe death was more uſeful to mankind than his life. The Romans were provoked by the interruption of their pleaſures; and the raſh monk, who had deſcended into the arena, to ſeparate the gladiators, was overwhelmed under a ſhower of ſtones. But the madneſs of the people ſoon ſubſided; they reſpected the memory of Telemachus, who had deſerved the honours of martyrdom; and they ſubmitted, without a murmur, to the laws of Honorius, which aboliſhed for ever the inhuman ſacrifices of the amphitheatre. The citizens, who adhered to the manners of their anceſtors, might perhaps inſinuate, that the laſt remains of a martial ſpirit were preſerved in this ſchool of fortitude, which accuſtomed the Romans to the ſight of blood, and to the contempt of death:—a vain and cruel prejudice, ſo nobly confuted by the valour of ancient Greece, and of modern Europe.

It muſt be obſerved, however, that the practice was not entirely aboliſhed in the Weſt before Theodoric, king of the Oſtrogoths. . Honorius, on the occaſion firſt mentioned, had prohibited them; but the prohibition does not ſeem to have been executed. Theodoric, in the year 500, aboliſhed them finally.

Some time before the day of battle, the perſon who preſented the people with the ſhows gave them notice thereof, by programmas, or bills, containing the names of the gladiators, and the marks whereby they were to be diſtinguiſhed; for each had his ſeveral badge, which was, moſt commonly, a peacock's feather, as appears, from the Scholiaſt of Juvenal, on the 158th verſe of the third Satire, and Turnebus Adverſ. lib. ii. cap. 8.

They alſo gave notice what time the ſhows would laſt, and how many couples of gladiators there were; and it even appears, from the 52d verſe of the ſeventh Satire of the ſecond book of Horace, that they ſometimes made repreſentations of theſe things in painting, as is practiſed among us by thoſe who have any thing to ſhow at fairs.

The day being come, they began the entertainments by bringing two kinds of weapons; the firſt were ſtaves, or wooden files, called *rudes;* and the ſecond were effective weapons, as ſwords, poniards, &c.

The firſt were called *arma luſoria*, or *exercitoria;* the ſecond *decretoria*, as being given by decree or ſentence of the prætor, or of him at whoſe expence the ſpectacle was exhibited. They began to fence or ſkirmiſh with the firſt, which was to be the prelude to the battle; and from theſe, when well warmed, they advanced to the ſecond, at the ſound of the trumpets, with which they fought naked.

Then they were ſaid *vertere arma;* the terms of ſtriking were *petere* and *repetere;* of avoiding a blow, *exire;* and when one of the combatants received a remarkable wound, his adverſary or the people cried out, *habet*, or *hoc habet.* The firſt part of the engagement was called *ventilare, præludere;* and the ſecond, *dimicare ad certum*, or *verſis armis pugnare:* and ſome authors think, with much probability, that it is to theſe two kinds of combat that St. Paul alludes, in the paſſage 1 Cor. ix. 26, 27. "I fight, not as one that beateth the air; but I keep my body, and bring it into ſubjection."

If the vanquiſhed ſurrendered his arms, it was not in the victor's power to grant him life; it was the people during the time of the republic, and the prince or people during the time of the empire, that were alone impowered to grant the boon.

The reward of the conqueror was a branch of palm-tree, and a ſum of money, probably collected among the ſpectators; ſometimes they gave him his congé, or diſmiſſed him, by putting one of the wooden foils or rudis in his hand; and ſometimes they even gave him his freedom, putting the pileus on his head.

The ſign or indication whereby the ſpectators ſhewed that they granted the favour, was *premere pollicem*, which M. Dacier takes to be a clenching of the fingers of both hands between one another, and ſo holding the two thumbs upright, cloſe together: and, when they would have the combat finiſhed, and the vanquiſhed ſlain, they *verterunt pollicem*, bent back the thumb; which we learn from Juvenal, Sat. iii. ver. 36.

> "Munera nunc edunt, et verſo pollice vulgi
> Quemlibet occidunt populariter." Juv.

The gladiators challenged or defied each other, by ſhewing the little finger; and, by extending this, or ſome other, during the combat, they owned themſelves vanquiſhed, and begged mercy from the people: "Victi oſtenſam digiti veniam a populo poſtulabant," ſays the old Scholiaſt on Perſius. Vide Plin. lib. xxviii. cap. 2. Prudentius, lib. ii. contra Symm. ver. 1098. Horace, lib. iv. 18. ver. 66.

Politian. Miſcel. cap. 42. Turneb. Adverſ. lib. xi. cap. 6. Lip. Saturn. lib. ii. cap. 22.

There were divers kinds of gladiators, diſtinguiſhed by their weapons, manner, and time of fighting, &c. as,

The *andabatæ*, of whom we have already given an account under ANDABATÆ.

The *catervarii*, who always fought in troops or companies, number againſt number: or according to others, who fought promiſcuouſly, without any certain order. Lipſ. lib. ii. cap. 16.

The *conſummati*, whom authors mention as a ſpecies of gladiators, the ſame with the rudiarii and veterani; founding the opinion on a paſſage in Pliny, lib. viii. cap. 7. But Lipſius ſhews, that they have miſtaken Pliny. Saturn. lib. ii. cap. 16. and Turneb. Adverſ. lib. xxx. cap. 36.

The *cubicularii*, which are a little precarious, being chiefly founded on a paſſage in Lampridius, in the life of the emperor Commodus: "Inter hæc, habitu victimarii, victimas immolavit, in arena rudibus, inter cubicularios; gladiatores pugnavit lucentibus aliquando mucronibus."

Turnebus reads *rudiarios* inſtead of *cubicularios*: and underſtands it of thoſe who had been diſmiſſed, and could no longer be obliged to fight, except with foils.

Salmaſius reads *gladiator*; and refers it to the emperor, who fought not only on the arena, and with foils, or blunted inſtruments, but at home, with his ſervants and valets de chambre, and with ſharps.

Lipſius will have nothing altered in the text: the *gladiatores cubicularii*, he obſerves, were thoſe who fought at private houſes, during feaſts, &c Accordingly, Dion ſays expreſsly, that Commodus ſometimes fought at home, and even killed ſome perſons in ſuch rencounters; but that, in public, he only fought with blunted weapons.

The *dimachæ*, who fought armed with two poniards, or ſwords; or with ſword or dagger. Lipſ. Saturn. lib. ii. cap. 13.

The *eſſedarii*, who fought in cars; called alſo, in an inſcription lately diſcovered at Lyons, *aſſedarii*. Saturn. ſerm. lib. ii. cap. 13.

The *fiſcales*, or *Cæſariani*, who belonged to the emperor's company; and who, being more robuſt and dexterous than the reſt, were frequently called for, and therefore named alſo *poſtulatitii*. Saturn. lib. ii. cap. 16.

The other kinds were, the *hoplomachi*, *meridiani*, *myrmillones*, *ordinarii*, *pinnirapi*, *provocatores*, *retiarii*, *rudiarii*, *Samnites*, *ſecutores*, *ſpectatores*, and *Thraces*: which ſee deſcribed under MERIDIANI, RETIARII, SECUTORES, &c.

Some authors, and particularly Vigenere on Livy, rank the *obſequentes*, mentioned by Spartian, in his life of Marcus Aurelius, among the number of gladiators; Lipſius ridicules him, Saturn. lib. ii. cap. 10. and with ſome reaſon: the *obſequentes* properly were the troops which that emperor raiſed among the gladiators; or whom of gladiators he made ſoldiers.

GLADIATORS' *war*, *bellum Gladiatorum*, or *Spartacium*, called alſo the *ſervile war*, was a war which the Romans ſuſtained about the year of their city 680. Spartacus, Crinus, Oenomaus, having eſcaped, with other gladiators, to the number of ſeventy-four, out of the place where they had been kept at Capua, gathered together a body of ſlaves, put themſelves at their head, rendered themſelves maſters of all Campania, and gained ſeveral victories over the Roman prætors. At length they were defeated, in the year 682, at the extremity of Italy; having, in vain, attempted to paſs over into Sicily.

This war proved very formidable to the Romans. Craſſus was not able to finiſh it: the great Pompey was forced to be ſent as general.

GLADIATOR, *dying*, is a moſt valuable monument of ancient ſculpture, which is now preſerved in the palace of Chighi. This man, when he had received the mortal ſtroke, is particularly careful, *ut procumbat honeſte*, that he might fall gracefully; he is ſeated in a reclining poſture on the ground, and has juſt ſtrength ſufficient to ſupport himſelf on his right arm; and in his expiring moments, it is plainly ſeen that he does not abandon himſelf to grief and dejection, but is ſolicitous to maintain that firmneſs of aſpect, which the gladiators valued themſelves on preſerving in this ſeaſon of diſtreſs, and that attitude which they had learnt of the maſters of defence. He fears not death, nor ſeems to betray any tokens of fear by his countenance, nor to ſhed one tear: "quis mediocris gladiator ingemuit, quis vultum mutavit unquam, quis non modò ſtetit, verum etiam decubuit turpiter," ſays Cicero, in that part of his Tuſculan, where he is deſcribing the aſtoniſhing firmneſs of theſe perſons. We ſee, in this inſtance, notwithſtanding his remaining ſtrength, that he has but a moment to live, and we view him with attention, that we may ſee him expire and fall: thus the ancients knew how to animate marble, and to give it almoſt every expreſſion of life.

GLADIOLE, in *Botany*. See BUTOMUS and LOBELIA.

GLADIOLUS, a name in Pliny, from *gladius*, a ſword, alluding to the form of the leaves. Linn. Gen. 26. Schreb. 35. Willd. Sp. Pl. v. 1. 208. Vahl. Enum. v. 2. 77. Thunb. Diſſ. n. 7. Ait. H. Kew. ed. 2. v. 1. 96. Ker in Ann. of Bot. v. 1. 230. Mart. Mill. Dict. v. 2. Juſſ. 58. Tourn. t. 190. Lamarck Illuſtr. t. 32. Gærtn. t. 11.—Claſs and order, *Triandria Monogynia*. Nat. Ord. *Enſatæ*, Linn. *Irides*, Juſſ.

Gen. Ch. *Cal.* Spatha inferior, ſhorter than the corolla, of two oblong permanent valves; the outermoſt larger, enfolding the inner one. *Cor.* of one petal, ſuperior; tube cylindrical, ſwelling upwards, curved; limb ſomewhat bell-ſhaped, irregular, in ſix deep, oblong, ſlightly ſpreading, unequal ſegments, the upper and lowermoſt either without or within the lateral ones. *Stam.* Filaments three, inſerted into the mouth of the tube, thread-ſhaped, aſcending, ſhorter than the corolla; anthers ovate, incumbent. *Piſt.* Germen inferior, triangular; ſtyle thread-ſhaped; ſtigmas three, ſpreading, folded, recurved, obtuſe, downy. *Peric.* Capſule ovate, triangular, obtuſe, thin, of three cells and three valves. *Seeds* numerous, ſmooth, ſurrounded with a membranous wing.

Eſſ. Ch. Spatha of two valves. Corolla tubular; its limb in ſix deep ſegments, irregular. Stamens aſcending. Stigmas three, dilated. Seeds winged.

Twenty-four ſpecies of this genus are defined in the 14th edition of Linnæus's *Syſtema Vegetabilium*, of which the *ramoſus*, Sp. Pl. 53, belongs, we believe, to *Ixia*, or ſome of its near allies. Willdenow makes 50 ſpecies, but Mr. Ker (late Gawler) has, we think, with great propriety, eſtabliſhed the old genus *Watſonia*, to which ſome of them are removed, while others go to his *Tritonia* or elſewhere, ſo that he names but 28 ſpecies in Sims and Konig's Annals above quoted. He is followed by Mr. Dryander in the new edition of the *Hortus Kewenſis*, except with regard to his *hirſutus*, there called *brevifolius*, after Willdenow and Jacquin; while a moſt diſtinct ſpecies figured in Curt. Mag. t. 574, by Mr. Ker as a variety of *hirſutus*, is properly retained as being the true *hirſutus* itſelf. Five of Mr. Ker's ſpecies are not found in Hort. Kew.

We judge it neceſſary to give a view of the whole genus in its reformed ſtate, adding the Linnæan G. *imbricatus* to what the above-mentioned writers have defined.

1. G. *Cunonia*. Gærtn. v. 1. 31. (Antholyza Cunonia; Linn. Sp. Pl. 54. Vahl. Enum. v. 2. 121. Curt. Mag. t. 343. Redout. Lil. t. 12.)—"Leaves linear-ſword-ſhaped. Upper ſegment of the corolla very long; lower very ſmall."—Native of the Cape of Good Hope, nor does it appear to grow, as Linnæus aſſerts, in Perſia. Remarkable for the vivid ſcarlet of its ſingular and beautiful *flowers*, the three upper ſegments of whoſe corolla are broadly elliptical and vaulted, the middlemoſt projecting far beyond the other two; while the three lower are very ſmall, and greeniſh. This is a hardy green-houſe plant. See ANTHOLYZA, n. 3.

2. G. *Watſonius*. Thunb. Diſſ. 14. Prod 8. Jacq. Coll. v. 3. 257. Ic. Rar. t. 233. Curt. Mag. t. 450 and 569. (G. præcox; Andr. Repoſ. t. 38.)—"Leaves linear-ſword-ſhaped, with three ribs on each ſide. Tube of the corolla cylindrical, longer than the limb."—Native of the Cape of Good Hope; almoſt hardy with us, flowering in April. The *corolla* is ſcarlet, ſometimes ſpeckled with yellow, as in Curtis's t. 569; its ſegments are ſharp-pointed, and nearly equal, each an inch long. Tube an inch and half in length, its baſe very narrow and thread-ſhaped.

3. G. *quadrangularis*. Ker in Curt. Mag. t. 567. (G. abbreviatus; Andr. Repoſ. t. 166. Antholyza quadrangularis; Burm. Fl. Cap. according to Mr. Ker.)—"Leaves with four angles and four furrows. Upper ſegment of the corolla very long; lower very ſmall and ſharp."—Imported from the Cape of Good Hope, by thoſe excellent cultivators Meſſrs. Lee and Kennedy in 1799. It firſt flowered with them in March 1801. The quadrangular *leaves* diſtinguiſhed this from moſt others, except the *triſtis*, n. 10, and *permeabilis*, n. 7; the *flowers* more agree with G. *Cunonia*, at leaſt in their large vaulted upper ſegment, but all the lateral ſegments are extremely ſhort, ovate and acute, the lowermoſt being the leaſt of all. The tube is yellow ſtreaked with orange; large ſegment of the limb purpliſh; all the reſt variegated with dull green and brown. According to the Linnæan idea of hybrid ſpecies, this might be gueſſed to have originated from G. *Cunonia* impregnated by G. *triſtis*.

4. G. *galeatus*. Andr. Repoſ. t. 122. (G. namaquenſis; Ker in Curt. Mag. t. 592.)—Upper ſegment of the corolla vaulted; two lateral rhomboid; three lower pendulous, ſpatulate, blunt with a little point. Leaves coriaceous, obovate.—Native of the Namaqua country, a conſiderable diſtance from the Cape of Good Hope; eaſily propagated by ſeeds or offſets, and blowing freely. The *leaves* are very thick, many-ribbed, obovate, obtuſe, curved or oblique. *Stem* low, bent or zig-zag, covered with *bracteas* and *flowers*. The latter are large and ſhowy, their three narrow drooping lower ſegments, each half green half ſcarlet, ſtrikingly contraſted with the large broad upper ones, which are of a rich ſcarlet, green white and purple at the baſe. No authority can induce us to prefer ſuch a ſpecific name as *namaquenſis*, it being contrary to rule as the name of a country, and ſo peculiarly barbarous in itſelf. The G. *galeatus* of Jacquin is *Sparaxis galeata* of Ker.

5. G. *alatus*. Linn. Sp. Pl. 53. Herb. Linn. Andr. Repoſ. t. 8. Ker in Curt. Mag. t. 586.—Upper ſegment of the corolla obovate, recurved; two lateral rhomboid; three lower pendulous, ſpatulate, pointed. Leaves rigid, lanceolate.—Common about the Cape of Good Hope; eaſily encreaſed by ſeeds or bulbs, but rarely flowering with us. Bears a conſiderable reſemblance to the laſt in form and colours, but the *leaves* are narrower and very differently ſhaped, the lower ſegments of the *corolla* more lanceolate, the upper one reflexed. Linnæus once called this ſpecies *labialis*, but his ſon changed it to *alatus*, in alluſion to the wing-like lateral ſegments.

6. G. *viperatus*. Ker in Curt. Mag. t. 688. (G. alatus; Jacq. Ic. Rar. t. 259. G. orchidiflorus; Andr. Repoſ. t. 241.)—Upper ſegment of the corolla ſpatulate, arched, incurved; two lateral rhomboid; three lower ſpatulate, pendulous, acute. Leaves ſtraight, linear-ſword-ſhaped.—Native of the Cape; rare in our collections. Plukenet's rude figure, t. 224. f. 8, is ſuppoſed to belong to this ſpecies rather than to the laſt, for which it is quoted by Linnæus. This differs from the two preceding in having long erect narrow *leaves*, and *flowers* variegated with dull green and purple, which are luſciouſly fragrant. The *ſtem* is tall, and ſometimes branched.

7. G. *permeabilis*. De la Roche Diſſ. 27. t. 2. Ker in Ann. of Bot. v. 1. 231.—Leaves awl-ſhaped, quadrangular, erect. Upper ſegment of the corolla broadeſt, vaulted, undulated; two lateral narrow-rhomboid; three lower ſpatulate, acute, recurved at the points.—Native of the Cape of Good Hope. We know it only by De la Roche's figure and deſcription. He ſays the *flowers* are of a very pale violet, diluted with purple and yellow. The name alludes to their being pervious between the ſegments, but this is not peculiar. That ſuppoſed variety of *triſtis*, figured by Jacquin, Ic. Rar. t. 244, ſeems to be very near the preſent ſpecies.

8. G. *verſicolor*. Ker in Curt. Mag. t. 1042 and 556. Andr. Repoſ. t. 19.—Leaves linear-ſword-ſhaped, with three ribs on each ſide. Segments of the corolla longer than the tube, pointed, recurved.—Native of the Cape, from whence it was received by Meſſrs. Lee and Kennedy in 1794. Its *flowers* are among the largeſt of its genus, with peculiarly long undulated recurved ſegments, and are remarkable for changing colour ſeveral days ſucceſſively. In the morning it is of a purpliſh brown, but becomes grey in the courſe of the day, and finally of a light blue in the evening. The moſt wonderful, and, as far as we know, unique circumſtance, is, that the original brown hue returns in the courſe of the night, and this happens for nine or ten following days. There are moreover ſome varieties of colour obſervable in different plants, ſome aſſuming more of a yellow hue. It differs eſſentially from the following in having a ſword-ſhaped, not a quadrangular, leaf.

9. G. *triſtis*. Linn. Sp. Pl. 53. Ker in Curt. Mag. t. 272 and 1098. Jacq. Ic. Rar. t. 245 and 243. (Lilio-gladiolus bifolius et biflorus, foliis quadrangulis; Trew. Ehret. t. 39.)—Leaves with four angles and four furrows. Segments of the corolla nearly equal, pointed.—Frequent at the Cape, and not uncommon in our green-houſes, where it is juſtly admired for its rich evening ſcent, like a pink, or a bergamot pear, eſpecially in the moſt common or particoloured variety, to which the firſt-quoted figures of Curtis and Jacquin refer. The deeply furrowed quadrangular *leaves*, like thoſe of the Snake's-head Iris, *tuberoſa*, diſtinguiſh it clearly from the laſt, for which Mr. Ker, we preſume by miſtake, quotes Jacquin's t. 245. He likewiſe cites and blames Trew's Ehret as the yellowiſh variety, which is a fine plate, though rather too pink, of the particoloured one.

10. G. *hyalinus*. Jacq. Ic. Rar. t. 242. Ker in Ann. of Bot. v. 1. 231. Willd. Sp. Pl. v. 1. 211.—Leaves linear, erect, the length of their ſheaths. Segments of the corolla ovate, acute; the uppermoſt largeſt, erect.—Native of the Cape. Jacquin ſays it flowered with him in December. We do not find it in the Hortus Kewenſis, nor Hortus

Cantabrigienſis, nor have we ſeen any ſpecimen. The ſhort, upright, ſtraight *leaves* are remarkable. The *flowers* are ſmaller than in the two laſt, ſcentleſs; the baſe of their ſegments ſemi-tranſparent, the extremities yellowiſh, ſtriped and dotted with purple. The upper ſegment is by far the largeſt; the others gradually ſmaller, to the lower one, which is leaſt of all. Tube funnel-ſhaped, ſemi-pellucid, very pale purple, as long as the largeſt ſegment.—Jacquin firſt called this ſpecies *ſtrictus*: ſee Collect. v. 4. 170.

11. G. *tenellus.* Jacq. Ic. Rar. t. 248. Coll. v. 3. 255, and v. 4. 169. t. 3. f. 1. Ker in Ann. of Bot. v. 1. 231.—Leaves linear, convoluted, ſmooth. Stem zig-zag. Segments of the corolla elliptical, bluntiſh, nearly equal, ſhorter than the tube.—Native of the Cape. Jacquin, from whoſe figures alone we are acquainted with this plant, ſays it bloomed with him in November. The *ſtem* is a ſpan high, curved and zig-zag. *Flowers* one or two, yellowiſh, more or leſs variegated with pale purple, ſcentleſs, about an inch and half long.

12. G. *ſetifolius.* Thunb. Diſſ. 18. Linn. Suppl. 96. Ker in Ann. of Bot. v. 1. 231.—"Leaves linear-briſtle-ſhaped. Corolla ringent. Stem branched."—Native of the Cape of Good Hope. "*Stem* bearing many ſpikes of flowers; very rarely ſimple; upright, ſomewhat zig-zag, four inches high; branches round and erect. *Leaves* about three, linear-ſetaceous, the upper ones gradually ſhorter; the lowermoſt as tall as the ſtem. *Flowers* alternate, white, ringent; their tube ſcarcely longer than the ſpatha." *Thunb.*

13. G. *gracilis.* Jacq. Ic. Rar. t. 246. Ker in Curt. Mag. t. 562.—Leaves linear, ribbed, deeply furrowed on each ſide, with a very ſlight midrib. Corolla ſomewhat bell-ſhaped; ſegments ovate, nearly equal.—Native of the Cape, eaſily cultivated with us, blooming in March or April. *Flowers* wavy, pale blue, more or leſs ſpeckled with black and white on the two lower lateral ſegments; without ſcent. *Bulb* very ſmall. *Stem* variouſly bent, ſlender, two or three feet high.

14. G. *recurvus.* Linn. Mant. 28. Ker in Curt. Mag. t. 578. (G. carinatus; Willd. Sp. Pl. v. 1. 211. Ker in Ann. of Bot. v. 1. 231. G. punctatus; Jacq. Ic. Rar. t. 247. G. ringens; Andr. Repoſ. t. 27 and 227. Redout. Liliac. t. 123. G. alatus; Schneev. Ic. t. 12.)—Leaves linear, flat; rib prominent on each ſide. Radical ſheath ſpeckled. Segments of the corolla nearly equal, ovate, recurved.—Native of the Cape, cultivated and badly figured by Miller, and now frequent in gardens, where it is valued for the fine violet fragrance of its blue and yellow bloſſoms, more than even for their beauty or ſize, which equals that of moſt ſpecies. The *leaves* have a ſtrong rib, prominent on each ſide, and the firſt ſheath from the root is curiouſly ſpeckled with brown, like the ſtalks of *Arum Dracunculus.* Thunberg confounded this and *gracilis* with *triſtis.*

15. G. *brevifolius.* Jacq. Ic. Rar. t. 249. Dryand. in Ait. Hort. Kew. ed. 2. v. 1. 98. (G. hirſutus α; Ker in Curt. Mag. t. 992; and β; t. 727. G. carneus; Andr. Repoſ. t. 240.)—"Leaf of the barren bulb ſolitary, linear, ſlightly downy; of the flowering one ſcarcely any. Corolla ſomewhat ringent."—Native of the Cape, readily cultivated and encreaſed with us. The *flowers* are among the ſmaller ſized, all leaning one way, variouſly tinged with pale purple or roſe-colour, with ſome yellow; their three lower ſegments moſt ſpeckled, and nearly of equal ſize, the uppermoſt one rather largeſt, vaulted, recurved at the ſummit. The *leaves* are minutely downy, upright, linear or ſlightly lanceolate; very ſhort, or rather mere ſcales, on the flowering ſtem; ſolitary and larger on the bulb, which produces no flowers.

16. G. *hirſutus.* Jacq. Ic. Rar. t. 250. Dryand. in Ait. Hort. Kew. ed. 2. v. 1. 98. Ker in Curt. Mag. t. 574. (G. roſeus; Andr. Repoſ. t. 11.)—"Leaves linear ſword-ſhaped, downy. Corolla nearly regular."—Native of the Cape; introduced into our green-houſes in 1795, when it firſt flowered in the collection of Mr. Orde at Fulham. The broadiſh, downy, red-edged *leaves* are remarkable. The *flowers* are large and fragrant, roſe-coloured; their ſegments elliptical, pointed, nearly equal. Jacquin's figure is indeed a poor one, but we can ſcarcely ſuppoſe, with Mr. Andrews, that it is drawn from a dried ſpecimen, as the author ſays it flowered in his green-houſe, nor does he, like Pallas, often practiſe this without acknowledgment.

17. G. *flexuoſus.* Thunb. Diſſ. 9. t. 1. f. 1. Linn. Suppl. 96.—Leaves linear, involute. Corolla ringent; ſegments elliptic-lanceolate, nearly equal, ſhorter than the tube. Stem zig-zag.—Gathered at the Cape by Thunberg, from whom we have a wild ſpecimen. The *ſtem* is a ſpan high, irregularly curved, and zig-zag. *Leaves* ſheathing, ſhort, linear, acute, ſmooth, involute. *Spathas* large, ſwelling, ſharply pointed. *Flowers* very pale fleſh-coloured, with red ribs; tube capillary, an inch and half long; ſegments of the limb narrow, nearly equal in ſize, but ringent.

18. G. *carneus.* Jacq. Ic. Rar. t. 255 Ker in Curt. Mag. t. 591. (G. cuſpidatus; Andr. Repoſ. t. 147. Redout. Liliac. t. 36.)—Leaves ſword-ſhaped, many-ribbed. Segments of the corolla ſhorter than the tube; the uppermoſt broadeſt, with an involute recurved point; the three lower narroweſt, dependent.—Native of the Cape. A tall and handſome plant, with ſeveral many-ribbed *leaves.* *Flowers* inodorous, two-ranked, large, fleſh-coloured with a roſy hue; their three lower ſegments oblong, bluntiſh, each marked with a red rhomboid central ſpot; the three upper broadeſt, eſpecially the top one, with long recurved points, whoſe edges are involute. The tube is ſlender, longer than the limb, twice as long as the ſpatha. This freely blowing ſpecies is a deſirable ornament for the green-houſe in the ſpring.

19. G. *cuſpidatus.* Jacq. Ic. Rar. t. 257. Ker in Curt. Mag. t. 582. Redout. Liliac. t. 136. Andr. Repoſ. t. 219. (G. undulatus; Linn. Mant. 27.)—Leaves ſword-ſhaped, many-ribbed. Segments of the corolla half the length of the tube, nearly equal, pointed, undulated, reflexed.—Native of the Cape; now become pretty frequent in gardens, for the ſake of its elegance of form and colour, and its fragrance in an evening. The very long narrow ſegments of the *corolla*, each of which has a recurved, channelled, undulated point, and the much greater length of the tube, are ſtriking characters. The colour is pale greeniſh yellow, or buff, with a remarkable lanceolate ſpot, ſtained with purple and red, on each of the three lower ſegments. Anthers deep blue. The Linnæan name ought to have been retained for this ſpecies, but to change the preſent appellation would now cauſe more trouble than advantage.

20. G. *blandus.* Ait. Hort. Kew. ed. 1. v. 1. 64. Ker in Curt. Mag. t. 625. 645. 648. Andr. Repoſ. t. 99. (G. carneus; De la Roche Diſſ. 30. t. 4. Redout. Liliac. t. 65. G. albidus; Jacq. Ic. Rar. t. 256. G. campanulatus; Andr. Repoſ. t. 188.)—Leaves many-ribbed. Tube of the corolla ſhorter than the ſpatha, equal to the limb, which is ringent, bell-ſhaped; its upper ſegment concave; three lower narroweſt, ſpotted.—Native of the Cape. Succeeds beſt with us in the open ground, but the bulbs muſt be taken up every year.—This is an elegant ſpecies, with

leaves of the ſword-ſhaped many-ribbed kind like the two laſt. The *flowers* vary in colour, from white to a pale pink, their three lower ſegments bearing each generally a pair of crimſon ſpots. They vary alſo in ſize, ſometimes vyeing in this reſpect with the largeſt. They have no ſcent.

We cannot but complain of thoſe authors who burthen the public with figures of trifling varieties of this and other plants, for which a ſingle plate ought to have been ſufficient; nor does the contrivance of a new name, though it may conceal the impoſition, by any means atone for it.

21. G. *anguſtus*. Linn, Sp. Pl. 53. Hort. Cliff. t. 6. Jacq. Ic. Rar. t. 252. Ker in Curt. Mag. t. 602. Andr. Repoſ. t. 589. Mill. Ic. t. 142. f. 2.—Leaves linear; midrib prominent on each ſide. Tube of the corolla longer than either ſpatha or limb; three upper ſegments ovate; three lower each marked with a triangular ſtalked ſpot.—Native of the Cape, from whence it was very early introduced into the Dutch gardens. It is readily increaſed, but does not flower freely, otherwiſe its elegance could not fail to render it a general favourite. The narrow *leaves*, compared with thoſe ſpecies neareſt akin to this, and eſpecially the three ſpade-like marks of the bloſſom, which are conſtant, mark it ſufficiently.

22. G. *undulatus*. Jacq. Ic. Rar. t. 251. Ker in Curt. Mag. t. 538. 647. Schneev. Ic. t. 19. Redout. Liliac. t. 121. (G. ſtriatus; Andr. Repoſ. t. 111.)—Leaves ſword-ſhaped, many-ribbed. Flowers erect, funnel-ſhaped; ſegments wavy, bluntiſh; three lower ones much the ſmalleſt.—Native of the Cape; often cultivated in our gardens. The *leaves* are numerous, broad and upright. *Flowers* yellowiſh-white, or pale bluſh-coloured, each ſegment always marked with a deep crimſon central ſtripe which runs down into the tube. The latter is ſeldom longer than the ſpatha, often ſhorter.—The name of *undulatus*, which Linnæus had applied to our *cuſpidatus*, has been miſapplied to this, with which however it agrees tolerably well, and we have already given our reaſon for retaining it. This ſpecies is the *auguſtus* of Thunberg, an appellation which ſeems corrupted from *anguſtus*, a totally different plant in every poſſible reſpect, nor are his quotations of Breynius, and of Linn. Mant. leſs erroneous. There is no end of correcting indifferent names, but *undulatus* ought, as Mr. Ker now allows, to have remained with the Linnæan plant; if ſo, *vittatus*, in alluſion to the ſomewhat ſimilar *Amaryllis vittata*, might have ſerved for the ſpecies before us, though indeed it alſo ſuits the following.

23. G. *floribundus*. Jacq. Ic. Rar. t. 254. Ker in Curt. Mag. t. 610. (G. grandiflorus; Andr. Repoſ. t. 118.)—Leaves ſword-ſhaped, many-ribbed. Flowers erect, funnel-ſhaped; ſegments nearly equal, flattiſh, emarginate, the uppermoſt broadeſt.—Native of the Cape; introduced into England by Lee and Kennedy in 1788. *Bulb* large. *Leaves* broad, with a thick edge, and often falcate. *Flowers* numerous, generally larger than in moſt other ſpecies, very pale pink, blue, or white, with a dark central ſtripe to each ſegment. The ſummits of the ſegments are emarginate, with a little point, and they are ſcarcely at all undulated.

24. G. *Milleri*. Ker in Curt. Mag. t. 632. Ait. Hort. Kew. ed. 2. v. 1. 101. (Antholyza, &c; Mill. Ic. t. 40.)—Leaves with many prominent ribs. Flowers inclining one way, bell-ſhaped, nearly regular; upper ſegment rather narrower than the next; tube fleſhy, ſlender.—Native of the Cape, but rare in gardens. Miller raiſed it from ſeed in 1757, and figured it as an *Antholyza*. It is of the ſame tribe as the two laſt, but differs in having a more inclined and more equal *corolla*, at firſt white then yellowiſh, with a darker purpliſh central ſtripe on the three lower than on the three upper ſegments. The tube, according to Mr. Ker's remark, though externally ſlender and exactly cylindrical, is peculiarly fleſhy, reſembling a flower-ſtalk. The outer *ſpatha* is inflated and convolute, oftener longer than the tube.

25. G. *cardinalis*. Curt. Mag. t. 135. Schneev. Ic. t. 27. Redout. Liliac. t. 112.—Leaves many-ribbed. Stem branched. Flowers erect, in one row, funnel-ſhaped; ſegments elliptical; three lowermoſt ſmalleſt, each with a lanceolate white ſpot.—Native of the Cape, from whence it was brought to Holland, and from the latter country to England by Mr. Græffer; before 1789, unleſs we are greatly miſtaken. It will bear an open border in a warm ſituation, but the bulbs muſt be taken up yearly to make it flower in its natural magnificence. The rich ſcarlet of its *bloſſoms*, and their three white ſpots, diſtinguiſh this fine ſpecies. Its green has a glaucous caſt, and the *ſtem* is properly branched, two or three feet high.

The name alludes to the ſcarlet colour, like that worn by the cardinals at Rome, as uſed by Linnæus in *Lobelia* and *Loxia*. The pious Scopoli thought the application profane, and changed it in the latter inſtance to *rubra*. See his Annus primus, 139.

26. G. *byzantinus*. Mill. Dict. ed. 8. n. 3. Ic. t. 142. f. 1. Ker in Curt. Mag. t. 874. Dryandr. in Ait. Hort. Kew. ed. 2. v. 1. 102. Park. Parad. 191. f. 3.—Leaves many-ribbed. Spike two-ranked. Flowers horizontal; upper ſegment covered laterally by the next; three lowermoſt equal, each with a linear-lanceolate ſtripe.—Suppoſed to be a native of Turkey, it having been for near two centuries a hardy inhabitant of our gardens, under the name of the Byzantine corn-flag, though generally confounded, as G. *communis* of Linnæus, with the two following. We readily ſubmit to Mr. Ker's corrections of this error, in which we have, in common with moſt botaniſts, been involved, but which is now alſo corrected in the new edition of *Hort. Kew.*—All the three have broad, upright, acute, many-ribbed *leaves*, and handſome crimſon *flowers*, projecting horizontally, in a long upright, unbranched ſpike, with lanceolate concave bracteas. The three ſegments of the lower lip are each marked with a central white or yellowiſh ſtripe, bordered with deep red, and more or leſs dilated in the middle. The *flowers* of the preſent ſpecies are larger than in either of the other two, their three lower ſegments very nearly equal in ſize and ſhape; the uppermoſt is embraced and covered at its ſides by the lapping over of the two lateral ſegments, ſo that the flower is cloſed, not pervious, at that part. It bloſſoms in June, rather before the *communis*, but, according to Mr. Ker, never bears ſeeds in England, nor does it increaſe by root ſo rapidly as the other two.

27. G. *communis*. Linn. Sp. Pl. 52. Curt. Mag. t. 86. Riv. Monop. Irr. t. 110. (G. narbonenſis; Ger. em. 104. Park. Parad. 191. f. 1.)—Leaves many-ribbed. Spike one-ranked. Flowers horizontal; upper ſegment covered laterally by the next; three lowermoſt each with a linear-lanceolate ſtripe; the central ſegment very large.—Native of fields in the ſouth of Europe, eſpecially in moiſt ſituations, where it is a troubleſome weed. It is now leſs commonly kept in our gardens than the laſt, from which it differs in the ſmaller ſize of its *bloſſoms*, which are approximated nearly into one row, only a little ſpreading alternately, and whoſe lowermoſt or central lobe is as broad as both the other two, and conſiderably longer. This is viſible even in dried

ſpecimens. We have this ſpecies from M. Favrod's herbarium, gathered wild in Switzerland, ſo that it appears to be Haller's n. 1261, the ſmaller variety; his larger being probably the following ſpecies. There is much difficulty in determining the ſynonyms of old authors, their cuts not being correct in thoſe parts on which our characters are founded; Parkinſon's G. *italicus*, for inſtance, Parad. 191. f. 2, has preciſely the lower lip of this preſent ſpecies, but not the infloreſcence, whilſt his f. 1. does not ſhew the lip ſo well as the poſition of the flowers. As however he mentions but two white ſtripes in his deſcription, ſo many only being viſible, as the ſegments naturally ſtand in our *communis*, we have little doubt of his ſynonym. The *communis* of the Linnæan herbarium is our's, and has winged ſeeds, ſo that we truſt this name will remain fixed, as belonging to the moſt common and general ſpecies, whatever Linnæus might comprehend under it as varieties.
